The *Blue Book*, a recognized authority on cotton-mill statistics, whose publishers send out every year to the cotton manufacturers blanks to be filled out by them, stating the number of operatives employed, reports in actual numbers, or by fair computation for the few mills that do not report the number of operatives, the total of 208,940 operatives for 1906. Taking the Georgia percentage of children under sixteen to the whole number of employees as conservative for the whole South, we would have 70,412 children under sixteen in the Southern mills, and other disinterested persons have testified that these children are of all the ages from sixteen to six. I quote again the statement made by Mr. R. M. Miller, Jr., of Charlotte, N. C., formerly president of the Southern Cotton Spinners' Association, later president of the American Cotton Manufacturers' Association, considered an expert in cotton-mill matters, that 75 per cent of the spinners of the North Carolina mills were fourteen years and under, while his predecessor in office, Mr. George B. Hiss, of Charlotte, told me that the usual calculation was that only 30 per cent of the operatives were adults.

Another example of the defectiveness of official returns is the Anthracite report of the Department of Mines, Pennsylvania (1905). This report shows that there were 760 boys of whose ages the deputy inspectors were in doubt, though the chief of the department says "the boys of doubtful age number a little over 9 per cent of the total number employed, . . . it is very probable, however, that many of the 760 classed as doubtful by the inspectors are over fourteen." Yet the chief admits the impossibility of securing reliable data in the following words:

The difficult thing is to get at the correct ages of these boys, as at least 75 per cent of them were born in foreign countries. Besides this, the department has neither the time nor the money to spend in prosecuting the parents or guardians of these children. If the next legislature could be induced to appropriate about $50,000 for this purpose, the department could enter proceedings to get at the true facts in the matter. . . .

The law is emphatic in its requirement of properly attested certificates for children applying for employment, but unfortunately, under the present system no protection is afforded in cases where the age is falsely represented. The inspectors may frequently have doubts as to the eligibility of the boys who are given employment, but as the certificates have been accepted by the mine foremen, they are without authority to take action in the matter.

From towns and boroughs representing not more than one sixth of the anthracite field, the National Child Labor Committee (1906) compiled returns from school superintendents familiar with the family life and childhood of these communities, showing not less than 2,460 boys under fourteen years of age working in the mines and breakers of these towns and boroughs. While the conclusion would be unwarranted that the total number of boys under fourteen years of age employed in the anthracite field is six times the 2,460 reported (14,760), it is evident that the 760 reported by the department of mine inspection is based on inadequate knowledge. This defect, as explained by the writer (*Annals of the American Academy of Political and Social Science*, Jan., 1907, p. 43), arises from the difficulties surrounding the work of the factory inspector on account of the very defective law of Pennsylvania governing child labor in the mines:

The mine inspectors have been hampered in their work by the fact that nearly all the boys have sworn certificates to their legal age for employment; by the fact that the records at the mines show all boys to be of proper age; by the fact that the visiting inspector is usually known to the boys, who are thus on their guard against any compromising confession; and also by the extent of the field to be covered. The department reports an average of forty-five mines for every deputy inspector, which, as every one familiar with the industry knows, would require superhuman speed and strength of every one of these fifteen representatives of the state. In his report for 1903, the chief criticizes the law requiring every mine to be inspected at least every two months in these words: "This requirement defeats the very purpose of the act and reduces the inspector to a mere walking machine with time only to note the most trivial matters."

A complete statistical report of child labor in the U. S. would include also a large number of children under ten years of age who are at work but who are not included in the census returns. There would also be included the large number of children employed in sweat-shops ("home industries"!), street trades and a multitude of unclassified and informal occupations who are not reported as gainfully employed, but are reported either as at home, or in school, or are omitted altogether.

The variety of commercial pursuits into which the labor of children enters is partly indicated by the list of 315 gainful occupations reported by census enumerators.

The New York State Bulletin of the Commissioner of Labor for March, 1907, contains returns from an investigation of tenement-house labor in certain streets in New York City. In seven streets visited there were found 193 children engaged in gainful labor—the manufacture of clothing, artificial flowers, etc. These children ranged in age from five to fourteen years, the report showing the following numbers for each year of age:

Five years of age, 4; six years of age, 8; seven years of age, 20; eight years of age, 17; nine years of age, 25; ten years of age, 27; eleven years of age, 25; twelve years of age, 37; thirteen years of age, 30.

Many of these children were reported as working only occasionally, while others were employed regularly for the entire day and some until nine or ten o'clock at night.

Legislative. No two states in the union have identical laws. Statutes differ as to minimum age limit for employment, hours of labor, educational requirements, methods of age certification, scope of regulation, etc. It is therefore impossible to present in detail the specific laws that govern child labor in the various states, especially since the statutes in several instances are complicated and extensive.

The principal features of the various laws are noted in the following table, from which many special features (hours of closing stores and factories, catalogue of industries affected by the law, description of kinds of educational tests or proofs of age required, and equipment and effectiveness of factory inspection departments) are necessarily omitted. A few important exceptions are noted supplementary to the table.[1] The age limit given does not in every state apply to all its industries, but applies in industries coming chiefly under the jurisdiction of the inspectors. The more important educational requirements appear in the column "Compulsory Education."

[1] For a detailed analysis of state laws (to Jan. 1, 1907), see "Consumers' League Handbook," 1907, by Josephine C. Goldmark, National Consumers' League, 105 East Twenty-second Street, New York City.

State	Age limit in factories, stores, etc.	Age limit in factories	Exemptions		Hours		Night-work prohibited	Compulsory education	Proof of age	Officials for enforcement	Special
			For poverty, dependent parents, etc.	Certain industries and periods	Per day	Per week					
Alabama	12		Age limit 10 for orphans and for poverty.			48 night-, 66 day-work	Under 13 in factories.		Affidavit		Age limit 14 in mines.
Alaska											
Arizona					8 in mines			to 14, 12 weeks each year			
Arkansas		12			10	60	Under 14 in factories.	to 14, 16 weeks each year	Affidavit		Age limit 14 in mines; if illiterate 16.
California	14		Age limit 12 for poverty.	No age limit for all agricultural, horticultural, and viticultural work in vacation.	9	54	Under 16 in factories, stores, offices, laundries.	to 14, entire school year	Documentary	Special state officials	
Colorado		14 [2]			8			to 14, entire school year		School officials	
Connecticut	14 [1]				10	60		to 14, entire school year	Documentary	School officials	
Delaware		14	Children of widows.	All places of employment except factories.	9	54			Affidavit	Special state officials	
District of Columbia								to 14, entire school year			
Florida	See Special										Under 16 may not be employed more than 60 days without consent of legal guardian.
Georgia		12	Age limit 10 for orphans and for poverty.				Under 14 in factories after Jan. 1, 1908.		Affidavit		
Hawaii								to 15			
Idaho	14 [1]			12 in vacation	9	54	Under 14	to 14, 12 weeks each year	Affidavit		
Illinois	14 [1]				8	48	Under 16 in all gainful occupations.	to 14, 110 days each year	Documentary	Special state officials	Age limit 16 in mines and dangerous occupations.
Indiana	14				10	60	Girls in factories	to 14, entire school year.	Affidavit	Special state officials	
Indian Territory											
Iowa	14						Minors under 16	to 14, 16 weeks each year		Special state officials	
Kansas		14						to 15, entire school year (some exemptions).	Affidavit	Special state officials	Age limit includes factories, mines, and packing-houses
Kentucky	14		Exemptions for poverty.	Handling fruits and vegetables in season and delivery and preparation of tobacco.	10	60	Under 16 in factories and mines.	to 14, 5 months each year	Affidavit	Special state officials	

CHILD LABOR LAWS. BY STATES—*Continued*

State	Age limit in factories, stores, etc.	Age limit in factories	Exemptions: For poverty, dependent parents, etc.	Exemptions: Certain industries and periods	Hours: Per day	Hours: Per week	Night-work prohibited	Compulsory education	Proof of age	Officials for enforcement	Special
Louisiana	See Special			12 years	10	60				Special state officials	Age limit in factories: boys 12, girls 14.
Maine		14		In vacation or on certificate of 16 weeks' schooling and in canneries.	10	60		to 15, entire school year	Documentary	Special state officials	
Maryland	12			Farm labor	10			to 12, entire school year	Documentary	Special state officials	
Massachusetts	14				10	58	See [3]	to 14, entire school year	Documentary	Special state officials	
Michigan	14				10	60	Under 16 in factories	to 15, entire school year (some exemptions).	Affidavit	Special state officials	
Minnesota	14 [2]		Under 14 and illiterates under 16 for poverty.		10	60	Under 16 in all gainful occupations.	to 14, entire school year	Documentary	Special state officials	
Mississippi	See Special										Same as Florida for boys under 21 and girls under 18.
Missouri	14 [2]				9	54	Under 14	to 14, ½ of school year	Documentary	Special state officials	
Montana	14 [2]				8 in mines			to 14, 16 weeks each year	Documentary	School officials	Age limit 16 in mines.
Nebraska	14 [1]			Age limit 10 in vacation.	8	48	Under 16 in all prohibited occupations	*Rural.* to 15, ⅔ of school year (some exemptions). *Urban.* to 16 entire school year.	Documentary	Special state officials	
Nevada								to 14, 12 weeks each year			
New Hampshire	14 [1]				10	60		to 14, entire school year	Affidavit	School officials	
New Jersey	14				10	55		to 14, entire school year	Documentary	Special state officials	
New Mexico								to 14, 12 weeks each year			
New York	14 [1]			Over 12 in mercantile establishments, in vacation, in cities of third class.	8	48	See [4]	to 14, Oct.-June each year	Documentary	Special state officials	
North Carolina		13		Apprenticed labor.	11	66	Under 14 in factories after Jan. 1, 1908.	4 months in year preceding employment.	Affidavit	Special state officials	
North Dakota	14 [2]		Under 14 for poverty.		10			to 14, entire school year		School officials	
Ohio	14 [1]				10	55	Girls under 18, boys under 16, in all gainful occupations.	to 14, 36 weeks each year	Documentary	Special state officials	
Oklahoma											
Oregon	14 [1]			Age limit 12 in any suitable work in vacation of more than 2 weeks.	10	60	Under 16 in all gainful occupations.	to 14, entire school year	Documentary	Special state officials	

CHILD LABOR LAWS. BY STATES—*Concluded*

State	Age limit in factories, stores, etc.	Age limit in factories	Exemptions: For poverty, dependent parents, etc.	Exemptions: Certain industries and periods	Hours: Per day	Hours: Per week	Night-work prohibited	Compulsory education	Proof of age	Officials for enforcement	Special

Wyoming	See Special	.....	.....	.....	.....	.....	.....	to 16, if unemployed	.....	.....	Age limit 14; applies only to mines.

[1] Also all employments during school hours.
[2] In all employments during school hours, unless school requirements have been complied with.
[3] Night-work prohibited:
From 7 P.M. to 6 A.M. children under 14 in all gainful occupations and under 16 in textile mills.
After 8 P.M. to 6 A.M. children under 14 in all street trades.
From 10 P.M. to 6 A.M. minors in manufactures.
[4] Night-work prohibited:
From 5 P.M. to 8 A.M. children under 16 in factories.
From 7 P.M. to 7 A.M. children under 16 in mercantile establishments in New York City and Buffalo.
From 10 P.M. to 7 A.M. children under 16 in mercantile establishments except in New York City and Buffalo.
After 10 P.M. for newsboys under 14 in cities of first and second class.
[5] Under 16 in all gainful occupations (except boys over 14 in certain industries, who may work not more than 9 hours at night).

The record year in child labor legislation was 1905, when twenty-two states and one territory enacted laws regulating the employment of children. This unusual harvest of legislative improvement may be looked upon as the fruit of many years of activity on the part of labor-unions, women's clubs, the National Consumers' League, the experience of states already having effective laws and efficient factory inspectors, and especially the organization of public sentiment against the practise of child employment since the formation of the National Child Labor Committee in April, 1904.

Promoted by these same forces, together with an awakened interest among the churches, improved child labor laws were passed in six states in 1906, Georgia and Iowa having for the first time placed on the statute books a law against child labor. The National Child Labor Committee cooperated in all of this work through distribution of literature, correspondence, and general support. In Iowa it was instrumental in bringing together into a state committee the various elements that had, unorganized, struggled for years without success. In Maryland, Georgia, and Kentucky representatives of the committee appeared before the legislative assemblies in active support of the bills, and the work of the Southern office, opened in Atlanta early in 1906, was concentrated on the situation in Georgia, which presented the most difficult legislative battle that has yet been fought for the protection of childhood in this country.

Since Jan. 1, 1907, important amendments have improved the child labor laws in Alabama, Florida, Maine, Missouri, Nebraska, New Jersey, New York, and Idaho.

In addition to these state activities interest in this subject has been expressed in a growing demand for national regulation of child labor. A bill was introduced in Congress in Jan., 1907, authorizing the federal government (under the provisions of the Interstate Commerce law) to exclude from interstate transportation goods offered for shipment from mines or factories employing children under fourteen years of age. The discussions of this measure on the floor of the Senate and by the press throughout the country have developed the encouraging fact that all well-informed people admit the existence of the evil and grant the urgency of some thorough method of regulation—the division of opinion turning only upon the question whether it would be expedient, and if so, whether the national government has the power to legislate in a matter heretofore regarded as wholly within the limits of state jurisdiction.

Legislation

In a country composed of a number of almost independent commonwealths the disparity in state laws is a source of great confusion. Not only does such inequality render enforcement of law difficult, but the states with regulation well advanced lay burdens upon merchants and manufacturers as against their competitors across the state line which they consider unfair. The glass manufacturer of eastern Ohio protests against the enforcement of the law against employment of boys under sixteen at night, when he knows that just across the river his competitor, whose expenses for fuel, material, and shipping are identical with his own, can employ boys in Pennsylvania at night at fourteen years and in West Virginia during vacation at twelve. The enforcement of the law is felt to be an injustice and the violation of a well-recognized economic principle.

In view of the halting action that may be expected in many states where the need of reform is greatest, many believe that some national action is necessary if the present generation is to be safeguarded. Despite the strong predisposition of the National Child Labor Committee to favor state regulation of the conditions of industry, it appears to have become the prevailing sentiment of its members that the national government should at least take steps to secure the entire elimination of children under fourteen years from the field of gainful occupation, leaving the individual states to take such further action as seems justified. This would establish a standard below which the nation cannot safely permit any of its parts to fall.

In some respects the most important measure dealing with the employment of children is the law enacted by Congress in February, 1907, authorizing an investigation of the conditions of working women and children. This law is a direct result of the persistent activity of the General Federation of Women's Clubs, the Woman's Trade Union League, the National Consumers' League, the National Child Labor Committee, and other organizations interested in the protection of children. An appropriation of $150,000 was devoted to this investigation and the Commissioner of Labor is authorized to add to his regular staff of investigators a sufficient force to make this special study. The value of such an investigation can hardly be overestimated. Heretofore, in default of reliable and complete statistics either from the census bureau or the departments of labor and factory inspection in the various states, it has been necessary for private organizations like the National Child Labor Committee to secure through their own agents the statistical data necessary for arousing public interest in the evils against which they are organized. The objection to this private investigation is obvious. No matter how thorough the agents of a private organization may be, their reports are always open to the charge of being unofficial or "irresponsible." These committees recognize the responsibility of private organizations in arousing public interest, promoting improved legislation, and aiding in law enforcement. But they believe the duty of discovering to what extent the citizens of our country are subjected to unfavorable or injurious conditions is distinctly a duty of the federal government and the various commonwealths. They have therefore been active in urging this government investigation which will lay an authoritative foundation for the work they are organized to conduct.

A Federal Investigation

This report will have a special value in that the investigation is not limited to a statistical study, but is designed to cover the whole field of research into the conditions surrounding wage-earning women and children. It is this larger social phase of the investigation which distinguishes it from a mere census report and which led the director of the census to declare so emphatically that such an investigation lies entirely outside the appropriate exercise of the powers of the census bureau.

The labor organizations have for many years protested against the employment of young chil-

dren in gainful occupations, and may be regarded as the first, in point of time, among the forces arrayed against this system. The General Federation of Women's Clubs has been so active in promoting better conditions that at present nearly all enterprising local clubs have a special committee on child labor, and these committees keep the club members informed of the work of the National Consumers' League and the National Child Labor Committee. Leading educators, social settlement workers, business men and many manufacturers and other employers of labor are joined together for the purpose of securing better conditions for working children, all these classes of citizens being represented in the *personnel* of the National Child Labor Committee, while latterly the churches throughout the country are awakening to the existence of this menace to the intellectual and moral interests of society.

Agencies Opposed to Child Labor

The National Consumers' League, and its local branches, seeks the improvement of industrial conditions through the means of a systematic boycott on producers and purveyors of goods manufactured in unsanitary factories or sweat-shops, or where child labor is employed, or offered for sale in places ignoring certain well-defined rules for the treatment of employees. The earlier activities of the league were mainly devoted to the improvement of conditions in the manufacture and sale of white underwear for women, but more recently a vigorous campaign has been entered against the manufacture and sale of impure foods. While this has been the avowed purpose of the league, perhaps its greatest service has been in the positive efforts aiming to secure higher standards of legislation regulating the employment of children and women, and to the Consumers' League should be accorded the honor of having first undertaken, in a systematic manner, the adequate legal protection of working children in America.

National Consumers' League

Since the National Child Labor Committee may be regarded as the direct outgrowth of the conviction, promoted by many interested agencies, that a problem of such dimensions requires treatment by the coordinated efforts of an organization of national scope, the National Child Labor Committee, formed in 1904, has become the most important organization working on this question. For its work, see NATIONAL CHILD LABOR COMMITTEE.

National Child Labor Committee

In the course of the investigations conducted under the direction of this committee we have made the following observations of the relation of child labor to social welfare, and these have, in part, determined the policy of the committee in its activities:

I. *Children in Agricultural Pursuits Need Protection.*

It has been customary heretofore to exclude children in agricultural pursuits from the discussion of the child labor problem, on the ground that work on the farm is always beneficial. The open fields and pure air and educational opportunities have been set in bright contrast to the environment of the overworked child in the factories and tenements of our large cities. There is a contrast, but not strong enough to justify the neglect of the child in agriculture. The investigations of this committee, while as yet incomplete, are sufficient to indicate the poverty and ignorance of children in many country communities. This is not chiefly in those sections of the country where families live in a degree of isolation, tho even here are many whose lives are devoted to hard manual labor during years that should be given to education and play. But action taken to regulate child labor in agriculture should be directed especially toward those phases of the industry in which people work in large groups. In the fruit and vegetable gardens and canning farms of Maryland, New Jersey, New York, Pennsylvania, and other Eastern states, as well as in sections along the Pacific slope, there are conditions which demand careful regulation.

Children whose ages range from nine to twelve years have been found working eleven or twelve hours a day during the rush of the canning season, the hours often reaching sixty or seventy a week. The chief objection to this form of employment is not so much in the labor itself, as in the housing and sanitary conditions. A description of living conditions reported by one of the investigators is fairly typical of what have been found in several sections of the country.

"As you enter the door of one of these shanties you see a long line of straw divided into bunks. These straw bunks are the beds of the workers. The bunks are divided by small boards not more than eight inches high, just high enough to prevent one family rolling over on another. Each bunk represents a family—man, wife, and children. There is no privacy, and the influence on the young boys and girls is wretchedly degrading. These bunks are probably seven feet long by five broad, and in each one there are from four to six people. From the ceiling or on ropes stretched across the room hang the clothes of the men and women, unclean and nasty looking; on the other side of the room are the trunks and traveling paraphernalia of the residents. Some of these shanties are reasonably decent, but even in these a whole family sleeps in a small room. Usually the shanties are far enough from the canning-house to escape the odor, but in two cases I found the drainage from the canning-house so close to the shanty that the rotten tomatoes and stagnant juice and seeds, turned into a moldy and festering mass, raised an odor that was absolutely repulsive."

No industry in which evil conditions may reach such an extreme should be left unregulated, especially when utilizing so large a majority of all working children. The investigation of this form of child labor has not yet been extensive enough to warrant an appeal for uniform legislation. Even the total prohibition of child labor in these large groups would not wholly mitigate the evil. The parents come for the season accompanied by their children, and the improvement of sanitary and housing conditions would be the greatest safeguard to childhood, while any law establishing a minimum age for employment should be accompanied by adequate provision for the care and education of the children excluded from labor.

From other parts of the country where there is truck-gardening and fruit-picking are such reports of the possibility of serious immorality among children working in groups, although returning to their homes at night, that strength is added to the conclusion that agricultural pur-

suits should not be left unregulated. It has been necessary thus far, however, for the committee to devote its principal attention to those forms of child labor confessedly more serious in their effects—employment in factories, mines, workshops, mercantile establishments, street trades, and transportation.

II. *The Demand for Child Labor appears to be Industrial rather than Economic.*

As soon as childhood shows its capacity for any specific form of labor, industry at once seizes it and posits an economic necessity for so doing. This takes the form of a demand from both the employer and the parent. It is urged in the cigar factories of Pittsburg, the coal-breakers of Pennsylvania, the glass factories of West Virginia and Maryland and the cotton-mills of the South, that neither cigars, glassware, cotton goods nor coal can be produced for the market without the employment of child labor. The need of the child is also made the defense of his toil. It is urged that without such employment the child will suffer want because of the poverty of the parents who depend on his labor.

Our research leads us to deny the validity of both arguments. No form of legitimate manufacture depends on child labor—tho often finding it an economy and a convenience. Cotton is produced as successfully in Massachusetts without the labor of young children as in Maine or Rhode Island with their labor partially limited, or in the South where child labor is almost without restriction. The glass industry is demonstrating that child labor is incidental rather than essential, and many large factories are being equipped with mechanical devices which will almost entirely supplant the children. The same is true in the coal fields where the widest disparity in conditions prevails, some collieries depending largely on men and automatic slate-pickers for the work performed in others by small boys. We have repeatedly observed that when laws are enacted so restricting child labor as to render it more expensive or inconvenient than machinery the latter is adopted without serious inconvenience. We are proving, even by the halting legislative steps taken in our states, what was apparent in England before 1850—that regulated industries, far from suffering in comparison with others, have continually improved their machinery and methods and developed higher standards of comfort and industrial achievement than have their exempted and unregulated rivals.

As to the economic prosperity of the homes of cheap labor, we observe that the influx of poverty drawn by forms of industry which bring quick returns without the investment of capital or skill peoples the regions promoting such industries with an ever-increasing number of hungry mouths, to the despair of philanthropic agencies. Instead of being benefited by such industries the average toiler grows poorer every year while his family falls ever farther below the standard of decent living. Great industries, like the glass, iron, steel, and railroad industries, often bring in their train the small merchant and pedler, the cheap garment worker and stogie roller who live in abject poverty and work in cramped tenements of unventilated filth. Poverty is never decreased by being congested, and the orphan and the poor widow are never permanently relieved by industries that bid for cheap labor.

To meet the immediate needs of such families as depend for support on children obviously unfit for hard labor, a system of relief has been established in several large cities by which private agencies undertake to pay to the family in the form of a scholarship a weekly sum approximating the amount the child could earn, on condition that the child is kept in school. This has the effect of relieving a number of worthy cases where the welfare of the child would otherwise have been menaced, and also of demonstrating how small a percentage of working children are really essential breadwinners of the families they represent.

III. *The Physical Effects of Child Labor Demand an Exhaustive Investigation.*

The brief industrial history of this country and the meager official data available prevent a comprehensive conclusion as to the physical effects of premature labor. While dogmatic assertions as to physical deterioration should not be based on insufficient data, there is a strong presumption that the same effects will follow the heavy and unregulated toil of children in America which were long ago demonstrated to be the fruit of child labor in England and other older countries.

Pictures and physical descriptions of factory children filed in the office of the National Child Labor Committee, showing the effects of a single year, or two years, of work are sufficiently striking to justify the demand for a thorough physical examination of all children entering industry, and at regular intervals thereafter—the results to be systematically compared with the results of an examination of children not gainfully employed. This should be undertaken by every state maintaining child-employing industries, and if necessary by the national government. Massachusetts has already adopted a system of examination for all children whether entering school or labor.

Among the specific indications of the physical effects of premature labor may be mentioned the following observations on child labor by Dr. Albert H. Freiberg, Cincinnati, Ohio:

> Laymen usually underestimate the physiological importance of the play hours of children between the ages of ten and sixteen years. Work during this period of life in factory and workshop has the effect of causing excessive fatigue in certain groups of muscles. This fatigue results in muscular degeneration and the assumption of certain faulty attitudes which are at first habitual but later assume the place of the normal, leaving the child more or less permanently deformed and to some extent incapacitated.
>
> These deformities are to be regarded on the one hand, however, not simply as disfiguring but as interfering with wage-earning capacity later on, or as menaces to health and the normal tenure of life.
>
> The work of boys is for the most part done in the standing position. This work usually constitutes an apprenticeship for work to be done in the same position as journeymen adults. A very frequent result of such premature and excessive toil in boys is the breaking down of the feet which results in what is popularly known as "flat foot." Under these circumstances, it is seen quite frequently in its severest forms, and thus often results in permanently forbidding the continuance of the trade learned as a boy.
>
> The girl, on the other hand, does her work in the factory in a sitting position, as a rule. The effect is frequently the development of what is known as "rotary lateral curvature of the spine." This results in disabling the expansive power of the chest, crowds the heart and lungs abnormally and even affects the capacity and shape of the pelvis. For this reason it is well known that severe cases of lateral curvature result in bringing the tenure of life far below the average by its effect upon the heart and lungs. The deformity of the pelvis has long been known as being productive of serious harm in the maternal function.
>
> While these deformities are not confined to one sex or the other, and while they do not occur in the greater number of toiling children, they are known to be particularly frequent among them. The baneful effects of these deformities are

greatly intensified by unfortunate home environment and improper nourishment. Finally, it is not to be overlooked that they are not the only, or even the most common evidences of physical deterioration to be observed among working children.

This testimony is amply corroborated by professional judgment in all countries having child-employing industries. The English medical authorities on the subject are familiar to the American student.

In France careful attention has been given to specific effects of child employment and Dr. Grancher, member of the Academy of Medicine, declares that a ten-hour day of labor for a child of thirteen or fourteen years is a physiological error. Dr. Letule, of the Paris Hospital, says:

> Children ought not to work in a closed-in space. The child needs his portion of play. . . . To make use of the growing strength of the child, to transform his gestures into remunerative work, gestures which are indispensable to his physical development, is to wither the species in its future hopes, is to condemn to tuberculosis thousands of poor beings who ought to become robust workmen.

Dr. Sevestre, member of the Academy of Medicine and Inspector-General of the Sanitary Service, says:

> It appears possible to me that if the hygienists and doctors who give special attention to the physical development of children had been consulted the legal duration of work for children in workshops or in establishments more or less healthful would have been diminished.

In 1846, in the British Parliament, Lord Macaulay delivered this condemnation of premature and excessive child labor:

> Rely on it that intense labor, beginning too early in life, continued too long every day, stunting the growth of the mind, leaving no time for healthful exercise, no time for intellectual culture, must impair all those high qualities which have made our country great. Your overworked boys will become a feeble and ignoble race of men, the parents of a more feeble progeny: nor will it be long before the deterioration of the laborer will injuriously affect those very interests to which his physical and moral energies have been sacrificed.

Yet one will find among American employers of labor, and American legislators, the same defense of the virtue of overwork for young children that has been advanced since the earliest days of factory legislation in England, Germany, and France.

Such state reports as give the number and ages of children in various forms of labor show a remarkable similarity in the percentage of accidents to children under sixteen as compared with accidents to adults. Whether in glass factories, textile, steel or iron mills, mines or quarries, the ratio of about two and one half to one prevails. The report of the Department of Mines in Pennsylvania, 1905, shows 16,774 slate-pickers employed in that year, 8,124, or 48 per cent, of whom were under sixteen. Yet of the slate-pickers killed by accident 75 per cent were under sixteen, the ratio of risk being three to one. The report also demonstrates that the steady increase in the number of accidents in and about the mines (the percentage to the number employed being greater in 1905 than in any year since 1880) is due either to the youth or the ignorance of the workers.

IV. *Child Labor Diminishes Family Income.*

The direct effect of child labor upon the family income follows the recognized tendency of the cheaper article to drive the better from the market. A comparison of wages in industries that utilize child labor with industries demanding only adult labor shows that the total income of the family in the former—as in the silk and cotton factories, cheap cigar and tobacco factories, and the unskilled departments of the glass and coal-mining industries—is not equal to the income of the family in the trades—iron and steel, bridge building, railroad and lumber industries—where only adult members of the family are employed.

When the natural breadwinner is no longer able to maintain his family as an economic unit but must impose upon each member the burden of semiindependent industrial existence, we are brought to a sociological problem of far-reaching import. The institution we call the family cannot survive the crumbling of its economic foundation.

A comprehensive tabulation of the birth-rate as related to family income and to the income of the head of the family is greatly to be desired. But such a tabulation is impracticable until our commonwealths are better equipped with records of vital statistics. And men who work in the social laboratory—especially teachers and physicians—bring to us startling evidence of the reluctance of intelligent and virtuous people to bear children, when they observe skilled employments steadily being divided into unskilled branches which bid for child labor, while the ignorant, the vicious, and the physically unfit continue to propagate their own kind.

It has been abundantly demonstrated by investigations recently conducted that the finding of the Committee of the House of Lords in England in 1889 has its counterpart in this country to-day—that the worst conditions, the longest hours, and the lowest wages existed in the domestic workshops which we have been so concerned to leave free from any government regulation.

V. Child Labor Tends to Industrial Deterioration.

The effects of child labor are seen in the cheapening of industrial products, due to unskilled labor on the one hand, and on the other to the unfitting of the adult for the proper consumption of goods, because of his defective mental and physical training. The Massachusetts Committee on Industrial and Technical Education, 1906, shows that those who too early in life enter industries that bid for cheap child labor are doomed to spend their future years in such labor at wages that will never afford adequate support. It is shown, for example, that while the cotton-mills offer about $4 a week to children beginning as against about $2.50 in the leather industries, and thus win the larger number of children, the wages do not increase in the same proportion. In the cotton-mills the weekly wages advance to about $6 or $6.50 and there rest, while in the shoe factories the advance proceeds from $2.50 to $11 or $12 a week, with a higher percentage of special opportunities for advancement. No other state has made so careful a research into this problem, but there is abundant evidence to the same effect from other countries. If the child laborer progresses in years but not in earning capacity his poverty precludes his participation in the fruits of industry. He becomes a poor purchaser, fails to consume his share of the goods offered for sale, and thus promotes that commercial congestion from which the markets of the world so frequently suffer.

The condemnation of the unregulated domestic

and street trades is even more emphatic. All the witnesses who gave evidence recently before the Inter-Departmental Committee of the British Government "concurred in the view that 'once a street trader always a street trader' and that the streets manufacture the casual worker, the unemployed, and the loafer." (Nettie Adler, 1906, "Juvenile Wage Earners and their Work," p. 7).

VI. Child Labor not a Problem of Foreign Labor.

A special study of the relation of our foreign populations to child labor has been made for the purpose of testing the validity of the claim often advanced that this system, even granting its evil, affects only the foreigners. This claim is well founded only in those localities in which recent arrivals from foreign countries constitute the lower and more helpless element in the community. There their ignorance and traditional subjection to industrial injustices make their children the easy prey of the unscrupulous or the misguided employer. Boroughs in the coal regions of Pennsylvania are found in which not more than 3 per cent or 5 per cent of the school pupils enrolled ever reach the high school, and of these few if any are of the foreign-born children who abound in these communities. But the exploitation of young children is no respecter of race distinctions and, where legal safeguards are wanting, the coal-mine and the glass factory and the silk- and cotton-mill take the children of the community, whether Lithuanian, Pole, Portuguese, French Canadian, or native Cavalier or Puritan stock. But were this evil limited to foreign-born races, they so soon become an integral part of our national life that an injury to them is an injury to all.

VII. A Working Plan.

We must recognize the possibility of misjudging the character of the phenomena that have thus far imprest us. Certain phases of child-labor research must be carried on systematically for some years before more than tentative results should be announced.

Meanwhile we are convinced that the results of the investigations thus far conducted, when interpreted by the experience of older industrial communities, justify as a working hypothesis a program of opposition to child labor along the following general lines:

(1) The regulation of all branches of industry in which children are employed. The experience of older industrial communities proves that in the absence of regulation there will be some trades in which at least some workers will be driven to exist under conditions so exhausting and demoralizing as to be injurious to the community. This excessive burden will fall most heavily upon the laborers least able to protest against injustice—namely, the children.

(2) The elimination of the child under fourteen years of age as an industrial factor.

(3) The restriction of employment for children between fourteen and sixteen years of age, excluding the physically or mentally defective and the illiterates; forbidding the employment of others at night, for more than eight hours a day, or in any employment dangerous to life, limb, health or morals.

The requisites of a good child-labor law are best set forth by Mrs. Florence Kelley, General Secretary of The National Consumers' League (in "Some Ethical Gains Through Legislation," The Macmillan Company, New York, 1905, pp. 93 *seq.*) as follows:—.

What Constitutes Effective Child-Labor Laws

Effective legislation dealing with child labor involves many differing elements, including the child, the parent, the employer, the officials charged with the duty of enforcing the statutes, and finally the community which enacts laws, provides schools for the children when they are prohibited from working, supports and authorizes officers for the enforcement of the laws, prescribes penalties for their violation, assists dependent families in which the children are below the legal age for work. In the long run, the effectiveness of the law depends upon the conscience of the community as a whole far more than upon the parent and the employer acting together.

With the foregoing reservations and qualifications duly emphasized, the following summaries are believed to outline the substance of the effective legislation which it seems reasonable to try to secure in the present and the immediate future. They deal only with provisions for the child as a child, taking for granted the provisions for fire-escapes, safeguards for machines, toilet facilities and all those things which the child shares with the adult worker.

An effective child-labor law rests primarily upon certain definite prohibitions, among which are the following:

Labor Is Prohibited: (1) for all children under the age of fourteen years; (2) for all children under sixteen years of age who do not measure sixty inches and weigh eighty pounds;[1] (3) for all children under sixteen years of age who cannot read fluently and write legibly simple sentences in the English language; (4) for all children under the age of sixteen years, between the hours of 7 P.M. and 7 A.M., or longer than eight hours in any twenty-four hours, or longer than forty-eight hours in any week; (5) for all children under the age of sixteen years in occupations dangerous to life, limb, health or morals.

The Child.—Effective legislation requires that before going to work the child satisfy a competent officer appointed for the purpose, that it (1) is fourteen years of age, and (2) is in good health, and (3) measures at least sixty inches and weighs eighty pounds, and (4) is able to read fluently and write legibly simple sentences in the English language, and (5) has attended school a full school year during the twelve months next preceding going to work.

The Parent.—Effective child-labor legislation requires that the parent (1) keep the child in school to the age of fourteen years and longer if the child has not completed its required school work, and (2) take oath as to the exact age of the child before letting it begin to work, and (3) substantiate the oath by producing a transcript of the official record of the birth of the child, or the record of its baptism, or some other religious record of the time of the birth of the child, and must (4) produce the record of the child's school attendance, signed by the principal of the school which the child last attended.

The Employer.—Effective child-labor legislation requires that the employer before letting the child begin to work: (1) obtain and place on file ready for official inspection papers showing (*a*) the place and date of birth of the child substantiated by (*b*) the oath of the parent corroborated by (*c*) a transcript of the official register of births, or by a transcript of the record of baptism, or other religious record of the birth of the child, and by (*d*) the school record signed by the principal of the school which the child last attended, and by (*e*) the statement of the officer of the Board of Education or the Board of Health designated for the purpose, that he has approved the papers and examined the child; (2) after permitting the child to begin to work, the employer is required to produce the foregoing papers on demand of the school-attendance officer, the health officer, and the factory inspectors; (3) in case the child cease to work, the employer must restore to the child the papers enumerated above; (4) during the time that the child is at work, the employer must provide suitable seats, and permit their use so far as the nature of the work allows; and must (5) post and keep posted in a conspicuous place, the hours for beginning work in the morning, and for stopping work in the middle of the day; the hours for resuming work and for stopping at the close of the day; and all work done at any time not specified in such posted notice constitutes a violation of the law. The total number of hours must not exceed eight in any one day or forty-eight in one week.

The Officials.—Effective legislation for the protection of children requires that the officials entrusted with the duty of enforcing it (1) give their whole time, not less than eight hours of every working-day, to the performance of their duties, making night inspections whenever this may be necessary to insure that children are not working during the

[1] This measure is not now specified in any statute, tho it is implied in the statute of New York, enacted in 1903.

prohibited hours; and (2) treat all employers alike, irrespective of political considerations, of race, religion or power in a community; (3) prosecute all violations of the law; (4) keep records complete and intelligible enough to facilitate the enactment of legislation suitable to the changing conditions of industry.

The School.—The best child-labor law is a compulsory education law covering forty weeks of the year and requiring the consecutive attendance of all the children to the age of fourteen years, and until sixteen years, unless they have meanwhile completed a specified portion of the curriculum, as eight years in Colorado or five years in New York. It is never certain that children are not at work, if they are out of school. In order to keep the children, however, it is not enough to compel attendance—the schools must be modified and adapted to the needs of the recent immigrants in the North and of the poor whites in the South, affording instruction which appeals to the parents as worth having, in lieu of the wages which the children are forbidden to earn, and appeals to the children as interesting and attractive. No system of child-labor legislation can be regarded as effective which does not face and deal with these facts.

The vacation school and camp promise reenforcement of the child-labor laws; which are now seriously weakened by the fact that the long vacation leaves idle upon the streets children whom employers covet by reason of the low price of their labor, while parents, greedy for the children's earnings and anxious lest the children suffer from the life of the streets, eagerly seek work for them. Nothing could be worse for the physique of the school child than being compelled to work during the summer; and the development of the vacation school and vacation camp alone seems to promise a satisfactory solution of the problem of the vacation of the city child of the working class.

The Community.—Effective child-labor legislation places upon the community many duties, among which are: (1) maintaining officials—men and women—school-attendance officers, health officers, and factory inspectors, all of whom need (*a*) salary and traveling expenses, (*b*) access at all reasonable times to the places where children are employed, (*c*) power to prosecute all violations of the statutes affecting working children, (*d*) tenure of office so effectively assured that they need not fear removal from office in consequence of prosecuting powerful offenders; (2) maintaining schools in which to educate the children who are prohibited from working; (3) maintaining vital statistics, especially birth records, such that the real age of native children may be readily ascertained; (4) maintaining provision for the adequate relief of dependent families in which the children are not yet of legal age for beginning work.

More important, however, than the enactment of the foregoing provisions is the maintenance in the community of a persistent, lively interest in the enforcement of the child-labor statutes. Without such interest, judges do not enforce penalties against offending parents and employers; inspectors become discouraged and demoralized; or faithful officers are removed because they have no organized backing, while some group of powerful industries clamors that the law is injuring its interest. Well-meaning employers grow careless, infractions become the rule, and working men form the habit of thinking that laws inimical to their interest are enforced, while those framed in their interest are broken with impunity.

Upon parents there presses incessant poverty, urging them to seek opportunities for wage-earning, even for the youngest children; and upon the employers presses incessant competition, urging them to reduce the pay-roll by all means, fair and foul. No law enforces itself; and no officials can enforce a law which depends upon them alone. It is only when they are consciously the agents of the will of the people that they can make the law really protect the children effectively.

Austria

Statistical.—The statistical returns of the factory inspectors show only the number of persons employed in the establishments visited by them. For the years 1902 and 1903 the data are as follows:

Number of Young Persons and Adults in Austria Employed in Establishments Visited by the Factory Inspectors, 1902 and 1903

[Source: "Soziale Rundschau" 1904 (Bd. II), p. 412.]

	Number		Per cent	
	1902	1903	1902	1903
Adults	728,408	744,264	94.2	94.2
Young persons	44,948	45,619	5.8	5.8

Legislative.—The labor of children in factories and workshops is regulated by the laws of June 4, 1884, and March 8, 1885. (An establishment employing more than twenty persons or equipped with machinery is considered a factory, while other industrial establishments are designated workshops.)

Age.—The age limit for employment in workshops is twelve years, provided that under fourteen years the work shall be such as is not injurious to physical development and does not prevent school attendance. Children under fourteen years are not to be employed in factories, and those from fourteen to sixteen only in the lighter forms of factory labor. The age limit for employment in mining enterprises is fifteen years, provided that by special permit children over twelve years of age may be employed in the "lighter work" when such employment does not interfere with school attendance. The form of labor permitted to males under sixteen and females under eighteen is limited, by executive officers, to such as does not retard physical development.

Hours of Labor.—For children under fourteen employed in workshops, not to exceed eight hours a day. The hours of labor for other persons may not exceed eleven. There must be a recess of not less than one hour and a half a day. Night work is prohibited from 8 P.M. to 5 A.M. for males under sixteen and for all females. The law of January 16, 1895, forbids (with certain specific exceptions) all industrial labor on Sunday.

Certificates.—Employers must keep lists of all employees subject to the provisions of the child-labor laws, and all children must comply with the regulations regarding school attendance and health qualifications, as a condition for employment.

Exemptions.—The Minister of Commerce may grant temporary or permanent exemptions from the provisions of the law, or may place added restrictions on industries or occupations regarded as dangerous for children.

Belgium

Statistical.—

Number of Women and Children in Belgium Employed in Industrial Establishments Visited by the Factory Inspectors, 1897 to 1900

[Source: "Rapports annuels de l'inspection du travail," Office du Travail, Bruxelles, 1897–1900.]

Year	Number of protected persons under 21 years of age				Females over 21 years of age	Total number of workers of all ages and both sexes	Per cent of total number of workers protected
	Children 12 to 16 years		Females 16 to 21 years	Total			
	Boys	Girls					
1897	15,392	9,452	17,229	42,073	19,365	210,767	19.96
1898	16,939	10,761	18,993	46,693	19,380	235,867	19.80
1899	19,810	11,761	21,978	53,549	23,276	252,965	21.17
1900	19,031	13,560	23,429	56,020	25,269	273,363	20.49

Legislative.—The labor of children is regulated by the law of Dec. 13, 1889, supplemented and modified by a number of royal decrees. The law and decrees affect mines, quarries, factories, and industrial establishments using mechanical motive power, and transportation by land or water.

Age.—Labor in any of these establishments is forbidden under twelve years of age, while females under twenty-one are forbidden to labor underground.

Hours of Labor.—Limited to twelve per day for males under sixteen and females under twenty-one (except where special regulations have been issued by royal decree). The regulation of hours of labor is based upon an analysis of the kinds of labor performed, varying from eleven and one-half to ten per day in different specified industries, with rest periods fixed by law (e. g., in the mining industry males under sixteen working underground may not work more than ten hours and a half, including descent, rest period, and ascent. The rest period must not be less than one eighth of the total time spent underground).

Night and Sunday Labor.—Prohibited 9 P.M. to 5 A.M., males under sixteen and females under twenty-one (except in certain specified industries). One day rest in seven is enjoined, though not necessarily Sunday.

Certificates.—Required of males under sixteen and females under twenty-one, showing age, educational and other qualifications. Furnished free by local authorities. Employers must keep files of all protected employees.

Exemptions.—Exceptions or additions to the provisions of the law may be made by royal decree.

France

Statistical.—The following table presents the results of a special enumeration made in 1900 of persons subject to the law of March 30, 1900:

Number of Children and Other Persons in France Employed in Establishments Subject to the Law of March 30, 1900, in the Year 1900

[Source: "Bulletin de l'Office du Travail," 1901, p. 856.]

Age and Sex	Number of workers	Per cent
Children under 18:		
Male	238,498	8.5
Female	220,027	7.8
Females over 18	623,565	22.3
Total women and children	1,082,090	38.6
Males over 18	1,719,916	61.4
Total	2,802,006	100.0

The Minister of Commerce and Industry in France made a report in 1903 upon the industries employing children under eighteen years of age, and the number employed, as follows:

Industries	Male	Female
Food preparation	9,146	8,291
Chemical	3,316	2,381
Rubber, paper, pasteboard	4,817	7,131
Books and printing	12,802	5,026
Textile	43,847	80,192
Cloth and clothing	6,805	100,776
Straw, feathers, hair	845	2,196
Leather and hides	11,548	5,501
Wood	30,117	4,943
Metallurgical	8,099	106
Ordinary metals	58,609	6,569
Fine metals	2,331	1,367
Cutting precious stones	128	156
Cutting and polishing stones	1,538	223
Stove construction	17,539	49
Crockery, glass, etc	21,715	5,766
	233,238	230,636

This makes a total of 463,874. In the same industries there were employed 627,051 women and 1,676,607 men.

Legislative.—The laws of November 2, 1892, amended March 30, 1900, regulating the labor of children applies to factories, workshops, mines, and quarries. Agriculture, mercantile establishments, and workshops in which only members of the family are employed, are exempt. In forty-seven distinct occupations the labor of women and children is forbidden, while ten others permit women but forbid children under eighteen. In ninety-four other kinds of establishments the employment of children is strictly regulated.

Age.—Limit, thirteen years for children who have completed the common-school course. No female of any age may be employed underground.

Hours of Labor.—Limited to ten per day for males under eighteen and females of all ages. In mines for boys thirteen to eighteen the shift must not exceed eight hours.

Night and Sunday Labor.—Labor prohibited 9 P.M. to 5 A.M., or for more than six days per week, males under eighteen and all females.

Certificates.—Required of all children under eighteen, showing age, educational qualifications, and physical ability to perform the work desired. Children under sixteen may be required to undergo special physical examination before employment in certain industries. Employers must keep file of all employees subject to the child-labor laws.

Exceptions.—Certain specified exceptions may be made by executive officials. A ministerial decision in 1895, modified by various decisions, to July 4, 1902, makes the following exemptions to the prohibition of night and extra work:

1. In mills where "fire burns continually" male children may be employed ten hours out of the twenty-four, on condition that they have two hours' rest.

2. In certain industries, such as butter, dairies, ready-made clothing, fruit and fish preserveries and toy manufactories, the inspectors may, during the busy seasons in these trades, permit overtime work until eleven o'clock at night, providing the total day's work does not exceed twelve hours, and may temporarily abrogate the provisions requiring periods of rest and one day's rest per week; but in no case are such special privileges to extend over sixty days in any one year.

Serious Defects.—The more important defects in the otherwise excellent child-labor laws of France are: (1) the entirely inadequate force of factory inspectors (there are 110 inspectors to cover the field of more than 159,060 establishments employing more than 3,000,000 people) and the imposition of penalties for violation of law so slight as to often invite the risk of detection; (2) the failure to properly guard the employment of apprentices, or of children who are boarded with their employers; (3) the failure to properly regulate employment in tenement-house sweat-shops.

The regulation of apprenticeship is under an antiquated law of Feb. 22, 1851. The law provides against certain abuses of overwork, etc., and requires that ignorant apprentices shall be given an opportunity (not over two hours a day) to study. But the apprenticeship system is dying as in other countries, there being but 180 trades in France in which apprentices are received, supervision of apprentices by justices of the peace is a dead letter, and parents have been

found generally indifferent to the violation of contract governing their apprenticed children. It is also possible, without infraction of law, for children to be sent to board with an employer, without being protected even by the apprenticeship contract. As a boarder he becomes a member of the family and thus devoid of protection. In this way many children work without learning a trade and are developed into cheap, inefficient workmen. Francis H. McLean, of the International Committee of the Consumers' League, says (*Charities*, April 22, 1905, New York):

"It is estimated that there are about 50,000 children so employed in the capital city alone. The Consumers' League of Paris has undertaken an investigation into the condition of children employed by pastry cooks. Their ages generally run from thirteen to sixteen years. The Superior Council of Labor, the labor-unions, and the Consumers' League have joined in an agitation to so amend the present laws that all the children so exploited shall work only under apprenticeship contracts strictly regulated, and furthermore, that the factory inspectors shall have jurisdiction over them.

"There is reason to believe that the legislation which will come in the years just ahead will even up French child-labor regulation, and make it in many more details as progressive as it is now in the points enumerated above. There are strong and influential bodies, the great Association for the Legal Protection of Workmen and the active Consumers' League of Paris among others, who are leading the fight. And most significant of all, the intelligent labor-unions of France are vitally and deeply interested in the suggested reforms. In all probability the first step in advance will be to still further curtail the power of a parent to act against the best interests of his child and therefore against the best interests of the State itself. In a country which is so strongly committed to the idea of the superior importance of the common weal over the welfare of any single individual or group in the nation, there can scarcely be any doubt of the early evolution of a model child-labor law."

Germany

Statistical.—In 1898 the German ministry of the interior made a special investigation of the employment of children under fourteen years of age in establishments other than factories, but not including agricultural establishments. The investigation was not a census, as several districts were not canvassed, and the methods followed were not entirely uniform throughout the empire, but the figures show approximately the extent of such child labor and its distribution in the several branches of industry.

The total number of children under fourteen years of age engaged in industrial establishments other than factories in 1898 was found to be 532,283. Making allowance for the territory omitted, the report estimates that this number formed 6.53 per cent of the children of school age.

The branch of industry and the number and per cent of children employed in each in 1898 are shown in the first of the following tables, while the second shows the number of children employed in factories for the years indicated:

Number and Per Cent of Children in Germany Under 14 Years of Age Engaged in Industrial (i. e., Nonagricultural) Establishments Other than Factories in 1898

[Source: "Vierteljahrshefte zur Stat. d. Deutschen Reichs," 1900, pp. iii, 101]

Legislative.—Laws regulating employment of children over thirteen years of age are in the industrial code, amended June 30, 1900, and the ordinance of the federal council, July 13, 1900. The labor of children under thirteen is restricted by the law of March 30, 1903, and of child labor in the coal-mines of Prussia, Baden, and Alsace-Lorraine by the ordinance of the federal council, March 24, 1903. To these general regulations individual states of the empire may add further restrictions. The laws of the empire apply to mines, factories, workshops, commercial establishments, and all industries connected with transportation. Other establishments may be included at the discretion of the federal council. The laws do not apply to workshops in which only members of the family labor under the direction of the parent.

Age.—Employment in mines, factories, building operations, and workshops designated as unsuited to the employment of children, is forbidden children under thirteen, or children over thirteen who have not completed the common-school course. The employment of children under thirteen or those who have not completed the common-school course is regulated according as the child is, or is not, a member of the employer's family.

Children not related to the employer may not be employed under thirteen in any of the above establishments or in theatrical performances. Those over twelve may be employed in certain workshops, in commerce or transportation, and in hotels and restaurants. Children related to the employer may be employed at ten years in industries permitted to the non-related children under thirteen, though the hours are carefully regulated. Such children may not be employed in industries forbidden other children under thirteen. In certain classes of workshops children under ten years may be employed under strict regulations. Related children may be employed under thirteen in the delivery of milk, newspapers, etc., though this may be at any time restricted by local officials.

No female may be employed underground.

Hours of Labor.—All children under thirteen are compelled to attend school regularly, and may not be employed after 8 P.M. or before 8 A.M. Work may not begin before the school session, nor earlier than an hour after the close of the session. Hours of labor may not exceed three per day, except in regular vacation when they may extend to four hours. Children under fourteen may not work in factories more than six hours per day, and children between fourteen and sixteen not more than ten hours. Specific restrictions also regulate the rest periods and higher age limits for employment in certain industries, also special hours for closing on days preceding Sundays and holidays. In the coal-mines of Prussia, Baden, and Alsace-Lorraine children fourteen years old may work eight hours per day, one hour of which must be a period of rest, while the eight-hour shifts must be separated by at least fifteen hours (thirteen hours before Sundays and holidays).

Night and Sunday Labor.—Prohibited 8.30 P.M. to 5.30 A.M., males under sixteen, females of any age. Females may not work after 5.30 P.M. on days preceding Sunday and holidays. Children under fourteen may not work between 8 P.M. and 8 A.M.

Certificates required of all minors seeking employment, supplied free by local police officials. Employers of children must first file a statement of location of establishment, number of women and children desired, character of work to be done, hours of labor, rest periods, etc. The employer must keep posted in his establishment a list of employees subject to the child-labor laws, showing hours of labor and rest periods. Before employment in mines (Prussia, Baden, Alsace-Lorraine) children under fourteen must be specially examined and obtain a certificate from an authorized physician, that physical development and health will not suffer by such employment.

Exemptions.—The federal council may make certain exceptions to special restrictions contained in the law, but only for a limited period, and may also forbid absolutely the employment of women or children under sixteen in occupations they consider dangerous to health or morals.

These imperial laws are regarded merely as a minimum standard of protection for children, and it is expressly provided that nothing shall prevent the separate states from enacting more stringent laws.

Great Britain

For Child Labor and Legislation in Great Britain see separate article on the subject.

Italy

Statistical.—The following table shows the number and age of the children employed in the establishments visited by the factory inspectors in the years 1897 to 1900. It should be stated that the factory inspectors are few in number and the number of factories visited in one year is not large. The statistics show the extent of the employment of children under the law of 1886, now superseded by the law of 1902:

Number of Children in Italy Employed in Factories Visited by Factory Inspectors in 1897 to 1900

[Source: Relazione sull' applicazione della legge 11 febbraio 1886, sul lavoro dei fanciulli, etc.]

Year	Number of children employed	Per cent		
		9–10 years of age	10–12 years of age	12–15 years of age
1897.....	15,592	1.30	18.07	80.63
1898.....	11,641	.96	7.70	91.34
1899.....	1,086	.18	12.34	87.48
1900.....	6,291	1.34	13.86	84.80

Legislative.—The labor of children is regulated by the law of June 19, 1902, and the administrative decree of Jan. 29, 1903. It affects factories, workshops, mines, quarries, work of construction (including buildings and roads). The government may also, on advice of the superior council of hygiene and the council of industry and commerce, entirely forbid, or place under special restrictions, labor of children in industries considered dangerous or unsanitary.

Age.—Labor is forbidden in the above industries under twelve, except that no child under fourteen (unless mechanical traction is used) and no female may work underground. By special decree children under fifteen may be forbidden employment in any establishment or occupation considered dangerous or unsanitary.

Hours of Labor.—Limited to eleven per day

for children twelve to fifteen years old, and not more than twelve for any female. The length and frequency of rest periods is also established by law. The minister of agriculture, industry, and commerce may, with the advice of the provincial council of hygiene, extend the hours of labor for children to twelve per day for a limited period and for specific cause.

Night and Sunday Labor.—Night-work forbidden (8 P.M. to 6 A.M. in winter, 9 P.M. to 5 A.M. in summer) males under fifteen and females of any age. Special regulations may be issued regarding night-work in specific localities. Children under fifteen and females of all ages must have one entire day of rest each week (not necessarily Sunday).

Certificates.—Required of males under fifteen and all minor females subject to the provisions of this law, showing that applicant has proper age, health, and educational qualifications. Certificates furnished free. Lists of protected employees must be kept and annual reports made by employers.

SWITZERLAND

Statistical.—

NUMBER OF CHILDREN IN SWITZERLAND EMPLOYED IN FACTORIES IN 1901

[Source: "Statistisches Jahrbuch der Schweiz," 1902, p. 99.]

INDUSTRIES	CHILDREN 14 TO 18 YEARS OF AGE			PERSONS OF ALL AGES		
	Male	Female	Total	Male	Female	Total
Textile	4,552	12,122	16,674	33,192	64,001	97,193
Other industries	12,117	6,481	18,598	117,011	28,330	145,341
Total	16,669	18,603	35,272	150,203	92,331	242,534

Legislative.—Child labor is regulated by the federal law on factories of March 23, 1877, supplemented by cantonal laws and administrative decrees by the federal council. The law applies to factories, defined (decree 1891) as industrial establishments (1) employing more than ten persons; (2) using mechanical motive power and employing more than five persons, or employing minors under eighteen, or offering danger to life or health of employees; (3) certain other establishments. The decree of 1897 specifically forbids employment of children under sixteen in certain employments, e. g., attending steam boilers, motors, dynamos, cranes, drawbridges, circular or band saws, and similar machinery; also work with explosives, harmful chemicals, or processes producing much dust.

Age.—Employment in factories forbidden all children under fourteen.

Hours of Labor.—Limited to eleven per day for all persons employed in factories. For children under sixteen the eleven hours must also include such time for school and religious instruction as required by local authorities. On days preceding Sunday and holidays hours of labor are limited to ten.

Night and Sunday Labor.—Night-work forbidden (8 P.M. to 6 A.M. in winter, and 8 P.M. to 5 A.M. in summer) males under eighteen and all females. Sunday work also forbidden. Under special conditions the federal council may authorize the employment of boys fourteen to eighteen years, for work in which a continuous process is necessary.

Certificates.—No requirement for employment certificates is contained in the general law, but cantonal governments establish regulations, and all employers are required by law to keep lists of all persons employed.

Exceptions.—May be granted by the federal council in certain cases, and establishments may be designated in which the employment of children is prohibited.

OWEN R. LOVEJOY

CHILD LABOR AND LEGISLATION IN GREAT BRITAIN: The employment of children in Great Britain is regulated by a series of enactments which may be roughly classified under three heads:

(1) Factory and Workshop Legislation (1802–1901).

(2) Education Acts and By-laws (1870–1900).

(3) Employment of Children Act and By-laws (1903).

These measures deal with three classes of children and young persons:

(*a*) Young persons from fourteen to eighteen years, employed full time and exempt from school attendance.

(*b*) Children from twelve to fourteen years, who have reached a certain standard of education or have made a certain number of attendances during five years of school life, and who are consequently permitted to work either full or half time.

(*c*) Children under fourteen, at school during the whole session, whose employment out of school hours is regulated by the Employment of Children Act.

The earliest Factory Act was passed in 1802, and applied almost entirely to apprentices employed in cotton and woolen mills. It was framed to deal with a specific evil, and at that time there was no intention of a general regulation of industrial work. The apprentices were pauper children, sent from the London workhouses by the parish guardians, who paid a small premium to the manufacturers as an inducement to relieve them of the burden of caring for these unfortunate young people. The employers were glad to obtain cheap labor on such terms, for the discovery of the application of power to the spinning and weaving looms had given an immense impetus to the manufacture of textiles. The children were treated as slaves, were frequently worked to death, and, it was said, even murdered, that fresh children and new premiums might be obtained.

The Act of 1802 limited the hours of work to twelve per day; that of 1819 prohibited the employment of children under nine years in factories, and restricted the hours of employment of children between nine and sixteen years to twelve per day. There were, however, no means of enforcing the law, and the evidence given before the Royal Commission of 1833 showed that children were being worked fourteen, fifteen, and even sixteen hours daily. Four factory inspectors were, however, appointed in that year. The Act of 1834, which followed as a result of the Royal Commission, instituted the distinction between children under thirteen and young persons between thirteen and eighteen years. It limited the hours of work for children between nine and thirteen years to nine, prescribed two hours' schooling daily, and enforced a weekly maximum of seventy-eight hours. The legal day, however, was from 5.30 A.M. to 8.30 P.M., and children were often detained the entire fifteen hours in the factory, on the plea that they were sent out for three hours' recreation. Moreover, the schools established could only be described as an impudent evasion of the law. Factory hands, disabled or past work, who could neither read nor write, were not infrequently appointed "schoolmasters."

Early Legislation

The Act of 1842 prohibited the employment of girls and women in coal mines, a step necessitated by the terrible revelations of the Royal Commission of 1841. In the factories a new principle was introduced—that of the *Half Time System*. Factory children were to work either ten hours on alternate days of the week, and were to attend school on the other days, or were to complete six and a half hours' factory and three hours' school attendance daily. The employer was required to obtain from the schoolmaster a certificate of the child's attendance.

The regulations hitherto promulgated only applied to children employed in mills. The Children's Employment Commission of 1863 showed, however, that large numbers of boys and girls, too young to be employed in factories, were set to work at home or in small workshops at lace dressing, fustian cutting, and other occupations, for fourteen or fifteen hours a day. The Factories Extension Act and the Workshop Act of 1867 regulated certain industries, not hitherto dealt with by law, and placed under control workshops defined as "any room or place in which any handicraft is carried on by any child, young person, or woman and to which the employer has access."

The value and utility of the Factory Act of 1878, which consolidated all previous regulations and removed ambiguities in the existing law, were greatly enhanced by reason of the compulsory system of national education which had come into existence during the years 1870–76. A ten hours' day for women, young persons, and children was imposed in textile, and a ten and a half hours' day in non-textile factories. The working day had to be placed within a defined period of twelve hours, beginning at 6, 7, or 8 A.M. Half-time employment by children under ten was prohibited. The Act of 1891 raised the age to eleven, and charged the local sanitary authorities with the duty of regulating the hygiene of workshops.

The Factory and Workshops Act of 1901 touches the high-water mark of British protective legislation in regulated industries. It consolidates all previous legislation on the subject. No child or young person under sixteen may be employed in a factory without a certificate of fitness from the certifying surgeon of the district. Such certificate may also be required for those employed in certain workshop trades; and the number of these was increased on Aug. 31st 1906 so as to include certainly the most important trades in the country. No girl or woman may be employed at any night work whatever. The regulations as to the employment of boys over fourteen or over sixteen are very stringent. In paper-mills and furnaces they may not be on night duty more than seven times in two weeks, and then only in shifts of eight hours, a shift of employment alternating between two rest shifts. No young person under sixteen may be employed in silvering mirrors and in white-lead making, nor may any girl work at brick or tile finishing or salt making. No child, altho exempt from school attendance, may be employed in match dipping or metal grinding. The maximum limit of humidity in the atmosphere of cotton factories is carefully regulated. No child or young person is allowed to clean any machinery when in motion. By the Mines Regulation Act of 1887, no lad under thirteen years may be employed under ground.

Recent Legislation

The Education and Employment Acts of 1876 and 1880 gave power to local authorities to make by-laws permitting children between eleven and thirteen years to be exempted from school attendance if they had reached a certain standard of educational efficiency. The Act of 1899 made these regulations more stringent. It prohibited half-time employment for children under twelve years, and then only permitted it if 300 attendances had been made in not more than two schools during the previous five years. The attainment of a standard fixt by a by-law sanctioned by the Board of Education also secured half-time exemption. For employment in agriculture the age is eleven, but no standard of education lower than the fourth grade for half-time, or the fifth grade for full-time exemption is permitted. The Act of 1900 raised the age for exemption by by-law from thirteen to fourteen years, increased the fine for contravention of the Act from five to twenty shillings, and prohibited full-time exemption under fourteen years, unless 350 attendances had been made in the previous five years.

Out of a total number of 6,870,832 children on the registers of schools in England and Wales in the year 1904–5, 80,368 were partial-exemption scholars. This number showed an increase of 1,492 against the number of half-timers at work in 1903–4. During recent years all the more progressive cities have gradually prohibited half-time employment, and have raised the educational requirements for full exemption to the highest or seventh standard. London and the surrounding suburbs, Liverpool, Bristol, Southampton, Portsmouth, Norwich, and a large number of smaller municipalities, have led the way. The manufacturing counties, Lancashire and Yorkshire, are unfortunately responsible for more than half the partial-exemption scholars in England.

School Children

In spite of stringent factory and educational legislation, extending over a period of more than a century, there has grown up, side by side with school attendance, a system of employment out of school hours, a system which has interfered sadly with efficient education. The case of children engaged in theatrical entertainments has been dealt with under the Prevention of Cruelty to Children Act of 1889, which prohibited the performance of children under seven, and required licenses for child actors under eleven and for young persons under sixteen employed as acrobats. The Act also proscribed street selling by

girls under sixteen and boys under fourteen between 9 P.M., and 6 A.M., but this provision was inoperative, the measure being so worded as to render it a matter of extreme difficulty to secure the conviction of a parent or guardian. But in addition to the children thus employed, there were known to be many thousands of children engaged in errand running, in shop and domestic work of various kinds, and in home industries, who, in addition to 27½ hours in school, were spending from forty to fifty, or even sixty, hours weekly in unremitting toil for very small wages. Accordingly, in 1899, a small society was formed, called the Committee on Wage-Earning Children, which had for its object the reform of legislation for the protection of children of school age. As a result of a deputation to the Minister of Education, Sir John Gorst, a parliamentary inquiry was instituted, which showed that over 144,000 children were engaged out of school hours in work of various kinds, while attending school full time. Further investigation was considered desirable; and in 1901 an Interdepartmental Committee was appointed consisting of representatives of the Board of Education, the Home Office, and the Board of Trade. The Commission sat for nearly six months, and took evidence from representatives of public and private organizations interested in the welfare of children, from employers, school managers and teachers, and social workers. The Committee found that the number of children returned by the parliamentary inquiry as employed was well below the number actually at work, and estimated that at least 200,000 were attending school full time, and were at the same time engaged in various occupations. The recommendations of the Commissioners were embodied in the Employment of Children Act, 1903, of which the most important provisions are as follows:

Act of 1903

(1) No child may work before six in the morning or after nine at night.
(2) The carrying of heavy weights, and employment in occupations likely to prove injurious to health are prohibited.
(3) The age for the prohibition of the employment of children in theatrical performances is raised from seven to ten years.
(4) Local authorities (the councils of county boroughs, municipalities of over 10,000 inhabitants, urban districts with over 20,000 inhabitants, elsewhere the county council) are empowered to make by-laws, regulating all occupations of children. Separate regulations for street trading may be enacted.

The measure came into operation on Jan. 1, 1904, and by-laws have already been framed and sanctioned by the Home Office in the case of about sixty large towns. About forty-seven other municipalities have regulations under consideration. The by-laws made by the London County Council may be quoted as a model. Doubtless other cities will base their regulations upon those of the metropolis. The most important clauses are:

(1) No child under eleven years may be employed.
(2) Children engaged in industrial work at home may only be employed between 5 and 8 P.M.
(3) No child may be employed for more than three and a half hours per day, or for more than twenty hours per week.
(4) A child may not be employed in a laundry, or in connection with the sale or delivery of intoxicating liquors, except where such liquors are sold in sealed vessels.
(5) A child under twelve years may not be employed as a lather boy in any barber's or hairdresser's shop.
(6) A girl under sixteen may not be employed in street trading except in the company of a parent or guardian.
(7) A child liable to attend school full time may not engage in street trading before 7 A.M., between 8 A.M. and 5 P.M., or after 8 P.M., except when in company of a parent or guardian. Between April 1st and Sept. 30th, the hour may be extended to 9 P.M.
(8) A boy engaged in street trading must wear a badge on the upper part of his right arm in such manner as to be conspicuous.

These regulations will be administered by inspectors appointed by the council for the purpose, by school attendance officers, and, in the case of street traders, by the police, if necessary. Children employed in shops will be under the supervision of the inspectors under the Shop Hours' Act. This measure, passed in 1892, limits the hours of employment of young persons exempt from school attendance and engaged as shop assistants to seventy-four weekly, including meal hours.

NETTIE ADLER.

CHILDREN'S AID SOCIETY (of New York City), THE: A Society organized in Feb., 1853, by the late Charles L. Brace (*q. v.*), who with a few other gentlemen had already been working for the vagrant boys of New York City. The society was incorporated in 1854 "for the education of the poor, by gathering children who attend no school into its industrial schools, caring and providing for children in lodging-houses, and procuring for them homes in the rural districts and in the West."

The fundamental idea upon which the society was founded, and which has been its governing motive ever since, was that of self-help—of teaching children how to help themselves. Its twenty-one industrial schools have trained and given aid and encouragement to over 100,000 children of the very poor. In the boys' and girls' lodging-houses about 200,000 homeless and vagrant boys and girls have found shelter, instruction, and the kindly advice and admonition of experienced superintendents.

Since the founding of the Children's Aid Society in 1853, it has rescued and placed in family homes 23,528 orphans or abandoned children, provided situations at wages in the country for 25,527 older boys and girls, restored 5,857 runaway children to parents. Of those placed in family homes in the West the vast majority have become farmers or farmers' wives. Of the others we know of the following noteworthy careers:

Governor of a state	1
Governor of a territory	1
Members of Congress	2
Sheriffs	2
District attorneys	2
City attorney	1
Members of state legislatures	4
County commissioners	3
Judges	2
Bankers	27
Merchants	22
Business clerks	460
Lawyers	34
Physicians	17
Postmasters	8
Railroad officials	3
Railroad men	30
Real estate agents	10
Journalists	15
Teachers	82
High-school principals	4
Superintendent of school	1
Civil engineer	1
Clergymen	21

As supplementary to its work the society maintains: The East Side Mission, whose work is to distribute flowers daily during the summer months among the sick and poor; free reading-rooms for young men; the Health Home at West Coney Island, comprizing cottages and dormitories where mothers with sick children are given an outing; the Sick Children's Mission, at 287 East Broadway, with a staff of fourteen physicians and four nurses, who visit the sick poor at their homes and supply free medical attendance, medicine, and food for sick children, of whom 1,500 are treated yearly; a summer home at Bath Beach, L. I., where over 4,000 tenement-house children are given a week's outing at the seaside each year; six lodging-houses, five for boys and one for girls, in which, during 1905, 242,780 meals and 136,788 lodgings supplied to 4,826 different boys and girls; twenty-one industrial schools with kindergartens, and twelve night-schools, in which 15,369 children were taught and partly fed and clothed. One of the industrial schools is located in each of the lodging-houses for boys. Special features of the girls' lodging-house, now called the Elizabeth Home for Girls, are its dress-making department, sewing-machine and type-writing schools, and laundry. The instruction in all branches is free. An adjunct to the society is a 125-acre farm located at Kensico, Westchester County, N. Y., for the primary and brief education of the large street boys in agriculture, preparatory to their being provided with places in the country.

At the Health Home in 1900 over 8,000 mothers and children were received and given the benefit of pure sea air, together with skilled medical care and nourishing food; 27,000 of these were there a week, and instances where a longer stay was advisable the time was prolonged until a permanent cure was effected. Parties of little ones were also taken there each week from the nurseries.

All the different branches of the society's work are dependent upon the contributions of the public.

The central office of the society is at the United Charities Building, Fourth Avenue and Twenty-second Street, C. L. Brace, secretary.

CHILDREN'S FRESH AIR FUND. See Fresh Air Work.

CHINA AND SOCIAL REFORM: The Chinese Empire comprizes China proper, East Turkestan, Jungaria, Manchuria, Mongolia, and Tibet.

I.—Statistics

Area and Population

	Area, Square Miles	Population
China Proper	1,532,420	407,337,305
Manchuria	364,000	13,000,000
Mongolia	1,200,000	2,000,000
Tibet	700,000	2,000,000
Chinese Turkestan	580,000	2,000,000
Total	4,376,400	426,337,300

The trade with the principal countries besides bullion, is in Haikwan taels (the Haikwan tael equals 68 cents): Exports (1903): To Japan and Formosa, 30,000,000 taels; Great Britain, 10,000,000; Hongkong, 89,000,000 (of Hongkong's exports, £582,764 went to Great Britain); United States, 19,000,000; Russia, 12,000,000; other European countries, 34,000,000. Imports: From Japan and Formosa, 80,000,000; Great Britain, 60,000,000; Hongkong, 225,000,000; (of Hongkong's imports, £2,719,614 came from Great Britain); United States, 45,000,000; India, 35,000,000; Russia, 15,000,000; other European countries, 56,000,000. The chief exports are: Silk, raw and manufactured, 74,000,000 Haikwan taels; tea, 26,000,000; raw cotton, 13,000,000; beans, 10,000,000. The chief imports are: Cotton goods, 128,000,000; opium, 43,000,000; oil and kerosene, 15,000,000; sugar, 15,000,000; metals, 15,000,000.

Commerce

China is essentially agricultural. The land is all held by families on the payment of an annual tax. Holdings are generally small; methods of implements, primitive; irrigation, very common. Horticulture is a favorite pursuit, and there are fruit-trees in great variety. Opium is now grown all over the empire. Sugar and rice are grown in the south; wheat, barley, and other cereals in the north; tea in the west and south. Silk is equally important. Cotton mills are being developed, especially at Shanghai. There were, in 1900, fourteen cotton mills, with 460,000 spindles. Near Hankow are iron-works turning out 300 steel rails a day. All the eighteen provinces produce coal, and China is among the main coal countries of the world. Iron ores also abound.

Revenues and expenditures are estimated at about $75,000,000 annually; the public debt at $616,025,000. With the exception of a railroad loan this debt is based on customs.

The emperor is the sole high priest, and Confucianism the state religion, tho Buddhism and Taoism are considered also indigenous and adopted. There is no hierarchy maintained at public expense, nor any Confucian priesthood. With the exception of the universal ancestry worship and the worship of Heaven (at Peking), there is little outward Confucian ceremonial. Buddhism and Taoism have a gorgeous ritual. Many people profess and practise all three. The mass of the people are Buddhist. Mohammedans number 30,000,000; Roman Catholics, 1,000,000; Protestants, 150,000.

For education, railways, post-office system, etc., see section on Social Reform, below.

II.—Government

The present Emperor of China succeeded to the throne in 1875 under the title of Kuang-hsü. The supreme dictation of the empire is in the privy or Grand Council (*Chün Chi Ch'u*); the administration is under the cabinet (*Nei-ko*) of four members, two of Manchu and two of Chinese origin, with two assistants from the Han-lin or Grand College, who see that nothing is done contrary to the civil and religious laws of the empire. Under this cabinet are eight boards. There are also, independent of the government and theoretically above the administration, forty or fifty censors, who can present any remonstrance to the emperor. A new foreign office was created in 1901, with Prince Ching as president. Each of the eighteen provinces (China proper) is ruled by a governor, responsible to the emperor. Grand Secretary of the Cabinet, Prince Ching.

III.—Social Reform

There is perhaps no country in the world where social reform is more inseparably connected with

political conditions than in China. The great uncertainty on the part of the Chinese people as to the sincerity and the continuity of purpose on the part of the government has made the progress of reforms of all kinds much slower and less steady than would otherwise have been the case. The suddenly manifested hostility of a single high official has sometimes exerted upon an advance movement the effect of an August frost upon a flower bed.

By an imperial decree of Sept. 13, 1901, the government ordered the establishment of modern universities, colleges, and schools in each provincial capital and in the subordinate cities. These were to be based upon a scheme drawn up by Dr. Watson M. Hayes, a Presbyterian missionary of Shangtung, whom Yuan Shih K'ai, then governor of that province, had invited to the capital for that purpose. The plan was adopted as a model for the empire. Unfortunately the beginning was made at the top, the provincial colleges being opened before there were any intermediate or primary schools to supply pupils. This strange inversion of the natural order—resembling a pyramid standing on its apex—rendered the execution of the project a matter of extreme difficulty, the students who wished to enter the colleges having little or no preparation, and there being no place at which it could be obtained. Most of the provincial capitals have now colleges of this sort, some of them with elaborate buildings partly furnished in foreign style, with a tower and a town clock; yet with a very elementary course of instruction. The Shansi University differs from all the rest in having for its use the sum of 50,000 taels (ounces) of silver each year for ten years, a sum which would have been used as a missionary indemnity but for the efforts of Dr. Timothy Richard, Secretary of the Christian Literature Society, who was invited by the Chinese Government to consult with the leading officials of Shansi. The Western Department of the new university was placed in his care in 1902, for a period of ten years, and under the care of the late Dr. Moir Duncan it has done excellent work. The province of Chili, to the government of which Yuan Shih K'ai was promoted from Shantung, under his vigorous lead has made exceptional progress, and a brief sketch of what is there undertaken will give an idea of what is aimed at for the empire, altho the work is elsewhere much less advanced than in that province.

Educational Reform

It should be said that for these excellent results Yuan is largely indebted to the untiring efforts of Dr. Chas. D. Tenney, who began educational work in Tientsin long before the government took any interest in it.

According to a memorial of Yuan there are in his jurisdiction the Pei Yang University at Tientsin; a high college at Pao Ting Fu; the Pei Yang Medical College; an industrial high school; an agricultural high school, and 21 agricultural and industrial primary schools. There are 89 normal high schools, normal schools, and other training-schools; 27 middle schools, 182 advanced schools; and 4,162 primary schools; a Woman's Normal College, and 40 girls' schools. There are 18 schools for Yamun runners; a strangers' school, a tracing and mathematical school, and a telegraph college. The number of students shown in the records is 86,653, besides those in the half-day and night-schools. The total number of scholars, including military and police students, amounts to 100,000. Each of the 124 districts of the province has about 20 primary schools, with about 30 boys each, who are taught upon a more rational plan than in the old schools. Each district has also one low- and one high-grade elementary school, with an average attendance of 50 boys, who not only study Chinese, but who are started in history, geography, arithmetic, and simple science. In each of the 16 prefectural cities there is a middle school where the study of English is begun, with more advanced courses of science and mathematics. Much attention is given to developing national and military sentiment. Physical training is an important part of the curriculum. In the lower schools there is simple drill; in the higher colleges the students wear uniform, are given manual exercises with the rifle, and are put through military evolutions. The text-books impress upon students the duty of developing the power of China, the danger of military weakness, and the importance of self-sacrifice for national interests, illustrating these teachings by pointing to the rapid development of Prussia and Japan. The instruction is all free, and in the higher schools the students are boarded and even clothed at public expense, thus opening the new education to the poorest families. This is the scheme, but at present much of the teaching is very inadequate, and there is a great lack of teachers. In every province are found Japanese teachers who can adapt themselves to the Chinese much better than can Occidentals, and who can be secured for much smaller salaries. When the general plan here outlined shall have been adopted all over China, as must eventually be the case, we shall have an entirely new empire. An important feature is the surprising development of schools for women and girls, which, absolutely unheard of a few years ago, are now very common, and rapidly increasing in number and importance. The girl students are becoming imbued with patriotic sentiments, and will be a feature of the greatest interest in the new China.

For more than two generations missionary influence has been exerted against the ancient Chinese custom of binding the feet of girls, but during the past five years this reform has made more progress than during the previous half century. Great societies have been organized by the Chinese themselves to promote the cause; essays and poems have been composed, and proclamations put out in its favor by many of the highest officials in China. An imperial edict was issued, which, while not absolutely forbidding foot-binding, strenuously exhorted against it. It is known that some persons holding high positions are memorializing the government to take more stringent measures than heretofore in the direction of this reform. The progress already made is certainly most encouraging. Memorials against the practise of keeping eunuchs in the imperial palace have been sent in, but the abolition of this ancient custom is exceptionally difficult. A serious effort is being made by the Chinese Government to put an end to the vice of opium-smoking, by forbidding its use by officials and in schools and colleges, by restricting its use also by confirmed smokers, and by limiting the time during which even they may remain exempt, and perhaps also by forbidding the cultivation of the poppy. The assigned reason for this reform is that the court is ardently deter-

Foot-binding and Opium

mined to make China powerful. It is to be hoped that in the end China may succeed, as Japan has done, in strangling this gigantic evil, which has long been more fatal than war, famine, and pestilence combined. Such a result would be one of the most remarkable transformations in history.

The number of Chinese periodicals is rapidly increasing. Many of them are published at the ports, virtually under foreign protection, and a large percentage are either controlled or strongly influenced by Japanese. In some of the provincial capitals there are journals published at intervals of several days, which will gradually develop into dailies. A woman's journal has appeared in Peking, issued every day, which has been a great stimulus to the women of that city, intellectually and perhaps morally. The Chinese woman editor has interested herself in giving and in attending lectures on current events, sanitation, and the like. Many Chinese papers have paid very little attention to the news of the day, which would be unintelligible to most readers, but print local gossip, tales of the supernatural, vicious stories, and blackmail. As a whole, however, Chinese journalism is said to be improving, exhibiting very little hostility to Christianity as such, while the Bible and literature intended for instruction are treated with respect.

Periodicals

In connection with educational and other reforms, mention should be made of the new literature with which China is literally inundated, issued by an increasing number of firms, especially in Shanghai. A careful analysis of the character of some of these books, by a competent foreign scholar in Shanghai (Mr. John Darroch), is of general interest. There were, he found, 60 volumes on the science of education, and 20 volumes of text-books on such topics as geography, physics, etc. There were 90 histories, varying in price from five cents (silver) to $2.50. Of these 7 are so-called universal histories, 11 of Europe, 12 of Japan, 7 of China, 5 of Russia, 4 of England, 2 each of France and the United States, 3 of Egypt, 4 of the nineteenth century, and 1 each of Rome, Italy, Greece, and Turkey. There were 40 books on geography, 60 on government, 40 on law, 30 on political economy, 70 on mathematics, 50 on literature, 30 novels, 50 on language, 70 on health, 60 on science, 70 on drawing, 120 on the art of war, 30 on agriculture, 20 on astronomy, 40 on mechanics, 30 books of travel, and 20 on mensuration: in all more than 1,100 works. As a rule they are excellently gotten up, very unlike the old style of Chinese books. They are plentifully besprinkled with English words, showing that the Chinese language was felt not to be sufficiently flexible.

New Literature

A Chinese scholar has invented what he calls a "Mandarin alphabet" of 50 more or less artificial characters, and 12 finals, by the aid of which it is claimed that within a few weeks the most untutored can learn to read fluently. This has been tried on a considerable scale both by Chinese and by foreigners, and appears to be a success. The use of the Mandarin alphabet is rapidly extending in China, as a result of a higher national vitality, increased communication by railways, and (it is said) by making its study compulsory. While the numerous dialects of China cannot be superseded, the wider currency of the Mandarin form—already current in some of its variations in 14 out of the 18 provinces—is a distinct advance.

The Chinese postal system is not yet ten years old, but during the last half of that period it has been greatly improved and extended, until it now connects almost all the cities of the empire. During the year 1905 the number of offices was increased by 307, making a total of 1,626. By the end of 1906 it is expected that the number will have risen to 2,000, as on the average a new office is added every day. The number of articles handled increased in 1905 from 66,500,000 to 76,000,000, and the parcels from 771,000 to over 1,000,000, while the money-order transactions grew from 500,000 taels to 820,000. The effect of this postal reform is profound and far-reaching, socially, educationally, and politically.

Post and Telegraph

All China is now covered with a network of telegraph wires, which has largely increased the power of the central government over the remote and semiindependent viceroys, or governor-generals. A telephone system has been introduced into Peking, connecting the different boards and the palace. Other cities also have telephone service and electric lighting has become not uncommon.

In many of the chief cities there have been established industrial institutes, in which different arts and crafts are taught to workmen of the most unpromising character, some of them children, others beggars picked up from the street, a class for which there has hitherto been no ray of hope. These establishments are found in Peking and in the capitals of many of the larger provinces, in cities like Suchow, Hangchau, Chi Nan Fu, and Ch'eng Tu Fu. Similar enterprises for the helpless poor—men and women—have been opened in unoccupied granaries, temples, etc., under the charge of a kind of Bureau of Charities (itself an unheard-of thing), the machinery, teachers, etc., being frequently imported from Japan. The abundant patronage of these places shows that they have met a deep need. Another branch of the same general plan is the instruction of prisoners in common jails. This reform is now well rooted, and is a wonderful contrast to the previous indifference and neglect. Prisoners, well-dressed, well-fed, well-guarded, are made to weave rugs, run sewing-machines for leather work, make boots and shoes, stamp Chinese writing paper, do carpenter and iron work, and many other things. In an institution of this kind in Tientsin there is a lecture hall, where the prisoners are required to attend at fixt times and listen to exhortation and instruction. Large sums have been invested in these enterprises, which will yield abundant return.

Industrial Reform

Industrial exhibits have been opened for the display of the results of these and other manual training-schools. By degrees this grows into a standing exhibition of whatever may be most noteworthy in the output of a place. Such a one has been open at Tientsin for more than two years, having separate days for men and for women, with an average of 2,000 visitors a day. As an immediate and striking result of these movements similar exhibitions have been ordered in every large city, with a view to holding first a national exposition, and after a few years an international one. No better method could be devised to bring the empire to industrial self-consciousness. Manufactures of many kinds are

beginning to appear here and there, generally under the patronage of the new Board of Commerce, which is invariably careful to require, under pain of forfeiture of the whole, that no stock shall be sold to a foreigner.

Cotton-mills have been established in Shanghai for many years, with tens of thousands of employees, but many of them have not been financially successful. Similar mills are now springing up elsewhere in cotton-producing districts. In many places improved wooden looms are being introduced from Japan. Experts from Hangchau are now teaching the natives of Shantung how to spin and weave the silk of that province, hitherto used only for the comparatively coarse product known as pongee, into the most beautiful fabrics, rivaling those of Central China. Cotton is frequently woven into various forms of toweling on Japanese patterns. Soap-works, candle factories, glass-works, knitting companies, and the like are found in different parts of the empire. But these enterprises often come to nothing for lack of capital, experience, and mutual confidence. In three different provinces it has been proposed to open potteries and kilns on western principles. A company has been organized to use steam trawlers of English make, with nets of English pattern. One official applied for American machinery for digging artesian wells; another asked an American consul for catalogs of machinery adapted to the manufacture of tape braid, and of plain and embroidered ribbons. Still a third purchased machines for making cigarets, to keep the great profits of the trade in Chinese hands. From a factory in Shanghai there is a considerable sale of pianos to Chinese. Thousands of bicycles are annually bought by Chinese, and a year or two ago they were introduced into a remote city of Hunan by a student returned from Japan.

An imperial decree ordered the introduction into the larger cities of a uniformed and paid police force, and the practise of street cleaning. Something has been done in this direction even in the interior, while in centers like Peking and Tientsin the system is now well established. In many places, however, for lack of intelligent supervision, it has come to nothing, or has been used as a means of extortion. Great numbers of students have been sent to Japan to study police methods, but the time allowed for this is almost invariably too brief.

Agricultural colleges and schools have been set up in many provinces, the instructors being often Japanese, but with results of varying value. In some there is no experimental farm, and others, through superstitious belief in geomantic influences, are badly located. In all cases much depends upon the temper of the governor of the province, and much also upon the local magistrate, who is often indifferent or hostile. Considerable attention has been paid to arboriculture. A few years ago, during the governorship of Chou Fu in Shantung, it was estimated that 2,400,000 trees had been planted in the neighborhood of cities, waterways, and roads. The example of the Germans at Ts'ing Tao has been followed, and many hillsides heretofore barren are now covered with pines. Mulberry-trees have been imported from the Chekiang province to improve the feeding of silk-worms.

Agricultural Reform

The Board of Commerce in Peking has been the means of the organization of Chambers of Commerce, as in Canton, where seventy-two guilds have combined in order to push trade, by studying modern commercial methods. It intends to open a bank to issue notes, and to start a paper to expound its objects and aims. An exhibit of foreign manufactures is also planned, to serve as an object-lesson to native workers. The avowed intention is to drive foreign trade out of the empire.

By the latest treaty between Great Britain and China (signed in 1902) China voluntarily agreed to revise her mining regulations in such a way as to promote the interests of Chinese subjects, and yet offer no impediment to foreign capital. Expert foreigners who are interested in these matters have for some years complained that the government is acting in direct contravention of this treaty, and that it has drawn up regulations intended to keep foreign capital out of China altogether, in accordance with a growing resolution not to have the empire exploited by outsiders. In some cases mines of considerable productiveness have been closed for lack of native engineers to work them.

Mining

In the last American treaty (1893) China agreed to reform her currency, and with this in view invited Professor Jencks of Cornell University to visit China, and to give his advice, which was done. One of China's foremost statesmen, Chang Chih Tung, in a memorial to the throne, recommended that Professor Jenck's judicious recommendations be *not* adopted. There is no unity in the monetary output of the empire, each province having its own coinage, frequently not current elsewhere. Each governor-general or governor has been industriously working one of the scores of different mints existing in China, issuing copper pieces ostensibly worth ten cash, but in reality representing an amount of metal only equivalent to from three to six of the ordinary cash. The immense apparent profits of this transaction were both illusory and transient. The people were very reluctant to accept the new coins, and only did so on the understanding that they were receivable for taxes. When this was later refused the new pieces were at a discount. At the time of maximum production it was estimated that the output for the empire was more than 16,400,000,000 pieces a year. Much of the ordinary cash has been withdrawn to be melted over, many of the mints are now closed, prices in general have risen, officials have been enriched, and the people plundered—all in the name of "Western monetary reform."

Coinage

The navigation of the inland waters of China by steam vessels has within the past few years been greatly extended, with obvious advantages and equally patent evils. The inspection of boilers is infrequent and at times perfunctory, the dangers and accidents from overcrowding serious and constant, the injury done to the banks in time of high water by the wash of steamers so great as to lead to frequent riots, and, especially on the West River of the Canton province, the number of boatmen thrown out of employment is given as an excuse for the great increase of river piracy, involving the loss of more than one foreign life, and the murder of great numbers of Chinese. The Chinese Government has adopted the plan of opening inland "ports" at various places along the line of railways and in Manchuria, in order the better to resist the aggressions of any single

power by enlisting the interest of all the rest. Each new "port" is an additional inlet for new ideas, and while the result may not be an unmixed good, the change is an important step in advance.

Railways

The era of railway building on the part of the Chinese themselves seems to have come, or is soon to arrive. We may now reckon ten railways in China as in working order, but the number increases so rapidly that statistics soon become obsolete. The following lines are in operation (the length in English miles is in some cases approximate only):

(1) Peking to Tientsin (83¾ m.); Tientsin to Tangku (27 m.); Tangku to Shanhai-Kuan (146¾ m.); thence to Newchwang (268 m.); total length, 555 m.
(2) Peking to Tungchow (14 m.).
(3) Peking to Hankow (760 m.); branch-line from Sin Si Ho to Chu Ku Tien (9 m.).
(4) Ts'ing-Tao to Chi Nan Fu Shantung (German), 240 m.
(5) Shanghai to Wusung (10½ m.). An extension is now in operation to Suchow.
(6) P'inghsiang to Siling (borders of Kiang-su-Hunan; 56½ m.).
(7) Canton to Samshui.
(8) Taokou to Ch'inghua Chen (Honan) "Peking Syndicate" railway bought by the Chinese Government (89¼ m.).
(9) Manchurian line. Port Arthur to Harbin (about 400 m.), controlled by Japanese to Kuan Ch'eng-tzu.
(10) Hsinment'un to Mukden.
The status of the Manchurian railways is not yet definitely settled.

The following lines are in course of construction:

(1) Canton to Hankow.
(2) Peking to Kalgau (120 m.; completed to Neu K'on).
(3) Cheng Ting fu to T'ai Yuan fu, Shansi (160 m.; about half completed. It is narrow gage).
(4) Shanghai to Nanking; extension of No. 5 above; to be about 180 m. long.
(5) Swatow to Ch'ao Chou fu (Japanese). This short line is practically completed.
(6) P'ing Yang fu (Shansi) to Tse Chou fu.
(7) K'ai Feng fu to Honan fu (140 m.). This is to be a branch of the Peking-Hankow line.
(8) Yunnan to Tongking (French).

In addition to these, fifteen or twenty other lines have been projected, and permission to build secured. With the exception of a Portuguese-Chinese railway from Macao to Samshui, these seem likely to be built, if at all, by Chinese alone. Nearly all foreigners are agreed that this is next to impossible under present conditions, especially the lack of unity, engineers, and funds. The effect of the railway development of China is already very marked, but its social, economic, and political effects will be much greater every year.

Legal Code

For some years a commission, of which Wu Ting Fang is the leading member, has been engaged on a revision of the Chinese legal code. The barbarous punishment of slicing to death has been abolished, the use of torture forbidden, and heavy fines are to take the place of the bamboo. No general confidence is felt, however, that these latter innovations will for a long time to come be generally adopted, the obvious motive being to make it appear that China is advancing after the manner of Japan as a preparation for demanding the abolition of extra-territoriality. A striking reversal of old custom is the permission for Chinese and Manchus to intermarry; and for Manchus to engage in trade, etc., as the Chinese do. The ancient discrimination between civil and military officials is now disappearing, as it is felt that to make China strong, the military and naval professions must be respected and respectable. This topic would of itself require an essay. The best Chinese troops, especially those under the command of Yuan Shih K'ai are now well-armed, well-drilled, well-uniformed, and well-housed. In the autumn of 1905 a great military review with maneuvers was executed on the plains of Chili to which foreign military attachés and correspondents were invited, and were duly imprest by the evidences of a revolutionary change in Chinese military effectiveness. During the succeeding year similar exercises took place in northern Honan. It is the plan to unify the hitherto distinct provincial forces into one great Chinese army, and to raise the number of troops to at least half a million. At present the Chinese forces are by no means what they may be expected to become a few years hence when their training and their *esprit de corps* will doubtless render them formidable to any enemy.

Patriotism

The always strong national feeling of the Chinese is being supplemented by what appear to be the germs of patriotism. This is at present accompanied by an intense antiforeign wave, the effect in part of the victory of the Japanese over Russia. Imperial birthdays are now celebrated with processions of school-children, sometimes addrest by scholars or officials. The number of Chinese students in Japan has increased so rapidly that in the autumn of 1906 they were estimated at 14,000. Many of them become dissatisfied with Confucianism and drift into Epicureanism. China's student class is one of her most serious problems.

The two imperial commissions, dispatched in 1905 by China to the West to study forms of government, furnish one of the most significant signs of progress yet seen in China. An unexplained attempt to destroy one of these parties by a dynamite bomb at the Peking railway station was a sinister prelude, and an ill-omened introduction into the East of Occidental methods. Upon their return the commissioners recommended that the proposed changes be adopted by China. Although no date has been fixt, there have been hilarious rejoicings in many of China's cities, with the obvious design of rendering a change of policy more difficult. As a preparation for this step, general, and even compulsory education is recommended by leading officials. It is interesting to observe the freedom with which the most far-reaching administrative changes are now proposed, both in memorials to the throne and by the press. Fifty-three students educated abroad have recently been examined in Peking, eleven of whom were rejected. Nine gained the doctor's decree (Chin Shih), five the master's (Chü-jen) in the first grade, and eighteen in the second degree, while ten failed. The candidates were allowed to write an essay on the value of compulsory education in English as an alternative to an essay in Chinese on a passage from the classics. This is a patronage of the New Learning of a practical sort, and means much for the future. China's greatest need at the present time is a large number of men, not merely of ability, but of incorruptible integrity. Some such there are, but incomparably fewer than are needed. If, with all other social progress, China is able to develop such men in numbers at all commensurate with her needs, she will ere long take her place among the great nations of the earth.

CHINESE IN THE UNITED STATES: There is hardly any other country in the world in which the question of immigration even approximately reaches the importance it has in social matters in the United States. Immigration may be divided in various ways; yet two great divisions will always remain, the *desirable* and the *undesirable*. To the latter belong people morally, mentally, or physically unfit for a country's citizenship. Such disqualifications may be inherited or acquired. They may even be based only on the fact that the people concerned do not appeal to the point of view of the country they desire to enter. To accurately determine the line where it will be justifiable to impose discriminating legislation against a whole nation is therefore a matter calling for grave consideration. Yet, for various reasons, the question of excluding the Chinese from the United States has long been a widely, and often hotly, debated proposition.

Statistics

The Chinese, generally, have never evinced any great inclination to leave their native shores, probably because they feel alien in almost every land except their own. Up to the "fifties" of the nineteenth century very few Chinese came to the United States; but in 1854 the numbers arriving annually began to jump, and altho never assuming very large proportions, it became clear that discouragement rather than encouragement ought to be the watchword. Prior to 1854 the largest Chinese immigration recorded for one year was 42. In 1855 it was more than 13,000. During the following decades it fluctuated, reaching the maximum in 1882 with 39,579. The exact figures from 1869 to 1903 are as follows:

Chinese Immigration into the United States, 1869–1903

Year	Males	Females	Total
1869....	11,900	974	12,874
1870....	14,624	1,116	15,740
1871....	6,786	349	7,135
1872....	7,605	183	7,788
1873....	19,403	889	20,292
1874....	13,533	243	13,776
1875....	16,055	382	16,437
1876....	22,521	260	22,781
1877....	10,518	76	10,594
1878....	8,641	351	8,992
1879....	9,264	340	9,604
1880....	5,732	70	5,802
1881....	11,815	75	11,890
1882....	39,463	116	39,579
1883....	7,987	44	8,031
1884....	241	38	279
1885....	12	10	22
1886....	25	15	40
1887....	8	2	10
1888....	21	5	26
1889....	90	28	118
1890....	1,401	315	1,716
1891....	2,608	228	2,836
1892....	2,501	227	2,728
1893....	2,660	168	2,828
1894....	3,805	213	4,018
1895....	913	61	974
1896....	1,382	59	1,441
1897....	3,334	29	3,363
1898....	2,061	10	2,071
1899....	.....	..	1,660
1900....	1,235	12	1,247
1901....	2,417	42	2,459
1902....	1,596	53	1,649
1903....	2,167	42	2,209

The sudden drop of the figures from thousands to tens was caused by a law passed in 1882, suspending Chinese coolie immigration for a period of ten years. This law, however, did not satisfy the Pacific coast states. The question of Chinese immigration has always been most acute in California, and it was this state which first demanded still stricter legislation, so that not only the Chinese should be prevented from entering, but that even those already arrived might be excluded. Such a law was finally passed in 1894. The following figures give a comprehensive survey of the disproportional quota of Chinese in California as compared with the country at large, and they show, furthermore, the fact that the city of San Francisco carries its full share of the burden:

Number of Chinese in United States, 1850–1900

Year	United States	California	San Francisco
1850..	758	660	.....
1860..	35,565	34,935	.....
1870..	63,042	48,826	11,729
1880..	104,468	73,548	21,213
1890..	106,688	71,066	24,613
1900..	81,534	40,262	10,762

These figures show conclusively that California's interest in the matter was paramount; and, indeed, most of the facts calling for restrictive legislation have been furnished by that state. The following paragraphs will set forth the various reasons that have been urged for and against Chinese immigration:

Against Immigration of Chinese

The "Report of the Industrial Commission" (xv., 747 sqq.) advances a great many seemingly valid reasons for excluding the Chinese. It says in condensed language:

> The Asiatic competition has spread enormously in the Pacific coast states. The Chinese colony in San Francisco is a veritable beehive, the units of which, having solved the problem of cheap living, are more than a match for the American laborer. Coolie labor has in many instances displaced white labor on the Pacific coast, and factories and workshops in San Francisco employ thousands of Chinese. They work in boot and shoe factories, in clothing shops, in broom-making, etc., etc. In 1901 there were 1,200 Chinese cigarmakers in San Francisco, and the scale of wages paid to these was from 33 to 50 per cent below that paid to white labor. The latter have almost been driven from the field, and San Francisco, instead of supporting 2,000–3,000 white cigarmakers, has now less than 200 union men who have remained to struggle against hopeless conditions.

In 1901 there were 2,579 Chinese employed in various industries in San Francisco, as will appear from the following table, which also shows the wages paid:

Industry	No. of Workmen	Hours	Wages per Day
Boots and shoes	251	11–12	$1
Shirts	195	11–12	1
Men's clothing	335	11–12	1
Overalls	430	11–12	1
Ladies' underwear	168	11–12	1
Cigars	1,200	10–14	1

Railway lines in California and other Pacific coast states employ a number of Chinese, especially in the construction branches of the service. The pay is $1.75 for ten hours' work. In 1901 there were 3,934 Chinese employed in Californian mines at $1–$1.50 a day as against $2–$3.50 paid to white laborers. In addition there were 3,000-4,000 Chinese employed at placer mining for Chinese companies in California.

The agricultural industries of the Pacific coast states, according to the Industrial Commission, have felt still more acutely the baneful effects of cheap coolie competition. The report says: "The Chinese show great enterprise and thrift, and devote themselves to the industries in which they have become proprietors: truck-farming, etc. As a result they demand and receive fair wages, and enforcement of the exclusion act will gradually remove this rival from the field."

As to the relation of Chinese immigration to crime the following table furnishes interesting data:

RELATION OF ASIATIC IMMIGRATION TO CRIME

(*Year Ending June* 1, 1899)

CITY	POP.	ARRESTS FOR DRUNKENNESS	FOR BURGLARY AND LARCENY	FOR VAGRANCY
San Francisco	350,000	12,183	1,290	2,836
Cleveland	380,000	7,685	1,020	142
Cincinnati	296,000	2,124	853	504

The Industrial Commission, in commenting on this showing, says: "The appalling number of arrests for vagrancy in San Francisco can be accounted for upon no other theory than that the white toilers of the coast have gone down in hopeless defeat in the unequal struggle with their Asiatic competitors."

Highbinderism

One of the strongest arguments against Chinese immigration is their so-called "tongs"—secret societies for committing crimes of various kinds: blackmail, gambling, prostitution. These "tongs" flourish especially in San Francisco, and it is said that out of 25,000 Chinese in that city more than 1,000 belong to the criminal class. They import women and sell them, impose fines, levy blackmail, and kill those who do not submit gracefully. They employ "hatchet men" whose duty it is to murder all those who invoke the displeasure of the "tong." Their power is absolute, because few have the courage to expose their nefarious practises. As a rule they do not molest white people, fearing an uprising against themselves.

Perhaps the most important reason urged both for and against Chinese immigration is that they furnish cheap labor. Those who are on the negative side of the question say that cheap labor is desirable, that it stimulates activities which would otherwise be latent, that it makes it possible to utilize natural resources that it would not pay to draw upon if labor were costlier. The affirmative side, however, aver that "cheapness" in labor is the same as "cheapness" in goods—it doesn't pay. Cheap labor affects the distribution, not the accumulation, of wealth. Cheap labor, by making it possible for a man to do with a small amount of capital what would otherwise require a great deal more, furnishes to industry what may be called the equivalent of usury in the money-lending business.

The opposite view of the matter may be representatively stated in the following quotation from an article in *The Outlook* of April 23, 1904:

For Immigration

No one has yet denied the thriftiness, industry, and loyalty to employer of the Chinese laborers and servants who have come to the United States. Nobody denies that on the whole they have been law-abiding dwellers in a strange land. Nobody denies that the horticultural beauty and agricultural prosperity of the State of California are largely due to the initial work of Chinese laborers who performed tasks with patience, skill, and good humor, that no other men could be found to perform. By our very laws they are forbidden to become citizens of the country. They cannot be naturalized. They are treated with aversion and with contumely. Why should they not segregate and live by themselves? Why should they eagerly adopt American habits of life?

The same article also says that the dangers of Chinese immigration are very much overrated. To quote further:

The census of 1880, up to which time no special restriction existed, showed only 105,465 [inaccurate!] in the United States. . . . If the vicious, the diseased, the incompetent, the paupers, and the contract laborers among the Chinese are excluded, as they are under our general immigration laws, it would probably be time enough to deal with the *hordes* of incoming Chinamen when those *hordes* appeared.

Legislation

The Burlingame treaty of 1868 had provided for free emigration and immigration, but the modified treaty permitted the limitation or suspension by the United States Government of the coming or residence in the United States of Chinese laborers, but the absolute prohibition of such immigration was forbidden. After excited discussion Congress passed in 1882 a bill suspending for twenty years the coming into the United States of Chinese laborers. The bill was vetoed by President Arthur, but a modified act fixing the limit of suspension at ten years became a law. The Chinese who had already become residents of the country were not disturbed, and those who wished to make visits to China with the intention of returning hither were furnished with passports. The suspension of immigration related only to laborers, a term which has been construed to include skilled workmen.

Nevertheless, this law was not considered sufficient by the Pacific coast, and in 1894 a law was passed, not only forbidding Chinese immigration, but excluding those now here except under certain conditions.

A convention between the United States and China, begun in 1880, was concluded at Washington on March 17, 1894; Walter Q. Gresham, U. S. Secretary of State, and Yang Yu, Chinese minister to the U. S., being the plenipotentiaries. The law adopted was ratified on Dec. 8, 1894, and contained the following provisions:

(1) The coming of Chinese laborers to the United States is prohibited for ten years.
(2) The return to the U. S. of Chinese laborers is permitted only if they have wives, children, property worth $1,000, or debts of like amount.
(3) Officials, teachers, students, merchants, travelers for curiosity, etc., are permitted to enter. . . .
(4) Protection and rights to be granted Chinese residents in the U. S. as "most favored citizens." (U. S. Statutes, xxviii., p. 1213.)

On April 27, 1904, the law mentioned in the foregoing being nearly expired, Congress enacted that "all laws in force on the 29th day of April, 1902, regulating, suspending, or prohibiting the coming of Chinese persons or persons of Chinese descent into the United States . . . are hereby reenacted, extended, and continued without modification, limitation, or condition."

Panama

With regard to the question of the necessity of employing Chinese labor on the Panama Canal, a great deal has been said both for and against. The whole matter may be dismissed from here with the words of President Roosevelt, sent to Congress on Dec. 17, 1906, after his return from the canal zone. Says the President:

It certainly ought to be unnecessary to point out that the American workingman in the United States has no concern whatever in the question as to whether the rough work on the isthmus which is performed by aliens in any event, is done by aliens from one country with a black skin or by aliens from another country with a yellow skin. Our business is to dig

the canal as efficiently and as quickly as possible; provided always that nothing is done that is inhumane to any laborer, and nothing that interferes with the wages of or lowers the standard of living of our own workmen. Having in view this principle, I have arranged to try several thousand Chinese laborers. This is desirable, both because we must try to find out what laborers are most efficient, and furthermore, because we should not leave ourselves at the mercy of any one type of foreign labor.

To conclude, it may not be out of place to give quotations from two articles in *The Forum* of March, 1902 (pp. 53–67). Says Truxtum Beale, in an article entitled "Why the Chinese should be Excluded":

To adapt the Chinaman to our institutions we should be obliged to begin by eradicating his religion, superstition, traditions, ideals, and customs—all of which have been so welded to his mind after four thousand years of inheritance as to have become a part of himself.

Robert Hutcheson takes the other side, endeavoring to show "Why the Chinese should be Admitted":

The Yellow Peril is a specter of the imagination, created of "such stuff as dreams are made of." Under the literal terms of the Treaty of 1868 millions [of Chinamen] might have come to our shores, but they did not. Attracted by the gold fields in California a few thousand came over, and nobody thought anything of it. In 1851 there were about 70,000 Chinese on the Pacific coast. Chinese emigration was always limited to a few districts in the province of Canton.

The objection that the Chinese work more cheaply than other foreigners or Americans in the same lines of industry is not sustained by the evidence. Like all other laborers they seek the highest wages going, and they soon learn what these are. . . . That they live more cheaply and save more money than our laborers is true, but this is a virtue that deserves imitation rather than condemnation.

FRANK F. H. CRAMER.

CHINESE LABOR IN SOUTH AFRICA: On Feb. 8, 1904, was carried in the Transvaal Legislative Council an ordinance for the introduction of indentured labor into that country "from outside Africa south of 12 degrees north of the equator." Among the provisions of this ordinance were sections to the following effect:

By Section 9 (*b*).—The Chinese laborer is to be bound to serve the master who imports him, or such master to whom the first shall lawfully "assign" his rights.

By Section 14.—The Chinese cannot trade, or hold any license whatever, or lease land, or have any economic rights.

By Sections 18, 19.—The laborer is to be bound to reside on his master's premises, and must not leave them without special permit, signed by a person authorized by his importer.

By Section 20 (2).—If found off the premises without such permit he may be arrested by any policeman without warrant.

Section 31 (10).—"Any person who shall harbor or conceal any laborer who has deserted from the service of his importer, or who has committed any breach of this ordinance, or who shall aid and abet any laborer to desert as aforesaid, shall be liable to a fine not exceeding £50, and in default of payment imprisonment not exceeding three months."

This ordinance, in order to become law, required the royal consent. The debate on it in the House of Commons lasted two days, and on a division the government won by 281–230. Sir H. Campbell-Bannerman gave notice of a vote of censure upon the government on this question, and the vote was lost (299–242).

The ordinance received the royal consent on March 11th, and the further convention with the Chinese Government, by which Great Britain is entitled to obtain Chinese laborers to work in any British possession, was signed on May 12th.

The first batch of Chinese were despatched from Hongkong on May 25th, 1904. Wages were to be 1*s.* a day. In Nov., 1906, the total number of Chinese employed in the Rand mines was over 53,134; and arrangements were then in progress for the shipment of additional coolies from China.

During these months a sufficient number of facts have come to light to enable a general judgment to be passed upon the results of the experiment.

In the first place, from a purely financial point of view, the experiment has not come up to the predictions of its promoters. Indentured labor has many drawbacks even from the employer's point of view; and the cost of bringing out the Chinese and repatriating them at the end of the contract is a heavy item to be set against the profits of their labor. In his book, "Transvaal Problems," Mr. Lionel Phillips, the well-known Rand mine-owner and financier, makes the following candid statement:

The cost of feeding Kafirs and Chinese, taking an average of nine mines from which returns have been obtained, is respectively 3.527*d.* and 6.851*d.* per shift, and shows that the tastes of the latter involve an increased charge for their keep. Adding to this other expenses, like compound and hospital charges, and the cost of importing and repatriating them even spread over the period of their contract time, we may take the monthly (a month is taken as twenty-six shifts) cost of a Chinaman, as far as can be ascertained at present, at, roughly, 12*s.* 9*d.* more than a Kafir, excluding wages.

It must not, however, be concluded from the fact that the mine-owners have given no overt sign of discontinuing the Chinese experiment that it is profitable to the shareholders. It was on political grounds that the mine-owners objected to white labor, and moreover they line their own pockets more rapidly by the fluctuations of the share market than they do by the profits of the mines. Even if the experiment be a financial failure they will be guided by other than the true financial interests of the mines in determining their course with regard to it.

In one respect, however, the coming of the Chinese has undoubtedly benefited the mine-owners. By creating a glut in the labor market, it has cheapened Kafir labor. Thus a correspondent of the *Financial Times* of Aug. 21, 1905, writes:

The employment of the Chinese on a large scale has, however, caused a vast economic upheaval affecting unskilled labor throughout the whole of South Africa. It has diminished the anxiety of the Labor Association to recruit Kafirs, and the native is no longer in a position to turn up his nose at the offers of work made to him by employers throughout the country. The rate of wages is declining; and in proportion to its fall, the Kafir's spells of work will become longer and the intervals of leisure correspondingly shorter.

Great indignation has been felt by all radicals and many Liberals and Conservatives over the introduction of Chinese labor into the Transvaal. Flogging and gross cruelty is shown to have been common. Many of the Chinese have deserted and been a menace to the community. The treatment of the question by the new Liberal administration has been perfidious.

At the same time, the whole question will have to be settled in the last resort by the forces on the spot. The principal event in the Transvaal has been the formation of the National Party, which, composed mainly of Englishmen, sets itself in definite opposition to the financial group who call themselves "Progressives." The new party, one of whose leaders is Mr. F. H. P. Creswell, has declared itself emphatically against the introduction of the Chinese, and for the repatriation of those at present in the country on

the expiration of their terms and at the expense of the mine-owners.

Pending the introduction of self-government no further importation is to take place after Nov. 30, 1906. At the elections in 1907 Mr. Cresswell was defeated, but the National Party (Hît Volk) won pledged to abolish Chinese labor.

CHRIST AND SOCIAL REFORM: The relation of Christianity to social reform and of the Church to social reform is considered elsewhere. In this article only the personal relation of Jesus Christ to the problems of social existence will be discust. With His relation to the individual, and with theological conceptions of Christ, this cyclopedia is not concerned, save in so far as these conceptions bear directly upon social reform. But to a large number of minds this is very distinctly the case.

I. We may speedily state the opinion of those to whom Christ was but an ordinary human being, tho the noblest, the best, the most inspired, nay, even in this sense, the most divine of men. Christ is conceived by those who hold this view in two main ways: (*a*) as a great idealist and religious teacher, quickening the world by lofty maxims, altruistic ideals, spiritual insight, and, above all, by a pure, self-sacrificing life. He is as Sakya-Mouni, as Confucius, as Socrates, as St. Francis, as many another, tho greater than any other. His relation to social reform, according to this conception is, therefore, to raise ideals of brotherhood, of self-sacrifice, of the supremacy of character over circumstances, of the scorn of material comfort. W. M. Salter says in his "Ethical Religion," pp. 188, 189:

A Religious Reformer

> It cannot be claimed that we stand in any such relation to Socrates or the Hindu prince or Confucius as to Jesus. Socrates has not been without influence upon us, but it cannot be soberly called a tithe of that which Jesus has had. Would that men read the "Apology" oftener; they would find meat and drink in it, a tonic and an inspiration for their lives! But there is need for no such wish in relation to the Gospels. Jesus is an ideal of goodness, all too indistinct often, but hovering in the thought of well-nigh every one of us. It is true that there is much uncertainty relating not only to His life, but to His teaching; yet as there need be no doubt as to the main tenor and events of His life, so there need be none as to the commanding features of His teaching. They make too largely consistent a whole, and bespeak a mind of too much freshness and originality and power, to allow us to think of them as coming in an indefinite way from an age otherwise so traditional, so barren, and so prosaic.

The ethical features which Mr. Salter finds in Christ are: (1) His opposition to the traditional morality of His day; (2) His giving to the moral law a more distinct inward application, teaching that thoughts and words have a moral significance, like that of actions; (3) His removing of all barriers of love to our fellow-men; (4) His teaching that the "kingdom of God" is to come from above, and not in the natural course of things—i.e., "not from the onworking of man's natural self-regarding impulses." The limitations in Christ's ethical teachings, Mr. Salter finds, *at least as far as the ethical requirements of our own day are concerned*, to be (1) His failure to emphasize "the intellectual virtues," straightforwardness, etc.; (2) His lack of concern with the State. Says Mr. Salter: "Jesus was not concerned with the State, indicating neither ideal nor practical courses for it to follow." He was ever looking for a kingdom to come, which, says Mr. Salter, has proved one "of humanity's blighted hopes"; (3) Mr. Salter finds in Christ's teaching little guidance for industry; and (4) no clear presentation of an ideal to be the end of human existence.

But (*b*) there is another conception of Christ held by those who deny the deity of Christ, very different from and at almost every point opposed to the conception we have just noticed. This is the conception that prevails largely among working men outside of the Church, and especially among materialistic Socialists. To such minds Christ was preeminently a social reformer. He is the first Socialist. They term Him the good "Sansculotte," to use Camille Desmoulin's phrase of the French Revolution. "The First Representative of the People" were the words written beneath the pictures of Christ that were posted in the halls of the French communists of 1848. "The Carpenter of Nazareth" is the name dearest to many working men. According to this conception, Christ was a Jewish labor leader, a religious trade-unionist, who taught of a kingdom of brotherly love, where inequalities and oppression were to vanish; where the poor, the weak, the unfortunate were to overthrow the kingdoms of wealth and of injustice. For opposing the rich and preaching communism He was crucified by the chief priests exactly as the pastors of the churches of wealth to-day oppose socialism and would hang all revolutionists. Christ, argues Austin Bierbower, in his "Socialism of Christ," sought to establish a kingdom in the interest of the "outs." He proposed to reverse existing conditions—to "lay the ax unto the root of the tree," "to put down the mighty from their seat," "to scatter the proud in the imagination of their hearts," "to send the rich empty away," "to fill the hungry with good things," "to exalt them of low degree." Christ's miracles, says Bierbower, "were all done in the interest of the poor." "The common people heard Him gladly." His command was to give up "houses and lands for the kingdom of God's sake." He said to the rich young man, "Sell all that thou hast, and distribute to the poor." The leading clergy Christ called hypocrites and whited sepulchers. Christ's method, says Bierbower, was one of revolutionary force. He was an insurrectionist, who could be confused with Barabbas. He came "not to bring peace, but a sword." He prophesied a reign of terror. Jerusalem was to be destroyed. Not one stone was to be left upon another. Pilate accused Christ of stirring up the people. This insurrection was to establish a communism. In Christ's teaching all men were to be equal. "Call no man master." There was to be no more clean and unclean. Men were to live in simplicity, to "take no thought for the morrow"; not to have two coats. Many working men think that Christ was an Essene, or at least the founder of a communistic sect like the Essenes, of which the Orient was then full. According to Osborn Ward's "The Ancient Lowly," Palestine was in the time of Christ full of trade-unions or secret gilds of slaves and despised artizans, and to these organized laborers Jesus Christ appealed, entering into their life and carrying their principles of fraternity and equality through the world.

A Social Reformer

Working men are not surprized that Christ was crucified. "The cross and hemlock cup have ever been the reformer's reward." Such is the materialist reformer's conception of Jesus Christ.

II. We now come to the views of those who

hold that Christ was more than man—God manifest in the flesh. Here again we find two divergencies. According to the one view (*a*) Christ's message was only to the individual and at most to the Church, the body of the redeemed who have been made one with Him.

The Individualist View

The holders of this view do not deny that Christ's teachings affect society, and are to be applied in the State; but they hold that the State and society are to be influenced only through the individual. "Make," they say, "perfect men and women, and then you will have a perfect society." Some do not even hold that society as a whole ever will be perfected on this earth, at least not in this present dispensation. The kingdom of God, they reason, is to be composed of the redeemed, of the elect out of the world. The kingdoms of this earth are, they teach, not to be conformed to the law of God, but to be destroyed and replaced by the kingdom of heaven. It is "a mistake," said the Bishop of Peterborough, at the diocesan conference at Leicester, England, October, 1889, "to attempt to turn Christ's kingdom into one of this world." The *Regnum Hominis*, he argues, can never be the *Civitas Dei*; the State does not and cannot exist on Christian principles. Did not Christ Himself say, "My kingdom is not of this world"? Were not Christ and all His disciples continually speaking of and looking forward to the end of the world, its destruction, and the coming of the new heavens and the new earth? Christian Socialists, says this school of thought, forget the doctrine of the second Advent, the personal coming of Christ, when this earth shall be destroyed and only the redeemed be saved. However, not all who hold that Christ's message is only to the individual argue from it that Christ's life is not to be applied to present social organizations. They hold that the Christ life will and inevitably must transform, nay, even revolutionize, human society. They assert strongly that Christ is the savior of society: but they hold that the salvation of society is to come only through the new life in the individual, by creating better men and women to compose the State. Such thinkers deny that Christ was a Socialist in any sense implying that He has a message for the State apart from the individual. Says Dr. Lyman Abbott, in his "Evolution of Christianity": "It has been said that Jesus Christ was the first Socialist. This is certainly an incorrect, if not an absolutely erroneous statement. It would be more nearly correct to say that He was the first individualist. The Socialist assumes that the prolific cause of misery in the world is bad social organization. Christ assumed that the prolific cause of misery in the world was individual wrongdoing." Those who hold this view argue that Christ came to save the world by saving individuals. Individuals, indeed, may cooperate in all kinds of reform and charitable societies; they may and should enter into politics; but the redeeming power is ever in the individual heart, and the Church's prime message, like Christ's, is to the individual. A few, like Tolstoï, carry this view to such lengths that they may be called, as occasionally they call themselves, Christian anarchists. They would do away with organization. To obey the State is to take an oath of loyalty, and Christ said, "Swear not." Society can only be saved by personal sacrifice. Self-sacrifice is the one word. Renounce life and you gain life. (For a full statement of this view of Christ, see Tolstoï.)

The First Individualist

But lastly, we come (*b*) to the view of Christ held by Christian Socialists. (See also Christian Socialism.) We are here concerned simply with the view of Christ held by this school. According to this conception, Christ is the King and Head of all humanity, and therefore with jurisdiction over all life, secular as well as spiritual, political and social quite as truly as individual. Christian Socialists do not deny, but assert the necessity of personal conversion and the new birth. Christ does not force any man to serve Him. A forced righteousness is not righteousness. Christ draws, but does not compel any man to follow Him. Hence all moral action from men in a sense commences with the individual, and in this sense Christian Socialists are individualists; but they deny that Christ came *only* to the individual; they deny either that Christ came only to save individuals out of a lost world, or even to save the world through the working alone of a new life in individual hearts. They do not admit that Christ taught that "individual wrongdoing is the prolific cause of misery in the world." They hold that man is born in society, and in a sinful society, which fact is the cause of deep evil. Throughout the Bible they find a teaching of racial sin. The child suffers for the father's sin, and the mother in the child's wrongdoing. They find a socialism in sin as well as a socialism in Christ. Men are not alone; men are molded by inheritance and by environment. Now, Christ, as the King of all the world, came to change this. He came to save rebellious individual men, but also to establish a new environment. He came to found a kingdom. He prayed for its coming. He taught that God's will should be done on earth even as in heaven. Those who argue that Christ's message is only to the individual, that He took no notice of the State and that He cared little for organization, forget, say Christian Socialists, Christ's whole relation to the Old Testament and the world. The old Testament is two thirds of the Bible. Christ only came after a long preparation of the Jews in social righteousness. He came, he declared, to fulfil the Old Testament laws. He Himself fulfilled and bade His disciples to fulfil every minute detail of the ritual law. Christ indeed denounced and reproved the rulers of the Jewish Church, but it was not because they fulfilled the law, but because they did not fulfil the law, because they made it of no effect through their traditions. Jesus Christ was the great conformist. He was circumcised; He was baptized; He was made a Son of the Law; He kept Feast and Fast; He obeyed all the law; He bade His disciples obey even the very priests He denounced. As to the assertion that Christ did not recognize the State, men forget what the Hebrew Church was. It was a State almost as truly as a Church. It was a Church State. Christ paid little heed to the Roman heathen State, tho He obeyed even its laws; but He magnified the ideal of the old covenant, the Divine State, the heavenly kingdom. He was ever speaking of it. Of it are most of His parables. He came to fulfil its laws. It is true that Christ idealized, spiritualized the materialistic conception of the laws held by the Jews. He came to fulfil them through love, not through legalism. But he did not come to abrogate the laws. Law must fulfil

The Christian Socialist View

law, not destroy law. Spirituality is not to make men disregard matter. Never did any one ever honor the material body as did Christ. Almost all His works were works of healing to the body. They were almost all secular Socialist works. He who thus magnified the body, law, organization, cannot be said—so Christian Socialists argue—to have come simply to save people out of a wicked world into heaven, or even to save a world on earth simply through the individual. If society, organization, the nation, count for nothing, why the thousands of years of the old covenant before Christ came? The law is the schoolmaster to lead to Christ, and Christ is the great Teacher to help us fulfil the law. Christian Socialists agree with the material Socialists that Christ was a social reformer—*the* social reformer; that He did come to establish a reign of equality, brotherhood, communism, here upon earth. They believe Christ's Church to be the world's first International; the call the Magnificat "the hymn of the universal revolution." Christian Socialists disagree with the materialist Socialists that He appealed to force or *depended* simply on organization. He came to bring a sword in the same sense only that the knowledge of the law brings forth sin. Christ has made a man's enemies those of his own household; He has turned the world upside down. He is the great revolutionist. But His appeal is not to force. He did not come to draw the sword any more than the law bids men to sin. He was led as a lamb to the slaughter. He conquers by self-sacrifice. His method is the cross. His kingdom is not of this world, but it is to include this world. "The kingdoms of this world are to become the kingdom of our Lord and of His Christ." Christ's whole teaching, according to some, may be summed up in the words: "Father, Child, Brother."

Not a Lawbreaker

Westcott, London, 1893; *The Evolution of Christianity*, by Lyman Abbott, Boston, 1892; *The Social Teaching of Jesus*, by Shailer Mathews, 1897; *Jesus Christ and the Social Question*, by Francis G. Peabody, 1901.

CHRISTIAN COMMONWEALTH, THE: Organized in 1896, in Muscogee County, Ga., by forty people, mostly from the Northern States. A college professor, a civil engineer, an editor, and the pastor of an institutional church were the leaders in the movement. They determined to open their doors freely to all who would come, confident that a hearty welcome to their brotherhood and to all the privileges of their association would soon put a new purpose and spirit of life even into the tramp and the loafer. They wanted no narrow or limited brotherhood. They bought an old plantation, at a price far beyond its value, on which they were able to make but a one-fourth payment. They had not sufficient means to lay in a three months' supply of food, and many months elapsed before they could hope to get returns from their planting. Yet they invited and received families from all parts of the country, most of whom came absolutely empty-handed and very few of whom added much to the financial strength of the colony. As the editor of *The Social Gospel*, the organ of the community, expressed it, "The colonists were kept sensibly dependent on heaven-sent supplies."

The first year all engaged in manual labor—farming, gardening, grubbing, building, fencing, preparing fuel, logging, milling, carpentering, orchard and nursery work, etc.

The society was not incorporated until Nov. 14, 1899. Its constitution adopted under its charter reads, in part, as follows: "Article 2. Object: The Christian Commonwealth is a society whose purpose is to obey the teachings of Jesus Christ in all matters of life and labor and in the use of property. The society is incorporated to establish a community of people on a cooperative basis, with the purpose of demonstrating to the world the practicability and desirability of Christian cooperation as the best method of earning a livelihood, of developing nobility of character, and promoting all the ends of a true Christian civilization."

Writing in Sept., 1899, the editor of *The Social Gospel* says: "The Christian Commonwealth lives and grows and is increasing in spiritual power and material equipment. Loaded down with the poor and with almost nothing in hand, by most self-denying economy and the hard labor of its people, the Commonwealth has made slow but steady economic growth." Yet one year later the whole property was in the hands of a receiver and the colony disbanded. The creditors, however, were paid, we are informed, in full, which indicates that the colonists must have made something more than a living, and that lack of business management or want of harmony must have been a factor in the breaking up. The spirit of brotherhood did not share the fate of the colony so far as the prime movers were concerned. Two of the leaders published for a while *The Social Gospel*, at South Jamesport, N. Y., and others *Social Ideals* at Elgin, Ill., tho these publications did not endure.

CHRISTIAN COMMUNISM: This is communism on the basis of the Christian religion, and has had illustration in all ages. These are, however, best considered separately. For the communism of the primitive Church, see Church and Social Reform. For the communism of the Church in medieval times, see Brotherhoods, Religious. For more modern times, see Anabaptists, Amana, Christian Commonwealth, Harmonists, Hopedale, Oneida Community, Shakers, Zoar. It is scarcely too much to say that religious communism has seldom *financially* failed, but that all the various attempts at Christian communism have failed because of being committed to celibacy, or some narrow religious tenet. The number willing to embrace its tenets has fallen off or become *nil*. See also Communism.

CHRISTIAN SOCIALISM: A term used in a larger and in a narrower sense. In its larger or looser sense, it may be defined simply as the application of Christianity to social problems. Used in its narrower and more accurate sense, it is socialism, but socialism in the name and spirit and on the principles of Jesus Christ. In the larger sense almost any Christian may call himself a Christian Socialist and the term comes often to mean little more than a vague interest and too often to become only a catchword, in the endeavor of the Church to enlist the interest of persons engaged in working out social prob-

lems. Much Roman Catholic and, in the United States especially, considerable Protestant so-called Christian Socialism is of this vague type. It is not really socialism at all and is not seldom actually opposed to socialism. In England, however, and on the Continent and in the U. S., when used by societies of Christian Socialists, or members of those societies, the term does indicate usually a very large acceptance and not seldom a complete acceptance of at least the fundamental principles and often the whole program of ordinary socialism. This is more especially true of more recent Christian Socialist movements, and is the result in part of a more accurate use of words in the course of the evolution of social thought, and in part of an increasing radicalism on the part of not a few of the younger clergymen in all branches of the Christian Church. To understand, therefore, the use of the word by particular writers or schools of thought it is necessary to know their definition of the word, or at least their modes of thought and expression. The term was first employed by the little group of men who gathered around Maurice (whom they considered their master), Ludlow, and Kingsley in England in 1848. It was used by them to express their conviction that socialism was really but a historical development or manifestation of Christianity. If in practise they understood by socialism little more than the principle and practise of cooperation as opposed to economic competition, it must be remembered that socialism itself had not developed into that more precise economic thought which is understood by the word to-day. The first Christian Socialists were accurately and truly Socialists of their day and generation, only holding that socialism to be practical must be founded on the Fatherhood of God and Brotherhood in Jesus Christ. They spoke of socialism as "the nineteenth-century livery of Christianity," and Maurice wrote in a tract in 1850, when the term Christian Socialist was first decided upon, "that is the only title which will define our object and will commit us at once to the conflict we must engage in sooner or later with the unsocial Christians and the unchristian Socialists."

Beginnings

The year 1848 was a dark one for English working men. Bad harvests, heavy taxes, the potato famine had brought to a head all their sufferings and wrongs. Ireland was on the verge of rebellion. There were riots in more than one English town. On April 10th there was an immense mass-meeting at Kennington Common. London was thrown into intense excitement and fear. Two hundred thousand special constables were sworn in.

Meanwhile, two clergymen of the Church of England, F. D. Maurice and Charles Kingsley, with a young lawyer, J. M. Ludlow, had been growing more and more interested in social questions. Charles Kingsley now rushed down from his parish at Eversley, and meeting Ludlow at Maurice's house, it was decided to publish placards and spread them broadcast, sympathizing with the workmen, but urging restraint from violence, and the necessity of virtue and religion to make men fit for liberty. Charles Kingsley wrote all that night, and the next morning appeared on thousands of posters his address to the workmen of England, signed "A Working Parson." A pouring rain and the energy of O'Connor prevented any outbreak.

It was now decided by the above three to publish a penny weekly, entitled *Politics for the People*. In these, in addition to Maurice, Kingsley, and Ludlow, we find articles by Archdeacon Hare, Professor Conington, Sir Arthur Helps, Archbishop Whately, Dr. Guy, French, Stanley, Osborn, and others—a rare galaxy of brilliant minds. Kingsley wrote in it the well-known articles signed "Parson Lot" (see KINGSLEY). The first number appeared May 6, 1848. The paper, however, was discontinued after seventeen numbers for lack of support, altho it attained a circulation of 2,000.

The little knot of writers, however, now including Thomas Hughes, held meetings all winter, meeting with many of the Chartist leaders, and starting night-schools. It was at one of these conferences that Kingsley made his celebrated speech beginning, "I am a Church of England parson and a Chartist," in which he acknowledged the grievous wrongs of the workmen, but dissuaded them from violence.

A Mr. Mayhew at this time contributed to the London papers a series of articles on the sweating system, which called out Charles Kingsley's burning and indignant tract on "Cheap Clothes and Nasty." But Maurice from first to last remained its directing spirit. Ragged schools were begun under their auspices, and "sanitary leagues" when the cholera began to rage. Colonization was projected. "Let us devise a Socialist home-colonization as soon as you please; provided only we give it a ground to stand upon, the sooner, the better," said Mr. Maurice, in a letter to Mr. Ludlow.

A cooperative institution, which was a practical embodiment of their ideas, was started, being an association of tailors in Castle Street, nearly opposite to the place where now stands the Cooperative Institution. This was in 1849. In 1850 a society for promoting working men's associations was formed, with Maurice for its president, and became the nucleus or center of the cooperative movement. The fundamental principle of this society was "the practical application of Christianity to the purposes of trade and industry."

"Christian Socialism" First Used

In December, 1849, a dinner was held at Ludlow's and a plan for cooperative stores was discussed, and for the first time the term *Christian Socialism* was agreed upon. The name was favored by Maurice largely under the influence of Ludlow, who had been in Paris and seen there the *associations ouvriers*, and who had written to Maurice from there that "socialism must be Christianized or it would shake Christianity to its foundation, precisely because it appealed to the higher and not to the lower instincts of man." The Christian Socialists, now working under this name, started a periodical and also a cooperative store under the leadership of Walter Cooper, the ex-Chartist.

Their periodical, *The Christian Socialist*, was edited by Ludlow, but contributed to by all the members. The following, by Ludlow, clearly expresses its ideas:

"A new idea has gone abroad into the world: that socialism, the latest born of the forces now at work in modern society, and Christianity, the eldest born of those forces, are in their nature not hostile, but akin to each other; or rather, that the one is but the development, the outgrowth, the manifestation of the other. . . . That Christianity, on the other hand, in this nineteenth century of ours, becomes in its turn chilly and helpless when stripped of its social influences; or, in other words, when divorced from socialism. . . . That if the Gospel speaks true, and 'ye cannot serve God and Mammon,' it is wholly incompatible with a political economy which proclaims self-interest to be the very pivot of social action; . . . but that it is compatible with those theories or systems which have for a common object to bind up into fellowship, and not to divide by selfishness and rivalry; to substitute fair prices and living wages for a false cheapness, and starvation, its child; and which have adopted for their watchwords *Association* and *Exchange* instead of *Competition* and *Profit*."

The Christian Socialist was, nevertheless, less long-lived than *Politics for the People*. The movement, however, did not end. Kingsley published his "Alton Locke." It brought down on the Christian Socialists a shower of abuse. Says Professor Seligman of it:

Opposition

"Tracts full of raving and disreputable rant; mouthpieces of class selfishness, popular prejudice and ignorant passion; ravings of blasphemy, rapine and nonsense; miserable delusions; mischievous provocations clothed in oily phrases of peace and charity; a clique of wayward-minded men, who, from a morbid craving for notoriety or a crazy straining after paradox, have taken up the unhallowed task of preaching the doctrines of Jacobinism and the Jacquerie"—this and much more of the like was said of them in all the reviews and journals. Advertisements were refused by the daily papers; booksellers did not dare to keep copies of their publications. *The Christian Socialist* was prohibited by the French Government from circulating in the realm. A committee of King's College was appointed to investigate Maurice's activity in these dangerous schemes, and he narrowly escaped losing at once his professorial position. Kingsley was invited to deliver a sermon in a London church, and at the close his opinions were openly branded as untrue and dangerous by the officiating rector.

Eventually Maurice was removed from his chair at King's College, and very affecting is the address of condolence presented to him by those workmen who had through him come to believe in the divine mission of Christianity in saving society. But opposition and obloquy, so far from discouraging the Christian Socialists, only acted as a spur to further exertion. "I am a revolutionist," says Kingsley in one of his letters. His "Bible Radicalism" meant to go to the root of the matter, and to recover the true and original basis of Christian fellowship. At the same time they all felt that if their work was to prosper they must put their hand to the plow and give a practical demonstration of their theory. Mr. E. Vansittart Neale provided the funds for the first attempts in cooperative production and the establishment

of the central cooperative agency. Many of the aristocracy and clergy wished to encourage the promoters. Orders came flowing in, and the success attained induced the promoters to open an "East-End Needle-women's Workshop," and an association of shoemakers. In course of time a number of productive associations were formed in London and the provinces, principally in the north. Out of this came an agitation for needed legislation and the "Magna Charta of Cooperation," the Industrial and Provident Partnerships Bill of 1852.

The early Christian Socialists, too, worked much for popular education. This led to the establishment of the Working Men's College, which was opened in 1854. Henceforth the Christian Socialism of England of this period is lost in the cooperative movement developing in the north of England. The London stores either failed or were swallowed by the larger movement. But the Christian Socialist thought lived.

Says Professor Seligman: "These Christian Socialists were reformers in the fullest sense of the word. The kingdom of Christ was to them no empty formula; they were thoroughly imbued with the belief that this kingdom, created through revelation, actually existed and was destined in time to subjugate all wickedness and misery. Society, according to them, is not to be made anew by arrangements, but is to be regenerated by 'finding the law and ground of its order and harmony, the only secret of its existence, in God.'" The Bible they considered the poor man's book, the voice of God against tyrants and humbugs. "Justice from God to those whom men oppress, glory from God to those whom men despise," was to them the thought running through the Bible.

Principles of the Early Christian Socialists

Men of such a stamp viewed with a sovereign disdain the social doctrines of the Manchester school. They wrote: "Of all narrow, conceited, hypocritical, anarchic, and atheistic schemes of the universe, the Cobden and Bright one is exactly the worst." Said Kingsley:

"I expect nothing from a public press which panders to popular Mammonism by scraps of politico-economic cant, and justifies the ignorant miser to himself by retailing Benthamite phrases which sound like scientific laws, while they are really nothing but the assertion of barren truisms. I expect nothing from the advocates of *laissez faire*—the pedants whose glory is in the shame of society, who arrogantly talk of economics as of a science so completely perfected, so universal and all-important that common humanity and morality, reason and religion must be pooh-poohed down, if they see n to interfere with its infallible conclusions, and yet revile, as absurd and utopian, the slightest attempt to apply those conclusions to any practical purpose. . . ."

"Competition," said Maurice, "is put forth as the law of the universe. That is a lie. The time is come to declare that it is a lie, by word and deed. I see no way but by associating for work instead of for strikes." Kingsley maintained that not self-interest, but self-sacrifice, was the only law upon which human society could be grounded with any hope of success. "That self-interest is a law of human nature, I know well. That it ought to be the root-law of human society, I deny, unless society is to sink down again into a Roman empire and a cage of wild beasts." The enthusiasm of the promoters was unbounded. Thomas Hughes thought they had found the solution of the labor problem and that "we had nothing to do but just to announce it and found an association or two, in order to convert all England and usher in the millennium at once, so plain did the whole thing seem." The majority of the promoters were equally sanguine.

The Christian Socialists were mistaken. Not thus are millenniums ushered in. Says William Clarke in the "Fabian Essays":

"*The Christian Socialist*, which was the organ of Maurice and Kingsley, betrayed great simplicity as to the real nature of the economic problem. It neglected Owen's principle of 'community in land,' and supposed that by working together and selling articles of good quality at a fair price poverty could be eliminated, while yet every worker in the community was paying his tribute of economic rent to the owners of the instruments of production."

After this wave of Christian Socialism in England, we have a long gap. Socialism of all kinds seemed dead in England. But early in the eighties the Rev. Stewart D. Headlam founded the *Guild of St. Matthew*. A High Church organization, it has become the leader of a remarkable movement among the younger Catholic wing of the Church of England toward radical socialism. It believes the secular to be spiritual, and finds secular principles involved in the highest Church teachings. Mr. Headlam long edited the *Church Reformer*, the organ of the gild, and an outspoken mouthpiece of Christian Socialism. Its radical nature can be seen in its reference to the Queen's Jubilee celebration as that "blasphemous" adulation going on at Westminster Abbey; and by the ultra-socialistic literature advertised and commended in its columns.

Later English Christian Socialism

Of more recent date and not so radical in its socialism, and yet doing a very wide and important work in the Church of England, is the Christian Social Union, founded in Oxford in 1889, under the lead of the Bishop of Durham and Canon Scott Holland. (See CHRISTIAN SOCIAL UNION.) While it does not declare explicitly for Christian Socialism, its principles and teachings so largely tend this way that it is commonly spoken of in England as a Christian Socialist movement. It is significant, therefore, that the union embraces so many of the leading members of the Church of England, is the publisher of the able *Economic Review*, and includes men of such power and spirituality as Bishop Gore, Bishop Stubbs, and others, including its secretary, the Rev. John Carter. Quite recently an out-and-out *Christian Socialist Society* has been formed in connection with the Church of England. Outside of the Church of England, too, there is much Christian socialism. A society of Christian Socialists organized early in the eighties, not confined to the Church of England, and which from 1883 to 1891 published an organ, *The Christian Socialist*, did not endure, but its work was taken up by *The Christian Socialist League*, with the Rev. Dr. John Clifford, a leading Congregational clergyman, as president, and J. Bruce Wallace, Percy Alden, E. D. Girdlestone, John H. Belcher, Professor Shuttleworth and the Wesleyans, Revs. Hugh Price Hughes and Mark Guy Pearse are outspoken Christian Socialists; while the Rev. John Glasse, of the Church of Old Greyfriars, became a pioneer of socialism in Scotland.

This league, too, disappeared, but has given place to various movements and leagues for social service, and the London Free Church Social Union. (See FREE CHURCHES AND SOCIAL REFORM.)

Apart from all regular church organizations, yet standing for a very vital Christian socialism, are the labor churches (*q. v.*) begun in England by John Trevor (*q. v.*) in 1891, which represent a radical movement politically in connection with the Independent Labor Party, yet insisting on a religious character of the labor movement. They have now largely disappeared yet played their part.

GERMANY

Christian socialism in Germany dates in its present form from the period of the Lassalle agitation, yet had its precursors in the philosophy of Fichte and Hegel and the communistic preaching of Albrecht the Prophet and of Weitling (*q. v.*). We consider its Roman Catholic and Protestant developments separately.

The Roman Catholics come first. Early in the nineteenth century Franz Xavier von Baader (*q. v.*), moved by the sorrows of the working class, recommended a "theocracy," a monarchy guided by Divine politics, as opposed to a democracy of revolution, a State held together by Christian love, equally free from slavish despotism and lawless individualism.

A greater German Roman Catholic Christian Socialist was Wilhelm von Ketteler (*q. v.*), the late Bishop of Mayence. Von Ketteler was in very many ways like Kingsley. He said of himself: "I have lived with and among the people, and know them in their sorrows and complaints. There are few of the tears and none of the sufferings among the people committed to my charge which have escaped my notice." He especially endeared himself to his people by his bravery and devotion during an epidemic of typhus fever in 1847. He was elected to represent his district in the Germanic Confederation at Frankfort. As early as 1848 he preached a course of sermons on the social subject in the cathedral at Mayence to audiences of many thousands. He largely endorsed the socialistic program of the day, invoking State protection against the encroachments of irresponsible capitalists; but he held that to endure, society must be founded on the rock of St. Peter. He pointed out the impotence of legislation to equalize property. Christianity alone, he taught, could put cooperative associations on a sound basis. "May God in His goodness," he cried, "bring all good Catholics to adopt this idea of cooperative associations of production upon the basis of Christianity." Yet little directly resulted. In 1864, however, Ketteler published a treatise, "The Labor Question and Christianity," and in 1868 organization was reached in the Christian Social Working Man's Associations. An organ of the movement was started, *Die Christliche Sociale Blaetter*. In 1870 the Catholic Journeymen's Clubs, which had been started in 1847 by Father Kolping, a pious artizan, joined the Christian Socialist movement. These clubs numbered, in 1872, 70,000 persons, mainly in Bavaria and Westphalia. They were strictly under the control of the Church, and therefore were more or less opposed by the Social Democrats. Yet the movement grew. In 1878 it numbered 12,000 in Westphalia alone. It took many forms—benefit associations, savings and credit associations, associations for diffusing literature, working girls' associations, etc. At the meeting in 1871 Canon Moufang presented the points which became the program of the movement: (1) Legislative protection of the rights of labor; (2) pecuniary state subvention in aid of cooperative associations; (3) reduction of the burdens of taxation and military service; (4) restriction of the

Catholic Christian Socialism

power of capital, and the removal of evils arising from usury and overspeculation.

Gradually, however, two wings developed, one tending to "self-help" and beneficent associations apart from the State, the other calling for State action and much of the Socialist program. The movement in one form or another has gone on, having to-day a large number of associations, mainly cooperative, and particularly among the peasants in Roman Catholic sections of the empire, but always distinctly under the control of the Church.

There are Catholic associations of masters and apprentices, of factory laborers, miners, and vintners; there are "Patriotic Bavarian" and Westphalian unions of peasant proprietors and a number of other societies of men and women in every direction, exercising a powerful influence under strict clerical supervision, the result of which is that in purely Catholic regions, for any efforts of social reform to be successful, it is essential in the first instance to secure the Catholic ecclesiastics as auxiliaries in any such undertaking.

This, too, has given the Roman Catholic Church in Germany large political power.

The Roman Catholic population of the empire is only 20,000,000 to 35,000,000 Protestants, and yet in the Reichstag, the Roman Catholic party, the so-called Center, has more delegates than any other party in the empire. It won in the last election 100 seats. Indeed the Protestant imperial government has usually had to depend for its majority on a coalition between the Roman Catholic Center with the Liberals or Conservatives. In that situation Rome is in power in the legislature and among the people. At a congress of German Catholics in Strasburg in Aug., 1905, Count Oppersdorf said, "Let every Catholic in Germany be a friend to every one in need." The Roman Catholic German Union for Works of Charity is a strong organization with 3,087 members and a very active life. There is also a strong Catholic propaganda and organization in Germany against the use of alcohol. Another organization is the Union of Catholic Women's Societies which publishes an attractive organ, *The Christian Woman*. Besides these and other societies, avowedly Catholic, German Catholics enter into every humane movement of every kind where they can exert influence. For example, at the International Congress for the Protection of Labor held in Zurich, 1897, a very strong Catholic delegation was present, including many priests. The congress received the papal approbation and one of its three presidents was the Swiss Catholic leader Decurtins. So also with the International Congress for Labor Legislation held in Berlin, 1890, and in Brussels in 1897.

Present Strength

This German Catholic movement is deeply founded and ably led. It does not drift with the times. There are in Germany at least a dozen Roman Catholic theological magazines and these give much space to developing from the principles of Catholic theology their scientific application to social reforms.

Protestant Christian Socialism in Germany has been a wholly separate movement. As early as 1838 Victor Aimé Huber (*q. v.*), who may be called the founder of German Christian socialism, at the request of Friedrich Wilhelm IV. of Prussia commenced in Berlin a paper, the *Janus*, advocating religious cooperation. He gave his life to this work and sowed much seed, but with little direct result.

Protestant Christian Socialism

About 1878, however, commences the chief movement of Protestant Christian Socialism in Germany, begun by Pastor Todt and brilliantly championed by Stöcker, the court chaplain. From the first it allied itself to the paternal State socialism, which has become the policy of the Prussian monarchs.

Kaufmann, in his *Christian Socialism*, says, however, of this movement that its name Christian Socialism "is somewhat misleading, since those to whom it is applied, and who cheerfully accept the appellation, are so far from being Socialists, in the ordinary sense of the word, that the name 'Defenders of Society on Church and State Principles' would convey a more correct idea of their aims and purposes to English readers. Properly speaking, they are conservative would-be saviors of society, who see no other means of escape from the present social dilemma but in a firm alliance between crown and altar for the purpose of regenerating society."

Two fundamental principles were laid down in the program, one indicating the duties of the State, the other those of the Church:

(1) That thorough reforms have become necessary in order to inspire the enfranchised masses with confidence toward the government.

(2) That the solution of the social question is impossible without the cooperation of the moral and religious factors and the Church's recognition of the just demands of the fourth estate (the working men).

But Stöcker, the leader of the movement, gave it a strong political bias. Two associations were formed, a Central Union for Social Reform on a religious, constitutional, monarchical basis, and the Christian Social Working Men's Party. The Union for Social Reform was to be composed of well-to-do and educated men, such as ministers of the Church, professors, manufacturers, and landowners, who would join in seeking for means of conciliating the anarchic classes through reforms inspired by the spirit of Christianity. The Christian Social Working Men's Party was to rally and aid working men.

The movement met great opposition. All the progressive papers protested against it as *mucker-socialismus*, or sham socialism. The liberal press also opposed it. "We prefer," said one paper, "Socialists in blouse to Socialists in surplice."

The higher dignitaries of the Evangelical Church held aloof from the movement, or were hostile to it; but the common clergy were stirred. More than 700 ministers sent in their adhesion to the Central Union for Social Reform. Dr. Stöcker displayed great energy. He attended public meetings at Berlin, where he confronted the most fanatical opposition of the Socialist Democrats, and sometimes, by sheer force of eloquence, he won cheers from the hostile crowd. He was attacked with extraordinary violence by Herr Most, who organized what he called a *Massenaustritt aus der Kirche*, or formal renunciation of the Church.

The Central Union for Social Reform also obtained the adhesion of several well-known economists, such as Prof. Adolf Wagner, of Berlin University; Dr. Schaeffle, former Minister of Finance in Austria, and author of "Socialismus und Capitalismus"; Herr Adolf Samter, banker at Konigsberg; and Professor von Scheel.

Pastor Todt was the chief author of the movement. In his "Radical German Socialism and Christian Society," he condemns the economics of liberalism as unchristian, and seeks to show that the ideals of liberty, equality, and fraternity are scriptural, as are also the Socialist demands for the abolition of private property and of the wage system, the laborer to have the full produce of his labor, and labor to be associated. Herr Todt places the following epigraph at the head of his work: "Whoever would understand the social question and contribute to its solution must have on his right hand the works on political economy, and on his left the literature of scientific socialism, and must keep the New Testament open before him."

The movement, however, was hurt by its politics. Depending in part on imperial support, this finally failed it. Dr. Stöcker, with unquestioned motives, but with doubtful wisdom, early became a leader in the anti-Semitic movement, and by so doing attached to himself a certain political following not always of a desirable character, and, at the same time, prejudiced against him many who had been attracted by his Christian Socialism. The movement, therefore, so far as it was Christian Socialist, broke away from his lead, and for the most part became a movement for all kinds of church and social philanthropic societies and efforts. It has in this line developed a large and useful activity, but so connected with the "Inner Mission" (*q. v.*) that we consider it best under that head. Only a few of the younger men adhered to any large extent to the radical Christian Socialism of England and America.

Dr. Göhre (*q. v.*) developed a radical wing, largely helped by the revelations in his book, "Three Months in a Factory," but he has gone over to straight socialism. Dr. Naumann, formerly of Frankfort and now of Berlin, with his paper *Die Hilfe* has stood for a more evangelical socialism. There exist in Germany a large number of so called Christian Trade Unions, both Catholic and Protestant, but they are best considered under Trade Unions. See also Germany.

France

France may be said, in a very real sense, to be the birthplace of Christian Socialism. As long ago as 1790 Claude Fauchet (*q. v.*), once a court preacher, and then a leader in the Revolution, advocated a radical Christian communism, and founded a Christian communist paper —the first Socialist paper of the world, *Bouche de Fer* ("The Iron World"). He founded Christian Socialist clubs, and exerted no little influence. The *bon mot* of Camille Desmoulins, calling Christ *le bon sansculotte*, is well known. Saint Simon (*q. v.*) himself has been sometimes called the first Christian Socialist. His first idea was to induce the Pope to found a new Christian social order, and when he failed in this, he undertook himself to found what he called a New Christianity. Several of the Saint Simonians, notably Buchez (*q. v.*), believed that they could, and endeavored strenuously to establish a new social Christianity. Far more truly may Lamennais (*q. v.*) be considered a leading French Christian Socialist. His journal, *L'Avenir*, begun in 1830 with its motto, "God and liberty, the Pope and the people," and after his break with the papacy, his *Les Paroles d'un Croyant* ("The Words of a Believer," 1839), are among the noblest and most

burning Christian Socialist utterances ever made. Cabet, the brilliant author of the utopian *Icaria*, must also be mentioned here, with his book, "Le Vrai Christianisme suivant Jesus Christ" (1846), striving to show that Christianity is communism. Yet in spite of these and other brilliant utterances there has been no organized Christian Socialist movement in France until recent times.

Says Kaufmann, in his "Christian Socialism," p. 169: "De Maistre, Lamennais, Lacordaire, on the one hand, Bonald, Le Play, and le Comte de Mun, on the other, represent in the order we have placed them, tho not in chronological sequence, the ascending and descending scale from and to the ultramontane standpoint of Christian Socialism."

The great movement of Le Play (*q. v.*) can, in itself, however, scarcely be called a Christian Socialist movement, altho it has led to some extent to a movement sometimes using this name. Le Play himself, altho a devout Roman Catholic, aimed to make his movement purely educational. The founder of the real Roman Catholic Socialist movement in France is the Comte de Mun (*q. v.*). He, with the Comte de la Tour-du-Pin Chambly, founded, soon after the Franco-Prussian War, the *Œuvre des Cercles Catholiques d'Ouvriers*, an association organized for the purpose of bringing together working men on a Church basis, and standing on the social principles of the encyclical and syllabus of 1864. Its professed object was "the counter-revolution, made in the name of the syllabus, and the great work of reestablishing a Christian order in the world of labor." The followers of this school hold the Protestant Reformation to be the parent of all France's moral and social ills. They see in the Reformation a revolution against God, the worship of the sovereignty of the man in place of the sovereignty of God. They class Luther, Calvin, Voltaire, Rousseau, Danton, Robespierre, side by side. Against the Reformation, with its asserted ecclesiastical, political, social, and moral results, they declare war. In place of Protestantism and economic individualism they would establish cooperative association with State aid, under the patronage of the Church of Rome. With the Social Democrats they have nothing to do. When the Pope, however, condemned socialism under that name, tho indorsing many of its principles, they denied there could be a Christian socialism. The movement is more ecclesiastical and political than really Christian Socialist. It is an effort to hold the working classes for Rome. The direction of the unions is placed in the hands of local committees in close connection with a central committee in Paris. It is an attempt, moreover, to bring together the higher and lower classes of society by means of Christian sympathy, and so to effect social union.

Catholic Christian Socialism

In 1887 there were 400 *cercles* and 130 cooperative associations.

Their leader, the Comte de Mun, an active politician and fluent speaker, tho sometimes defeated, has frequently been elected to the Chamber of Deputies.

This movement, however, is not the only Roman Catholic social movement in France. In 1890 Bishop Frippel founded *La Société Catholique d'économie politique*, representing the Le Play movement, but in direct conjunction with the Church.

French Roman Catholic political Christian Socialism, however, has not been a success. Compromised by their persecutions of Dreyfus, accused of plotting against the French Republic, the French voter has voted against these Ultramontanists. Therefore the movement is now taking a more practical turn.

Marc Sangnier, a brilliant young student at the Collège Stanislas in Paris, developed a burning interest in social reform, and finally, in the year 1899, an institution known as the *Sillon*, in many senses the Young Men's Christian Association of Catholic France, and, like this, with many branches or clubs of an undenominational character.

These clubs are open to all. Their organization varies. In towns they may take the form of literary and musical societies, daily classes for shorthand, English, or drawing, debating clubs, and the like. In the country they meet less frequently, and generally occupy themselves with lectures on agricultural or industrial topics. In every case the *Instituts* endeavor to meet the social wants of the district. Altho they are not exclusively Catholic, every occasion is taken to bring before those who attend them the truths of Catholicism and its social sympathies. Besides these *Instituts Populaires* the *Sillon* has founded a number of cooperative societies in various parts of France, and an *Office Social*.

An equally important association for social purposes in the French Church, tho perhaps more theoretical than practical, is the *Action Populaire* which undertakes to exhibit the condition of certain sections of the laboring classes, to teach the people that they must organize themselves, and to show them how to do so.

These two associations show which way the Catholic Church in France is moving. They are not political; they oppose socialism, but are social efforts to hold the people for the Church.

Protestant Christian Socialism in France is still more recent.

In 1887 Pastor L. Gouth of Aubenas (Ardèche) took the initiative in the establishment of a Protestant Association for the Practical Study of Social Questions. And on Oct. 18 and 19, 1888, the association held its first general assembly at Nimes (Gard). The aim of the association, as the result of its studies, was to labor to repair the evils from which we suffer, by pointing out to Christians their social duties, by suggesting to them the initiative in works of brotherhood and relief, and by acting upon public opinion and the established powers to bring about necessary reforms.

Protestant Christian Socialism

Many general assemblies were held—at Nimes, Lyons, Montbeliard (Doubs), Marseilles, Havre, and Paris, and much thought aroused. Professor Gide, Pastor Fallot, and Charles Secrétan were active in it. The association early developed 600 members. Several of the members have established in their churches, or rather in their communes, institutions answering to its aims, a bureau of information and employment, a *maison de travail*, a mutual aid society; elsewhere a society for the aid of young apprentices of both sexes, lodging-houses, and the like institutions. The *Review of Practical Christianity* became the official organ of the association.

Belgium

Belgium has distinguished herself in the literature of Christian Socialism. Colins, born in Belgium, should be mentioned here, tho he wrote mainly in Paris, and developed a philosophy in most respects anything but Christian, since he believed, strange to say, in immortality, but not in God. As an ardent land nationalizer, however, and with a religious spirit, altho a bizarre theology, he sowed seeds which have sprung up in Belgian Christian Socialism. Huet (*q. v.*) was an out-and-out Christian Socialist. His "Le Regne Social du Christianisme," published about 1850, is one of the earliest and best statements of Christian Socialism in any language. Professor de la Laveleye was his pupil, and says of this book that it has not received the attention it deserves, being too full of Christianity for most Socialists and too full of socialism for most Christians. A Roman Catholic of the school of Pascal and Bossuet, he protested to the last against ultramontanism, and for a liberal Catholicism and a spiritual secularity. Professor de Laveleye, his most distinguished scholar, belongs to the same school. Professor of political economy at Liège, he became as well known for his Christian Socialism as for his economic and sociological writings. A Catholic, of the extreme liberal type, his position on Christian Socialism may be summed up in the passage from the introduction to his "Contemporary Socialism," where he says: "Every Christian who understands and earnestly accepts the teachings of his Master is at heart a Socialist; and every Socialist, whatever may be his hatred against all religion, bears within himself an unconscious Christianity." Prof. C. Perin, of the Roman Catholic University of Louvain, belongs to the ultramontane school. His treatise on "Wealth in Christian Society" was published in 1861. Later he published a work on the "Laws of Christian Society," which was prefaced by a pontifical breve, dated 1875. In 1879 he published a work on "Christian Socialism," to which was added an address he delivered at the opening of the Congress of the Directors of the Roman Catholic Workman's Associations, at Chartres, Aug. 9, 1878. Perin founds social order on divine authority, but trusts largely to the moral rather than the dogmatic influence of the Church. Industry, he believes, should be organized, both paternally and fraternally, under employers, and yet with a Christian fraternal spirit. (For further details, see Colins; Huet; Laveleye; Perin.) With all these and other Christian Socialist writers in Belgium, one is not surprised to find much fruit. Indeed, in no other country of the world has a whole national church been so penetrated with Christian Socialism, as the Roman Catholic Church. Hence, many think, its deep hold on the people.

As early as 1854, a Jesuit, R. P. Van Caloen, organized in a Brussels basement a few working men into an association of St. Francis Xavier. Its object was to evangelize working men by working men, but it early developed social activities, including economic branches, cooperative societies, institutions for saving, trade-unions of various trades. To-day it has 354 societies, some 70,000 adult and 10,000 juvenile members, besides thousands of women, connected with it only to pray for its success. In 1867 was founded the Belgian Catholic Federation (for working men). In 1869 it published an organ, *The Christian Economist*, and later a popular journal, *The Worker*. In 1882 the first named was changed to the *Catholic Economist*. In 1888 was organized the Belgian Federation of Catholic Working Men's Societies, which in 1891 became *The Democratic League* (under the guide of the Church), and has held twenty-nine congresses in various parts of the kingdom. Its aim is declared by its constitution to be the moral and material improvement of the working classes and the pacification of labor and of capital. Societies may be affiliated with it composed either of employers or employees, but all must accept its aim, and recognize the indispensability of religion to the social order. The league has 300 societies with about 90,000 members. It is this league that largely gives Catholicism its political power in Belgium.

Catholic Movement

These societies are largely under the lead of the parish priests. The movement agitates for legal reforms, such as laws limiting child labor, woman's work, providing for working men's insurance, a Sunday rest, etc. It has established working men's hotels, schools, orphanages, savings-banks, mutual purchasing societies. Particularly has the movement organized cooperative agricultural societies, as one of its writers says, "for the salvation of agriculture, the first of all industries."

The movement has been an educated and instructed movement. It was Roman Catholic Louvain that first inaugurated a course in social studies in Belgium in 1885. By 1891 this had grown into a school of political and social sciences. To-day this school has thirteen professors, with some forty students. It has a course of two years and a half, grants diplomas, has already published twenty-five volumes and nineteen doctrinal theses. This is for the leaders of the movement who make social studies their specialty, but at every theological seminary in Belgium departments exist for the social and political instruction of the priests.

A Jesuit writer, A. Vermeersch, has published (1904) the most complete work on Belgian social legislation and activities.

Other European Countries

In other European countries Christian Socialism has had less development. In the Netherlands both Protestants and Roman Catholics have gone largely into politics and have created Church parties which separately or by combination have till recently largely ruled the country, but they have been in the main ultra-conservative. Recently, however, the growth of radicalism has compelled action on social lines.

A Catholic Social Union (Katholicke Sociale Actie), covering the whole country, has been formed, its central office in Leyden. This society will take the initiative in social action, and will be a bureau of information.

The Calvinists are following suit in a society in connection with the "Patrémonium," a working man's society.

In Scandinavia one recalls the late Bishop of Zeeland with his book, "Socialism and Christianity as a Fragment of Christian Ethics." There has, however, been little or no organization on Christian Socialist lines, except the efforts of a few pastors and others for temperance and other particular reforms.

In Austria, Christian Socialism was first advocated by a Protestant, Rudolph Meyer, but was taken up by Roman Catholics, Prince von Leichtenstein, Counts Blome and Knefsteen, and above all Baron von Vogelsang, and has grown into a large movement. It has, however, been principally a political movement to increase the political power of the Church, by organizing working men as in Germany into societies under the guide of the Church. It has also had much to do with anti-Semitism.

In Switzerland there have been various local Protestant Christian Social societies and a few leaders of economic thought, but the movement has developed little more than some charitable efforts on the part of the respectable upper middle class. Swiss Roman Catholic Christian socialism has been more radical, and some of the priests have been very active cooperators in the labor movement.

In Italy there has been nothing that can be called Roman Catholic Christian Socialism, except for a few utterances like Rafaele Mariano's "Christian Catholicism and Culture," and Professor Nitti's notable "Catholic Socialism." Some of the evangelical pastors write and preach on Christian Socialist lines.

The United States

Christian Socialism in America made a more recent appearance. This is due undoubtedly mainly to economic conditions, in part to the American idea of the divorce of Church and State, which has meant too often the divorce of secular and religious life. There have long been those, however, in America who have individually looked this way. Many of the participants in the Brook Farm and the early Fourier experiments acted on motives largely those of Christian Socialism. As early as 1849 Henry James, Sr., in a lecture delivered in Boston, argued the identity of Christianity and socialism. In 1872 a Christian Labor Union was organized in Boston under the lead of George E. McNeill, Edward H. Rogers, Hon. T. Wharton Collins (of New Orleans), the Rev. Jesse H. Jones, Henry T. Delano, and others. The Rev. Jesse H. Jones from 1874–75 published a paper in Boston called the *Equity*, really a paper of Christian Socialism. The writings of Dr. R. Heber Newton, of Drs. Lyman Abbott and Washington Gladden, of Prof. R. T. Ely, are well known. Yet there were no Christian Socialists, so called, in America till organization was effected in Boston, April 15, 1889, largely under the lead of the Rev. W. D. P. Bliss. It was called the Society of Christian Socialists, and adopted the following principles:

Society of Christian Socialists

To exalt the principle that all rights and powers are gifts of God, not for the receiver's use only, but for the benefit of all; to magnify the oneness of the human family, and to lift mankind to the highest plane of privilege, we band ourselves together under the name of Christian Socialists.

I. We hold that God is the source and guide of all human progress, and we believe that all social, political, and industrial relations should be based on the fatherhood of God and the brotherhood of man, in the spirit and according to the teachings of Jesus Christ.

II. We hold that the present commercial and industrial system is not thus based, but rests rather on economic individualism, the results of which are:

(1) That the natural resources of the earth and the mechanical inventions of man are made to accrue disproportionately to the advantage of the few instead of the many. (2) That production is without general plan, and commercial and industrial crises are thereby precipitated. (3) That the control of business is rapidly concentrating in the hands of a dangerous plutocracy, and the destinies of the masses of wage-earners are becoming increasingly dependent on the will and resources of a narrowing number of wage-payers. (4) That thus large occasion is given for the moral evils of mammonism, recklessness, overcrowding, intemperance, prostitution, crime.

III. We hold that united Christianity must protest against a system so based and productive of such results, and must demand a reconstructed social order, which, adopting some method of production and distribution that starts from organized society as a body and seeks to benefit society equitably in every one of its members, shall be based on the Christian principle that "We are members one of another."

IV. While recognizing the present dangerous tendency of business toward combinations and trusts, we yet believe that the economic circumstances which call them into being will necessarily result in the development of such a social order, which, with the equally necessary development of individual character, will be at once true socialism and true Christianity.

V. Our objects, therefore, as Christian Socialists, are:

(1) To show that the aim of socialism is embraced in the aim of Christianity. (2) To awaken members of Christian churches to the fact that the teachings of Jesus Christ lead directly to some specific form or forms of socialism; that, therefore, the Church has a definite duty upon this matter, and must, in simple obedience to Christ, apply itself to the realization of the social principles of Christianity.

VI. We invite all who can subscribe to this declaration to active cooperation with us, and we urge the formation of similar fellowships in other places throughout the land.

This society included members of all churches. Its president was a Baptist, the Rev. O. P. Gifford, and among its officers Rev. P. W. Sprague (Episcopalian) and Mrs. Mary A. Livermore (Universalist). Branch societies were also started in many cities. The society also established, in 1889, a monthly organ, *The Dawn*, for some years published in Boston by Mr. Bliss. The society, however, no longer exists. Mr. Bliss established an Episcopal mission, the Church of the Carpenter, in Boston. This movement as an organized movement has disappeared, but the seed has been widely sowed. *The Dawn* in 1893 published a list of some 700 clergymen more or less actually engaged in Christian social reform. To-day there are many more.

In the Episcopal Church the *Christian Social Union*, established in 1891, under the lead of such men as Bishop Huntington, Dr. Holland, of St. Louis, Prof. R. T. Ely, Mr. Bliss and others, attained considerable following, and still exists, tho the organization as an organization has not grown. The more radical and locally more active *Church Association for the Advancement of the Interests of Labor* ("C. A. I. L."), organized in New York in 1887, has had more permanent success. The undenominational *Brotherhood of the Kingdom*, established in 1893, by Dr. Leighton Williams and others largely of the Baptist churches, has done, and still does, a quiet but good work. In his Christian Socialist days, Dr.

George Herron, by his brilliant books and burning words, stirred up much thought and some organization, particularly in his own denomination, Congregational; but this, so far as organization goes, was largely undone by Dr. Herron's later break with organized Christianity. Dr. Josiah Strong, tho never calling himself a Christian Socialist, has done very much for Christian social thought through the country. The same may be said of Dr. Gladden and several other prominent religious leaders. In 1906 a national Christian Socialist League, definitely committed to socialism, was organized in Louisville, Ky. But for all these different societies and forces, see articles under the respective names. The following is perhaps a correct representation of the principles and actual methods usually advocated by avowed and radical Christian Socialists:

Christian Socialism is the application to society of the way of Christ. Christ has a social way, and only in this way are there healing and wholeness for the nations. Christian Socialists do not deny the necessity of individual Christianity. Christian Socialism is no salvation by the wholesale, by machinery, by power of environment; it is no new gospel. It is, rather, the carrying out of the old full gospel, which is to all people. It holds that Christian Socialism follows from and is involved in personal obedience to Christ. It is Christian. Its starting-point is the Incarnation.

But this being so, it quickly adds, that while Christian Socialism follows from personal obedience to Christ, *it is not enough to-day to say that all that is needed is for the individual to follow Christ.* This, *while true*, begs the question. *We need to be told what it means to follow Christ.* Those sentimental Christians who say that all that is necessary is for individuals to obey Christ are in danger of saying, "Lord, Lord," without showing what the Lord would have us do. Christian Socialism tries to voice the social law that it has learned from Christ.

Christian Socialist Principles

First, it declares that all men are the children of God. It follows that men are not *merely* individuals; they are born united. The world *is* one. Society makes the individual, more than the individual makes society. Society begins in God. The first social necessity is to recognize this. We are to develop the social unity we derive from God. *Second*, the *law* for the social life is revealed in part in the Old Testament. The Mosaic revelation founded a theocracy on earth. God was the Universal Father; every man of the theocracy a brother. Property in land was not absolute; the land was conceived as belonging to God. No individual could own it in fee simple. He could only use it. In its use he was inalienably protected. It came to him through the family as an inalienable inheritance. If, through poverty or misfortune, he temporarily parted with it, it returned to him in the year of jubilee. No landless, homeless class could, therefore, be *permanently* developed among the Hebrews. (See JUDAISM.)

The law went farther. It cared especially for the poor, the oppress, the children, the fatherless, the widow. Usury (or interest: all scholars agree that the two words originally meant the same thing) was forbidden between members of the theocracy. The law provided for every one's independence. It not only provided land for the worker, but defended him in the ownership of clothes, tools, etc. (capital), which could not *permanently* be taken from him. If taken as a pledge, they must be returned before night. No permanent mortgage indebtedness was, therefore, possible on either land or capital; that is, the law was truly socialistic in providing in the name of organized society for both land and capital for every family. And this was *not*, be it remembered, a law of mere individual righteousness. *In order to reap its benefits, the family had to belong to the theocracy.* The Jew could take interest from a foreigner; the foreigner could be enslaved, even killed. The law was essentially national and institutional.

Third, this law is to be fulfilled *in Jesus Christ.* The Hebrew law did not work; no law can work; *man must work the law*; hence the Christ, conversion, the sacraments, the means of grace. Jesus Christ came to enable us to fulfil the law. What the law could not do, in that it was weak through the flesh, that Jesus Christ came to fulfil. Individualism forgets law; institutionalism forgets grace. A true Christian Socialism fulfils the social law through grace. The Old Testament gives the world its social track; Jesus Christ gives the locomotive power. To preach as Tolstoy and most Protestants do, the latter without social organization, is to try and run a locomotive without a track. Protestanism has run the world into a quagmire. Jesus Christ is the locomotive power drawing the world along the social track.

Fourth, a social law must be fulfilled *socially*. Protestantism has here made a grievous mistake. But to make a mistake here is to misconceive the whole Incarnation. In Christ, God became man *on earth*. He took all humanity into Himself. Christ was not only a man, but MAN; man in all that is in man or possible to man; man in art, in science, in letters, in politics, in society, in commerce, in industry. In the Incarnation God entered into all life. God's laws are practical. What is impractical is not divine. Individualism has been found impractical. Men have tried to carry out the Golden Rule on individual lines, and they have failed. We do not say they have wholly failed. No earnest effort, even tho mistaken, wholly fails. But, generally speaking, they have failed. Large numbers of business men say to-day that the Golden Rule cannot be applied to business. They are right on the present system of business, because the system is wrong. You 'cannot serve God and Mammon." Pathetic, noble but impractical are the desperate efforts of Christian men and women to do good and be Christ-like in modern business. It is a hopeless task. God's way demands a social basis.

Fifth, Christian Socialism would fulfil the social law by striving to build up a socialism based on Christ.

It would aid the eight-hour movement. It would reduce the hours of labor in factory and in shop, that men may have longer hours of labor in the home, the library, and the church. Christian Socialism would favor *direct legislation*, through the initiative, the referendum, and proportional representation, purging our politics of corruption, breaking down the machine, and teaching the people self-government. It would emancipate woman as well as man. It does not believe in a democracy of half the people. It would develop a true municipalism, as is being done in Birmingham, Glasgow, London, Berlin, and other cities. Glasgow, by spending $7,000,000 in tearing down and rebuilding the worst tenements, and by municipally clearing courts and passages; by providing municipal baths, wash-houses, etc., has reduced her death-rate from 54 to 29 per 1,000.

Measures Favored

This Christian Socialism considers practical Christianity. It would have the city employ the unemployed, in ways not to compete with present labor. Says Turgot, whom Matthew Arnold calls "the wisest statesman France ever had": "God when he made man with wants and rendered labor an indispensable resource, made the right of work the property of every individual; and this property is the first, the most sacred, and the most imprescriptible of all kinds of property." It would have cities obtain the funds for doing this by conducting gas works, surface railroads, etc., for a profit for the city, instead of having them owned by rich capitalists favored by city franchises.

Christian Socialists would have the nations own and manage railroads, the telegraph, expressage, etc. In every way it would replace competition by fraternal combination, and it would press toward reform in all these ways. It is not one reform. It is many reforms on *one principle*. Perhaps most important of all is land reform. Christian Socialism would revert to the Bible principle, that God is the owner of all the earth, and men only entitled to its use. It would, therefore, favor the reclaiming of the land for the use of all the people, by taxing land values on a graduated scale, and increasingly every few years, till finally the whole value of the natural resources of the earth be taken for the people, and not for the favored few. Christian Socialism would not go out of the world to save the world. It would be in it, tho not of it. Gradually it would influence cities and states and nations.

CHRISTIAN SOCIAL UNION, THE (AMERICAN): Organization founded in New York, April 3, 1891, on the basis of the English Christian Social Union. Its first president was the Rt. Rev. F. D. Huntington, Bishop of Central New York; its first secretary, Prof. R. T. Ely; and its traveling secretary and lecturer, the Rev. W. D. P. Bliss. For its principles, see CHRISTIAN SOCIAL UNION (ENGLISH). It has found considerable response among clergymen and others, and has issued numerous tracts. Its president is Dr. Clinton R. Woodruff; its secretary, the Rev. A. J. Arkin, 3113 Richmond Street, Philadelphia, Pa.

CHRISTIAN SOCIAL UNION, THE (ENGLISH): An organization of the Church of England, founded in 1889 for the study and advocacy of Christian social principles.

The first regularly constituted branch was organized at Oxford, Nov. 16, 1889. The London branch began in 1890. The Oxford branch has been mainly engaged in the systematic study of economic facts; the London branch has been more active in holding public meetings, organizing courses of sermons, and issuing addresses on definite political, social, and industrial problems.

The principles of the union declare it to consist of Churchmen who have the following objects at heart:

(1) To claim for the Christian law the ultimate authority to rule social practise.
(2) To study in common how to apply the moral truths and principles of Christianity to the social and economic difficulties of the present time.
(3) To present Christ in practical life as the living Master and King, the enemy of wrong and selfishness, the power of righteousness and love.
Members are expected to pray for the well-being of the union at Holy Communion, more particularly on or about the following days: The Feast of the Epiphany, the Feast of the Ascension; the Feast of St. Michael and all Angels.

The president of the union is the Bishop of Worcester, who has succeeded the late Bishop of Durham, Dr. Westcott, who was the first president. The largest branches are at Oxford and in London; there are also branches at Cambridge Leicester, Leeds, Liverpool, Birmingham, Manchester, and some thirty other centers. Canon Scott Holland, Professor Sanday, Professor Stanton, the Archbishop of Canterbury, the Bishop of Liverpool, the Bishop of Durham, the Bishop of Rochester, the Bishop of London, and the Bishop of Chester are prominent members. The Rev. John Carter, of Pusey House, is the honorary secretary. Canon Scott Holland is chairman of the executive committee of the London branch, and the Rev. Percy Dearmer (102 Adelaide Road, London, N. W.), is secretary. The union has upward of 5,000 members in sixty branches, and is very influential in Church of England thought and activities. It has affiliated societies in Australia, New Zealand, and the United States. It has two organs: *The Economic Review*, published at Oxford; and *The Commonwealth*, published in London (3 Paternoster Buildings, E. C.).

The spirit of the union may be seen in the following quotations from a tract, "The Ground of Our Appeal," by Canon Scott Holland:

(1) We start from the conviction which has been for so long stamped on every heart that feels or brain that thinks that the time is come to vote urgency for the social question. We believe that political problems are rapidly giving place to the industrial problem, which is proving itself more and more to be the question of the hour. . . .
(2) We are of those who are convinced that the ultimate solution of this social question is bound to be discovered in the person and life of Christ. He is "the Man"; and He must be the solution of all human problems. That is our primal creed. . . .

It is true that this relationship of His to the social life of men is less obvious and direct than His relationship to their sorrows or their sins as the Redeemer. For the victory which gained Him this living lordship over all that man is was won by Him not in the social, or economic, or political, but in the *spiritual* sphere. He redeemed men's souls from sin. That was His primary task; . . . but its significance is bound to tell on every level of existence down to which the influence of the victorious spirit reaches. The whole of human nature is to be brought within the sway of the "New Man." And human nature is corporate; "man is a social animal." The natural bonds which hold together men into societies and races must, of necessity, receive the new inflowing force which comes to them out of the supremacy of Him, who gathers all men unto Himself.

(3) But this application of the redemptive force of Christ to actual society can be no very simple matter. The problems raised by human society are manifold, intricate, and immense; and however firm our conviction may be that Christ is Himself their one and only solution, yet the solution of a difficult problem must, of necessity, be itself difficult; and if the perplexities have been themselves a matter of long and gradual growth, then their undoing, also, will be slow and gradual.

These are the questions; and they can only be answered by those who have got long past the merely sentimental assertion that Christ is all in all, and have set themselves to the solid task of discovering what that solemn truth really and precisely means, and have worked it down into the concrete facts, and have surveyed and estimated the full need of the circumstances, and striven to make clear to themselves what is the first step, and what the second, and the third, if that great royalty of Christ is, in very deed, ever to be made good here on earth, amid men as they are, and after a history such as they have hitherto had.

We cannot all of us undertake such a study as this involves; we have not the leisure or the brains. But that is just why we should all take some direct measures for keeping in touch with those who have the faculties and the opportunities that we lack. Some servants of the Church there *must* be who will give themselves seriously to the training that such a task involves. . . . They will arrive at the discussion possest by two deep convictions: First, that the present situation is intolerable; and, secondly, that its solution must be found in the unfaltering assertion of *moral* as supreme over *mechanical* laws. . . . It is to collect together such men as this, it is to foster and to enlarge such a spirit, that the Christian Social Union exists.

CHRISTIAN SOCIALIST FELLOWSHIP, THE: Organized in Louisville, Ky., June 18, 1906. Objects: To permeate churches, denominations, and other religious institutions with the social message of Jesus; to show that socialism is the necessary economic expression of the Christian life; to end the class struggle by establishing industrial democracy, and to hasten the reign of justice and brotherhood upon earth." Membership is open to all who agree to the objects of the fellowship. Organ, *The Christian Socialist*. Secretary, E. J. Ward, 5406 Drexel Avenue, Chicago, Ill.

CHRISTIAN SOCIALISTS, THE SOCIETY OF: A society organized in Boston, U. S. A., in 1889, but tho not disbanded, not now in active existence. (See CHRISTIAN SOCIALISM.)

CHRISTIANITY AND SOCIAL REFORM: This article is concerned neither with the teachings of Christ, nor with the activities of the Church, but solely with the effect of Christianity on social problems, and with the principles of a Christian sociology. The subject is considered under two heads: (1) History, and (2) Christian Sociology.

I.—History

The first effect of Christianity upon society was to introduce a new spirit of brotherhood, of equality, and of humanity to the suffering and the lowly (see CHRISTIAN COMMUNISM). Outside of Judea, at least, it seems probable that up to the third century Christianity spread largely among the vast slave and despised population of the empire, perhaps mainly among the trade *sodalities* or *colleges* or brotherhoods with which Mr. C. Osborn Ward shows the empire to have been honeycombed (see GILDS). Spreading mainly among these, the enslaved

rather than the masters, it is evident that Christianity could not at once overthrow slavery; but it did what it could to elevate the position of the slave. It bade him submit, in the spirit of Christian love, to his master, and yet it treated him as an equal and a brother. It inculcated a spirit and *practise* of brotherly love. "How those Christians love one another!" is the suggestive exclamation concerning life in the primitive Church. For a beautiful tho imaginative picture of the life of the early Church, see Koun's "Arius the Libyan."

Coming to more authoritative and established facts, we can see the evidence of the social effect of Christianity by comparing legislation before and after its influence began.

The Family

Rome, like all early civilizations, gave almost unlimited power to the father. He could and often did chastise or even slay an adult son. He could take his property, assign him a wife, divorce him when married, transfer him to another family by adoption. See *Val. Max.*, v., 8; *Liv.*, vii., 7; *Plut.* (*P. Gr. et Rom.*). Over the daughter he had still further power. Under the Christian emperors, whatever their personal character, this was abridged. Constantine punished a parricide, and Justinian went much further. The father could now only inherit from a son to a less degree than the son's minor children. Under Justinian the son had full control over all his acquisitions. He could not be killed, exposed, bought, sold, or imprisoned, save by decree of the courts. Under old Rome, inheritance was not by blood, but by *power*. Relationship was limited to descendants by males, tho a daughter inherited equally with a son. But neither an "emancipated" son nor a married daughter who had "left the family" inherited. They were *cognates*, not *agnates*. Under the Christian emperors this distinction disappears. Under the old Roman law the woman was almost wholly under the tutelage of her male relations. A court of her relatives could try her. Her husband had power of life and death over her, and power over her property. To the three ancient forms of Roman marriage, the *confarreatio*, or religious, the *coemptio*, or civil, and the *usus*, or without ceremony, there was gradually added "free marriage" in the interest of the woman, which was recognized by law, but did not make the wife of the husband's "family," leaving her her own property, her own gods, and her old family relation.

Under the Christian emperors this was changed. "Tutelage of women must be done away with," says Justinian in his "Institutes." The absolute power of the husband ceased. If unjustly divorced, she received full paternal power (*C. Theol.*, v., 4, 5).

Marriage

Under Rome, divorce had become frequent to the utmost. Juvenal declares that "no crime or deed of lust was wanting to the age" ("*Sat.*," vi., 223). Modesty was held to be a presumption of ugliness (*Plut. Vet. P. Aem*). In the year 19 A.D. the Roman senate had to pass a law that no woman of a certain rank could make her person venal. (*Tac. Ann.*, 2, 83). In 330–331 A.D., however, a wife might be divorced from her husband only when he was a murderer, a magician, or a violator of tombs. The husband could be divorced when the wife was an adulteress or given to evil practises. If the wife's innocence was proved, she had right again to all the property of her husband, and even the *dos* of the second wife. A married man was prohibited (340 A.D.) from having a concubine, and finally adultery was punished by death. Justinian's code, however, extended the causes of divorce. Jerome confesses that "some were the laws of the Cæsars, and some of Christ." A stoical jurist, Paul, writes in the third century: "Women in every kind of affairs and obligations, whether in behalf of men or women, are prohibited from having any concern" (*Paul Sent.*, ii., xii.). Justinian says that nothing in human affairs is so much to be venerated as marriage. "We enact then that all persons, so far as they can, shall preserve chastity, which alone is able to present the souls of men with confidence before God" (*Nov.*, iii., 1, 14).

Slavery

In ancient Rome and Greece, unnatural vices became the rule even among the learned (confer Lucian, Apuleius, Arbiter, Athenæus, Plato's *Symposium*). The plain words of St. Paul are well known. The Theodosian code, which codified the legislation of Constantine, ordered the most intense punishments to be inflicted on those guilty of such crimes. He says: "Taught by the Holy Scriptures, we know what a just punishment God inflicted on the inhabitants of Sodom" (*Cod. Theod.*, ix., tit. 7).

Slavery was probably never worse than just before the advent of Christianity. Stoicism mildly denounced, but did not alleviate it. Cato approved of selling a sick slave (*De remot.*, II.). Six hundred slaves were put to death because one had slain their master, and Cassius defended the act, which the law requited (*Tac. Ann.*, xii , *lib.* 42). Similar inhumanities are well known. Slaves were fed to fish and put to death for amusement. Under Christianity the Lord's day became a day appropriate to emancipation (*Cod. Theod.*, l. 2). The setting free of slaves became common. In 312 A.D. the poisoning or branding of a slave was declared by law to be homicide. In 314 liberty was a right which could not be taken away. By 316 emancipation in the church before witnesses was emancipation before the law. Later a few words from a priest could emancipate. Under Justinian those who served in the army or entered a monastery, with the consent of their masters, became free. Slavery was suppress by penalty. If, at the death of the master, the heir was directed to free one slave, all became free. The marriage of the master with the bondwoman freed and legitimatized all the children, and even without marriage, if the woman held the position of a wife, she became free with her children. The violation of a slave woman was made an equal offense with crime committed upon a free woman, and punishable by death. The movable property of slaves became their own, and with it they often purchased their liberty. The code declared its purpose "to have the republic frequented by freemen rather than liberated slaves." These were but the principal enactments. Under Leo (717) all slaves on imperial domains were allowed to do with their property as they chose. If property reverted to the State (867), the slaves became free. In the ninth century St. Theodore of Studium (Constantinople) commanded "Thou shalt possess no slave, neither for domestic service nor for the labor of the fields, for man is made in the image of God" (Wallon's "Hist. de l'Esclavage," v. iii., p. 484). Slavery had disappeared in Europe when the Reformation came.

Humanity

The gladiatorial games of Rome are well known. The Stoics objected to them, but it did no good. Cæsar had 320 pairs of gladiators at once in the arena. Trajan surpassed all in forcing 10,000 prisoners and gladiators to contend for life in a carnage lasting 123 days. Constantine, in the very year before he accepted Christianity, exposed a vast number of prisoners to wild beasts in the amphitheater. The early Christians protested against all this. In 325 A.D. Constantine passed the law, "Bloody spectacles in our present state of civil tranquillity and domestic peace do not please us, wherefore we order that all gladiators be prohibited from carrying on their profession" (*Cod. Theod.*, lxv. tit. 12, l. 1). Their final abolition by the leaping into the arena of the monk Telemachus (404) is well known.

Under old Rome public spectacles were licentious as well as bloody. Nude women were made to bathe before the spectators. The actresses were prostitutes and the plays obscene. The Christians denounced these, as they did the gladiatorial shows. By 343 no Christian woman, bond or free, could be forced to serve as a prostitute on the stage. Exhibitions were forbidden on Sundays and saints' days. By 439 a law of Theodosius forbade the profession of the *leno*, or procurer. Under Justinian no woman could be retained by force on the stage. Under Theodosius it was forbidden to sell or train women for social entertainments. A slave mutilated became free. Often when examined a slave would answer, "I am not a slave; I am a Christian; Christ has freed me."

Under ancient Rome, the exposure and frightful mutilation of children, and especially of female children, were frequent. Even Seneca approved of exposing weak infants. Exposed children were often taken to be prostitutes. The Christian fathers were full of denunciation of the custom. Constantine (315) forbade the practise, and had his revenue and treasure used to rescue any who were exposed. The Council of Nice ordered the foundation of hospitals in the principal towns. Houses of mercy for children were founded by Justinian. A marble vessel was provided for exposed children at the door of each church, and nurses were employed for them.

Under Constantine began the first prison reform, and with the Christians, the first active condemnation of war and the adoption of arbitration. Many of the Christians refused to fight or to go to law. Tertullian called Christians "priests of peace." The first hospital is said to have been built in Rome at the end of the first century. Pulcheria, sister of Theodosius the Younger, built and endowed several at Constantinople.

The Middle Ages

It is often claimed that the elevation of woman under the Christian emperors could not have been due to Christianity, because the same elevation was found in unchristian Germanic tribes. But the same elevation was not found. The woman occupied a higher position than under ancient Rome, but not so high as under Christian Rome, and when Christianity conquered these tribes her position was very much bettered. It is true, according to Tacitus, that woman among these tribes was the companion of her husband, and often the honored prophetess; a high ideal was maintained of female purity; and the debauchery of Rome was unknown; nevertheless the wife was under the absolute authority of her husband, and could be bought, beaten, or killed. The wife was usually bought, being rated at so many pieces of silver. The offender was required by law simply to pay the husband for the adultery of his wife, and to furnish a new wife (*Leg. Æthel.*, 32).

Marriage

Christianity immediately strove to increase the sanctity of marriage. The law of Ethelred is striking: "And we direct very earnestly that every Christian man carefully avoid unlawful concubinage and rightly observe Christian law; and let it never be that a Christian man marry within the fourth degree, nor have more wives than one as long as she may live, whoever will rightly observe God's law and secure his soul from the burnings of hell" (*Lex. Æthel.*, v. II., vi., II.). The Pepin and Charlemagne capitularies

are equally strong on the indissolubility of the marriage tie, save for the cause of fornication. The Church strove likewise to root out the old venal character of marriage. The Council of Treves (1227) forbade the relations of the bride from taking money under any pretense for giving the woman in marriage. The ring is now well-nigh the only relic of the ancient *wed* or pledge that the man would fulfil his part of the money contract. France was the first to abolish tutelage.

A greater effect of Christianity on the Germanic tribes was in the mitigation and finally the suppression of personal feuds. In barbaric society individual injury was revenged on the person of the enemy, and the injured, being a member of a family or association, was protected by the association, and his wrongs regarded as wrongs done to the family. Hence arose feuds (*faida*). In the Teutonic tribes an elaborate system of fines, or amends, was arranged. Christianity agitated the subject. King Alfred, in the introduction of his laws, speaks of the ordaining of *bot*, or money fines, to repress feuds by the legislative assemblies of England as a special effort of the Christian faith. All Sundays and religious days became sacred from feuds. In the seventh and eighth centuries a confessor at shrove-tide would refuse absolution to a man at feud who would not make peace. From a Russian code of 988 A.D., we learn that "King Wladimir lived in the fear of God, and murders waxed greatly. Then spake the bishops to Wladimir: 'Murders wax greatly. Why dost thou not punish?' He answered: 'I feared injustice.' But they replied: 'Thou hast been set by God for the punishment of the wicked and for grace to the good. It becometh thee to punish the murderers, but only after much searching out.' Then Wladimir rejected *wergild* (fine), and punished the murderers."

From feuds arose private wars. A nobleman once declared war against the city of Frankfort because a lady residing there had promised a dance with his cousin, and had danced with another. The city was obliged to satisfy his wounded honor. The Margrave of Brandenburg boasted that he had burned 170 villages. A Church council held near Soissons in 909 A.D., declared "that the monasteries were burned or destroyed, the fields reduced to solitude, so that we can truly say that the sword has pierced to the very soul." Wherever feudalism went there was private war. Consequently the clergy preached "the Peace of God." In France, in the tenth and eleventh centuries, there seems to have been a sort of peace "revival," almost "a crusade of peace." Whoever broke the "Peace of God" lost his property, and was driven from among men. The peace lasted from Thursday evening to Monday morning, and included Christian feasts and other festivals. Many religious fraternities to reconcile enemies were formed in the Middle Ages. A meeting of clergy at Charons (989 A.D.) anathematized all who should plunder the poor and the clergy. The Council of Poitiers, 1004 A.D., worked for the same end. By the Council of Limoges (1031) all disputes were to be brought before the bishop and his chapter. The popes made public proclamations of peace. Almost all the councils reaffirmed this peace. In the thirteenth century Brotherhoods of the Agnus Dei worked for peace. In the same century Friar John of Vicenza traversed large portions of Italy, preaching the "Peace of God." In the fourteenth century a great religious movement for peace stirred the minds of different nations. Pilgrims with white bands around their necks (*I Bianchi*) marched through various lands preaching the duty of a Christian peace. In Germany the Church and the free cities combined, and in the twelfth and thirteenth centuries largely introduced courts of arbitration under the bishop in place of feuds.

"The Peace of God"

The capitularies of Charlemagne are replete with evidence showing the effect of Christianity in the way of social reform. One of them reads: "Let peace and good intelligence rule among bishops, abbots, counts, judges, and men of all conditions, for without peace, nothing pleases the Lord." "If ye love one another, all will know ye are Christ's disciples." "Widows and orphans and minors are to be protected as under the peculiar care of God." "The true charity, which loveth God and our neighbor," is to be cultivated. The people are exhorted to peace, because "they have one Father in heaven," and because the blest book has taught them that "blessed are the peacemakers." The powerful are cautioned against the oppression of the poor, and all are exhorted to be imitators of Him who would save the souls of men. All Christians are most solemnly warned to give their utmost diligence lest they be forever separated from the kingdom of God by their strifes and contentions and falsehood and wicked vices. The laity were ordered to learn the Apostles' Creed. The stranger and far-comer were especially protected "under the injunctions in the Bible, and because such may be journeying in the service of their common Master."

Similarly indicative of the influence of Christianity are old English laws. King Alfred (about 870 A.D.) introduces his code with the ten commandments and other laws taken from the Bible. Of his laws, the king says: "These are the dooms that the Almighty God Himself spake to Moses and bade him to hold, and when the Lord's only begotten Son—that is, Christ the Healer—on middle earth came, He said that He came not these dooms to break nor to gainsay, but with all good to do and with all mildheartedness and lowly-mindedness to teach them" (Hughes's translation). "That ye will that other men do not to you, do ye not that to other men. From this one doom, a man may think that he should doom every one rightly; he need keep no other doom-book." The Saxon and early Norman laws are strict as to Sunday work. If a bondsman work on Sunday by his lord's order, the lord must pay a fine of 30*s*.; if without this order, he must be flogged. If a freeman work without his lord's order, he must forfeit his freedom or pay 60*s*. A priest pays double. In King Ethelred's dooms the Christian impulse is very strong (978 A.D.). "This, then, first, that we all love and worship one God and zealously hold one Christianity; . . . that every man be regarded as entitled to right, and that peace and friendship be carefully observed within the land before God and before the world." King Canute's laws (1017 A.D.) are similar: "Let every Christian man do as is needful for him; let him keep his Christianity," etc.

English Laws

Christianity in the Middle Ages did much for education. The Council of Vaison (529 A.D.) says: "It hath seemed good to us that priests with parishes should receive into their houses, according to a sound custom in Italy, young readers to whom they give spiritual nourishment, teaching them to study, to attach themselves to holy books, and to know the law of God." The Synod of Orleans (799) says: "Let the priests in villages and towns hold schools, in order that all the children entrusted to them can receive the first notion of letters. Let them take no money for their lessons" (*Theod.*, cap. 20). In 859 another council declared: "Let one raise everywhere public schools, that the Church of God may everywhere gather the double fruit of religion" (*Conc. Ling.*, cap. 10). The Council of Trent commands that the children of the poor have at least one master to teach poor scholars grammar gratuitously" (*Conc. Trid. occ.*). Charlemagne had already said: "Let one open schools to teach children to read; let, in every monastery, in every bishopric, some one teach psalms, writing, arithmetic, grammar, and employ correct copies of holy books; for often men seeking to pray to God, pray badly on account of the unfaithfulness of copyists" (*Cap. Ecc.*, 61–66).

All these exhortations, and there were many more, had the effect of multiplying schools. The contribution of the monasteries to education is well known. An immense quantity of manuscripts was copied. Thomas à Kempis said of this copying: "Do not trouble yourself at the fatigue of your work, for God, who is the source of every good and just labor, will give the reward, according to your efforts, in eternity. When you shall be no more, those who will read the books copied by you with elegance will pray for you; and as he who gives a glass of cold water does not lose his reward, so he who gives forth the living water of wisdom will receive more surely his recompense in heaven." All classes studied in these monastic schools, so that rich and poor were brought together on the field of learning. Nor were the popes altogether wanting to the intellectual movement.

Equally was the Church effective in behalf of liberty. Mediæval serfdom sprang from the chaos of the times. Freed slaves, finding that they could not protect themselves, preferred to join some master as land slaves. The small farmer found himself better guarded from robbers by becoming the serf of some powerful nobleman. Wealthy patrons at Rome rewarded their faithful clients by bestowing on them parcels of land in the provinces, where they were attached as *coloni* to the soil. Again, the government settled bodies of prisoners or immigrants on large districts of public land, and made them serfs to the soil. These *coloni* were considered as free born, but attached to the estate. They could not marry, nor teach their children without the consent of their lord, tho they could become priests. They had a little cottage, a little land, pasturage, and fuel, and, according to Rogers, rent free. (See SERFS.) The estate could not be sold without them, nor they sold from the estate. They paid no taxes.

Serfdom

The laws of Constantine forbade the separation of near relatives among slaves of the soil. Slavery, however, still existed. Up to the twelfth century there was an absolute power of the master over the life of the slave. For these and for the serfs the Church did much; thirty-seven Church councils are reported to have passed acts favorable to slaves. In 305 A.D. any master ill treating his slave was condemned; in 517 the murderer of a slave was excommunicated; in 549 the right of asylum in a Christian church was offered to the runaway, and slaves freed by the Church were protected; in 585 the ornaments and property of the Church were permitted to be sold for ransoming slaves; in 566 Christians were forbidden to reduce freemen to slavery; in 922 no Christian was permitted to enslave a fellow Christian; in 656 any slave compelled to work on Sundays became free by the fact, or if he were held over the font for baptism. The decree of the Council of Chalons (650 A.D.), with forty-four bishops in session, ordered that no Christian slaves should be sold outside the kingdom of Clovis, with the words: "The highest piety and religion demand that Christians should be removed entirely from the bonds of servitude." One form of manumission was, "For fear of Almighty God and for the cure of my soul I liberate thee, and may the angel of our Lord Jesus Christ deem me worthy of a place among His saints." Another form was, "I, in the name of God, thinking of the love of God, or eternal retribution, . . . do free this slave from the bonds of servi-

tude." In the eleventh century the Emperor Conrad speaks of the sale of human beings as a thing nefarious and detestable to God and man (*Pertz.*, xi., 38). In the fourteenth century the Count of Valois, brother of Philip the Beautiful, freed the serfs of his *comté* with the words: "As the human creature who has been formed in the image of our Lord ought to be free by natural right, . . . let these men and women be free. . . ." In 1256 the city of Bologna freed all its serfs, paying an indemnity to their masters, closing the decree with these remarkable words: "The city of Bologna, which has always combated for liberty, remembering the past, and its eyes fixt on the future, in honor of our Savior Jesus Christ, hath ransomed all the serfs on its territory, and decreeth that it would not suffer there a man not free" (*Istoria di Bologna, Girarhacci*, quoted by Laurent Sugenheim and von Raümer, vol. iii., p. 168). In Germany, the "Sachsenspiegel," or Mirror, the code of the thirteenth century, is full of the traces of the influence of Christianity against slavery. The Lord is said to have "put rich and poor equally under His love." Slavery is declared to have its origin "from unjust captivity," and, quoting the Bible, the law affirms that man belongs to God alone, and "whoever holds him as slave, sins against the power of the Almighty."

Slavery

One of the first Christian kings of Norway, Knut the Holy, at the end of the eleventh century publicly proclaimed that slavery should be abolished. By 1214 it had almost ceased, and by the fourteenth century there are no traces of it. In Sweden, King Magnus Eriksen, 1335, made a similar proclamation. In England, as upon the Continent, slavery arose from many causes—birth, captivity, punishment, poverty. Thousands of Britons, in the first century after the Norman conquest, sold themselves into thraldom. Children were sold by their parents. Bristol was the great slave market, and there might be seen long trains of British youths and maidens—the latter often received for the sake of selling their offspring—all to be sold either to Ireland or to foreign countries. One authority says that from Ethelwolf to William I., for 230 years, a great part of the English peasantry became reduced to slavery. By the Doomsday Book (1068–71 A.D.), the number of male slaves in Sussex was 9,200, which would make the whole number about 50,000, while the freemen were only about 38,000. In the whole of England there seems to have been 25,000 slaves, 89,000 serfs, and 110,000 villeins. There is proof that slaves were branded and yoked as cattle.

Christianity strove against this evil. Bishop Wulfstan, of Worcester, about 1086, came yearly to Bristol and spent several months preaching against the slave trade. Edward the Confessor, 974 A.D., said of Christian brotherhood: "We have all one heavenly Father and one spiritual mother, which is called Ecclesia—that is, God's church—and therefore are we brothers." St. Aidan, of Northumbria, ransomed slaves. Bishop Wilfred, having received an estate with 250 Christian slaves, emancipated them. Laws were enacted in behalf of the slaves, but always on a Christian basis. Some of these we have seen. A female slave led into sin by her master, by that act became free. The Seven Years' Jubilee, taken from the Jewish system, did much to destroy slavery in England. Under William I. the law forbade the slave trade. A council in London (1102), called by Anselm, forbade absolutely the nefarious business of selling human beings like brute beasts. The chivalry of the Middle Ages owes much to Christianity. The initiation of the knight was essentially religious; his ideals were largely so. His first oath was often "to fortify and defend the Christian religion to the uttermost of my power." Similarly the crusades and much of the life of the first period of the military orders like the Knights Templars were largely influenced and formed by Christianity, and were undoubtedly for good. The effect of the monastic life upon equality is noticed under the article COMMUNISM. Christianity and the Church did far more for civil liberty than is usually recognized. It should not be forgotten that Stephen Langton, Archbishop of Canterbury, was the main instrumentality in forcing from King John the priceless Magna Charta. For the part played by John Ball and Wycliffe, "poor priests," see JOHN BALL. The social influences of Savonarola in Italy, who can estimate? The democracy of the Church certainly influenced the political movement.

Slavery in England

THE PERIOD OF THE REFORMATION

The first social effect of the Protestant Reformation, with its emphasis upon the right of private judgment, salvation by personal faith, the worth of the individual soul, was the outbreak of a struggle for social freedom. In this struggle Germany took the lead. (See PEASANTS' REVOLT.) Many associations among the peasants were formed. One is spoken of on the Upper Rhine, which had a banner with a picture of Christ crucified, before whom knelt a serf with the legend, "Nothing but God's justice." The Swabian peasants, in the insurrection of 1525, said: "It hath been the custom till now to hold us for serfs, which is a pity, seeing that Christ hath bought us and redeemed us with His blood;" and, "It is found in the Holy Writ that we are free, and we . . . desire to be free. . . . We would have God as our Lord, and know our brother in our neighbor." The fourth article claims on religious grounds the use of wild game and wood from the forests. In conclusion, say the peasants, "If any of these articles are opposed to Holy Writ, and this can be proven to us, we will give them up. The peace of Christ be with us all." The peasants on the Neckar claimed under the emperor an absolute equality for all men. "All worldly lords are to be reformed, so that the poor cannot be burdened by them beyond the rules of Christian freedom; the same law is to be for the highest and lowest." "All cities and parishes are to be reformed in divine and natural rights, after the principles of Christian freedom." (See also ANABAPTISTS; CHRISTIAN COMMUNISM, etc.) Such was the first social result of the Reformation. But it did not endure. The leaders of Protestantism soon became too much engaged in the discussion of doctrines to lay great stress upon social rights. Protestantism became "other worldliness." It is not to be denied that the preaching of the right of private judgment and the value of the individual had far-spreading social and political influence. John Fiske says of Calvin: "The spiritual father of Coligny, of William the Silent, and of Cromwell, must occupy a foremost rank among the champions of modern democracy." Liberty owes indeed a great debt to Protestantism, however much Protestants hung and burned and tortured those who did not believe with them according to the spirit of the times. Plymouth Rock is a truer outcome of Protestantism than the persecution of the Salem witches. In the words of Cromwell, "They that trusted God for the liberty of conscience could venture life for the liberty of country." Protestantism against Romanism meant to Protestants, very largely, liberty against absolutism. Nevertheless, Protestantism soon turned against the common people. Luther was against the German peasants. Others than Milton found that "new presbyter was but old priest writ large." Protestantism had stood for political liberty, but not for social reform. What Christianity did for social reform up to the Reformation was accomplished largely through the Church. Since then it has been mainly through individuals, in spite of the Church. The Reformation produced in the Church of Rome, it is true, somewhat of a counter reformation, yet the effect upon her, as upon the Protestant mind, was mainly doctrinal, and the Church, both Protestant and Roman, largely forgot to apply its Christianity. The opening of the new world, and especially of the gold mines of the New World produced a revival of greed and of mammon worship, and led to the horrors of a modern slave traffic, that has endured 400 years. The first considerable cargo of slaves seems to have been bought in 1444, under Prince Henry of Portugal, by a Portuguese captain from the coast of Guinea. Charles V. granted in 517 a monopoly to Governor de Bresa to import 4,000 negroes during eight years into the Spanish colonies, but in 1542 the monopoly covered 23,000 slaves. In 1700 a Spanish treaty with a Portuguese company of Guinea stipulated to furnish 10,000 *tons* of negroes. The treaty of Utrecht (1713) gave Great Britain a monopoly in the slave trade for thirty years, from 1713–43, and during this period the British Government agreed to import 144,000 negroes of both sexes into Spanish America at 33⅓ piasters per head. The British slave trade began under Queen Elizabeth. Certain statutes of William declared that "the trade was highly beneficial and advantageous to the kingdom, and to the plantations and colonies thereunto belonging." Between 1752 and 1762, it is estimated that 71,115 slaves were imported into Jamaica alone. During two centuries the Spanish Government concluded more than ten treaties "in the name of the most Holy Trinity," which authorized the sale of more than 500,000 human beings. The first ship which sailed from England in 1562, under Sir John Hawkins, to buy slaves in Africa and sell them in the West Indies, bore the name of *Jesus*. In 1807 Lord Eldon said in Parliament: "It [the slave trade] has been sanctioned by Parliament, wherein sat jurisconsults the most wise, theologians the most enlightened, statesmen the most eminent." Bancroft estimates that for one century previous to 1776, 3,250,000 negroes were torn from Africa by Great Britain alone, of whom 250,000 perished in the Atlantic from the horrors of the "middle passage," where they were chained between decks so low that they could not stand up, the living often chained to the dead. Helps estimates that from 1519–1807, between five and six millions of negroes were carried as slaves from Africa to America by various European powers. The American colonies protested against it, Oglethorpe, the great founder of Georgia, declaring that they prohibited it in that colony "because it is against the Gospel, as well as against the fundamental law of England." Within two years, however, the inhabitants petitioned for slaves. Protestantism and Romanism have thus the terrible stain to bear of the approval of slavery. Yet it should not be forgotten that it was mainly Christian thought that finally broke up the slave traffic and slavery itself. The Society of Friends or Quakers, both in England and America, was the first modern body of Christians to denounce and oppose slavery. As early as 1675 the devoted missionary, John Eliot, in Massachusetts, spoke against slavery, and in 1701 a petition against slavery was presented to the representatives of Boston. Among the Friends who opposed it in the eighteenth century should be mentioned Benezet and John Woolman. The

In Germany

Slavery

The Antislavery Movement

great divines Wesley and Whitefield preached against it. Dr. Hopkins, a Congregational clergyman of Rhode Island, distinguished himself by his efforts against it, till in 1774 Rhode Island gave up the traffic, and in 1784 abolished slavery. The Society of Friends was, however, the only religious body which as a whole forbade the holding of slaves. The early abolition societies all took religious ground. "Nearly all," says Wilson, the historian of the slave power (vol. i., p. 230), "who engaged in the formation of antislavery societies were members of Christian churches." In Great Britain the opposition to slavery came equally from Christian men, notably Baxter, Bishop Warburton, Paley, Wesley, Bishop Porteus, Whitefield, and others. The first petition to Parliament against the slave trade (in 1776) was based on the religious ground "that the slave trade is contrary to the laws of God and the rights of man." The slave trade was abolished in the British Empire, 1806–7. The United States had included their judgment on the slave trade in the Constitution, but adjourned the final abolition till 1807. In England antislavery sentiment rose till in 1833 England abolished slavery, paying £20,000,000 to the planters as indemnity. In the United States early Church conferences denounced slavery. The Presbyterian Synod in 1787 "recommended to all their people to use the most prudent measures, consistent with the interests and state of civil society in the countries where they live, to procure eventually the final abolition of slavery in America." In 1818 it pronounced slavery "utterly inconsistent with the law of God . . . and totally irreconcilable with the spirit and principles of Christ." Congregationalists and Unitarians went even further. The Methodist Episcopal Church in 1780 plainly condemned the system of human bondage. In 1800 the annual conference was directed to prepare an address favoring gradual emancipation. But the words were finally removed, and this was added, "Let all our preachers, from time to time, as occasion serves, admonish and exhort all slaves to render due respect and obedience to the commands and interests of their respective masters."

But the conflict was as irrepressible in the Methodist Church as it afterward proved to be in the nation. At the General Conference of 1844, which was held in the city of New York, the contention took an extremely angry form. It centered upon the personal relations of one of the bishops of the Church (Andrew), who had come into the possession of slaves by a marriage which was contracted after he entered the episcopate. It was his wish and intention to resign, but he was overruled by the Southern delegates. They finally called a convention of delegates from the Southern conferences, which met at Louisville, Ky., in 1845. This body took formal action, separating itself from the Northern churches. Many discerning minds regarded this action as prophetic of the same results in the organic life of the nation.

The Irrepressible Conflict

But it was true nevertheless that from 1830 to 1850 the churches as a whole were subservient to the slave power. Dr. Albert Barnes said, "There is no power out of the Church that could sustain slavery an hour if it were not sustained in it." Judge Birney called "the American churches the bulwarks of American slavery." Yet there were individual churches and not a few clergymen that battled for abolition. The clergyman Lovejoy was killed for advocating abolition. Garrison and Phillips were strong in Christian sentiment. At one meeting in Illinois more than thirty clergymen attended and opposed the introduction of slavery into that state. During the struggle in 1823, which prevented Illinois from becoming a slave state, the clergymen were almost as one man against slavery. But whatever the position of the churches, it is not too much to say that Christianity put down slavery.

For the other social effects of modern Christianity, see CHURCH AND SOCIAL REFORM; but Christianity, if not the Church, has had at least its part to play in the gradual emancipation of woman, in the condemnation of war, the favoring of arbitration, in the care of the wounded in war, the condemnation of dueling, in prison reform, in the creation of hospitals and charities of every kind, and in temperance reform.

II.—Christian Sociology

The first note of Christianity in relation to society is that it is world-wide and international. It knows "neither Greek nor Jew, circumcision nor uncircumcision, barbarian, Scythian, bond nor free, but Christ all and in all." It taught Peter to call no man common or unclean, "that God is no respecter of persons, but that in every nation he that feareth Him and worketh righteousness is accepted with Him" (Acts x. 34). It led Paul, once a Pharisee of the Pharisees, to write to the Ephesians, "Now, therefore, ye are no more strangers and foreigners, but fellow-citizens with the saints, and of the household of God" (Eph. ii. 19). It taught the Christian Church the unity of the faith—"One Lord, one faith, one baptism, one God and Father of all, who is above all and through all, and in you all" (Eph. iv. 5, 6). One Lord Jesus Christ, "of whom the whole family in heaven and earth is named" (Eph. iii. 15). Hence Christians of every age, however they have explained it, have believed in "the holy Catholic Church," "the communion (literally the communism, κοινωνία) of the saints," the unity of believers, the kingdom of God. Thus Christianity, at least till the Protestant Reformation, in Catholic countries, and even under Protestant denominationalism, in a deeper-lying unity, has ever stood for the unity of man in Christ. Says Bishop Barry:

World-wide

"The Catholic [not Roman] Church is a universal society, which knows no distinction of age and physical circumstance, no distinction of peoples, nations, and languages. It is no castle in the air, no mere promise of a future heaven. It is a living reality now, obviously the one, ever-growing international society; already realizing by its Bible read and its Christian worship offered in some 200 languages, the sign of Pentecost, and always advancing toward its future heritage of the world of humanity. This great unity . . . underlies all special, local, temporary characteristics; its communion is a communion of saints; its one universal tie is the indwelling of the Spirit of God; . . . its means and pledges of unity are the sacraments of communion with Him" ("Lectures on Christianity and Socialism," p. 13). Canon Fremantle's "Bampton Lectures" (1883) bring out still more plainly the unity of the Church "as a moral and social power, present, universal, capable of transforming the whole life of mankind, and destined to accomplish this purpose." The Church he calls "the social state in which the spirit of Christ reigns, embracing the general life and society of men, and identifying itself with these as much as possible, as having for its object to imbue all human relations with the spirit of Christ's self-renouncing love, and thus to change the world into a kingdom of God."

This makes the field of Christianity the world, and identifies with the coming of God's kingdom *any* advance in unity and in love. Says Canon Fremantle: "All goodness is essentially one, and therefore essentially Christian." The coming of love in all human relations is thus the coming of God's kingdom. Canon Fremantle therefore calls the Jewish Church a training in national righteousness. The early Christian Church he considers the beginnings of the universal society. The imperial and medieval Church a united Christendom attempted. The medieval theory of Christendom he thus states: "Christendom forms one great whole, in which there are two chief functionaries, the Pope and the Emperor, each in a different way its head. Each power is instituted by God. The one is to rule over man bodily, the other over his spiritual interests. Both spring from the old Roman Empire, which, having become Christian, was at once empire and Church. The two powers must support each other, both mutually necessary. The emperor sanctions the pope's election, the pope crowns the emperor; the emperor protects the pope and the clergy and the spiritual courts, and these in return support the authority of the emperor over his subjects. This theory," says Canon Fremantle, "tho it did not wholly correspond to the facts, had much in it, considered as an ideal, which was sound." It explains much of the crusades, is the key to Dante's "De Monarchia," gives rise to both a Frederick Barbarossa and a Hildebrand. It gave to the world an Alfred the Great, a St. Louis, a Savonarola. The Reformation was largely a reaction toward individualism, but still it was full of efforts toward a Christianized society; and in England especially toward a Christian nationalism.

Its Field all Life

Christianity to-day is drawing together the lines of Chris-

tendom. Canon Fremantle sees its unity and universality in (1) public worship, not as a separate cult, but as seeking to raise the tone of the general life; (2) the family, the social unit; (3) knowledge, the education of all; (4) art, which must be national and popular, to gladden, not individuals, but mankind; (5) society, which must acknowledge its stewardship; (6) trade, which must learn cooperation; (7) the nation, the constitutional and organic form of the Christian spirit; (8) the universal Church or universal State, to be attained through arbitration, international law, international congresses, and federation. Into all these channels the spirit of Christianity is more and more being poured. This is Christianity leading to international socialism.

But, more definitely, what does Christianity teach as to social reform?

First, that humanity is to come into a unity of brotherly love, *not* by building up some new scheme of universal brotherhood, but by the recognition that mankind *is* to-day a unit in the common Fatherhood of God, and may through Christ enter into united life. It denies that society can be "made anew by arrangements"; it believes that it is to be regenerated "by finding the law and ground of its order and harmony the only secret of its existence in God" (Maurice). This is the first social message of Christianity—"Return to God." Carlyle saw the need when he wrote, "The beginning and the end of what is the matter with us in these days is that we have forgotten God." Mazzini saw it when he wrote to the working men of the world, "The source of your duties is in God," and contended that agitation conducted in the name of the rights of man had brought in up to the present day simply an increase of selfishness and individual competition. When we accept God, we have the basis and possibility of union. "There can be no brotherhood without a common father," wrote Maurice. "From that time began Jesus Christ to preach and to say, Repent, for the kingdom of heaven is at hand." To return to God is the first step in Christian sociology.

The Brotherhood of Man

Second, Christianity declares that to do this Christ is *the Way*. "I am the Way, the Truth, and the Life; no man cometh unto the Father, but by me." This is the second sociologic position of Christianity, that Christ is the elder brother, the Way, the leader into brotherhood. This, as we have already seen, Christ came to be —the fulfiller of the law. He is the King made manifest, the King in man, the King on earth, the head of the body. The way to realize human brotherhood and unity is not alone to discuss Christ's divinity, but to accept His mastership, to become His follower, to join His kingdom. This is to be a Christian. Men realize this in personal salvation; but it is equally to be realized in social salvation. For Christians, He is "the Man," and He must be the solution of all human problems. That is the primal creed. Not only is He, as the "Man of Sorrows," the Brother and Comforter of all who are weary and heavy-laden; not only are the poor His peculiar charge and treasure, but more than that: He is Himself, in His risen and ascended royalty, the sum of all human endeavor, the interpretation of all human history, the goal of all human growth, the bond of all human brotherhood.

Christ the Way

Third, it is a *spiritual* way. "Ye must be born again" is true of society as well as of individuals: the third point in Christian sociology. A nation's life must be from the spiritual to the material, from the inner to the outer, till all be spiritual. Not by law material but by law spiritual does God's kingdom come. This does not mean that we are only to build up God's kingdom by spiritualizing individuals alone. It was not Christ's method (see article CHRIST AND SOCIAL REFORM). We must spiritualize all life—the body, the city, the State, the nation. This is the distinctive function of the Church. The national Church should be the *soul* of the nation, into which and through which God's *Spirit* may come to the nation.

A Spiritual Way

Fourth, if Christian sociology consists in society's obeying, through spiritual life, the social law of Christ, we must know that law. It is simple.

The Social Law

"Then one of them, which was a lawyer, asked Him a question, tempting Him, and saying,

"Master, which is the great commandment in the law?

"Jesus said unto him, Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind.

"This is the first and great commandment.

"And the second is like unto it, Thou shalt love thy neighbor as thyself.

"On these two commandments hang all the law and the prophets" (Matt. xxii. 34–40).

Says Professor Ely: "This is a most remarkable, and at the same time a most daring summary of the whole duty of man. A human teacher would never have ventured to reduce all God's commandments to two simple statements; nor would such a teacher have presumed to exalt man's obligation to love and serve his fellows to an equal plane with his obligations to love his Creator. All false systems of religion exalt the love of God above the love due our fellow men, and tell us that we may serve God by injuring our fellows. How many millions of human beings have thought that they did God service by human sacrifice!

"The second commandment, which is like the first, means that in every act and thought and purpose, in our laws and in their administration, in all public as well as private affairs, we —if indeed we profess to be Christians—should seek to confer true benefits upon our fellow men. It means that the man who professes to love God and who attempts to deceive others in regard to the real value of railway stock, or, for that matter, any other property, that he may coax their money into his pockets, is a hypocrite and a liar. It means that the man who oppresses the hireling in his wages is no Christian, but a pagan, whatever may be his declarations to the contrary notwithstanding. What does God say of such an one? He says: 'I will be a swift witness against those that oppress the hireling in his wages.' What does His second commandment mean for those rich men who keep back the hire of their laborers? It means that they 'must' weep and howl 'for the miseries that shall come upon them.' And what does this message mean for monopolists who use their superior advantages of wealth or intellect or bodily strength or other resources, to crowd out and grind down their fellows according to the methods of modern commercial competition? The prophet Isaiah shall tell us: 'Woe unto them that join house to house, that lay field to field, till there be no place, that they may be placed alone in the midst of the earth.'

"It is needless to enlarge upon this. It must be seen that the arrangements of this world are not in accord with the commandment given to love our neighbors as ourselves."

Fifth, the interpretation of this is the *Cross*. The Cross cannot be removed from Christian sociology. There can be no obeying Christ without sacrifice. *Via crucis, via lucis*. "If any man will come after me, let him deny himself and take up his cross and follow me." This is the fifth point in Christian sociology. It is the only way to fulfil love. *Love* is the *leaving* of self, the *living* in others. Love and life and sacrifice are one. It is thus indeed that we most truly gain. But if we love and deny ourselves *for the sake of gain*, we do not love. "Whosoever shall seek to save his life shall lose it." Christian sociology is finding one's true individuality in losing it in the life of all. Therefore, luxurious

The Cross

bishops and priests and ministers cannot teach Christian sociology, for their lives give the lie to their words. We must become poor, if we would make the many rich.

Sixth, we come to more detailed questions. They can only be answered by those who have long passed the merely sentimental assertion that Christ is all in all, and have set themselves to the solid task of discovering what that solemn truth really and precisely means, and have worked it down into the concrete facts, and have surveyed and estimated the full need of the circumstances and striven to make clear to themselves what is the first step, and what the second, and the third, if that great royalty of Christ is, in very deed, ever to be made good here on earth, amid men as they are, and after a history such as they have hitherto had.

(*a*) Christianity must demand in some form the opening of all the earth, including all natural advantages, to all God's children equally. *How* may be a question of political and economic method (see LAND), but in some form it must be accomplished. Equity, brotherhood, and the declaration of Christ demand it. That private *property* in land was forbidden, and every Jew entitled to the *use* of land by the Jewish theocracy, is indisputable; that Christ came to fulfil the law and the prophets can no more be denied. That we must follow their *method* is not certain, but that in some way Christianity must bring to the world what Judaism required of the Jew can be denied by no Christian.

(*b*) Christianity demands that love and not competition be the law of trade. The golden rule must be made the rule for gold. "Competition," said Maurice, "is put forth as the law of the universe. This is a lie. The time is come to declare it is a lie by word and deed." This means that *in some form* Christianity implies SOCIALISM. Said Laveleye: "Every Christian who understands and earnestly accepts the teachings of his Master is at heart a Socialist; and any Christian who opposes what is commonly known as Christian Socialism misunderstands Christ, or Socialism, or both." The inference is not, of course, that Christianity must be committed to State Socialism, but society to be Christian must in all ways conform to the law of cooperation.

(*c*) Christianity demands that every man able to work should work. Not otherwise can he follow the Carpenter of Nazareth. "If any man would not work, neither should he eat" is the injunction of well-nigh the oldest Christian epistle.

The Law of Labor

(*d*) It follows from this and from the whole spirit of Christianity that we are not to live upon the work of others by usury. (For the detail of this argument, see USURY.)

(*e*) Christianity demands the enthronement of the family, in the abiding unity in love of one man and one woman. "And I say unto you, whosoever shall put away his wife, except it be for fornication, and shall marry another, committeth adultery; and whoso marrieth her which is put away, doth commit adultery." These words of Christ, with all they imply, are fundamental to Christian sociology (see FAMILY).

(*f*) Lastly, Christian sociology demands that the Christian go into the details of all political, social, and industrial life of every kind, and bring them into subjection to Christ. Only so shall we be His disciples. "Not every one that saith unto me, Lord, Lord, shall enter into the kingdom, but he that doeth the will of my Father, which is in heaven."

Christ's spoken ordinances do not go into all these details. Christianity is not a system of ordinances. But it is a life, and into these details the Christian life must go. (For different views, see CHRIST AND SOCIAL REFORM.)

CHURCH ARMY: This is a mission of the Church of England, originated in the year 1882, for the benefit of the working classes. It is governed by a committee within the Church, some of the bishops being members thereof. The membership approaches almost a thousand, consisting of workers of both sexes. It extends throughout the kingdom, having also branches in the United States and in other English-speaking lands. The mission is divided into two departments, one of which, the evangelical, chooses suitable persons and trains them, free of expense to themselves, to become teachers and speakers in Christian doctrine and mission nurses. The other department, the social branch, seeks to help the downfallen, the outcast, the homeless, by labor and by every other means possible. The Army possesses nearly 120 houses for the lodging of the working people in London, as well as in the provinces. There are test farms at Essex, Hempstead, Newdigate, and Surrey. They also assist in the matter of emigration. There are also homes for boys and for girls; for first offenders and for persons addicted to intoxication. There is also an Aid Society for convicts. The Society for the Houseless Poor, which was established in 1819, is now under the charge of the Army. Over 400,000 men, women, and boys were cared for by the mission in the year 1905, some 60 per cent having turned out well. *Chief Secretary*, Prebendary Carlile. *Address*: 55 Bryanston Street, London, W., England.

CHURCH ASSOCIATION FOR THE ADVANCEMENT OF THE INTERESTS OF LABOR, THE: This society, commonly known as "C. A. I. L.," was founded in 1887, in New York City, by communicants of the Protestant Episcopal Church. The Rt. Rev. F. D. Huntington, Bishop of central New York, was elected president. It was felt that the Church should take active measures to show her sympathy with the laboring classes in their struggle for justice, and C. A. I. L. grew out of a desire to carry this sympathy into effect. Its principles are as follows:

The Church Association for the Advancement of the Interests of Labor, believing that the clergy and laity of the Church should become personally interested in the social questions now being agitated, should inform themselves of the nature of the issues presented, and should be prepared to act as the necessities of the day may demand, sets forth the following principles and methods of work for its members:

(1) It is of the essence of the teachings of Jesus Christ that God is the Father of all men, and that all men are brothers.

(2) God is the sole possessor of the earth and its fulness; man is but the steward of God's bounties.

(3) Labor being the exercise of body, mind, and spirit in the broadening and elevating of human life, it is the duty of every man to labor diligently,

(4) Labor, as thus defined, should be the standard of social worth.

(5) When the divinely intended opportunity to labor is given to all men, one great cause of the present widespread suffering and destitution will be removed.

More than sixty bishops of the Church are honorary vice-presidents. Communicants of the Church are eligible for membership, and others willing to work with the society may become associate members. The society has an official Organ, *Hammer and Pen*, the only Church labor paper in the United States. The association has standing committees on promotion of peace, organized labor, investigation of strikes, sweat-shops, and tenement houses, looking to the reform of abuses. In connection with the ACTORS' CHURCH ALLIANCE it also takes an active interest in looking after the relations between the Church and the Stage. The association was one of the pioneer societies to introduce arbitration of industrial disputes in the United States; and it has been particularly active against the evils of the sweat-shop system, notably in New York City. President, Rt. Rev. Henry C. Potter, D.D.; secretary and organizer, Miss Harriette A. Keyser, Church Mission House, 281 Fourth Avenue, New York City.

CHURCH AND SOCIAL REFORM: The influence of Christianity on social reform has been discussed in its alphabetical place. It seems necessary, however, to consider the relations of the Church to social reform in an article by itself; first, because very many make a sharp distinction between Christianity and the Church, and, secondly, because all are agreed upon the immense power wielded by the Church, be it for evil or for good, in the advancement or retardation of social reform. The subject is considered under the following heads: (1) The apostolic Church; (2) The primitive Church after Apostolic days; (3) the medieval Church; (4) from the Reformation to the present time; (5) the modern Church; (6) what the Church could do.

I.—The Apostolic Church

The Church is here considered as commencing with the apostles and their followers in the upper chamber at Jerusalem. (For the beginnings of the Church in the Hebrew theocracy, and the relations of that theocracy to social reform, see JUDAISM; for the teachings of Christ in regard to society, see CHRIST AND SOCIAL REFORM.) That the Church, as organized in Jerusalem, had vital relation to social life needs no reiteration. (See COMMUNISM.) The indisputable record is that the members had "all things in common," and that to each was given "according as any man had need." It may, however, be necessary to point out that this was not an accident or mere passing incident in the history of the apostolic Church, born of the enthusiasm of its first love, but rather the necessary and logical result of the very character and nature of the Church. The first Christians of Jerusalem were drawn from among the Jews or from among the proselytes to the Jewish faith, the "strangers within the gates." They were therefore familiar with the social teachings and requirements of the Jewish law and the Jewish scriptures. Any one who knows what these were—their care for the afflicted, the opprest, the fatherless and the widow, their minute directions as to the organization of social life, their provisions for securing land *in perpetuo* to every individual for *use*, while in ownership it was held as belonging to God, their prohibition of usury and oppression in every form, and, *above all*, the recognition of all this as binding because it was *the law of God*, to be taught, upheld, and enforced by the institutes and officers of the national religion—any one, we say, who at all realizes this cannot wonder that the first act of the first Christian Church was to apply its pentecostal love to the conduct and the ordering of property and of the social life. Jesus Christ had enforced this spirit. He had taught both by word and deed that He had come as a King, with authority over all life, social as well as spiritual. He had fed the hungry, healed the sick, raised the dead. He had entered Jerusalem as a King. He had in every word taught of the kingdom of heaven as the great summation of His life and as near at hand, on earth as truly as in heaven. (See CHRIST AND SOCIAL REFORM.)

The Church of the Upper Chamber

Yet it must be also noted that this so-called communism of the Church of Jerusalem was not one of law and of requirement. Love was the fulfilling of the law. The incident of Ananias and Sapphira (Acts v. 1–11) shows that there was no *requirement* to renounce private property in land or houses. Until the disciples had given property to the Church, their property remained their own. It was only out of their *love* that "as many as were possessors of lands or houses sold them and brought the prices of the things that were sold and laid them down at the apostles' feet, and distribution was made unto every man, according as he had need."

Nor are we to think of it as peculiar to the Church at Jerusalem. While it is true that we do not know so much of the communism of any other Church, and while but little has come down to us in any way of the life of other Christian churches of the first century, the indications nevertheless are strongly against the communism of the Jerusalem Church being exceptional. All that we know points to its *not* being exceptional. In the Book of the Acts and in the Epistles there are abundant references to the life of love as carried on in these other churches. We have Dorcas, or Tabitha, at Joppa (Acts ix. 36) "full of good works." Paul writes to the Corinthians (2 Cor. ix. 7) about giving to the poor. He praises the Christians of Macedonia (2 Cor. viii. 2) for giving almost beyond their power. He orders the churches both at Galatia and Corinth (1 Cor. xvi. 2) to lay by a store for charity "on the first day of the week," as each person was prospered. St. James declares that "pure religion and undefiled before our God and Father is this: to visit the fatherless and widows in affliction, and to keep himself unspotted from the world." We read of the churches at Troas (Acts xx. 6) and at Corinth holding *agapæ* or love-feasts, where they came together to break bread. Jude 12 indicates that this was a common custom in all the churches. 1 Tim. v. 10 indicates the duty of the widow (or deaconess) to wash the saints' feet, entertain strangers, bring up children, relieve the afflicted. Hospitality is continually urged. The slave is to be treated as "a brother beloved" (Philemon 16). If it be said that the fact that St. Paul took up a collection for the poor saints at Jerusalem is indicative of a peculiar condition in that Church, and

Primitive Christianity

that their communism and giving up of private property had brought them into special poverty, it may be said, on the other hand, that the Church at Jerusalem was under notorious and excessive persecution, as during the first century the churches throughout the rest of the Roman Empire were not. It appears (cf. Heinrici, "The Christian Church of Corinth" and the "Religious Communities of the Greeks" in the *Zeitschrift für wissenschaftliche Theologie*, 1876, iv.; Uhlhorn's "Christian Charity in the Ancient Church," and the whole of C. Osborn Ward's "The Ancient Lowly"), that as soon as the Church emerges into recognized form, its legal position in the Roman Empire was as a *collegium*, very much resembling the *collegia tenuiorum*, or sodalities of the poor, organized to collect contributions for the poor or for special ends, such as burial, etc. For a full account of these, see GILDS; but we must here note the similarity between these and the early churches in their social life.

Tertullian uses the same words, *steps* and *arca*, for the contribution and contribution chest of the Church as were technically employed in the *collegia* for their collections. These *collegia* had their presiding officers, or *magistri*, their meeting places, more or less humble, according to their wealth. They had regular meeting times and dues for various purposes, mainly of benefit, but sometimes for carousals. They had banquets or meals together. Some of them had considerable wealth, lands, houses, etc., being donated to them by wealthy members or patrons. On appointed days there were *sportula*, or distributions of bread, wine, or money among the members. Members were called brothers and sisters, and their presiding officers fathers and mothers (for there were women among them as truly as men). It is evident how close these were in resemblance to the social organization of the Church at Jerusalem, with its contributions, its officers, its gifts of houses and land, its common meals, its organized distribution "in the daily ministration" to the widows and those in need. Now if these *collegia*, so exactly in this respect like the Church in Jerusalem, existed through all the empire, as seems proven, and that legally all the churches were regarded as *collegia*, and used the very technical terms of the *collegia*, does it not indicate almost beyond a doubt that the picture given in the acts of the Church at Jerusalem is a picture of every Church in the apostolic days? The Church, even in apostolic days, was by no means immaculate; it was *being* saved, not wholly sanctified; but its very essence and its inmost spirit was a life of brotherhood and of practical love upon this earth.

II.—The Primitive Church after Apostolic Days

We come here into fuller light, and may treat the subject in detail, dividing it into parts, considering, first, the spirit of *equality* and of *brotherhood* that prevailed in the primitive Church.

Spirit of Equality

The Roman Empire was full of poverty and distress. Slavery was universal. Uhlhorn estimates that at Rome under Augustus there were 580,000 proletarians needing support to 90,000 senators, knights, soldiers, and traders not needing support, and this does not include the slaves, who constituted the mass of the population. (See CITIES.) At Athens at one time, according to some historians, there were 400,000 slaves to 31,000 citizens; according to others 200,000 to 100,000. In Italy, according to Blair, there were under Claudius nearly 30,000,000 slaves to 7,000,000 freemen; and tho these figures may be too high, the slave population was, according to all, in an immense majority. This, of course, meant widespread suffering beneath a corrupt aristocracy of enormous wealth.

The working class lived, and little more. Mommsen reckons the Roman bushel of wheat at 1 denarius, and this was the usual day's wage. Meat was proportionally dear. Diocletian fixt the price of beef and mutton at about thirty cents the kilogram, and a fowl at the same price. A modest dwelling in the upper stories of one of the large lodging-houses at Rome came to about $80 a year. On the other hand, the wealth of the few was enormous. The augur, Cnæus Lentulus, and Narcissus, Nero's freedman, were said to own $22,000,000. *Latifundia* were growing. Cæcilius, a freedman of Augustus, left in his will, Pliny tells us, 4,116 slaves. It is true that this does not indicate either such wealth on the part of the rich, or such poverty on the part of the laborer as we have to-day; but the worst of the slave condition under the Roman Empire was the lack of civil or moral standing: the slave could be sold, killed, violated, thrown to the fish at pleasure with impunity. Such was the society in which the Christian Church took root. In CHRISTIANITY AND SOCIAL REFORM we have traced the influence of Christianity upon the laws and organized society, and have shown how it gradually overthrew slavery. Here we are simply concerned with what the *Church* did directly as a church. The Church spread at first, it is evident, mainly among the slaves and the opprest. Hence it was powerless directly to affect the legislation of proud emperors and senators, but it did welcome the slave to its fold as an equal and it did practise brotherhood among men. It taught that, being descended from one Father, all men were equal. "We are all born alike, both emperors and beggars," said an early Christian writer (*Brevarium in Psalt.*, in opp. Hieron., vol. ii., p. 233). "Thou sayest that thy father is consul and thy mother holy and good," says Chrysostom; "What does it matter to me? Show me thy own life, for it is only by that I can be able to judge of thy nobility" (Or. *in terræ motum et Lazarum*, § 6, vol. i., p. 782). Man is "the great work of God" (Ambrose, *Sermo* 10, in Ps. cxviii.). "The world is a vast republic, a great family of God's children," writes Tertullian (*Apol.* xxxviii.). The *whole* of Christianity the early Church found in charity rather than in hope or faith (*Zeno Veron*, Book I., tract 2, p. 111). Chrysostom put it above fasts or solitary penances. Love, gentleness, almsgiving, are greater, according to him, than celibacy (*Hom.* I., in Matt., § 7). "Love on earth must be without thought of earthly profit or heavenly recompense" (Orig., *Contra Cels.*, I., 67, vol. i., p. 382). Gregory Nazianzen says: "Rich and poor, strong and weak, servant and freeman, have one only Head, from whom everything comes, Christ Jesus. What the members of the body are for each other, each among us is for his brothers, and all for each" (Greg. Naz., *Or.* 16, vol. i., p. 243). Of this unity the *agapæ*, or love-feasts, were symbols. "Here they brought the poor and the needy" (*Constit. Apost.*, II., 28, p. 243). The Church Augustine calls "a spiritual republic in the midst of a pagan society" (*De opere Monach*, chap. xv., vol. vi., p. 363).

Spirit of Brotherhood

At first the Christian Church did not favor monasticism. Their communism was not like that of the Essenes. "Christians," says one, "are not distinguished from other nations either by language, dress, or habits. They do not shut themselves up in particular towns, but live where they were born, in the midst of Greeks or barbarians. They are different from pagans in conduct, and their life is altogether distinct" (*Ep. ad. Diogn.*, chap. iii., p. 237). They honored the magistrates and prayed for them, and for the emperor, who was their earthly head, as Jesus Christ was head in the kingdom of God (Polyc. *Ep.*, chap. xii., p. 191; Just., M., I. c.; Athenag., *Leg.*, chap. xxxvii., p. 313). The Christians obeyed all laws save those which compromised their faith, such as giving divine honors to the emperors, bowing before idols, swearing by their genii. Here they were inflexible. The aged Polycarp, summoned by the proconsul to swear by the genius of Cæsar, refused to do so, but was willing to obey in all else. Ambrose reckons it among the duties of an ecclesiastic to take an interest in the opprest and suffering. "Your office will shine gloriously," he writes, "if the oppression of widows and orphans attempted by the powerful should be hindered by the servants of the Church; if you show that the commandment of the Lord is more to you than the favor of the rich" (*De Offic.*, II., 22). Athanasius excommunicated the viceroy of Lydia, notorious for his cruelty and excesses, and Basil declared that the Church agreed with him (*Bas. Ep.*, 16). Synesius of Ptolemais excluded from the Church the Prefect Andronicus for the same reason (*Synesii Epp.*, 57, 58, 72). When the inhabitants of Antioch were trembling before the wrath of the emperor, because they had overthrown his statues, Bishop Flavian went to Constantinople to intercede, while Chrysostom preached his famous "statue sermons," and when prosecutions began, a monk, seizing the bridles of the horses drawing the carriage in which the judges were riding, cried: "Tell the emperor you are not only an emperor, but a man, and those you reign over are your fellowmen. Human nature was made in the image of God; do not then so mercilessly and cruelly destroy the image of God." The story of Ambrose himself expelling Theodosius the Great from both Church and sacrament till he did public penance, for having allowed his soldiers a massacre at Thessalonica, is well known. The Church became the sanctuary of the opprest. When a debtor, sued for 17 solidi (about $150), fled to the Church, Augustine paid the debt. He who violated the right of sanctuary was excommunicated.

Relation to the State

Next to the spirit of the equality and brotherhood and protection to the opprest, we notice what the primitive Church did for the *family* and for *woman*. Under Rome woman was either the slave, the toy, or the property of man. The Church recognized her equality.

"I do not know anything more unjust," said Augustine of the Roman laws which kept women in an inferior position (*De Civit. Dei.*, iii., chap. xxi., vol. vii., p. 63); and all the Fathers

teach the equality of man and woman (Clem. Alex., *Pædag.*, I., 4, vol. i., p. 103; Greg. Naz., *Or.* 31, vol. i., p. 502; Greg. Nys., *Or.* 1, in *Verba Fac. Hom.*, vol. i., p. 151).

The Church and Woman

Marriage was regarded in its spiritual aspect as for eternity an association of souls rather than of bodies (Athenag., *Leg.*, chap. xxxiii., p. 311). It was a type of the union of Christ with His Church (Chrysost., *Hom.*, 12 in col., § 5, vol. xi., p. 419). Some of the Fathers, such as Ambrose and Augustine, began to exalt celibacy and virginity above marriage, but in the beginning it was not so; and was never so with all the Fathers. With Chrysostom a true man and wife joined in sacred union show a holier life than the inhabitants of many a monastery (*Hom., I., in Rom.* xvi. 3, vol. iii., p. 175). In marriage, the woman, according to the Fathers, was wedded to the husband as the Church to its Head. Chrysostom says: "Woman can neither carry arms nor vote in the assemblies nor manage the commune, but she can weave thread, give better advice than her husband about domestic matters, rule and keep order in her household, superintend the servants, and bring up the children. Each sex has its special vocation. God has not given all to one. He has wisely divided it" (Chrysost., *Quales Ducendæ sint Uxores*, vol. iii., p. 127). "Nothing," he says further, "can better mold man than a pious and wise woman" (Chrysost. l. c.; *Sermo*, 4, *in Gen.*, § 1, vol. iv., p. 659). Mixed marriages between pagans and Christians were frowned upon. Second marriages were discouraged. Tertullian said that "he who marries again commits a decent kind of adultery" (Athenag., *Leg.*, 33, p. 311). Montanists absolutely forbade second marriages, but after the time of Augustine it was a heresy to condemn second marriages. Adultery was the only admitted cause of divorce, and then separation was usually recommended. Purity was required of both sexes equally. "The laws of the Cæsars are different from the laws of Christ," says Jerome. "With us, on the contrary, what is not permitted for women is also forbidden for men" (*Ep.* 77, Ann. 399, vol. i., p. 459). Nevertheless, condemning strictly their vice, the Church welcomed the Magdalenes, and many of them became noble martyrs. Pelagia, a celebrated courtezan of Antioch, was converted and retired to a convent, where she spent the rest of her life in humble piety. Afra died for her Savior in Augsburg, together with three servants who, having followed her in vice, followed also in conversion. Similarly high was the position of the Church in regard to *children*. At a time when abortion and exposure were frequent, the Fathers declared that to cause a child to perish by abortion is to destroy the work of God. God is the father of all life, however incomplete it be. Those guilty of it were excluded from the Church for ten years (*Const. Apost.*, vii., 3, p. 366). Exposure was still more condemned. The Church welcomed the children. "If old sinners," says Cyprian, "are received in the Christian community, with how much greater reason shall the new-born child be received, who has not yet committed sin?" (*Ep.* 59, p. 99). This was true even of natural children. They were still under God's paternal care, and to be welcomed by the Church (Methodius, *Conviv.* x. *Virginum, Or.* 2, in *Combelis*). According to Chrysostom, what has upset the whole world is that man has not cared more for his own children (*Hom. de Viduis*, vol. iii., p. 317). Chrysostom and Jerome especially urge upon mothers to rightly influence the children. Thus we have in the early Church Monica, the mother of Augustine; Nonna, the mother of Gregory of Nazianzus; Anthusa, the mother of Chrysostom. The first schools that may be called primary were kept in the fourth century by Christian priests (Palladius, *Vita Chrys.*; in *Opp.*, vol. xiii., p. 77). Basil during his rule made their keeping an especial duty (*Regula Fusius. Tract., interrog.*, 15 *et* 23, vol. ii., p. 355).

The next thing to be considered is the relation of the primitive Church to *the laboring classes*. These, according to all classic antiquity, were despised. Artizans, according to Aristotle, were not worthy of the name of citizens (*O.*, chap. ii., 1). Almost all manual and most mental work was done by slaves. By Christians work was honored. They neither felt themselves to be miserable nor disgraced because they had to work with their hands (*Ep. ad. Zenam et Serenum*, chap. xvii., in *Opp. Just. Mart.*, p. 416). They remembered Christ the carpenter and Paul the tent-maker. The "Apostolic Constitutions" forbid a man to mix with the idle crowd, and advise him to engage in useful work, having his soul turned toward God (Book I., chap. iv.). The necessity of teaching youthful arts to children was dwelt upon (*Constit. Apost.*, Book IV., chap. xi., p. 301). They taught that if a man did not work, "neither should he eat."

The Church and the Working Classes

The relation of the Church to *slavery* has been much discust. The primitive Church, while not immediately seeking to overthrow slavery, undermined it. Before the Reformation slavery had *wholly* disappeared from Christian lands, and *long before that* it had *almost* disappeared. The Church, started among the poor, and, despised by the powerful, had not the power to abolish the institution in any legal way. But while the Church long allowed slavery, it did much to alleviate it, and welcomed the slave as an equal; only in later years did the Church ever practise slavery.

"No one is a slave by nature," say Clement of Alexandria and Basil (Clem. Alex., *Pædag.*, III., chap. xii., vol. i., p. 207; Basil, *De Spir.*, s., I., chap. xxi., vol. iii., p. 42). Chrysostom says that God, who created the two first beings free and equal, never created slaves to serve them (*Hom. 22 in Eph.*, § 2, vol. xi., p. 167). Some of the Fathers held that slavery was punishment, but they held so of all work, and yet that work was honorable. "I call noble and lord," says Chrysostom, "the slave who is covered with chains, if it accords with his life; I call him low and ignoble who in the midst of dignities retains an enslaved soul" (Or. in *Terræ Motum et Laz.*, § 7, vol. i., p. 782). In the Church slavery was only an accidental external condition which did not affect the moral worth. Again and again the Church taught that Christianity was *service*. Christians called themselves, like St. Paul, servants or bond-servants (δουλοι) of Christ. Ignatius wrote of the slaves: "Let them continue to serve without murmuring, and God will give them a better than earthly liberty" (*Ad. Polyc.*, chap. iv., p. 41). Slaves were recommended to bear servitude in the passing world of exile, where none is free, and beyond which the Christian expects deliverance and glory (August., *De Agone Christiana*, chap. vii., vol. vi., p. 181). In 451, the Council of Chalcedon forbade the convents to receive slaves without the consent of their masters, "in order that the name of God be not dishonored" (Canon IV.). Many slaves bore noble testimony to their master Christ, such as Potamiæna, Eutyches, Victorinus, Maro, Nereus, Vitalis, and others. But while bidding the slave be patient, the Church spoke plainly to the master. Said Chrysostom: "Do not imagine that an injury to a slave will be regarded as indifferent, because it is only to a slave. The laws of the world see a difference between the two races; but the laws of the commonwealth of God ignore it" (Chrysost. *Hom. 22, in Eph.*, § 2, vol. xi., p. 167).

We observe the difference between the recognition of slavery by the primitive Church and its recognition too frequently by the Church in modern times. The primitive Church recognized it as a *human* institution, to which they were to submit. The modern Church too often tried to prove slavery a *divine* institution. Masters were told by the primitive Church to love their slaves as sons and as equals (*Constit. Apost.*, Book IV., chap. xii., p. 302). The Church refused to receive the gifts of the master who ill treated his slaves (*Constit. Apost.*, Book IV., chap. vi., p. 197). In the early Church there were households where master and servants formed one family.

When Thecla was cited to appear before the tribunal fifty of her slaves, urged by gratitude, appeared in her favor (*Acta ss.*, January, vol i., p. 601). Paula, a descendant of Paulus, Æmilius, Leo, and Fabiola are spoken of as the servants rather than the mistresses of their women. But the Fathers went farther than to counsel gentleness. They urged masters to free their slaves. Gregory Nazianzen and Chrysostom are prominent in such exhortations, and many masters did the same. The earliest instance that has come down to us is that of Hermes, Prefect of Rome under Trajan, who embraced Christianity with his wife, children, and 1,250 slaves, whom he freed on the day of their baptism, Easter Day, with ample assistance to enable them to gain a livelihood. He himself afterward suffered martyrdom with Bishop Alexander, who had been the means of his conversion. Another prefect of Rome, Chromatius, under Diocletian, freed his 1,400 slaves, saying that those who had God for their father ought not to be the servants of man. Melania, with the consent of her husband, Pinius, freed 8,000 slaves; Ovonius, a French martyr, 5,000.

The Church especially did her utmost to end the horrors of the *gladiatorial* combats and the

degradation of the *theatrical* exhibitions. The Church refused baptism to gladiators unless they gave up their profession. Lactantius said: "Instead of buying and feeding wild beasts, ransom prisoners and feed the poor; instead of bringing together men to kill each other, go and bury the innocent dead" (*Div. Instit.*, Book VI., chap. xii., vol. i., p. 470). From the theaters, at this time grossly immoral, Christians were warned to absent themselves. Those who, in spite of warnings, still attended, were declared unworthy of Christian communion.

Gladiatorial Combats

Christians were urged to find their exhibitions in nature. "What theater," says one writer, "constructed by the hand of man can equal these wonders of creation" (*Tract. de Spect.*, in *Opp. Cypr.*, p. 312)! Actors who became Christians and had no other means of earning a livelihood, such as Euchratius, were provided for by the Church through the efforts of Cyprian.

We come now to consider the relation of the primitive Church to the *poor*, and its property relations in general. This may be said to be a more or less faithful carrying out of the voluntary communal life of Jerusalem. There seems to be no evidence that there was anywhere established by the primitive Church a mechanical communism. Voluntary communism seems to have been the ideal to which they always tended, tho sometimes very vaguely and remotely. The emphasis was on love. "It is not the census," said Ambrose, "but the qualities of the soul, that show the rich man" (*Ep.*, chap. lxiii., § 89, vol. ii., p. 1044). Barnabas, in warmly commending charity, argues that "we ought not to consider anything as belonging to ourselves alone, but to share everything with our neighbor; for if there is communion in spiritual and everlasting things, with how much greater right ought it to exist in these material things" (chap. xix., p. 52). Ambrose of Milan wrote, "Nature created everything for common use. If, then, there are men who are excluded from the enjoyment of the products of the earth, it is contrary to nature. The unequal division of this wealth is the result of egoism and violence. Nature is the mother of common right, usurpation is the mother of private right" (*De Off. Ministr.*, Book I., chap. xxviii., § 132, vol. ii., p. 35).

The early Church opposed riches as hindering salvation, but Augustine, Ambrose, Jerome, and others teach that riches are not to be condemned in themselves. "Neither is every poor man a saint, . . . nor is every rich man condemned," wrote one (Asterius, *De Divite et Lazaro*, p. 13). "The hand of the Christian," said the same writer, Asterius, "ought only to be held out to give alms, never to seize what does not belong to him" (*Hom. de Œconomo, Iniquio*, p. 23). The giving of charity the primitive Church exalted. "It is better to do the works of charity than to ornament churches, or to enrich them with precious vases" (Hieron., *Ep.* 130, vol. i., p. 991). The priests were to lead in this, especially the bishops. The "Apostolic Constitutions" lay down their duties in these words: "To orphans take the place of a father; to widows give the protection that they would have from their husbands; help young people who desire to marry with your counsels; find work for the artizans; have pity on the infirm; receive strangers beneath your roof; give food and drink to those who are hungry and thirsty and clothes to the naked; visit the sick and help the prisoners" (Book IV., 2, p. 295). Charity was to cause sacrifice. We read of the early Christians fasting that they might give to the poor (*Constit. Apost.*, V. xx., p. 331). Deaconesses were appointed to aid poor women. Under Bishop Cornelius, toward the close of the third century, the Church of Rome supported more than 1,500 poor people. The Church of Antioch, in the time of Chrysostom, maintained more than 3,000. The Church of Rome, under Bishop Sotir, in the second half of the second century, and 100 years later, under Bishop Stephen, sent money collected in distant provinces, sometimes to help famished populations, sometimes to lighten the burdens of the persecuted. Prelates sold the vases and ornaments of their churches to aid the poor. This was done by Cyril, by Acacius, Bishop of Amida, who sold 420 vases and sent back to freedom 7,000 imprisoned Persians, and by Deogratias, of Carthage. Augustine and Ambrose did it to ransom captives. Paulinus, of Nola and Hilary of Arles sold their large estates for the poor. Martin of Tours sacrificed his sacerdotal robes. The Bishop of Escupère, of Toulouse, went hungry and used only basket and glass for the bread and wine of the Eucharist, in order to help the poor. When the martyr Lawrence was asked by the pagan governor for the treasures of the Church, he showed him the poor. Peter, the tax-gatherer, in the time of Justinian, on being converted expiated his harshness by selling himself to a slave merchant for the benefit of the poor. Clement of Rome writes to the Church in Corinth: "We have among us many who have given themselves to servitude in order that others might be free." It is told of Bishop Eleusis of Cyzicus, that he took the pagan temples and made them into hospitals for the old and widowed. The first orphan houses are of this period, and were cared for by priests. Special collections were made for prisoners. The poor denied themselves a day's food to give to these. The funds of the Church were used to ransom brothers sentenced to public works or the arena. The Church was the asylum. Even Alaric, on taking Rome, is reported to have spared those who took refuge in the churches. The innocent went to the bishops for redress. In the midst of universal anarchy, the bishops raised their voices in behalf of outraged humanity. It was one of their special duties to save defenseless men from the hands of powerful oppressors, and to intercede with the emperors and magistrates in their behalf; to undertake long journeys and brave all wrath, provided the cause of those in whom they were interested was just. Most frequently we find bishops giving assistance to country people, who suffered from the rapacity of the fiscal agents, the avarice of the usurers, the oppression of great proprietors. For the sick, the primitive Church did much, even for the lepers. Basil advises that lepers be not deserted, but be loved the more for the miseries of their desolation. During the plague of Carthage, about 250 A.D., and during that of Alexandria, the Christians showed great bravery and love. The earliest hospitals are due to the Church, the first being established in the beginning of the fourth century. From the latter half of this century they multiplied greatly. The most important of these was founded by Basil in Cæsarea. It rose, says Gregory Nazianzen, like a new town, providing lodgings for travelers, rooms for invalids, workshops for the poor, provision for lepers. It bore the name of Basilias. Chrysostom founded several hospitals. By the time of Theodosius most of the large towns had hospitals. The hermit Thalassius founded one for the blind.

Ransoming Captives

The early Church was especially remarkable for its sacrifices in behalf of its *enemies*. Tertullian could truly say that "if all men loved their friends, the Christians alone knew how to love their enemies" (*Ad. Scap.*, i., p. 69). The Fathers, too, with their profound respect for human life, unanimously condemned capital punishment. The Council of Elvira (A.D. 305) excludes the magistrates whose duties as decemvirs caused them to judge cases involving capital punishment from joining in worship during the year. The emphasis the early Church put upon *hospitality* is well known, as is also its universal opposition to *war*.

It is well to notice the organization of the Church for practical charities. At first there was little or none.

"We give to all and communicate to every one who is in need," says Justin (*Apolog.*, i., 14). The shepherd of Hermas says: "Give simply to all, without asking doubtfully to whom thou givest, but give to all" (*Pastor Hermæ. Mand.*, II.). Clement of Alexandria warns against trying to judge who is deserving and who undeserving (*Quis divis salvus.*, chap. xiii.). Concerning the giving up of property, Hermas says to Christians: "You are dwelling here in a foreign city. Would any one dwelling in a foreign city provide himself with fields and expensive accommodations?" (*Similet*, I.) The Church was in the world, but not of it. "We are no Brahmans nor Indian gymnosophists; no wild men of the woods and separatists from life. We are mindful of the gratitude which we owe to the Lord our God, and do not despise the enjoyment of His works," wrote Tertullian (*Apolog.*, 42). But the Fathers everywhere counseled simplicity of life. "On the road to heaven," says Clement, "the best provision is frugality, moderation is the shoe, and beneficence the staff." (*Pædagog.*, III., 7). Clement pities the insatiable who collect their dainties from all parts of the world, with whom "the basting ladles and the kitchen form the central point of existence" (*Pædagog.*, I., 1). In an old catalog of the apostles,

Charities

Peter, Andrew, and the sons of Zebedee are fishermen; Philip an ass driver; Bartholomew, a vegetable gardener; James, the son of Alphæus, a mason. Later, when the Church became corrupt, men like Chrysostom vehemently attacked the luxury of the day. Said Chrysostom of the luxuriously dressed woman: "Of how many poor, O woman, dost thou bear upon thine arms the spoils!" Yet, even when the Church was at her simplest, there were some organizations for charity. Deacons, deaconesses, and widows, who were considered officers in the Church, had special charge of the charities, but always under the direct guidance of the bishops. Alms were collected and distributed largely at the *agapæ*, which were first suppers in common for all Church members, later suppers for the poor, and finally occasions of drunkenness and excesses. Montanism tried to react from these excesses and any compromise with the world by strict discipline and by limiting church-membership to the select few, but this was to make the Church separatist and sectarian and sacrifice her power as a Church for the world. It taught the Church to distinguish between the "religious" and the "secular," sending the "religious" into monasticism and asceticism, and the "secular" into worldliness.

As a result of this alliance with the State, the Church, still more developing her worldliness, gradually came to palliate, allow, and endorse, and even own slaves (so that even so pure a spirit as Gregory the Great makes no apology for having a fugitive slave brought back "by any means" from Otranto, tho he was also torn from wife and children, to serve as a baker in Rome). Thus the Church gradually became full of all such worldliness as called forth the burning protests of Chrysostom. On the other hand, we have the development of MONASTICISM, for the social results of which see the article on that subject. Still through all the earlier centuries the Church was not only the friend but the leader of social reform. If she did not abolish slavery or advocate all the social reforms that are suggested to-day, it was because they were not proposed. She was at least on the side of the most radical reform there was, or, rather, the mother and the life of all reform. On the whole, well could Tertullian point to the life and love of the Church, which to the jealous hatred of its enemies was a reproach. "See how they love one another," mocked these enemies; "as if they were ready to die, the one for the other." "Yes," says Tertullian, "we love one another; we are brothers, for we have a common Father, and the same Spirit has led us from darkness to light. We are also your brothers, because, altho you are our persecutors, you are men like us. We support one another; we have everything in common except our wives; each one freely brings his offering to relieve the poor, the sick, orphans, widows, travelers, and prisoners. We are not incapable of the business of life, for do we not live with you, sharing your habits and necessities? We do not retire into forests; we do not flee from life; we use everything with thanksgiving; we sail with you; we mix with you in the forum, in camp, in commerce; we refrain only from your spectacles, sacrifices, disorders, and crimes" (*Apologeticus*, about 198 A.D.).

III.—The Medieval Church

In this section we shall not enter so much into details, because these are given in other articles: that on the CANON LAW, which belongs almost exclusively to the medieval Church, and the general article on CHRISTIANITY AND SOCIAL REFORM, Christian influence, in the Middle Ages at least, being admittedly almost identical with *Church* influence. Yet a few general characterizations may here be made, and one or two points elucidated.

We notice, first, that the medieval Church was the great leveler; the clerical order was the one profession in which it was possible for a man of the humblest birth to attain to the highest position. This was less by virtue of enactment than in consequence of the facts (*a*) that the Church remained free from the distinctions of classes that grew up in the civil state, and (*b*) that churchmen, as the rule of celibacy became universal in Latin Christendom, could be raised to any rank without founding a family of nobles. Many a peasant heard of the learned Grostête, son of a serf, the most distinguished scholar of thirteenth-century Oxford, the Oxford which existed long before a college was founded—the friend of the reforming friars, the enemy of the Roman court, the advocate of England for the English; and was eager, out of his scanty means, to buy the license that his son might go to the schools and take orders. The possibility of rising was, it is true, not confined to churchmen; but that which was the exception among the laity was common among the clergy. Nor was it till centuries later that it became the accepted doctrine that an ordained person was *ipso facto* a free man; and if in the fifth century it could be conceived that a man might be a clergyman and yet a slave, this idea early gave way before another, which presumed that if a slave were ordained with the knowledge of his lord, and without any objection raised by him, he was a free man, tho not formally manumitted. For the effect of the medieval Church upon slavery, see CHRISTIANITY AND SOCIAL REFORM. It must not be forgotten that before the time of the Reformation slavery, and, in some countries like England, even serfdom, had disappeared from Christendom. The medieval Church had put it down.

We notice next as characteristic of the medieval Church its monasteries, nunneries, and Church brotherhoods of various kinds, not only as centers of Christian equality, but as asylums for the oppressed and as centers of brotherhood life and work. Says Thorold Rogers upon this point:

Monasteries

"The relief of destitution was the fundamental religious duty of medieval Christianity, I might have said of Christianity itself. In ancient polities it might be the duty of the State to relieve distress; it was always its prudence, if it cared for security. To get abundant supplies of food for the poorer citizens in one way or the other was the constant anxiety of democratic Athens and of imperial Rome. But from the very first Christianity transferred this duty from the State to the individual, and to the voluntary corporation. The early Church undoubtedly preached patience, but it much more emphatically inculcated the duty of almsgiving. The contribution of the tithe was enforced in order that a third part, at least, of the proceeds should go to the relief of the deserving poor. In the fifteenth century nothing moves the righteous wrath of Gascoigne more than the teaching of Pecock to the effect that ecclesiastical revenues enjoyed by churchmen can be disposed of according to the discretion of the recipient as freely as the proceeds of private property. After heresy, simony, and sorcery, the heaviest charge which could be leveled against a churchman was that of avarice, and a covetous priest who hoarded his revenues was lucky if the charge of avarice was not coupled with those graver vices to which I have referred. We may be certain, too, that the duty which was so generally imposed on them by public opinion—the force of which is not yet extinct—was inculcated by them on others. In times of plenty, too, food was often given with wages. A wealthy monastery or college would find a place at its servants' table for the artizans which it employed without much grudging, and the poor at the gate would not be sent away empty-handed. Where mendicancy was no disgrace, almsgiving was like to be considered the most necessary and the most ordinary of the virtues.

"It has been often said and often denied that the monasteries supplied the want which the poor law, two generations after the dissolution of these bodies, enforced. That the monasteries were renowned for their almsgiving is certain. The duty of aiding the needy was universal. Themselves the creatures of charity, they could not deny to others that on which they subsisted. But some orders were under special

duties. The Hospitalers were bound to relieve casual destitution. Hence when Waynflete procured the surrender of the house of the Oxford Hospitalers, he bound his college to the duties which the surrendered house had performed, duties which, it is almost superfluous to say, were speedily evaded. So again the preaching and begging friars were the nurses of the sick, especially those who labored under infectious diseases. There were houses where doles of bread and beer were given to all wayfarers, houses where the sick were tended, clothed, and fed, particularly the lepers. There were nunneries, where the nuns were nurses and midwives; and even now the ruins of these houses contain living record of the ancient practises of their inmates in the rare medicinal herbs which are still found within their precincts. In the universal destruction of these establishments, the hardest instruments of Henry's purposes interceded for the retention of some among the most meritorious, useful, and unblemished of them. It is possible that these institutions created the mendicancy which they relieved, but it cannot be doubted that they assisted much which needed their help ('Work and Wages,' p. 416).

"What an enormous part in the polity of the Middle Ages was played by these monasteries is well known. The estates of the monasteries are said over and over again to have comprised a third of the knights' fees in England. Most of these religious houses were founded before the close of the thirteenth century, many of them in the early ages of the Saxon polity. Only a few were founded in later times. Besides these monastic estates, the bishops and the chapters held large possessions.

"Many of the English towns grew up round monasteries. The piety of the converted Saxons led them to spend lavishly in the foundation of these institutions, and the principal part of the documents which have been preserved from a period antecedent to the Conquest refer to these early monasteries. Thus the town of Oxford grew up under the shadow of the great monasteries of St. Frideswide and Osney. Such was the origin of Abingdon, of Reading, of St. Albans, of Coventry, of Durham."

That these centers of religious life were centers also of humble brotherly work is well known. Says Palgrave's "Dictionary of Political Economy":

"The lands held by a religious house, at least those in its immediate vicinity, were, as a rule, cultivated by the brotherhood itself, and the personal interest thus devoted to the work produced better results than the enforced labor of bondmen. The evidence of the Domesday survey goes to show that the Church lands were in a higher state of cultivation than other property. The monks also employed themselves in clearing forests, draining marshes, and making roads and bridges (cf. Lingard, i., 267 *seq.*; Cunningham, 'Growth of English Industry and Commerce in the Early and Middle Ages,' pp. 64, *seq.* 1890); and the Cistercian order, through the activity which it displayed in sheep farming, promoted in a singular degree the production of the staple commodity of England. Through the immense extent of their property, variously estimated in the thirteenth and fourteenth centuries from a quarter to a half of the total landed property of England (Wycliffe, *de Eccl.*, xv., p. 338; cf. Pearson, 'History of England,' ii., 497, 1867), the churches and religious houses came to take an important share in the industrial development of the country; and it is acknowledged that the clergy were mild landlords (see Stubbs, 'Constitutional History,' iii., 562). The attacks of the Lollards upon the landed property of the Church were inspired rather by *a priori* objections to the system itself than by any actual abuses to which it led; and the consideration which Bishop Pecock, writing in the middle of the fifteenth century, alleged on the opposite side are probably in the main just. 'The treuthe is,' he says, 'that the tenementis and alle the possessiouns with her purtenauncis, which the clergie (religiose or not religiose) holden and hauen, is better meintened and susteyned and reparid and kept fro falling into nouzt and into wildirness, than if tho same tenementis and possessiouns with her purtenauncis weren in the hondis of grete lordis, or of knyztis, or of squyeris. . . . The tenauntis, occupying tho tenementis and possessiouns with purtenauncis vndir the clergie, ben esilier tretid, lasse disesid, and not greeued bi extorcioun, as thei schoulden be, if thei helden the same tenementis and possessiouns of temporal lordis or of knyztis and squyers.' Among other points in favor of those who held of the Church, Pecock notices that their tenure was less liable to be disturbed than that of those who held under lay lords ('Repressor of Overmuch Blaming of the Clergy,' vol. ii., p. 370 *seq.*, ed. Babington, 1860). It has been noticed by critics least friendly to the medieval Church that it was such causes—the known advantage to the tenant—that did much to reconcile public opinion to the enormous estates held by the Church (Pearson, 'History of England,' vol. ii., p. 502; Rogers, vol. i., p. 160). That at the close of the Middle Ages the state of things was somewhat altered, and the abuses which had arisen with respect to the management of Church property called forth well-founded complaints (cf. 'Dyaloge betwene a Gentillman and a Husbandman,' 1530, ed. Arber, 1871, p. 134 *seq.*; 'Ballads from Manuscripts,' ed. Furnivall, 1869, vol. i.), need not be denied."

But it was not only manual work that was performed by the monks and clergy. Says Rogers:

The Clergy of the Middle Ages

"The clergy, in the widest sense of the term, contained nearly the whole of what we should call the professional classes. The architects, the physicians, the lawyers, the scribes, the teachers, of the Middle Ages, were almost always clergymen, and when employed in these callings were rewarded for their services with benefices. We know but few of the men who designed the great cathedrals, churches, and castles of the Middle Ages—those buildings which are the wonder of our age for their vastness, their exquisite proportions, and their equally exquisite detail. But when we do know, as it were by accident, who the builder was, he is almost always a clergyman. It seems as tho skill in architecture and intimate acquaintance with all which was necessary not only for the design of the structure, but for good workmanship and endurance, were so common an accomplishment, that no one was at the pains to proclaim his own reputation or to record the reputation of another. It is known that we owe the design of Rochester Castle and the Tower to one ecclesiastic. It is recorded that William of Wykeham was Edward III.'s architect at Windsor, as well as his own at Winchester and Oxford, and of various handsome churches which were built during his long episcopate. It is probable that Waynflete designed the beautiful buildings at Magdalen College; and it is alleged that Wolsey, in his youth, planned the matchless tower, which has charmed every spectator for nearly four centuries. But no one knows who designed and carried out a thousand of those poems in stone which were the glory of the Middle Ages, and have been made the subjects of servile and stupid imitations in our own.

"The monks were the men of letters in the Middle Ages, the historians, the jurists, the philosophers, the physicians, the students of nature. It is owing to their labors that we know anything of our annals, of the events by which the political history of England is interpreted. They were often frivolous, frequently credulous, but they collected the facts to the best of their ability. It is true that the material which they put into shape is far less in quantity than those voluminous archives are which are preserved in our national collection. But these, tho of great collateral value, would have but little constructive importance in the absence of the chronicles which the monks compiled. This is abundantly illustrated by the history of the fifteenth century and part of the sixteenth. . . .

"I am convinced that schools were attached to every monastery, and that the extraordinary number of foundation schools established just after the Reformation of 1547 was not a new zeal for a new learning, but the fresh and very inadequate supply of that which had been so suddenly and disastrously extinguished. ('Work and Wages,' p. 162.)

"And it must be remembered that they were not monks of the lower ranks who did manual and literary work, but ecclesiastics of the highest rank. We find such men as Hilary of Arles, one of the leading prelates in the French Church, working in the field. Becket, the Archbishop of Canterbury, when he visited a monastery in harvest did not hesitate to labor in the fields. St. Dunstan is reported to have been an excellent blacksmith."

For what the medieval Church did to put down feuds, to bring in "the peace of God," etc., see CHRISTIANITY AND SOCIAL REFORM. We notice here the influence of the Church upon the State. The political influence of the medieval Church was enormously great. Undoubtedly much of it was due to ambition for temporal power, especially with the Roman see and wherever her spirit went; but equally undoubtedly, apart from all question of ambition, the medieval Church often used her enormous power, and especially did many of her leading prelates use their commanding influence, to protect the rights of the common people against the aggression both of the barons and of the king. We can cite only a few examples, but they are strewn on every page of medieval history. In England, Stephen Langton, Archbishop of Canterbury, was the leader and the prime mover in wresting from King Richard the Magna Charta, which has now become the birthright of every Englishman and American. In France, the life of Bernard of Clairvaux is filled with records of masterly and effectual resistance against the

wrongs and violence of the barons. In Italy, the political influence of Savonarola, the Dominican monk, can hardly be overestimated, and these are shining illustrations of what was done in a humbler way and on a lesser scale by thousands of brave medieval churchmen. The influence of Wycliffe's poor priests, and above all of John BALL, must not be forgotten. Says Thorold Rogers:

The Poor Priests

> The poor priests alone could traverse the country by right, and, without suspicion, advise their followers. They were precisely the persons who could organize resistance among the serfs, could win and keep their confidence, and could be trusted with their subscriptions, their plans, and their communications. Wycliffe's poor priests had honeycombed the minds of the upland folk with what may be called religious socialism. By Wycliffe's labors the Bible men had been introduced to the new world of the Old Testament, to the history of the human race, to the primeval garden and the young world, where the first parents of all mankind lived by simple toil, and were the ancestors of the proud noble and knight, as well as of the down-trodden serf and despised burgher. They read of the brave times when there was no king in Israel, when every man did that which was right in his own eyes, and sat under his own vine and his own fig-tree, none daring to make him afraid. They read how God, through His prophet, had warned Israel of the evils which would come to them when a king should rule over them, and how speedily this was verified in the conduct of the young Rehoboam, with his depraved and foolish counselors, of how woe had been predicted to the people over whom a child should rule. The God of Israel had bade His people be husbandmen, and not mounted knights and men-at-arms. But, most of all, the preacher would dwell on his own prototype, on the man of God, the wise prophet who denounced kings and princes and high priests, and, by God's commission, made them like a potter's vessel in the day of His wrath, or on those bold judges who were zealous even to slaying. For with this book, so old, yet so new, the peasant preacher—we are told that many learned to read when they were old that they might tell the Bible story—could stir up the souls of these clowns with the true narrative of another people, and would be sure that his way to their hearts and their confidence would be, as it always has been with the leaders of a religious revival, by entirely sympathizing with their wrongs, their sufferings, and their hopes. And when they told them that the lords had determined to drag them back to their old serfdom, the preacher could discourse to them of the natural equality of man, of the fact that all, kings, lords, and priests, live by the fruits of the earth and the labor of the husbandman, and that it would be better for them to die with arms in their hands than to be thrust back, without an effort on their part, into the shameful slavery from which they had been delivered. And as their eyes kindled, and they grasped their staves, he could tell them to keep their ears open for the news of their deliverance, that on the password being given, they were at once to hie to the appointed place, where a great work could be done for God's people by His appointed servant ("Work and Wages," p. 254). It is true that the correctness of this view has been questioned, but that it is largely true is perhaps fixt. Green says that in the preaching of John Ball, "the mad priest of Kent," England "first listened to the knell of feudalism and the declaration of the rights of man." For an account of somewhat similar movements on the Continent, see BRETHREN OF THE COMMON LIFE; COMMUNISM; MIDDLE AGES, etc. But already in noticing these movements that were reformatory of the Church, as well as of society, we are in the dark days when Rome, led by her earthly ambition and desire for temporal power, had forgotten the life of the spirit; and, first, the papacy itself had grown utterly and scandalously corrupt, and was completely dominated by worldly policy, and then gradually the poison spread from the head to feet and members, till the whole medieval Church, save for reforming movements like those led by Wycliffe, Huss, and Savonarola, became dead in trespasses and sins—the higher clergy profligate mammon servers, the lower clergy profligate servers of the senses; the monasteries (tho not always even then) too commonly centers of vice, the nunneries homes of license for the monks. But on this we need not dwell, tho it must be remembered in obtaining a true picture of the effect of the medieval Church upon social reform; yet there is little danger in Protestant lands of its being forgotten. We are more apt to forget that the poison of corruption came from the worldliness of Rome, and that for long centuries, even after Rome was herself corrupt, the Catholic Church (in England especially, never wholly subject to Rome) was the great purifying, liberating, civilizing, Christianizing factor of medieval life. For the close relation between many of the medieval trade gilds and the Church, see GILDS. Almost all gilds had their patron saint and their church, where they went for solemn worship, and whose clergy took an active interest in their life, religion and business being continually interblended in medieval life.

IV.—From the Reformation to the Present Time

With the Reformation, or at least soon after, when the principles of the Reformation had become well established in reformed countries, we have a great change in the history of the Church and social reform. That Protestantism, by reaching the *individual*, has along certain lines done much for social reform, no thoughtful man can deny. But the Protestant Churches as a whole accomplished but little. Rome, too, since the Reformation has, until recently, done even less. The Reformation, in its appeal to personal faith, to the right of private judgment, to the letter of the Scriptures, had largely the effect, *both on Roman and Protestant churches*, of exalting belief, creeds, dogma, and discussion above life. It divided Protestantism into so many sects, each discussing and battling to sustain its own peculiar belief and separate church machinery, as to cause the reform of the social life to be until recently almost forgotten. This, too, has been intensified by two other elements in Protestant faith. First, its exaltation of what it calls "the spiritual life," largely meaning by this a life that finds its chief interest in the life hereafter, leading to what has been well called "*other worldliness*"; and secondly, the tendency to *individualism*. This combination of tendencies in Protestant thought has at times almost wholly divorced Church life from the life of this world; and it is therefore no wonder that in the history of the Church and social reform we have after the Reformation nearly a blank. There are, however, exceptions to be noted. First, the early Protestants—for example, the Anabaptists of Germany—referring directly to the New Testament, learned there of its communism, and not a few attempts were made to reproduce it. It has led to a long series of Protestant attempts at communism (see COMMUNISM), some of them very successful—for example, the SHAKERS. But, in the first place, these attempts were made by sects, and therefore were so limited by narrow and peculiar doctrinal requirements as to very materially reduce their influence; while secondly, they were based on the belief that Christians must go out from the world and be *separate*, rather than on the Catholic doctrine that the whole world is God's, and the duty of Christians is to remain *in* the world, tho not of it, and to bring it wholly into subjection to its King. The second exception to the divorce between the Protestant churches and the social life was in the attempt of many of the first Protestant leaders, such as Calvin, Cromwell, and the Pilgrim Fathers in America, to set up a theocracy on earth, with their particular church organization as the interpreter of the Divine will. These efforts have passed into history, and are now as much marked by their complete failure and their renunciation by all Protestant sects as they were once marked by intense faith in their efficacy. The attempts belong to the first years of Protestantism, when its principles were held in the glow of enthusiasm, fanned by persecution and martyrdom. Protestantism, as soon as it reached its logical outcome, conceived this world for the most part to be "a dreary wilderness," from which the individual is saved by the efficacy of his personal faith in the atoning blood of Christ; Christianity to be the salvation of the individual soul, and the Church to

Social Uprisings of the Reformation

The Puritan Theocracy

be but the coming together of the individuals who are being saved. While later Protestant thought in Unitarianism and even in orthodox circles has given up much of this soteriology, still the divorce of the Church from practical social matters has until recently remained. The individualism of Protestantism is admitted by friend and declared by foe. As applied to economics, it has its good and its bad effect. Undoubtedly it has produced a period through which both the world and the Church had to pass. Economics and religious individualism are largely identical. Says Palgrave's "Dictionary of Political Economy":

Guizot[EN] Seebohm, K. Marx, and É. de Laveleye declare alike that the "history of capital and the supremacy of private interest," i. e., commerce in its modern aspect, commenced contemporaneously with the period of the Reformation, accompanied, as that movement was, by many discoveries and inventions, and the recovered sense of personal freedom and responsibility. In "Protestantism and Catholicism in their Bearing upon the Liberty and Prosperity of Nations," by Emile de Laveleye (1875), the progress of economic enterprise is attributed to the superior education and enlightenment fostered by Protestantism. De Tocqueville ascribes to the Puritan discipline of the first settlers the same result in the commercial expansion of the United States. From Luther to Protestant divines of the present day the moral force of the dignity of labor and the duty of cheerful exertion in the subduing the earth by economic effort have been held up to admiration, and have given an impulse to the economic life of Protestant countries. The "Wealth of Nations," which appeared in 1775–76, marks a revolution of thought as truly as in the world of industry. "The machine is somewhat in the nature of Protestantism," says Dean Uhlhorn in his brochure on "Katholicismus und Protestantismus gegenüber der socialen Frage" (1887). Private property is encouraged by Protestantism. Luther, in his "Sermon on Usury" (1579), speaks of three grades "of dealing well and worthily with temporal goods." The highest is to allow ourselves to be despoiled of it without offering opposition; the lowest is to take neither profit nor interest, tho he sees objections to this ideal being realized. While Erasmus complained of the "rage of ownership," Protestantism endeavored to make a compromise, maintaining the ideal in theory and encouraging what Fr. A. Lange calls a "moderate egoism" or "ethical materialism," in practise (see "Geschichte des Materialismus," i., 254, 294. Cf. J. E. Thorold Rogers on "The Economic Interpretation of History," 1888, p. 83). Liberation of industry follows logically from that of liberty of thought, developing the five points of industrial independence—freedom of labor, free trade in land, free movement of capital, freedom of industrial enterprise, and a free market regulated by demand and supply; it further implies the removal of all governmental and trade restrictions—in a word, *laissez-faire*. Individualism in religion and industry go together.

Protestantism Individualistic

It is not therefore strange that slavery, suppress in Europe by the medieval Church, reappeared in the slave trade after the Reformation, practised by both Protestant and Roman peoples. It is not strange that all the evils which are laid at the door of individualism and competition should be largely condoned, sometimes defended, and at least allowed and not seldom practised by individualistic and competing churches. Individual Protestants like Wilberforce and Howard and Chalmers and Shaftesbury and Garrison (for at least in Garrison's early reform days he was a believer in the Church), and Gough and a long list of noble Protestants may have done much for social reform, and no one can challenge the effect upon the daily moral life of Protestantism among the Scotch Covenanters, the English and American Puritans, or the more ordinary life of many a parish in Scotland or town in New England (such as Northampton, Mass., under Edwards, when nearly the entire population were in church every Sabbath, and 600 out of a population of 1,100 were members of the Church); yet the point is only too well sustained that the Protestant churches as organizations have had little to do with social reforms.

V.—The Modern Church

With the modern Church we reach a new era. The Church of to-day can by no means be fairly accused of doing nothing for humanity. Those who accuse it, as many do in unsparing terms, of being separated from the masses and not battling for social reform, mean that it does not battle for certain ideas of reform. For charity and in certain lines of reform the Church, in all its history, never accomplished more than to-day. If charity (in the modern sense) be the fulfilling of the law, no one acquainted with the facts can condemn the Church. And this should not be forgotten even by those who do not believe that such charity is the fulfilling of the law. Those who would put justice before charity must themselves be just enough to give the Church credit for what she is doing. The real state of the case seems to be not that the Church is inactive, for she is immensely active, but that she is not active along the lines most needed in the opinion of most progressive thinkers. We shall therefore point out here the lines upon which the modern Church is active, and in the next section point out the position she might take.

Activity of the Church

We cannot here enter into details concerning separate churches and church organizations. For these, see Baptist, Church of England, Congregationalist, Methodist, Presbyterian, Protestant Episcopal, Roman Catholic, Unitarian, and Universalist Churches in their relation to social reform. We consider here only those activities which hold more or less true of all churches.

The first of these is the marked activity of the churches in sustaining our great charitable institutions. Especially in our larger cities, like New York, our great hospitals, for example, are almost solely due to the churches. Many of our best educational institutions, too, are the direct offspring of our churches. (See Charity Organization Societies; Hospitals; Education, etc.) The immense activity of the Church in these respects can hardly be realized, save by a detailed study, and if one adds to this the enormous benefactions given, the sums contributed, and the charities and institutions founded by individual members of the Church, and largely as the result of the constant, quiet teaching and inculcation of Christian pulpits, the influence of the Church for the social uplift of humanity can scarcely be exaggerated.

Secondly, in spite of severe criticism from those who believe that our churches, or at least church-members, are guilty in supporting political parties wedded to the saloon interest, it cannot be denied that in other ways at least our churches are exerting a vast influence for *temperance* (see Temperance; Prohibition; Women's Christian Temperance Union; Church Temperance Society, etc.)

Thirdly, the churches are exerting a growing social influence through the development of numerous so-called "institutional churches," where charities and classes and clubs and benefit societies of the most various kinds are developed and maintained, and largely on the lines of social reform. These will be noticed in more detail in the articles on the several churches. We here refer only to such churches and institutions as the East Side House of St. Bartholomew's Church, New York City; the work at St. George's, in the same city; at Berkeley Temple, Boston; the People's Palace, Jersey City; the Temple College, connected with Grace Church, Philadelphia; the Church of the Paulist Fathers, in New York City; in London, the Oxford House, Mansfield House, Newman House, and numberless others in all the important cities and towns of Europe and America. For Germany and France, see article Christian Socialism.

Fourthly, many general movements for social reform, like the social work of the Salvation Army, the immensely important educational work of the Chautauqua movement, of the University Extension, the battle for Social Purity, the Social Settlement Idea—these and a hundred others are, first, the indirect result of Church teaching and, secondly, very largely supported by Church people, and not seldom directly in connection with the Church.

Fifthly, the main influence of the modern Church on social reform we have yet to notice in its deep, vital influence through the development of individual character. That the *whole* present influence of the Church upon character is good many may doubt; that the total effect of its influence is good a few radicals may question; but that the Church helps to develop purity, kindness, filial and marital love, general honesty, patriotism, temperance, the sacredness of life, the supremacy of duty, and that these are immensely important social forces, no man can deny. It is frequently said that the main work of the Church is not to teach social reform, but to prepare and move individuals to develop social reform. Into this private fundamental work, however, we cannot largely enter; yet must it never be forgotten by those who would ask what the Church is doing.

Often those who condemn the Church know her only as she was twenty or more years ago, and know not that a wholly new life and spirit have entered into her to-day. And yet no fair reviewer of the question can deny that along certain lines the Church is far from being or doing what she should. Almost all social thinkers are now agreed that the social evils of the day arise in large part from social wrongs, in monopolies of land, of money, of machinery, of railroads, and of capital of other kinds. They are also all agreed that whatever be their especial economic views, in some way society has a large part to play in righting these wrongs, and that such reforms are therefore at present needed as much as the personal charities and activities of the Church. Now it is in this large field that the Church does so little. Many earnest churchmen claim that this is a field which the Church should not enter. But this is exactly the difficulty urged by social reformers. They claim that the Church has no adequate conception of what she could and should do. If Jesus Christ be the King of all life (see CHRISTIANITY AND SOCIAL REFORM), surely the Church, as working for Him, should demand that all life obey Christ, and surely the political, social, and industrial spheres are a part of human life. It is more than hinted that while the churches do much for charity (often, however, in their wealth giving of that which costs them little), they fear to take up these fundamental social questions because they have become identified with and dependent upon wealthy donors interested in sustaining these private and class monopolies. City clergymen, with their (often) large salaries and luxurious homes, are especially scorned, hated, and denounced by working men, who claim that these men are not true followers of the Nazarene Carpenter. "We denounce and leave the Church," say these labor leaders, "not because it is Christian, but precisely because it is *not* Christian." In these lines it is easy to see how, in spite of their growing activities, the churches are still denounced as false to their pretended creed and duty. Nevertheless even on this line there is a great change. The article on CHRISTIAN SOCIALISM and the respective articles on the various Christian Churches contain evidence of this. Clergymen of all denominations are coming to see that Christ really meant His kingdom to come on earth, and all kingdoms of this earth, including the kingdoms of politics, trade, industry, etc., to become a portion of His kingdom. It is significant that a new policy is proposed for foreign and home missions, whereby the Church should organize its converts into Christian, industrial, and social communities, as indeed Moravian missionaries have long done. Certainly a new life is in the Church, altho when one realizes the social need and the power that is in the Christ the Church professes to serve, the little done seems lost in the undone vast. (See also CHURCH AND THE WORKING MEN.)

Failure of the Church

VI.—What the Church Could Do

In an address upon "The Needs of the City," before the Evangelical Alliance, convened in Boston, Dec. 4, 1889, Professor Ely, in words still true, spoke of the need in the Church:

(1) Of a profound revival of religion, not in any narrow or technical sense, but in the broadest, largest, fullest sense, a great religious awakening which shall shake things going down into the depths of men's lives and modifying their character. The city needs religion, and without religion the salvation of the city is impossible.

A Proposed Program

(2) The first need restated from a different point of view, a renaissance of nationalism or municipalism. Said Professor Ely:

"Societies have failed and will fail. They cannot, acting simply as societies, do the work. Their resources are inadequate, the territory they can cover is too small, and their power is insufficient. The Evangelical Alliance simply as such can never do the work. The Evangelical Alliance, like other societies, must put itself behind municipal government and recognize the reform and elevation of municipal government as one of the chief features of its work. It must strive to establish among us true cities of God. There is plenty of room for the individual and for individual activity. Not all the work can be done by government, altho without government very little can be accomplished. But in addition to strict private work, there is room for any amount of individual work in stimulating official work and in cooperation with official work.

"We must recognize this, and the sooner we recognize it the better. . . . The most successful work, says Barnett, after his long striving, is done by the Education Act, the Poor Law, and other socialistic legislation. That that is the most successful work is also illustrated by the life and career of the seventh Earl of Shaftesbury, who carried through Parliament legislation which has benefited millions of Englishmen. If simply by touching a person you could confer a distinct benefit on the person touched, it would take you twenty years to benefit as many people as have been benefited by legislation chiefly due to this great philanthropist."

The Church could work for:

(3) Education of all kinds.
(4) Good amusements, gymnasiums, parks, etc.
(5) Public baths, washhouses, etc.
(6) Improvement of artizans' dwellings.
(7) Organized medical relief.
(8) Temperance.

National churches might do still more. It was proposed at the World's Congress on the Church and the Labor Movement that among the first things for the Church to do was in conventions and conferences, and finally national councils, to create true ideals of social and industrial life, teaching men of our day what conscience demands in the daily life, even as the canon law of the Middle Ages exprest then the sense of the Church on such questions of the daily life as taking of interest, etc. The Church, to do this, needs not to lay down laws, but it should lift up practical ideals.

Again, the Church in pulpit, church paper, conference, and convention, should protest against great social wrongs and oppressive monopolies and tyrannies, and agitate for such far-reaching reforms as the lessening of the hours of labor, the progressive taxation of great incomes, the nationalization of land and of monopolized capital, the employment of the unemployed. Says a leading Christian Socialist in England, Rev. S. D. Headlam: "Lastly, I come to what is the main plank in the platform of the Christian Socialist, the chief political reform at which he aims, being bound by his creed to go to the very heart of the matter; to be content with no tinkering. It is summed up in the resolution which was moved by the English Land Restoration League in Trafalgar Square; after which the authorities, being conservative authorities, wisely settled that no more should be said there for the present. It ran as follows: 'That the main cause of poverty, both in the agricultural districts and in the great centers of population, is the fact that the land, which ought to be the common property of all, is now monopolized by a few; and that therefore those who want to cut away at the root of poverty must work to restore to the people the whole of the value which they give to the land, to get for the people complete control over the land, and to that end see to it that those who use land pay

for the use of it to its rightful owners, the people.'" Perhaps, first, above all else the Church should see to it that her own life is rightly fashioned; that she organize her needy converts in home and foreign fields into true self-supporting Christian communities; that she see to it that her own churches be built and her church papers and prayer-books be printed by united labor working during just hours at righteous wages. A Church that did this, led by clergy, living from the Christ life in humility and self-sacrifice and lifting up her voice for the opprest against every oppressor, would be indeed a Church following her Master in social reform."

CHURCH AND THE REFORM WORKERS, THE: The writer in 1905 conducted an investigation into the church affiliation of the men and women engaged in social reform work in the United States. Returns were received from over 1,000 persons. Four hundred and one were workers in associated charities, 339 in settlements, 272 were connected with various national social reform organizations. All portions of the country were represented. Four hundred and seventeen were men, 495 were women, the excess of women being in the associated charities and settlements.

Out of 878 social reform workers reporting upon the point, 753 were returned as communicants in some church. Even if the 134 who did not report on this point be all counted as non-communicants, it still makes 753 out of 1,012, or 74 per cent.

The method was by sending blanks to the secretaries of associated charities, to the head workers in settlements, and the presidents or secretaries of national reform organizations. Blanks were sent to all whose addresses could be secured. Each person to whom a blank was sent was requested to fill it out for individuals known personally to him or her as social reform workers. They were asked not to report the names of the individuals, so as to avoid seeming to pry into personalities. It was thought, too, that in this way more returns could be obtained. As a guaranty, however, of good faith, each one sending in a report was asked to sign his or her name to the statement that the returns did represent the facts as to workers in social reform personally known to the sender of the facts. To obviate reduplication, each was asked to report for individuals so intimately connected with the society or organization in question as not to be likely to be reported by any one else. One thousand and twelve such returns were made.

The Church membership of workers in the associated charities rises to 92 per cent; with the settlements it is 88 per cent; among other reform organizations it falls to 71 per cent.

What does this finding mean? It may be said at once that it does not mean that there is therefore no basis for criticism of the Church. Blanks were not sent to any institutional church, nor to any distinctively church organizations. It was taken for granted that workers in such societies would be affiliated with the Church. If anything, the presence of such a large proportion of church people in societies distinctly extra-ecclesia would indicate that the Church herself was not doing such work, at least not sufficiently to furnish an adequate outlet for earnestness and effort.

Complaint is raised in many quarters of the decreasing number of candidates for the sacred ministry; may it not be that in the large number of church men and women found in these social efforts there is one cause for this scarcity?

It is also clearly evidenced by the returns that religion and Christianity and the creed are not dying. It is a time of change, but the changes are modal and not of faith. Still, to-day, the majority of the men and women who are striving to make the world better—at least in the U. S.—are members of the Christian Church and believers in the Christian faith. Rather do we see to-day Christianity blossoming into a new life and the creed putting forth new credentials in the eyes of a practical world.

This becomes even more manifest as we note the denominational preferences of the social reform workers. The churches that do social reform work are, naturally, the churches social reformers choose.

If we take the proportion of communicants in each religious communion to the total number of communicants in the United States, and compare this with the number of communicants the same communions furnish to social reform, we shall find that the Roman Catholic Church should produce 33 per cent of the reform communicants, and does produce 5 per cent; the Methodist Church (of all kinds) should produce 20 per cent, and does produce 14 per cent; the Baptist Church should produce 17 per cent, and does produce 6 per cent; the Presbyterian Church (North and South) should produce 5 per cent, and does produce 16 per cent; the Congregational Church should produce 2 per cent, and does produce 16 per cent; the Protestant Episcopal Church should produce also 2 per cent, and does produce 21 per cent; Unitarians and Universalists together should produce 0.4 per cent, and do produce 6 per cent. Other churches should produce some 18 per cent, and do produce 10 per cent. Other returns were as to church attendance. The average social reform worker, according to these returns, attends church 3.7 times per month, tho 37 nominal church members and 120 non-church members do not attend church at all.

Another set of returns shows the dominant early religious influences of the reform workers. Of the 980 reporting on this point, only 22 report no dominant early religious influence; 108 report the influence simply as Protestant, without naming any denomination; 872 report a denominational early influence. Comparing this with their present religious affiliations, we get some indication of the denominational changes that are taking place among this class of workers. The Baptist and Presbyterian churches have neither gained nor lost. The Roman Catholic Church, the Methodist, Unitarian, and Universalist, and the "scattered" churches seem to have lost. The Roman Catholic Church, with originally 7 per cent, has now 5 per cent of those reporting the points; the Methodist Church, with originally 15 per cent, has now 14 per cent. The Unitarian and Universalist churches, with originally 7 per cent, have now 6 per cent; while the "scattered" churches, with originally 16 per cent, have now 10 per cent. The Protestant Episcopal Church and the Congregational Church have gained. The latter originally had 15 per

cent, and now has 16 per cent; the Protestant Episcopal Church, having originally also 15 per cent, now has 21 per cent of those reporting.

So go the denominational changes, indicating, with what has gone before, that to-day it is not, on the whole, the churches most characterized by revivalistic methods, not the churches working on old personal lines, be these Roman Catholic or liberal, that are reaching the earnest social workers. Personal religion means to-day the devotion of the person to the common effort.

W. D. P. Bliss.

CHURCH AND THE WORKINGMAN, THE: Labor troubles come as the result of an advancing civilization. Social unrest is sometimes an indication of social progress. There are no labor troubles in "Darkest Africa." Curiously enough, Christianity will have a good deal to do with introducing them.

The ancient philosophers declared that "a purchased laborer is better than a hired one," "a workshop is incompatible with nobility." And in accordance with these principles they erected great prison-like structures in which they hid away the laborer, compelling half the world to live in slavery. Then came Jesus Christ. Standards changed. Jesus discovered the individual. He showed the world how highly God values a human soul. Men have caught His spirit, with the result that in every Christian land the standing of the laborer has been elevated.

It was in Christianity that the labor movement had its rise. Its success is due to the fact that Christianity blazed the way. It was because Christianity and the labor movement had so much in common, that, as C. Osborne Ward points out in "Ancient Lowly," it was among the members of the labor gilds of the apostolic days that the Gospel had its freest course. In those days practically every workingman belonged to the gild composed of the men and women of his craft. It is not unlikely that some of the apostles themselves were identified with these organizations. This may have been especially true of Paul, who still worked at his trade as a tent-maker, usually seeking out those who were of the same craft, when visiting a strange city. As he was dependent upon his trade for a living, and as he constantly traveled from place to place, it seems reasonable to suppose that Paul identified himself with an organization which would give him greater opportunities for gaining his support. If, in connection with this benefit, there might come an opportunity for doing a larger service among a great class of toilers, it may be that Paul again "became all things to all men, that by all means he might win some," following out the principle of his approach to men. This we know without dispute—it was among the gilds of the larger cities which Paul visited that he established the churches whose names are given in the inspired record. And these very gilds of working people became centers for the proclamation of the Gospel.

Changing Conditions

Since those days, the relation of the workingman toward the Church has undergone a great change. Labor organizations and mass-meetings of working men have, from time to time, passed resolutions denouncing the Church and the ministry because of their apparent indifference to the interests of working people. Vast numbers of working men have undoubtedly been alienated from the Church, and it has often been true that the Church was to blame for this alienation. If it is insisted that it is the fault of the workingman that he does not go to church, it should be remembered that the Church was established for faulty people. Therefore the greater the fault of the workingman, the greater becomes the responsibility of the Church in this connection.

The Church is slowly awaking to the fact that the labor movement is the most significant movement of modern times. It should be understood that when one speaks of the labor movement one does not refer exclusively to the labor-union. There are forces organized and unorganized which are comprized in this term. It includes the 25,000,000 Socialists of the world, nearly 7,000,000 of whom have cast their ballots for Socialist candidates; it includes the 8,000,000 trade-unionists from every land, 3,000,000 of whom are in the United States and Canada; it embraces the uprising among the Russian peasantry, 20,000 of whom (in 1906) suffered martyrs' deaths because of their belief in the ideal which somebody has given them; it includes the movement among the British working men, who practically control the English Parliament; it includes the movements among the masses in Germany, in Italy, in France, in Belgium, in Australia—to say nothing about the social unrest that exists in the U. S. In view of all this, it does not require a very wise man to say that this is the era of the common man, and when the hour strikes that shall proclaim the victory of the common people, this is the question which will confront us as a church: Will they be inspired by a high religious ideal given them by the Church, or will they go on to better and nobler things, indifferent to the Church, because of the consciousness that they have won all in spite of the Church? For win they will; no human power can prevent it, and no divine power will.

This, then, is the great labor movement that confronts the Church to-day. There is so much religion in this movement that some day it will be a question as to whether the Church will capture the labor movement or whether the labor movement will capture the Church. We hear a great deal about the Church saving the masses, but some day the masses are going to help save the Church.

Three very interesting facts give the Church a decided advantage in the matter of capturing the labor movement.

First. Workingmen almost universally honor Jesus Christ as their friend and leader, and most of them believe in His divinity.

Second. The great mass of working people are naturally religious, altho that religion may not always be exprest in the most orthodox manner.

Third. The labor question is fundamentally a moral and a religious problem. It will never be settled on any other basis. In the end there will be not one answer to the social question, but many; but they will all agree in this: all of them will be religious.

If the Church is to permanently attract working men, the workingman must find in the approach of the Church an absolute sincerity. It must make the people the end of its endeavors. They must find in the Church a greater democ-

racy. It behooves the Church to study the new movement among the masses and to direct it with unselfishness and with a devotion to the right, which shall win the millions who are incarnated in the "common people." The Church must preach a clearer social message. Working men are not particularly concerned about social theories, but sometimes their social conditions are so real and so vital a part of their lives, that it is almost impossible to reach them through an evangelistic campaign. Furthermore, the workingman must find in the Church more of the prophetic spirit.

Practically every church has exprest its interest in this problem, but some of the leading denominations have spoken with no uncertain sound. At the session of the Federation of Churches held in New York City in 1905, representatives of practically every Protestant denomination in the U. S., who spoke for nearly 20,000,000 church members, unanimously adopted the following resolution:

Whereas, In the divine order of things there can be no discord between labor and the accumulated results of labor known as capital:

Resolved, That private capital in every instance ought to be administered as a sacred trust for the common weal—this not merely in the distribution of surplus wealth, but also in all the active productive uses of capital, the law of God requiring not only beneficence instead of corrupting extravagance, but also instead of greedy production productive activities conducted on lines most considerate of the ultimate well-being of the whole community and the immediate welfare of the immediate workers.

Among other resolutions adopted by the Congregational Church at its national meeting with reference to labor, was the following:

Recognizing that the need and the right to work are fundamental in human society and that much remains to be done to establish just relationships in the industrial order, we urge our churches to take a deeper interest in the labor question, and to get a more intelligent understanding of the aims of organized labor.

The National Council of the Congregational Church also has a representative Industrial Committee which is to study such questions as child labor, organized labor, immigration, industrial organizations, and socialism. State associations also have similar committees under whose auspices frequent conferences have been held in various parts of the U. S.

The Protestant Episcopal Church, at its national conference, had this to say:

In the face of a prejudice and a hostility for which there are serious reasons, we are convinced that the organization of labor is essential to the well-being of the working people. Its purpose is to maintain such a standard of wages, hours, and conditions as shall afford every man an opportunity to grow in mind and in heart. Without organization the standard cannot be maintained in the midst of our present commercial conditions.

This denomination also has a Labor Committee composed of prominent clergymen and laymen. For many years there has been in this church an organization known as the Church Association for Improving the Condition of Labor, commonly known as the C. A. I. L. While not in organic relationship with the Church, it has among its officers many of its bishops, and the work of the organization has received the hearty indorsement of the General Convention. Among the committees are those on Tenement-House Reform, Labor Organization, Sweating System, and the Church and Stage. The official organ of the association is *Hammer and Pen*, published in New York City.

The Presbyterian Church has established a Department of Church and Labor, which is in official relationship with that church. Its General Assembly of 1905 adopted this resolution:

Appreciating the increasing importance of the industrial problem and realizing that the labor question is fundamentally a moral and a religious question, and that it will never be settled upon any other basis, we recommend that the Presbyterian Home Mission committees appoint subcommittees for the purpose of making a systematic study of the entire problem in their respective localities. These committees shall cooperate with the Department of Church and Labor, thus establishing, in connection with the organized Presbyterianism of every city in America, a board of experts, who may be able to inform the churches with respect to the aims of organized labor, and to inform the working men concerning the mission of the Church.

The department serves as a clearing-house for the study of up-to-date methods of city mission work. It is attempting to reduce to a science work among working men. In this matter it has the cooperation of committees in practically every city of importance in the U. S. An article dealing with some phase of the labor question from the Christian view-point is regularly sent to the 300 labor papers in the U. S. and Canada, through which the department speaks weekly to 10,000,000 working people. Noonday shop meeting campaigns are conducted under its auspices in the industrial centers, the ministers of the city doing the preaching. Each year on Labor Sunday—the Sunday before Labor Day—every minister in the church is requested to preach on some phase of the labor question. So that both the Church and labor may see each other with clearer vision, the plan of the exchange of fraternal delegates between local ministers' associations and central labor-unions has been advocated by this department. Several of the leading denominations have entered most heartily into this work. The fraternal delegate goes unpledged to secrecy. He does not have the privilege of voting, but he has the right of the floor on all occasions. In some instances the labor-unions have created the office of chaplain for the ministers, and the regular meetings are opened with prayer.

Fraternal Delegates

Working together, the Ministers' Association and the Central Labor Union may bring about many municipal reforms. Indeed, united, there are few things in this direction which they may not accomplish in the cause of good citizenship, independent of partizan politics. Especially in those matters which involve moral issues—such as the saloon, gambling, the social evil, Sunday work, child labor, sanitary conditions in tenement-houses and factories, and everything else that influences the moral life of the community—may these organizations cooperate. If the opportunities for service which the ministerial fraternal delegate to the Central Labor Union has presented to him are rightly appreciated and properly employed, there are few positions that offer greater possibilities in bringing men of all classes the message which will bring about a truer spirit of Christian brotherhood. In operation in about 100 cities, the plan is spreading from city to city, until it is hoped that it will become effective in the 600 cities of our country that support central labor unions and ministers' associations. As a practical result of this plan, there is a more cordial relationship between working men and the Church; first, because the minister has a broader conception of what the labor movement stands for; and, sec-

ond, because the labor leader has come to know something of the mission of the Church. The plan has the hearty indorsement of the American Federation of Labor. At its Pittsburg meeting, held in 1905, the following resolution was unanimously adopted:

Resolved, That the American Federation of Labor recommends that all affiliated state and central bodies exchange fraternal delegates with the various state and city ministerial associations, wherever practicable, thus insuring a better understanding on the part of the Church and clergy of the aims and objects of the labor-union movement of America.

To further indicate its attitude toward the Church, another resolution was adopted which very strongly commended the Church for its renewed interest in the study of the problems which concern the toilers.

Altogether the outlook with relation to the Church and labor is most encouraging. The question of the workingman and the Church is no longer a problem. It is an opportunity. It is simply another challenge to the Church.

CHARLES STELZLE.

There is, however, another side, not contrary to the foregoing, but to be taken in connection with it.

In 1906 Dr. Josiah Strong wrote in *Social Progress*, of which he is editor:

The most striking fact revealed by the study of these eight denominational year-books is the large and increasing number of barren churches; that is, those which do not report a single addition on confession of faith. The number of barren Congregational churches last year was 2,390, against 2,306 the year before, and 1,632 in 1895. The number of barren Presbyterian churches was 2,270, against 2,024 the previous year, and 1,699 in 1895. The minutes of the Methodist Episcopal conferences do not give statistics for separate churches, but for *charges*, and there are often several churches in one charge. The number of Methodist charges which reported no additions on confession last year was 2,276, against 2,046 the year before, and 1,134 ten years earlier. Both the absolute number and the percentage of barren churches is increasing, having risen in the Congregational denomination from 30.5 per cent in 1895 to 41.0 per cent in 1905.

The increase of barren churches in recent years is the more significant in view of the evangelistic efforts of the last year or two. . . .

From 1800 to 1850 there was a flowing tide of individualistic religion, which swept over an increasing proportion of the population; but from the middle of the century on, the tide ran more slowly, and by 1900 it was practically stationary. We must not, therefore, be surprised to learn that the tide has now turned, and the statistics of the past year show that *it has already begun to ebb*. The estimated annual increase of our population is 2.18 per cent, while the increase of the entire church membership of the United States during 1905 was only 1.69 per cent—the lowest rate on record.

That this falling off in church life is particularly true among the working classes is seen in many facts, among others in what Dr. Strong reports in his *New Era*:

United States

He says that in Brooklyn (the city of churches) the rector of an important Episcopal church said: "On the list of my church members there is not a single workingman." A Reformed Church clergyman: "That is also my case." A minister of a large Congregational church said: "We have one artizan on our list." A leading Presbyterian clergyman added: "Of working men, strictly so called, I have not a single one in my congregation." The total number of the members of these churches was about 2,200, and of these professed believers gathered into church fellowship only one was a workingman.

Says a pamphlet (American):

Much has been said about "reaching the masses" . . . but I am compelled to say the Church *does not want to reach the masses*. The Church wants the classes. . . . The poor are passed by because they are poor, and the rich and well-to-do are sought because they are rich and well-to-do.

Says Richard Heath in "The Captive City of God" (London, 1905):

It is not Mariolatry or Bibliolatry we have to fear—what has desolated the Church and is desolating the Church is the worship of Property.

It was stated, in 1891, at the Congregation International Council, that almost all of the hundred richest men in the U. S. were members or adherents of Protestant churches, and out of the 200 men who possest $20,000,000, or more, 95 per cent were members of Evangelical churches. In the Protestant Episcopal Church, the dioceses of New York, Long Island, Massachusetts, western Massachusetts, Pennsylvania, Pittsburg, out of a possible twenty-five lay delegates to the General Convention choose at present thirteen millionaires. The fact that the Church is the church of the wealthy, keeps it from being the church of the people.

This last winter at a Young Men's Christian Association theater service on Sunday afternoon in Brooklyn, the city of churches, an audience of 500 men was asked to show by raising the hand how many had been to church that morning, Twenty-five responded, of which twenty-three were Roman Catholics.

In Great Britain it is perhaps worse. Says Charles Booth (quoted in Haw's "Christianity and the Working Classes":

The general conclusion is that the great masses of the people remain apart from all forms of religious communion.

Mr. Percy Alden, M.P. (long warden of Mansfield Settlement), is quoted as saying:

Great Britain

An intimate acquaintance with many thousands of working men has taught me that, even where there is no hostility whatever to religion, there is a sort of subconscious and unrecognized feeling of antagonism to the Church as an institution or corporate body and to the parson as a paid teacher of religion.

Says the Rev. Arthur Jephson, vicar of St. John's, Walworth:

Why should working people go to church? What have they got to learn there? The Church is largely to blame for the alienation of the working classes. The Church is almost always the friend of the landlord and employer. The Church has allied itself with land and capital, and generally with the master against his workmen. Its clergymen have dined with the rich and preached at the poor, instead of doing the exact opposite.

An editorial in the *Labor Leader* says:

In these later days the Church has fallen into almost obscurity as a power in the moral and civic life of the nation. Its form remains, its habiliments are still gorgeous, but it walks behind not in front of the State, and its gestures and speech are almost unheeded in the great march of the nation."

A Fabian writer shows by an analysis of the votes in the House of Lords that the bishops and archbishops of England have voted "No" on almost every progressive and advance bill.

For the following statistics (as well as for some of our quotations as to the position on the Continent) we are indebted to Richard Heath's "The Captive City of God" (London, 1905).

The religious census taken by the *Daily News* in London, 1902–3, compared with the census taken in 1851 by Sir Horace Man, shows that the population has doubled, but that the total church attendance has fallen from 37.38 per cent in 1851 to 22.44 per cent in 1902. The attendance on the Anglican churches fell from 17.73 per cent to 7.44 per cent. The census also shows that few things are less hopeful as far as the working classes are concerned than the modern mission in

London. In the boroughs of Shoreditch, Bethnal Green, Poplar, Stepney, Hackney, Finsbury, Bermondsey, and Southwark, with a population of 1,352,903 persons, the attendance on Sunday services of the Free Church Missions, including those of the Evangelical Mission churches, the City Mission, and the Salvation Army, was (without deducting those who attended twice) somewhat more than 40,000, or about 3.3 per cent of the population, and of these, 22,000, or more than 53 per cent, were children. For Scotland the elaborate statistics published in 1893, by Dr. Robert Howie, show that while the population of Scotland increased 39.3 per cent in forty years, the attendance at its Presbyterian churches had decreased 22.4 per cent.

Scotland

In Germany conditions are the same. Dr. Stöcker, of Berlin, is quoted by Richard Heath as saying:

Nowhere has so great a part of the population broken with the Church. Protestantism is sick, sick unto death. Individual expressions of Christian life are on the increase, but the organized Church is steadily losing influence and respect. . . . In the north and northeast the friends of Christianity are among the aristocracy and among the peasants, while the middle classes, the educated industrial commercial people, as well as the artizans and little tradesmen, are, with few exceptions, opposed to the Church; the working men of the towns, belonging, as they often do, to the Social Democratic Party, being necessarily hostile.

Germany

Pastor Erich Forster, of Frankfort-on-Main, editor of *Chronik der Christlichen Welt*, says:

It is undeniable that the alienation from the Evangelical Church and its worship goes on increasing. In Mecklenburg, Pomerania, and the north of Brandenburg, that is, in the most purely Protestant part of Germany, the Church is dead. Worst of all is the condition in the great cities.

Says Paul Göhre in his "Three Months in a German Workshop":

Among the working classes only one quality of religion remains, and that is respect and reverence for Jesus Christ. . . . There is no escaping the conclusion that the materialistic influence of social democracy has nowhere so fundamentally destroyed the received ideas and impressions of the workingman as in the sphere of religion. The old forms and images in which the beliefs of Christendom have hitherto been handed down are, for the bulk of our wage-earners under the capitalistic system of production, forever broken. And with the form, the spirit, which alone is the essence and the work of the form, is for many also gone. A world without God is growing up under our eyes; a world whose horizon is continually growing wider, and whose icy chill and desolation is creeping over many souls who still waver and struggle and despair who in their inmost depths reject the barren teachings of a materialistic philosophy.

Forsaken by their Church, without help, without enlightenment, without support or guidance, surrounded by an atmosphere of socialistic thought from which there is no escape, they are all dying a lingering and often a torturing spiritual death.

Other Countries

Of France, Pastor Elie Gournell says:

Why are people aleniated from the Church? Because its action is neither just enough nor promotive of solidarity. In the sixteenth century we were the vanguard of science, moral action, and faith; to-day we lag behind in the rear-guard.

In Switzerland, Prof. Gaston Frommel says:

The churches are not true churches, only audiences.

Of Holland, Dr. A. Kuyper is represented by Richard Heath (from whose book several of our quotations are taken) as saying in substance:

Orthodoxy in Holland is faced by a destructive criticism subversive of the very sources of Christian faith, by a remodeling of moral ideas, and above all by a social movement, which means nothing less than a total overthrow of the social edifice.

Of the Roman Catholic Church we have few reliable statistics, but of its weakening hold upon the masses in Europe there can be no question. Witness the startling political reverses for the Church in France, Italy, Spain, and Austria. Its very efforts at a so-called Christian Socialism (see Roman Catholic Church; also Christian Socialism) are but efforts to stay the work of the Social Democratic Party, which has taken millions of men from the Church. In Germany the Roman Catholic vote (1907) was 1,375,000. The Social Democratic vote 3,000,000. If in the U. S. the Church of Rome seems sometimes to be gaining, it is only due to the immense Roman Catholic immigration. But the increase of the Church of Rome is less than the Roman Catholic immigration, so that here, too, the Church of Rome is steadily losing ground.

Roman Catholicism

Editor.

CHURCH OF ENGLAND: The relation of the Church of England to social reform is best seen under Christian Social Union; Guild of St. Matthew; Christian Socialism (section England); Church Socialist Society, also Church Army and Church of England Temperance Society. For statements of the failure of the Church of England to reach the masses, see Church and Workingmen (§ 2). To what extent, however, radical thought has entered the Church of England, especially in London, may be seen in the fact that at a meeting of the London Conference in 1906, a resolution indorsing the general principles of socialism was carried by a vote of 58 to 13.

CHURCH OF ENGLAND TEMPERANCE SOCIETY: Organized 1862, and reformed on the basis of the dual pledge 1873. One of its sections, including the junior department, is composed of those who take a total abstinence pledge. The other section includes non-abstainers, who take a pledge of moderation and cooperate with the abstainers in work for temperance. There is also a woman's union connected with the society. *Address*: 4, The Sanctuary, Westminster, London, S. W., England.

CHURCH SOCIALIST LEAGUE, THE: English organization, founded June 13, 1906. *Principles*: (1) The Church has a mission to the whole of human life, social and individual, material and spiritual; (2) the Church can best fulfil its social mission by acting in its corporate capacity; (3) to this end the members of the league accept the principles of socialism. *Object*: To secure the corporate action of the Church on these principles. *Methods*: (1) To cultivate by the regular use of prayer and sacraments the life of brotherhood; (2) members undertake to help each other in fulfilling the object of the league by speaking and lecturing and in other ways; (3) members shall cooperate as far as possible to secure the consideration of social questions at their various ruridecanal and diocesan conferences, and the election of Socialists on these and other representative bodies; (4) members shall work for the disestablishment of the patron, and the substitution of the Church in each parish in conjunction with the Church in the diocese in the patron's place; (5) to secure the due representation of the wage-earning classes upon all the official representative bodies of the Church.

A leaflet of the league says:

The league requires its members to be convinced Socialists, in the historical and economic meaning of the word. It is thus a society within the Church, composed exclusively of Socialists.

It accepts the principles that the Church has a mission to the whole of human life, social and individual, material and spiritual; that the Church can best fulfil this mission by acting in its corporate capacity. . . . Whilst the Church has some claim to be the Church of the people, it is notorious that the wage-earners of this country have little or no place in the councils of the Church. The constitution of any diocesan conference or of the Houses of Laymen is the revelation of the Church's preference for rank, position, and wealth. This is as wrong as it is disastrous to the life and influence of the Church. The league will aim at securing the more adequate representation of the wage-earners on these various Church bodies.

Honorary Secretary, Rev. J. H. Hastings, Halton, Lancaster, England.

CHURCH TEMPERANCE SOCIETY (THE): An American society founded in 1881 on the following basis: "Recognizing *temperance* as the law of the Gospel, and *total abstinence* as a rule of conduct essential in some cases and highly desirable in many others, and fully and freely according to every man the right to decide, in the exercise of his Christian liberty, whether or not he will adopt said rule, this society lays down as the *basis* on which it rests and from which its work shall be conducted, a *union and corporation on equal terms* for the promotion of Temperance, between those who use temperately, and those who abstain entirely, from intoxicating drinks as beverages."

Objects: (1) The promotion of temperance; (2) the reformation of the intemperate; (3) the removal of the causes of intemperance.

Lines of Action: (1) Prevention, embodied in the semimilitary orders of Young Crusaders of from eight to sixteen years of age; Knights of Temperance from sixteen to twenty-one years; and Veteran Knights over twenty-one years of age. (2) Counteraction, through the establishment of saloons without liquor. The society has established the *Squirrel Inn* at 131 Bowery, New York, with free reading-room, a library of 1,000 volumes, monthly lectures, and coffee at one cent per cup. It has six lunch wagons, open day and night, from which 355,712 ten-cent meals were sold in 1906. During the summer months the society maintains free ice-water fountains at a cost of about $2,000. It has also a firemen's van, which attends all large fires in the city, supplying the firemen with sandwiches and coffee. (3) Restrictive legislation. Twenty-five years ago the saloon license in New York City was $120, and the trade was controlled by the board of twelve aldermen, of whom nine were interested in the liquor business. The high license is now $1,200, and the number of saloons has been reduced to 6,930. (4) Rescue. The society's offices are always open for the consideration of personal cases of intemperance; and for counseling those who have fallen its victims and needing a home where they will be medically treated and cared for.

The governing board consists of forty members. Chairman, Rt. Rev. Bishop Courtney, D.D.; treasurer, Mr. Irving Grinnell; general secretary, Mr. Robert Graham. Office, 281 Fourth Avenue, New York City.

CIGAR-MAKERS' INTERNATIONAL UNION, THE: An American union with highly developed methods of governmental administration and an elaborate system of sick, death, and out-of-work benefits. Moreover, its structure and functions, which exemplify those of the English unions, modified to suit American conditions, have frequently served as models for newer national organizations. The piano and organ workers, for example, have borrowed almost bodily a constitution from the cigar-makers. In 1902 the plumbers adopted their financial system; and various characteristic features have been copied by other American unions.

The cigar-makers were not among the first trades in this country to form local societies. Until recent years it required very little capital for a journeyman cigar-maker to open a shop of his own. The members of the craft, therefore, occupied an independent position, and were able to command good wages without forming unions. A few attempts to organize the trade were, however, made at a comparatively early date. Thus, in 1835, at the time of the agitation among the mechanics of Philadelphia to inaugurate a ten-hour working day, a committee of cigar-makers in that city held a meeting, and adopted resolutions to the effect that the cigar-makers of the city "organize in order to regulate the prices of work, so as to earn a sufficiency on the principle of ten hours." The females engaged in cigar-making were also urged to strike with the journeymen of the trade, and "thereby make it a mutual interest with both parties to sustain each other in their rights." A local society of the trade is said to have been formed at Cincinnati, Ohio, in 1843. On May 5, 1851, a cigar-makers' union was organized in Baltimore, Md., then one of the leading centers of the cigar trade. Between 1852 and 1853 about sixty cigar-makers employed in the shop of a manufacturer named Mark Sharkey, in New York City, organized a union. But the English and German members of the society did not harmonize. Suspicion and ill-feeling were engendered, and in about six months the union ceased to exist. Another attempt was made, in 1859, to form a local in New York City. But like its predecessor it went to pieces in a few months on account of internal dissensions.

The Internal Revenue Law, adopted at the time of the Civil War, and particularly the law of 1868, which required every journeyman who desired to manufacture cigars or who worked in his own home to furnish bonds to the amount of $600 on real estate, hastened greatly the unionization of the trade. Most journeymen were unable to pay this bond. They thus permanently became wage-earners, and formed unions to bargain more effectively with their employers. The introduction of the mold, about 1870, the team system of manufacture, and other labor-saving devices have successively lowered the skill required of the cigar-maker, and have made increasingly necessary the organization of the trade.

Revenue Law

A national federation of all local unions was formed in 1864, for the purpose of preventing competition for work between journeymen cigar-makers in different cities, and to regulate nationally the conditions of apprenticeship. Almost immediately, also, provision was made for the support by the national union of locals on strike. A few years later, with the admission of certain Canadian societies, the name Cigar-makers' International Union was adopted. The international organization has maintained a continuous existence until the present day. During the depression of 1873–77 many of the subordinate unions went to pieces; and from 5,800 in 1869 the membership sunk to about 1,000 in 1877. After the depression, however, the union reorganized on a much sounder basis; and most of the features

which characterize the society to-day were adopted at that time. Moreover, the membership has since then maintained a steady growth, and has reached about 45,000 at the present time. Of recent years the cigar-makers have been engaged in a severe contest with the tobacco trust, which has consistently opposed the union from the beginning, and has undoubtedly weakened the power of the locals in many places.

The Cigar-makers' International Union was one of the first American organizations to adopt the various beneficiary features of the English unions. In 1867 an abortive attempt was made to introduce the system of advancing loans to members who wished to travel in search of work. The administration of the loan system was, however, so dishonest that, in 1873, this feature was replaced by the so-called "endowment plan" or death benefit; but under the stress of industrial depression the endowment plan was abandoned. In 1879 the loan system was permanently reestablished, and in 1880 the sick and death benefits were introduced, the Cigar-makers' International Union being the first American organization to pay a sick benefit. This union is also one of the few American confederations that have adopted the out-of-work benefit, which was inaugurated in 1890.

The cost per member for the out-of-work benefit has varied according to the state of the trade, having reached its highest point during the four years of industrial depression from 1894–97. The cost per member for the sick and death benefits has steadily increased. This has been partly due to the fact that the amount of benefit paid in each case has gradually been made larger; partly it is the result of the higher sick and death rate, due, in turn, to the steady increase in the average age of the members—a condition found in all organizations with a slowly growing or stationary membership.

The members who pay fifteen cents as dues receive strike benefits and not more than $50 death benefit. The twenty-cent retiring card holders receive sick and death benefits.

On the side of government and administration, the cigar-makers have, almost from the beginning, employed the system of popular initiative and referendum, and, since 1896, have not held a general representative convention. Amendments to the constitution are proposed by the local unions, and adopted or rejected by a majority vote of the members. The officers of the union have also been elected by popular vote since 1893. The cigar-makers have adopted the English financial system of nationalization and equalization of funds. All funds are made the property of the International Union. They are kept, however, not at central headquarters, but in the treasury of each local union. The local societies are allowed a certain percentage of the total amount in the treasury. The remainder must be expended for activities guaranteed by the International Union. When the amount in any local treasury becomes exhausted, the president of the International Union equalizes the funds, so that there shall be in every local treasury a certain amount for each member.

The union label, the well-known device now used to mark goods made by union labor, had its origin among the cigar-makers. It was utilized by the San Francisco local in its fight against Chinese coolie labor. A little later, a similar label was employed by the local at St. Louis. A label for all subordinate societies was adopted by the International Union in 1880. The fact that working men prefer cigars which bear the union label, is an important source of the union's strength in bargaining with employers.

CINCINNATI: While heralded abroad as "the worst governed city," it is the distinction of Cincinnati to have quite early in its career taken two steps that placed it far in advance of any other city in the world, and which to-day give it a unique position in the family of American municipalities. Behind many others in the extent of its municipal activities, and not even now the theater or the forum for the discussion of municipal ownership and operation, it has in a manner all its own gone perhaps to bolder extremes in this direction than any other American city.

Cincinnati is the only city in America that owns a steam railroad, a road that runs over territory in three states from Cincinnati in Ohio to Chattanooga in Tennessee. Cincinnati is also the only American city that owns and operates a university, altho other cities have colleges and seminaries. Cincinnati, too, was the first American city to establish on a country site a municipal hospital exclusively for consumptives, and it owns and operates this hospital to-day. However, having taken these vast steps, the city would seem to have spent its energy and met its desires in this direction, for its municipal activities, compared with those of other cities, seem to be exhausted as far as innovations are concerned. The fact that Cincinnati built a steam railroad and established a municipal university and a hospital, and yet has since practically halted in the extension of its municipal activities, presents perhaps as strange a contrast of temperaments in a people as history affords. Cincinnati is conservative in the accepted sense and as a normal condition; yet the fact remains that when aroused it has shown a daring and radical spirit not to be found elsewhere. On one notable occasion, when lashed into fury by what they considered repeated miscarriages of justice and a general condition of public debauchery, the people became a "many-headed mob," which placed the torch to its temple of the blind goddess; and in the morning its court-house was a smoldering ruin.

Public Ownership

The story of the Cincinnati Southern Railroad is filled with interest, and not without flashes of romance. Cincinnati, the home of Mrs. Stowe when she wrote "Uncle Tom's Cabin," had long been a hotbed of abolition sentiment; and at the conclusion of the Civil War the feeling of the South was bitter against the city. Louisville, Ky., had the Louisville and Nashville Railroad to the south, and was diligent in nursing the trade to that section. It was seen that if Cincinnati was to maintain its commercial and manufacturing position it must regain and develop its Southern relations. As early as 1865 James Dalton, a Cincinnati man, had introduced legislation in the General Assembly for a railroad to

the south, but the people were not then ripe for the venture. However, the matter was taken up by E. A. Ferguson, a Cincinnati lawyer, and in May, 1869, the legislation was passed. This law provided that whenever the city council should declare the necessity for a railroad, and the people on a referendum should approve, the Superior Court should appoint five trustees, and a bond issue of $10,000,000, secured by mortgage and a tax for interest and sinking-fund, should be authorized. This was all done, and the debate as to what should be the southern terminus of the road was eventually decided in favor of Chattanooga. A charter from Tennessee was obtained without much trouble in 1870, but there was considerable delay and difficulty in getting a charter from Kentucky. This too, however, was secured in 1870, and then an act was passed by Congress to allow of a bridge across the Ohio River. New loans of $6,000,000 and $2,000,000 respectively were authorized as the work progressed and the cost found to increase. These several acts were accompanied by the most strenuous debates, and frequently the people were worked up to a great state of excitement. As usual there were charges and countercharges regarding the intelligence and purity of actions and objects of persons. The scheme for a city to build a railroad, and that, too, through three sovereign states, was so novel and unheard-of that naturally it met with the opposition of "constitutional" lawyers, and lawsuits were abundant. But Ferguson and his associates persisted, and in 1880 the road was completed, an event celebrated with a great banquet, bonfires, and ringing of bells. The road was leased, and in 1896 an effort to sell it was defeated on a referendum to the people, altho the most powerful interests were for its sale. In 1901 the people decided on a renewal of the lease, the terms being an annual rental of about $1,116,000, for sixty years. There are also other provisions of a rather technical nature in the lease. If the experience of Cincinnati with the Southern Railroad has not been an unbroken chain of benefits—if there have been disappointments—yet the fact is now undisputed that the worth and wisdom of the venture have been more than demonstrated. It furnishes an object-lesson of what has to be endured as well as of what is to be enjoyed, of the forces that have to be opposed and of the friends to be gained.

As with the Southern Railroad, there are none now who would sell the Cincinnati University, a great institution housed in a series of magnificent buildings, and in which are 1,500 students in the various schools and departments. It has a revenue of about $115,000 from taxation, and about $32,000 from endowments, rents, and fees.

So well satisfied is the city with its hospital for consumptives, that not only is there no whisper of getting rid of it, but plans are now being carried out for its enlargement and improvement. This hospital was started in July, 1897.

These three things accomplished, Cincinnati did little in the way of marked advancement, altho millions have been well spent on the streets, and a new water-works is now practically completed. It was not until about four years ago that the people manifested any marked desire for a larger municipal activity. They could not forever fail to catch the contagion for betterments, and the "new spirit" first manifested itself for improvements in the schools.

Public Schools

As a consequence, the public schools have undergone and are undergoing a transformation in their physical equipment, along with academic improvements that make them the peer of any in the country. The fight was long and bitter. Every influence that could be utilized to prevent this improvement was summoned. The industrious and saving Germans were especially beguiled for a while by "scare talk" about a high tax-rate, and those who pointed to other cities were accused of "knocking the town" and of lacking local patriotism. But the fight was won, and having been won the people wonder that it should ever have been necessary to make it.

The result of the school battle, for such it truly was, has encouraged the people to demand some more evidence of what is sneeringly called "altruism" in the municipal government itself. This demand has in Cincinnati, perhaps more largely than in other cities, taken its most effective form by the alertness of numerous "Improvement Associations," "Welfare Societies," "Taxpayers' Associations," and such bodies as the Business Men's Club and the Associated Organizations, and the central organizations of the Labor Unions. Robert Peel fought the repeal of the Corn Laws for years; but it was Peel, the minister, that had them repealed. So too, in Cincinnati, many of the steps in advance have been made by the politicians who were inert when the people were quiet, but who, under the lash of no uncertain public demand, went forward. There are those who, while unwilling to admit that the so-called reform movement that placed the present city administration in power under the emblem of the Democratic Party did a wise thing, yet say that it was perhaps just as well that the people asserted their power and showed what they could do if they had a mind. If it should be the fate of the political-reform movement to fail totally in gaining the confidence of the people, it appears certain that there will be no lessening of the people's vigilance. What form this will take is of course a matter of conjecture, but the signs now seem to point to the initiative and referendum, with its correlated principles of the imperative mandate and the power of recall. Agitation for direct legislation has recently taken an organized and intelligent course, and its friends feel confident that it will in a few years be written into the law of the state.

Cincinnati organizations that are influential in municipal affairs are:

City Club, United Bank Building.
Vine Street Congregational Church, Vine Street, near Eighth Street.
Associated Organizations, 1250 Harrison Avenue.
Business Men's Club, Vine and Fourth Streets.
University Settlement, Liberty and Plum Streets.
Citizens' Municipal Party, 9 Blymyer Building.
Associated Charities, 304 Broadway.
Commons Club, 621 Walnut Street.
Central Labor Council, 1313 Vine Street.
Chamber of Commerce, Vine and Fourth Streets.
Taxpayers' Association, 2518 Moormann Avenue.
Socialist Party, 304 West Ninth Street.
Hamilton County Referendum League, 34 East Sixth Street.

ALFRED H. HENDERSON.

CITIES: In this article are considered the development of cities, their administration, and matters pertaining to civic reforms. For other civic topics, see OVERCROWDING; CORRUPTION; EDUCATION; EXPENDITURES; LIGHTING; HOUSING; LUXURY; MAYOR; MUNICIPALISM; POLICE; PROSTITUTION; SLUMS; STREET-RAILWAYS; SWEATSHOPS; TENEMENTS; WATER-WORKS.

A city may be defined in general as a large or important town; more accurately, it is an incorporated municipality, usually governed by a mayor, aldermen, and common council. The number of inhabitants required to constitute a city in the United States is usually 10,000, but in some western states it is as low as 3,000. In Great Britain a city is usually a corporate town which is or has been the seat of a bishop.

I.—The History of the City

The origin of cities loses itself in the unknown past. Discoverers, as at Troy, have often found the ruins of one city buried many feet below the ruins of another, these in turn many feet below the present soil. It is doubtful, however, if these early cities from the standpoint of social science had any true civic life. They seem to have been gigantic conglomerations of walled-in populations, ruled by some despot or family of lords or priests, who sometimes, indeed, gave to the city a rude splendor and developed monumental art, yet without allowing the citizens any corporate life of their own. The inhabitants were the slaves of some king or the devotees of some god. It is in Greece that we come to the first actual city in the sense of the corporate unity of citizens. Greek social polity turned upon the conception of the city begun undoubtedly as a colony from some patriarchal clan, but early developing organized democratic life. (See ATHENS.) Many of the cities, however, were long *oligarchies*, and often, even after democratic life had been gained, some family or families would gain the power and establish an oligarchy. Sometimes an individual would gain the power and establish a tyranny, which was, however, personal, rarely inherited. The city was usually supreme, and not a part of any State. It dominated the country around, made treaties, waged war, etc. It was sacred in the eyes of the citizen, his church as well as his home. The city entered into, ruled, and conducted all kinds of activities. It built temples, markets, theaters, gymnasia. It conducted worship, games, instruction. It sent out colonies and ruled commerce. It worked mines, fields, and factories. It supported its free citizens rather than was supported by them. (See ATHENS.) Citizenship was limited, but the assemblage of the citizens was supreme. Often, however, officers were nominally elected who were virtually irresponsible. Next to the citizens came a class of "aliens," subject natives or foreigners, having special rights on payment of special taxes. At the bottom of the whole structure were the slaves. Even a democracy of free men was simply a democracy of slave-owners. Thus at Athens there were at one time at least 140,000 slaves, 10,000 resident aliens, and 21,000 male citizens. (See SLAVERY.) Two gigantic evils resulted: First, danger of servile revolts, which not infrequently broke out with terrible results (see GILDS), and were put down only by relentless cruelty; secondly, class antagonisms were roused between other classes of citizens. (See ROME.) Civil war became the order of the day. The State was either paralyzed by internal conflict or demoralized by corruption. Slavery ate out the life of ancient cities. In the Roman civilization the city gradually lost its sovereignty and became a part of the empire, furnishing the transition to the medieval city.

The Classic City

In the early Middle Ages the city lost power before the military chieftain and the robber castle. FEUDALISM magnified the country over the city. Where feudalism was weak, as in South France or in Italy, or where natural conditions were favorable, as along the Adriatic coast, the Rhine, and the northern coast of Europe, free cities were developed soonest. In the north the struggle of the cities for independence was fiercer, and their development slower, but stronger. They grew by work, by art, by commerce, not by war. All through the eleventh and twelfth centuries they developed rapidly. The Italian republics, the cities of the Hanseatic League, the Flemish and English cities, tho often dominated by a fierce and quarrelsome nobility, tended, on the whole, to develop the rule of the trader rather than that of the noble or chieftain. They became first the creator and then the creature of the gilds. Gradually, as the national life developed itself, the city became but a part of the nation, ready to gain commercial rights and privileges and representation in Parliament, for contributions to the royal treasury. Where the royal power was greatest the cities lost their power first, as in France and England and Spain; later, in Germany and Italy. Free thought, however, developed in the cities, and the Reformation and the Renaissance were largely matters of the city. The medieval city was a democracy more truly than the classic city, but not at all so pervasive. It ruled commerce and trade; it sharply watched the market and attempted to fix prices and to decide industrial disputes, but it did not conduct activities, as did the Greek city. The medieval city was ruled by the individual citizens more than it ruled them. Yet the city played a much larger part in industrial and social life than ordinarily to-day. Mr. Albert Shaw ("Municipal Government in Great Britain," p. 21) gives the following sketch of a medieval town:

Middle Ages

"The rise of town life, which dignified mercantile pursuits and handicrafts, had opposed the system of leagued and equal freemen, of burgesses of incorporated citizenship, to the feudal military system of lordship and vassalage. And this was a great preparatory step toward modern institutions and conditions. We know that there was a certain dignity and form about municipal life that appears well in the retrospect. We have surviving, here and there, a fine old medieval town hall, or gild hall, with its banqueting chamber and its council room. There was much stateliness in the office of mayor; and the old maces of mayoral authority survive to this day. Then there was impressiveness in the liveries that the freemen of the gilds disported on formal occasions. As for municipal conveniences, those were times when life was simple, and 'modern improvements' not so much as dreamed about. The streets were narrow, with the houses built close upon them. The paving was of the rudest character. There was simple surface drainage, and no garbage removal or cleansing system. Water was supplied from a few town fountains or public wells. Street-lighting had not been invented, and early hours were prescribed. Most towns had a skirting of common lands, where the cows were pastured, and where, in many cases, fuel was procured. The houses were, in large part, built of wood; and in spite of vigilant 'watch and ward' and compulsory hearth precautions, destructive fires were not infrequent. The death-rate, of course, was high. There was infection in the wells, and no means of checking the spread and fatality of the frequent 'plagues' that swept the towns. But the science of public sanitation being undiscovered, these things were accepted piously as inscrutable visitations of God."

II.—The Modern City

The modern city is somewhat of a return to the Roman city. It is the creature of the State. The industrial and political revolutions of the last century shattered the ancient rights and privileges of the medieval boroughs and gilds. The city was left with little sovereign power. Nevertheless the growth of the factory system, and, above all, the development of railroads and centers of commerce, have crowded people more and more into cities. Cities have grown in size, but not in corporate power. Hence they have become unwieldy, shapeless, confused, with often little true civic life. The modern divorce, too, between Church and State has at least temporarily hurt the city in a portion of its life. It has given the city responsibilities which it has not always been willing to accept. The poor and needy have been left to seek from confused private charities what formerly they received from the Church as part of the organized city life. The tendency of the well-to-do to leave the city and live in the suburbs; the crowding of the poor in quarters where rent is low, and the grouping of the wealthy in sections where rent is high; the development of parks and other improvements in the latter quarters and their absence among the poor—all these factors have added to the difficulty. The problems of modern city life have thus grown out of the sudden development of cities, without a corresponding development of organic municipal life.

The modern city in England, France, and the United States, markedly, and to a less extent in Germany, is the creature of the State. It can only do what it is chartered to do by the State. It has in some cases almost lost self-government. It fixes its own rates, but often has its taxes collected for it by national officials; it is in many cases responsible for its own peace and order, but has no control over an armed force, and has to ask for help if it requires it. On the other hand, it exercises many local functions which in the Middle Ages were left to the Church or to compulsory or voluntary private effort.

Poor relief, education, sanitation, police, the supplying of light and water, are usually in the

hands of the city, while the conduct of justice, of national defense, of postal communication, and commercial regulation are in the hands of the State.

In the United States

Considering first American cities, we find a general similarity coupled with considerable variety in the details of their charters and constitutions. They are all the creations of the State. The first city in the United States to receive a charter was New York (1686), and the next Philadelphia (1701). In New England the township system prevailed, and Boston was not incorporated till 1820. Each city received a special charter; and, following English models, the charter was given to the mayor, council, and officials, rather than to the citizens. The council was the governing body. Powers were very limited, being confined to few spheres of activity. The city was the instrument of the State; and in colonial days the mayor was appointed by the governor, even down to 1822, in which year mayors were elected in Boston and St. Louis, other cities gradually following suit. Even police powers were limited by inadequate taxation to finance the city. The result was that little attention was paid to city government or its administration. The supply of water and other public necessities was in private hands.

Early States

Nevertheless, cities grew rapidly. The ownership of city franchises became of immense value. They were to be obtained from state legislatures or city councils. The state legislatures were composed of city and country representatives. A representative of some rural district, who perhaps had little business interests at home, could in the legislature cast a vote worth millions of dollars to some corporation. The almost inevitable result was the purchase of votes by the corporations, and their active participation in rural politics to secure representatives favorable to their interests. It has frequently happened that the chairman and the majority of the cities' committees in state legislatures have been rural delegates. Then again, city councils, tho nominally with limited powers and occupying positions not held in esteem (since originally city governments were little thought of), have really been in a position to sell or give away franchises, or to enact provisions of enormous commercial value. This was another incentive to corruption. Both in state legislatures and city councils honest members could make little money, whereas dishonest members could rapidly accumulate a fortune. It was therefore a paying proposition for corrupt rings and dishonest cliques to organize the city politically, and elect their creatures to office. Hence Tammany and the rings which have disgraced every American city. By the same rule, it did not pay honest men to be elected, since, if elected, they had no certain tenure of office, and usually found themselves in a hopeless minority, which could only be a helpless witness to corrupt methods. As a result, generally speaking, the worst citizens have been members of and active in city government; while the best citizens, until recently, have kept out of city politics. By the same system corrupt corporations and dishonest directors who would buy franchises and legislative enactments were favored, while honest corporations and directors were made almost an impossibility. The perfectly natural and all but inevitable result of this has been a corruption of city government unequaled in any other civilized country. Said Mr. James Bryce ("American Commonwealth," vol. i., p. 608):

Corruption

> "There is no denying that the government of cities is the one conspicuous failure of the United States. The deficiencies of the national Government tell but little for evil on the welfare of the people. The faults of the state governments are insignificant compared with the extravagance, corruption, and mismanagement which mark the administrations of most of the great cities. For these evils are not confined to one or two cities. The commonest mistake of Europeans who talk about America is to assume that the political vices of New York are found everywhere. The next most common is to suppose that they are found nowhere else. In New York they have revealed themselves on the largest scale. They are 'gross as a mountain, open, palpable.' But there is not a city with a population exceeding 200,000 where the poison germs have not sprung into a vigorous life; and in some of the smaller ones, down to 70,000, it needs no microscope to note the results of their growth."

Andrew D. White on Corruption

Said Mr. Andrew D. White (*The Forum*, December, 1890):

> Without the slightest exaggeration we may assert that, with very few exceptions, the city governments of the United States are the worst in Christendom—the most expensive, the most inefficient, and the most corrupt. The city halls of these larger towns are the acknowledged centers of the vilest corruption. They are absolutely demoralizing, not merely to those who live under their sway, but to the country at large. Such cities, like the decaying spots on ripe fruit, tend to corrupt the whole body politic. As a rule, the men who sit in the councils of our larger cities dispensing comfort or discomfort, justice or injustice, beauty or deformity, health or disease, to this and to future generations, are men who in no other country would think of aspiring to such positions. Some of them, indeed, would think themselves lucky in keeping outside the prisons. . . . Few have gained their positions by fitness or by public service; many have gained them by scoundrelism; some by crime. . . . It has been my lot also to have much to do with two interior American cities of less size—one of about 100,000 inhabitants, the other of about 12,000. In the former of these I saw a franchise, for which $1,000,000 could easily have been obtained, given away by the common council. I saw a body of the most honored men in the state go before that council to plead for ordinary justice and decency. I saw the chief judge of the highest court of the state, one of his associate judges, a circuit judge of the United States, an honored member of Congress, two bishops, the president and professors of a university, and a great body of respected citizens urge this common council not to allow a railway corporation to block up the entrance to the ward in which the petitioners lived, and to occupy the main streets of the city. They asked that, if it were allowed to do so, it might be required, in the interest of human life, either to raise its tracks above the streets or to protect the citizens by watchmen and gateways, and to pay a fair sum for the privilege of cutting through the heart of a populous city. All was utterly in vain. I saw that common council, by an almost unanimous vote, pass a bill giving away to this great corporation all this franchise for nothing, so far as the public knew, and without even a requirement to protect the crossings of the most important streets; and I soon afterward stood by the mutilated body of one of the noblest of women, beheaded at one of these unprotected street crossings while on an errand of mercy. So, too, in the smaller of these two interior cities, while the sewerage and the streets were in such bad condition as to demand the immediate attention of the common council, I saw the consideration of these interests neglected for months, and the main attention of the council given to a struggle over the appointment of a cemetery-keeper at a salary of $10 a week."

This, however, by no means exhausts all the causes of municipal corruption. Another cause of misgovernment is the uncertainty of responsibility, especially in its executive branches. Various departments, which should work in closest harmony, owe their appointment to as many different authorities; and often not only do not cooperate, but actually pursue cross purposes. Said Mr. Francis Bellamy:

> "At one time Philadelphia was found to be possest by four boards with power to tear up the streets at will, but none

whose duty it was to see that they were properly relaid. Or here is an example of a composite officialdom which may happen any day: a 'citizens' ticket' mayor, a Republican street commissioner, both elected by the people; other appointments filled by men acceptable to a Democratic board of aldermen; a police commission named by the governor, together with the state legislature interfering on occasion. With such a mixture it is not easy to fix responsibility for maladministration. Non-partizan commissions of four members, two from each party, is another favorite and specious arrangement by which the people are prevented from calling either party to account. This non-partizan contrivance is also an open door for the most unblushing division of spoils in the department between the 'workers' of both parties . . . The people of Boston, for instance, do not know [the charter has been now changed.—Ed.] where to lay the blame for many municipal disorders. Mayor and street commissioner, school board, and the two chambers are elected by the people. Treasurer, auditor, superintendent of the streets, and 104 other officials are appointed by the mayor and aldermen together. There are forty distinct executive departments which depend on mayor and aldermen. The police department is controlled by the governor and his council. The state also appoints a fire marshal to investigate fires, while the city-appointed firemen put them out. The various departments are headed by commissions of three or five men, and by another ingenious contrivance these men are appointed by the mayor singly, only one each year; so that the mayor can never control any commission of three until his second year, nor any commission of five until his third year, if he lasts so long. But these are not all the obstacles the people meet in finding out who is accountable. If seven of the twelve aldermen are not in sympathy with the mayor, they can, by dictations or bargains, put such a restriction on his appointments that he finds himself without control of the executive departments of which he is the nominal head. It is, indeed, as an English journal said, 'the craftiest combination of schemes to defeat the will of democracy ever devised in the world.'"

The efforts at reform began with an increased trust of the people. Popular election of mayors was begun in Boston and St. Louis in 1822, and in Detroit and New York in 1834. The council too was modeled after the state legislature and frequently made bicameral, the mayor having a veto power. But these changes produced little result, because they did not in the slightest degree touch the fundamental evils.

Various Theories

The next idea was, because of the corruption of city councils, to minimize their powers, and to create boards appointed by the governor, the legislature, or the mayor—rarely chosen by election. This system probably began with the New York charter of 1849. By 1860 almost all important municipal functions in the chief cities were in the power of such boards, which had little accountability to the people or to the council. They were sometimes self-perpetuating, and their members could be removed only for cause. The result was disorganization and a very divided responsibility. About 1880 the theory came into vogue that to ensure responsibility increased powers should be given to the mayor. He should have large powers of appointment and removal, so that he could be held responsible. This idea was incorporated in the charter of Brooklyn in 1882, and rapidly embodied in the charters of many other cities (New York in 1895). This change was accompanied by the creation of many single commissionerships in place of boards. But the system has not produced large results, and has by no means been copied in all cities. To-day there can hardly be said to be any American municipal system. City charters created by different legislatures vary in every possible way. The tendency has developed to enact laws, not for specific cities, but for grades of cities according to size. But this has had little effect on the larger cities. In California, Missouri, Washington, Minnesota, and Colorado cities have been given the right to frame their own charters; but this right is practically nominal, since the state constitutions largely determine what powers can be adopted.

The American city has only authority in powers enumerated by the Constitution or by legislative enactment. Nor has it any taxing power beyond what the legislature gives it.

In most city charters this financial limitation has also been largely increased by provisions strictly fixing the city's debt limit. These limitations were placed in the effort to restrain the vast and useless expenditures of corrupt and inefficient councils; but they now work to prevent activities for improvements absolutely needed, even when these improvements may in the long run be made very remunerative to the city. It is this provision of most American city charters which often blocks the development of municipal ownership and operation that prevails in Europe. The city having no power to develop such activities, it is left for private corporations to do so; and this naturally tends to stimulate the latter in endeavors to control and debauch legislatures, councils, and city and state politics. Parties need the support of corporations, and their machines therefore become dependent upon these. With little proper civic life, city politics become ensnared with national politics. The effort to prevent this has led to the holding of city elections on separate days from state elections. About 1880 it began to be held that if city politics could be divorced from national politics, great good would result. This was largely emphasized by the New York Commission of 1876, appointed to investigate municipal government. Since then it has been accomplished to a considerable extent, but has been productive of little good. The state still has virtually all the legislative and governmental powers, while the city has only administrative powers; and monster corporations still control legislatures and councils. Preying upon and using ignorant and corrupt masses of voters, these corporations, through rings and cliques, rule our cities.

Reforms

The New York City charter of 1897 marked the beginning of a tendency to increase the power and responsibility of the city council; and the revised charter of 1901 actually removed many of the checks placed upon the council's actions. Mr. Dorman B. Eaton argued that a council could be non-partizan, a mayor never. Other reforms have been agitated. Quite recently Iowa, California, Nebraska, and South Dakota have granted to local legislative authorities the right to refer questions to the people of the localities. (See DIRECT LEGISLATION.) In order to take the nominating power from the machine leaders, Minnesota (1900–1902) adopted a system of direct nominations, and other states are following suit. The latest idea is the so-called Galveston idea. See GALVESTON.

Above all a spirit of reform has entered into civic life. Men of character and position (such as Mr. Seth Low, Mr. Roosevelt, and others), have entered into city politics, and have taken office. National conferences for good city government became important in 1894. A NATIONAL MUNICIPAL LEAGUE was founded, and also a LEAGUE OF AMERICAN MUNICIPALITIES. Local citizens' unions and municipal leagues have been formed in all the principal cities. (See under the head of the several cities.) Reformers have appeared, who are willing to unearth and expose corruption at any cost. The results have not as yet justified

the hopes of these reformers. Undoubtedly something has been accomplished; but too often the uprisings of indignant citizens have been but temporary, and at the next election the reformers have been defeated by the experienced work of corrupt machines. Many are coming to believe that there can be no permanent reform until the system has been changed whereby gigantic corporations owning or desiring franchises of enormous value are given such inducements to corrupt legislatures and councils. Public-ownership parties are therefore being formed in many cities; and in Chicago and New York these parties have already polled formidable votes. (See Chicago; New York; Public Ownership.)

Great Britain

The city in Great Britain, because of the early development of a central government, as compared, for example, with Germany and Italy, never attained in medieval times the same independence as some of the German and Italian cities; but, on the other hand, it has never been so completely subordinated to the State as many continental cities, because the administrative system of the English Government has never been largely centralized. The administration of justice and the preservation of peace were administered by the city, tho regarded as functions of the state government. The cities, however, had little or no political life of their own, and were constantly used, first by the crown, then by the nobility and gentry, and later by national political parties to control Parliament. The cities, or boroughs as they were usually called, were incorporated through a grant of the crown to each locality of an especial charter. These charters were given, not to the people living in the district, but only to the municipal officers, or perhaps including a very narrow border of freemen. The corporation usually consisted of mayor, aldermen, and councilors. The charters were distinctly oligarchic, and the sphere of action was very limited. Not the council, but special parliamentary trusts or commissions conducted such functions as the paving, lighting, and even the watching of streets. The administrative degradation of the city was complete.

Beginnings of Reform

Modern municipal reform in Great Britain begins with the Scotch Municipal Government Act of 1833, and in England with the Municipal Reform Bill of 1835. These bills were consequent upon the great Reform Bill of 1832 reconstructing the parliamentary boroughs. They admitted to burgess rights all property owners and all occupiers of rented property valued at £10 per annum. These remained substantially in force till the Act of 1882 consolidated all acts bearing on the subject into one municipal code. By the Local Government Act of 1888, cities having over 50,000 inhabitants became distinct counties for administrative purposes. Under these bills and some special bills enlarging their functions England's towns exist to-day. It has been said that the whole substance of British municipal government is condensed in the following clause:

"The municipal corporation of a borough shall be capable of acting by the council of the borough, and the council shall exercise all powers vested in the corporation by this act or otherwise. All that the burgesses have to do is to elect the councilors, and they do the rest."

No attempt is made by law to secure amenability of the council to the popular will, except through public opinion. The position of the councilor is made one of power and of honor, and the result has been that the council is usually composed of the best citizens, instead, as is too often the case in America, of the worst. The council divides itself into committees, and each of these has control of some civic department. The people control the council, the council the committees, the committees the departments. Members of the council serve without pay; and are therefore not prompted to seek election by motives of pecuniary gain. For this reason, if for no other, they are usually men of position and of character. For councilors on the various committees and for heads of departments it secures the best citizens, thus obtaining an honest and efficient administration. Also the officers of the departments are appointed by the council, and with no legal requirements as to length of time of office or of qualifications. Thus the councils can choose the best, and good men can be retained. Hence continuity of effective administration. The entire administrative force is out of politics, national and local. The most important office is that of clerk of the corporation, often a life position.

Any burgess is eligible to the council. In addition, property and rate-paying qualifications admit to eligibility suburbans who live beyond, but within 15 miles from, the limits, yet have their business interests in the town. The councilors are elected for three years, and one third of them retire annually. The aldermen (or those councilors who rank next to the mayor, and who are also police judges), and mayor are an integral part of the council, the law stating specifically that "the council shall consist of the mayor, aldermen, and councilors." Aldermen are elected by the council, and hold their office six years. They are one third as many as the councilors. Half the aldermen retire every three years. The mayor is elected by the council from among the aldermen or councilors or persons qualified to be such.

The English franchise is very complicated and very different in different portions of the United Kingdom. The franchise is often different for parliamentary, town-council, school-board, and parochial-board elections. It turns on the household rather than the individual. Mr. Shaw says ("Municipal Government in Great Britain"):

The Suffrage

"The English municipal electorate excludes in practise nearly all the unmarried men, all floating laborers and lodging-house sleepers, and nearly all the serving class. Furthermore, in judging of the political effects of the extension of the franchise to the humblest householders, it must be borne in mind that the exploitation of the votes of the ignorant, vicious, and indifferent in English cities by demagogs or party agents is so extremely difficult that it does not count for anything at all in election results. The extraordinarily severe laws against bribery, direct and indirect, apply to municipal elections, and it is next to impossible to get a British voter to the polls who does not contemplate the contest with some glimmering of interest and intelligence. In Scotch towns the slums do not vote, because they evade the rate collector and are not registered. In English towns, altho registered by canvassers, they do not care about voting, and are a neglected field so far as political missionary work goes. The organized working men vote, of course; and they seem to vote with more intelligent and distinct purpose than any other class in the community. Of the women rate-payers nothing is to be said except that their voting is variable, sometimes being high in proportion to their numbers, and sometimes low, depending upon their interest in particular candidates or special issues. Their disposition to espouse party causes seems very marked, but it is not to be relied upon as unthinking or as oblivious of the qualities of candidates. Obviously, the franchise needs simplification, altho for municipal purposes it is difficult to see what desirable end would be gained by changing the principle from that of a household franchise to a personal one."

Such is a general view of British civic administration. The recent growth of the cities has, however, developed new needs, and new problems; but these, on account of their importance, are

best treated under special heads. (See Local Government; Municipalism; Municipal Trading; School Question in Great Britain.)

Germany

Municipal structure in Germany varies somewhat in different states and in different cities, yet has everywhere certain similar characteristics. In Prussia it is based on the Stein and Hardenburg reforms of the early part of the century. The Prussian franchise, both in the municipalities and in the kingdom, is based upon a division of the population according to the taxes paid. The wealthiest class, which pays one third of the taxes, has one third of the suffrage. The middle class, which pays a second third of the taxes, has another third of the power; while the remaining third is left to the whole remainder of the population. In the constitution of the empire, however, and in many German cities, outside of Prussia, the franchise is based on manhood suffrage as demanded by the revolutionists of 1848. In all cases, however, the city council (*Gemeindwalt*) has the municipal power. Its members are usually elected for six years, one third going out of office every two years. The executive power is exercised by the burgomaster or mayor and a body of department chiefs, called magistrates. These are elected by the council, and have practically a life tenure. They are selected for expert knowledge and ability. A city will sometimes advertise for an experienced mayor. The magistrates are either highly salaried men or men of position who serve without salary. They form a council called the *Magistratsrath*. With this constitution in all German cities, the council, through the burgomaster and magistrates, conducts the city government as a father would a household. The city can do anything that it is not forbidden to do—the reverse of the American theory. It is supposed to do all that is necessary to the best interests of the community. The cities as a rule furnish their own water supply, gas, and electric lighting. They strictly rule the running of the horse-cars, etc. They build and maintain baths, lavatories, abattoirs, markets, savings-banks, pawn-shops, etc. They care minutely and effectively for sewerage, street-paving, cleaning, and lighting. German cities provide systematically, too, for the relief of the poor. The cities are subdivided into districts, with a visitor for each. Workpeople must be insured by the municipalities or the state; compulsory education is provided at low rates; manual training and gymnastic drill is a part of the education. German cities are thus households, carefully watched, regulated, kept clean and healthful. Taxation is generally not high, no small portion of the municipal revenue coming from municipal activities or franchises, carefully sold at rates very favorable to the city corporation. (See also Berlin.)

Organization

The following from Dr. Wilms Erster, Mayor of Posen, gives a favorable idea of German civic administration:

> In Germany to-day everything is planned by the municipalities with a view to general harmony. Factory, business, and housing districts are conformed to special needs. The height of the houses in proportion to the width of the street, and the utilization of building sites are restricted to admit light and air. Ordinances govern the height of rooms, the number of windows per room, substantial construction, etc. The pavement of the streets is suited to the character of the surrounding neighborhood. Careful attention is given to the future erection of public buildings, play-grounds, and recreation centers. Artistic effect is always sought. Municipal building here takes the initiative and influences private enterprise. When property is bought for building purposes, the plans showing the front of the building to be erected must be submitted to the authorities for approval. The disfigurement of street fronts by bill-boards is regulated.
>
> Sewage pipes receive street drainage as well as house sewage. Some cities separate the drainage from the sewage system. Pipes conduct the sewage outside of the city limits and utilize or dispose of it in various ways. Berlin and Breslau carry it through fields, where it is used for fertilizing and manuring. In other cities the pipes empty into rivers after their contents have been clarified. This process is costly and difficult, forcing the towns to acquire large areas to fertilize them with this waste.
>
> The larger cities have, almost without exception, hygienic institutes where all questions relating to the public health of the city are studied. The interest of the authorities in the promotion of public health has led to a considerable decrease in mortality during the last decade. In the seventies the death rate was 35 to 40 per 1,000; to-day the average has decreased to 20 per 1,000. In cases of contagious diseases prompt notice to the Board of Health is compulsory. All premises are disinfected by the Board of Health, and the poorer classes are not charged for fumigation. In some cities, as for instance, Posen, disinfection is free for all classes.
>
> The inspection of foods, such as milk, butter, and meat, is in charge of the Board of Health.
>
> Public swimming and shower baths are provided.
>
> Consumptives are cared for in homes for consumptives, and persons suffering with incipient consumption are sent to forest colonies. Those unable to pay for treatment are placed in these institutions at the expense of the city or State. Asylums are provided for the feeble-minded. Any one who, on account of illness or incapacity, cannot support himself, receives relief from the Poor Department, in case the sickness, old-age, invalidity and accident insurance does not provide for his maintenance or the support received is insufficient.
>
> The departments of education of the various communities and cities provide public, elementary, and high schools. Special schools and institutes give courses in the building-trade and machine-shop training. Cities engaged in special industries, such as textile, ceramic, woodwork, etc., have special schools. There are further arts and craft schools for women. When the public-school education of the child is completed, the continuation school must be attended, etc. In the upper grades the girls are taught cooking.
>
> For the laboring classes, people's restaurants and coffee-houses are opened, which, at the same time, serve as substitutes for the saloons.
>
> For instruction and information in legal matters, many cities maintain bureaus and consulting stations.
>
> Even the very smallest city runs its own slaughter-house. Every slaughter-house has a special department for the microscopic examination of pork.
>
> Nearly all cities own their own water-works. Gas-plants are in most cases owned by the city. These add largely to the city's income. The water-supply is not regarded by the city as a business enterprise, inasmuch as a higher rate would interfere with its free consumption. The cost to German cities for maintaining water-works is greater than in American cities; therefore the rates charged are somewhat higher, and the average consumption consequently less. Electric-lighting plants are only partly municipalized. The tendency in this respect is, however, in favor of municipalization. Cities are urged to erect plants where as yet no electric-lighting plants exist; even to erect such plants in competition with private enterprises. Competitive plants may be successfully started where private plants are operated, by withdrawing from the corporation the privilege of using the streets for conducting electricity, either above or below ground.
>
> Street railways are only partially municipalized. In many cities these are operated by private corporations. These corporations then receive franchises from the cities to lay tracks, and in return for this privilege they, in the first place, maintain part of the street in proper condition, and, secondly, pay the city annually either a certain stipulated sum or a fixt percentage of the earnings. Many cities reserve the right to determine the fares to be charged. Almost every city has its own municipal theater, and most of the large cities have their own concert halls, conductor, and orchestra. Everywhere, in large cities and small towns, the authorities have expert economists working out the social, industrial, and economic problems confronting the cities in every phase of human progress.

France

The French municipality is intimately connected with the old communes or townships, which in the early history of France won a high degree of local autonomy, and played no small part in the national history. (See France and Social Reform.) These ancient communes,

however, had gradually lost all autonomy, and become but administrative parts of the absolutism of the Louis. The Revolution instantly liberated them, but under Napoleon, as First Consul (1800), they again became but units of his highly centralized system—a system, however, with some attempt at justice and freedom. Changing with the changes of France, the communes at present, under the third republic, have considerable local power, yet are by no means free from the control of the central government. The Act of 1884, which is virtually the act under which they exist to-day, increases the local powers of the communes materially, yet leaving very much to be desired by the radicals and Socialists, who in France, more than in most countries, center their ideals around the autonomy of the old communes. According to the present system, some of these communes are municipalities, some of them rural townships. According to the present law, they are governed by a mayor, with his executive assistants, and a council. The council elects the mayor, and the council is elected by manhood suffrage in the communes. The councilors hold office for four years, and all retire together. The council holds four regular sessions a year, lasting from fifteen days to six weeks, tho the mayor may call extra sessions. The council appoints consultative committees, but the mayor has all executive power with his assistants. He has the appointing power, subject to the approval of the prefect of the department, the representative of the central government. The council has large authority in the levying of taxes, voting of public works, etc., but usually subject to the approval of the department authorities.

Paris has in many ways less local autonomy than any other city in France. In the Revolution she gained her old communal freedom, and has at every revolution, but it was taken away by the various imperial governments, and has only been partially granted by the republic. Paris is still largely governed by the prefect of the department of the Seine, and his colleague, the prefect of the police. The city is divided into twenty arrondissements, and in each there is a central building called the *mairie*, the bureau of an officer called the *maire*. There is, however, a municipal council with considerable power, and the tendency is to develop municipal self-control.

Statistics

One of the prominent facts in the nineteenth century was the drift of population in all countries into the cities. The following tables are compiled, except for their latest figures, from Weber's "Growth of Cities in the Nineteenth Century":

Growth of Cities (Population in Thousands)

City	1800	1850	1890	1900
London	958	2,362	4,211	4,536
New York	62	660	2,740	4,014
Paris	546	1,053	2,448	2,714
Berlin	173	378	1,578	2,033
Tokio	...	...	...	1,818
Vienna	232	431	1,341	1,674
Chicago	...	30	1,099	1,698
Philadelphia	81	408	1,047	1,293
St. Petersburg	270	490	1,003	1,373
Constantinople	300ô	400ô	873	1,125
Moscow	300ô	360ô	822	1,092
Bombay	150ô	560ô	821	1,125
Rio de Janeiro	125ô	170ô	800ô	872
Calcutta	800ô	400ô	741	776
Hamburg[1]	120ô	205	711	750
Manchester[2]	90	388	703	543
Buenos Ayres	70ô	120ô	677	1,000
Glasgow	77	329	658	735
Liverpool	82	376	518	684

[1] Including Altona. [2] Including Salford.

Some Comparative Statistics[1]

City	Population	Area acres	Density per acre.	Death-rate	Annual expenditure	Per capita cost	Debt
London	4,654,437	75,575	61	16.6	$82,000,000	17.62	$378,278,250
New York	4,014,000	197,760	20	18.2	156,000,000	38.94	459,000,000
Paris	2,714,000	19,259	142	17.2	65,000,000	24.09	400,000,000
Berlin	2,033,000	15,676	130	16.9	45,000,000	22.1	87,000,000
Vienna	1,674,000	43,980	38	18.3	32,932,614	19.07	.....
Chicago	2,050,000	121,920	17	16.2	64,104,166	31.27	20,200,000
Philadelphia	1,500,596	82,880	18	21.2	46,874,326	31.25	61,137,000
St. Petersburg	1,487,000	71,679 (with suburbs)	20	23.7	9,250,000	6.22	.....
Hamburg	872,000	94,693	9	17.9	25,280,000	29.0	.....
Manchester	631,185	19,893	31	21.3	.....	.....	.....
Glasgow	798,778	12,796	63	21.2	.....	.....	.....
Liverpool	710,337	17,792	40	22.6	.....	.....	11,126,950

[1] The items are not all for the same year, tho all for recent years and the financial items, like Annual Expenditure and Debt, are not all estimated on the same basis, yet do in a general way present a real comparison.

The foregoing table of comparative statistics has, however, very little value, unless rightly interpreted, and may very easily completely mislead. The relative population and acreage of cities mislead unless one knows to what extent populous suburbs are included in the city area. New York vastly increased her population in 1898 by including Brooklyn and other boroughs, and becoming "Greater New York." Density per acre may be still more misleading, because of variations in different sections of a city. New York appears in this table with a low density per acre, but this is only because large areas as yet little occupied are included in the city limits. As a matter of fact certain sections of Manhattan Island, where is found a large portion of New York's population, has a greater density than any city in the world. Death-rates may also mislead, tho to a less extent. An average general death-rate may conceal a very high death-rate among the poorer classes, balanced by an unusually low death-rate among the more prosperous classes. Similarly with comparative financial statements. Annual expenditures and municipal debts have very different real values, depending upon what they represent. A city making large expenditures

and carrying a large debt may be in a very much better financial condition than a city with a small expenditure and debt, because the former represents revenue-bringing investments, while the latter do not. Some city governments are expensive at any price; others cheap at any ordinary cost. This distinction generally speaking is against American cities as compared with European, because American cities have few revenue-bringing properties, while European cities often have many.

POPULATION IN CITIES OF 100,000 OR OVER

COUNTRY	1800 [1] Total population in such cities	Per cent of population of country	1850 [1] Total	Per cent	1900 [1] Total	Per cent

CITIZENS' INDUSTRIAL ASSOCIATION OF AMERICA, THE: An outgrowth of the feeling that labor-unionism has taken on certain features which operate most injuriously to the general interest and which need correction. The fact that in all labor disputes, however brought about, the public must foot the bills and suffers from consequent derangement of business, loss of employment by the working classes, etc., suggested the idea that an organization which should comprize all classes of society was necessary to meet these conditions. Employers and strikers alike have been prone to disregard the interests of any one, except themselves, in case of a controversy.

The Citizens' Industrial Association is not opposed to labor-unions. It recognizes the value of organizations of working men, not only to themselves but to the general welfare. But many of the practices of modern unionism are directly opposed to that welfare, are extremely harsh in their operation upon working men who do not belong to the unions, and establish unjust conditions, as by a limitation of output, whereby working men who are members of the union are restricted to the amount of work they may do in a day, by restricting apprenticeship until it has become practically impossible for more than one out of eight of American-born boys to learn a trade, and by denying forcibly, and by violence very frequently, and sometimes by murder or manslaughter, the right of working men not members of the union to accept employment when and where they please and on such terms as suit them and thus to earn their living by the labor of their hands. The resulting assumption of the labor-unions that they must be permitted to control the labor market and dominate all transactions between employed, employers, and the public is regarded as un-American and the practical establishment of a trust which is more mischievous in its operations and more threatening to the best interests of the common people than any other in existence. It is unfortunate that the management of labor-union forces has fallen into the hands of a class of men not of the highest intelli-

gence and patriotism, who in seeking the advancement of their personal interest, as such leaders have misled their followers (the majority of whom are really at heart good and patriotic citizens) to the support of methods which cannot be justified.

For these reasons the effort was entered upon some four years ago to unite the people who are not members of the union and to set their strength over against that of the labor organizations in order to secure the correction of the evils referred to. This it was felt was not only required on behalf of the members of the unions themselves, but emphatically necessary for the protection of the people. And to that end the cooperation of not only employers and working men but also of professional men, of merchants, of farmers, of clerks, and the vast multitude who are not affiliated with labor organizations has been sought.

The census of 1900 gave 29,000,000 as the number of working men, wage-earners, etc., in this country. It is reasonable to assume that by this time the number has reached 32,000,000 at least. The leaders of what may be termed the Labor Trust do not claim that the membership of the unions amounts to more than 2,000,000, and yet they assume to speak for the other 30,000,000, assume to dictate as to the employment of the other 30,000,000, and assert the right to control relations between labor and employers. The result is, so far as the latter point is concerned, that by the unwise increase of wages brought about by force and duress, and not by natural operations of normal conditions, the cost of living to all has been enormously increased with no resulting benefit to the members of the Labor Trust (whose living expenses have been also forced up with the increase of wages, that is, the increase of the cost of production), while the burden has fallen with tremendous weight upon many millions who find no increase in their own incomes to correspond with the greater cost of living thus brought about.

There are between 400 and 500 local associations throughout the country, in at least forty-three states and all of the territories, which are in affiliation with this National Association. These local associations run from a hundred or more up to several thousand in membership each. The St. Louis local association, for instance, has a membership of over 8,000 and is rapidly increasing. By its influence it has succeeded in giving industrial peace to St. Louis where three or four years ago the most violent demonstrations were characteristic of labor strikes, where the commerce and business of the city was held up at the mercy of the leaders of the strikers to the infinite loss of the community in general.

The work of the extension of the influence of the association is going steadily forward in all parts of the United States, is being emulated in Canada, and has been imitated in Great Britain by the recent organization of a British Citizens' Industrial Association, modeled upon the principles of the American institution. This system of meeting organization with organization is the first practical effort that has been made at reducing the undesirable conditions established by the Labor Trust. In politics the unions have been accorded an undue weight because of the fact of their organization as a compact body operating as a trained and disciplined influence, while the great mass of the voters had no organization outside of political parties.

Activities

The officers of the association are Mr. C. W. Post, who was elected last December for the third time to the position of president, Messrs. James W. Van Cleave (president of the National Association of Manufacturers), first vice-president; F. C. Nunemacher, second vice-president; A. C. Marshall, third vice-president; James A. Emery, Esq., secretary; and Major A. C. Rosencranz, treasurer, with an executive committee of ten members comprizing leading business men representing the large cities and manufacturing centers of the country. The association has its headquarters in the St. James Building, Twenty-sixth Street and Broadway, New York, and publishes, as its national organ, a monthly magazine known as *The Square Deal*, which is used chiefly as an educational instrumentality and which carries at its head the following platform of principles:

No closed shop.
No restriction as to the use of tools, machinery, or material except such as are unsafe.
No limitation of output.
No restriction as to the number of apprentices and helpers, when of proper age.
No boycott.
No sympathetic strike.
No sacrifice of independent workmen to the labor-union.
No compulsory use of the union label.
"I find every one of these principles to be in defense of private and public liberty."—*Charles W. Eliot, President Harvard University.*
That power through organization be placed in the hands of the people to effectually control the acts of all organizations when such acts relate to the public welfare, thus to perpetuate the individual liberty of every citizen and prevent interference with the continuous operation of industries.

WILSON VANCE.

CIVIL SERVICE REFORM: The Civil Service of the United States includes all public employments which are not military or naval. It may be divided into two parts—the political and the non-political. The political part comprizes the positions which are essential to carrying out the policy of the administration which has been approved by the people at the polls; and the non-political part embraces the positions which are subordinate and ministerial. This last part is strictly a business agency with no representative political character or significance, and civil service reformers aim to purify politics by the removal from political contests of all inducement of office-seeking in these business agencies, and to make the tenure of office in them independent of party changes by putting them under the protection of law. They urge the adoption by legislation or executive action of rules for the regulation and improvement of the public service and for aiding appointing officers in choosing candidates for appointment upon a merit instead of a party basis. While it is obvious that a public office belongs to the people, that its duties are fixt by law and its salary paid by the people, yet owing to the infirmity of human nature the power of patronage tends to be exercised for personal and partizan gain. The reform rests upon the theory that a public office is a public trust and that a president, governor, or mayor in making appointments must not, therefore, himself profit directly or indirectly, in his own person or through the advancement of any other individual or party organization, in administering his trust, and he must himself conduct this administration and not hand it over or farm it out to others. The use of patronage by an appointing officer to strengthen himself in his faction or his faction in his party or his party at the polls is, upon this theory, an

abuse of trust and a form of bribery. The reform, therefore, does not merely propose the establishment of a system of mechanical examinations to test fitness for appointment, but aims at the eradication of the doctrine that offices are party spoils for the victors. A reform in this regard is deemed by its advocates to be vital if the government is not to break down under its work. Under the spoils system the government cannot deal worthily with the problems presented by the growth of industrial combinations, the tariff, the currency, and the regulation of public utilities. Business has attained a high economic organization with which law and administration have not kept pace. Governments are outgrowing their shell and are called upon to do more things and do them better than formerly. The number of public employees is increasing more rapidly than population, due to the assumption of functions that have heretofore been neglected or left to private enterprise. The task of solving these new problems and of administering government efficiently and economically needs the aid of men of as good abilities as the great captains of industries, men trained in administration and fit to be the dispensers and instruments of the power of society, who will administer their trust in the interest of the whole people and not pervert it to the interest of a faction or for corrupt ends.

The reform of the civil service is chief among the great administrative reforms for which the nineteenth century is distinguished. No other reform has made such rapid progress or reached such a stage of general acceptance. It has been found the necessary basis and means of effecting other civic reforms. The history of European countries during the century exhibits social transformations arising from the improvements which have been effected in their administrative machinery, and our country advances as fast as civic spirit and conscience gain the strength and find ways to overcome the forces which would debauch and dishonor it. Party leaders in all countries have used the power of patronage in aid of their own power or that of their party, and their followers appointed to office have regarded their allegiance and efforts as due to them rather than to the government. At the beginning of the eighteenth century the party system reigned in the civil service of Great Britain and state employments were treated as the assets of the party in power and available for party purposes. This feudal administration of the government demoralized the public service and public spirit and is said by Trevelyan to have been one of the efficient causes of the American Revolution. The founders of our government, in breaking away from the mother country, sought to escape the evils of the patronage system; and the purity of the early administrations was such that during the first forty years after the establishment of the Constitution the appointing power was exercised in the spirit of Washington, who declared that nothing would procure an appointment but evidence of ability, integrity, and fitness. The intent of the Constitution, that office should be held during good behavior, was during this period given thorough and practical effect. The spoils system had its beginning in the laws of 1820 and 1823, causing a departure from the traditional policy. It rapidly became the practise to regard these four-year tenure offices as agencies not so much for the transaction of the public business as for the advancement of political ends. The public service, from being used for political purposes, came also to be used for currupt purposes, frauds and defalcations were common, and the public duties, where not entirely disregarded, were negligently and inefficiently performed. The saturnalia of spoils and corruption culminated in the assassination of President Garfield.

The tide of corrupt practises in Great Britain began to turn with the growth of a better sentiment during the reign of George IV., and a merit system of selecting candidates for office began in a small way in 1834. In 1855 a uniform system of competitive examinations was established, effecting a sweeping reform, which has proved permanent and salutary. In our own country in 1853, the same year with the passage of the India Act, and in 1885, laws were passed providing for an examination before an appointment in any of the executive departments. These pass examinations proved inadequate, as they had also in Great Britain, and while useful to a degree, they failed to remedy the evils at which they were aimed. In 1864 Senator Sumner put the reform sentiment of our country into a bill which he introduced in the Senate. A somewhat similar measure was introduced in the House of Representatives in 1867 by Mr. Thomas A. Jenckes of Rhode Island, followed by a comprehensive report presented by him from a joint committee of the two houses of Congress. These bills failed, probably because public sentiment had not been sufficiently awakened, and because their provisions were regarded as too radical and sweeping.

The Commission of 1871

In his annual message of 1870 President Grant recommended legislation, and a commission was established in 1871 of which Mr. George William Curtis was chairman. He was shortly succeeded by Mr. Dorman B. Eaton. An appropriation was made by Congress during two years for carrying the law into effect. Competitive examinations were enforced under rules applying to promotions as well as to original admissions. In the same year President Grant, in a message to Congress, urged that an appropriation of $25,000 be made to continue the system. Congress refused to make the needed appropriation, partly because of the inherent defects of this meager law and the partizan hostility to it. President Grant was obliged to arrest the work of the commission in 1875, and the efforts for reform in a large measure failed, tho the good effects of the examinations were beyond question. In 1877, and again in 1879, President Hayes requested Congress to make the necessary appropriation for the resumption of the work, and he established rules under which competitive examinations were enforced at the New York custom-house and post-office.

Public opinion, which had been diverted from the growing evils in the civil service by the Civil War and the problems arising out of it, was now turned to the imperative need of reform. The voice of the people was unmistakable, and on Dec. 15, 1880, Mr. Pendleton, a Democratic senator from Ohio, presented in the Senate a bill which was in substance and in nearly all of its provisions the same which had been originally presented in the House by Mr. Jenckes. In the debates upon this bill its advocates declared that it would "vastly improve the whole civil service of the country," which they characterized as being at that time "inefficient, expensive, and extravagant, and in many instances corrupt." The bill

became a law on Jan. 16, 1883. It aims to eliminate patronage and political and personal favoritism in appointments, thus taking out of political contests all inducement to office-seeking, and preserving the independence of the legislative and executive departments. It provides for the appointment of three commissioners, not more than two of whom shall be adherents of the same political party, and makes it the duty of the commission to aid the president as he may request, in preparing suitable rules for carrying the act into effect. The act requires that the rules shall provide, among other things, for open competitive examinations for testing the fitness of applicants, the making of appointments from among those passing with the highest grades, an apportionment of appointments in the departments at Washington among the states and territories, a period of probation before absolute appointment, and the prohibition of the use of official authority to coerce the political action of any person or body. The act also provides for investigations touching the enforcement of the rules and forbids, under penalty of fine or imprisonment or both, the solicitation by any person in the service of the U. S. of contributions to be used for political purposes from persons in such service, or the collection of such contributions by any person in a government building.

Legislation in 1883

The first parts of the service classified embraced the departments at Washington and the custom-houses and post-offices having as many as fifty employees, applying in all to less than 14,000 positions. A committee of Congress, composed of eight Democrats and five Republicans, in June, 1884, made a unanimous report in which it declared itself "entirely satisfied with the thorough, conscientious, and non-partizan work of the commission," and added that the continuance of its work would in a large degree aid in eradicating the prevalent evils in the civil service. In the second year the new system was subjected to the severest test of its vitality. A party which had been out of power for twenty-four years refused to treat the New York custom-house and post-office as party spoils. Notwithstanding the change of power and the fact that the new party had been out of control of the offices for a quarter of a century, the new system was enforced, and the number of places subject to it nearly doubled. In 1886 direct assaults to annul the law failed in both houses of Congress. In the same year President Cleveland commended the cause to the liberal care and jealous protection of Congress. He said that the scheme for reform in the methods of administering the government was no longer an experiment, and that wherever the reform had gained a foothold it had steadily advanced in the esteem of those charged with public administrative duties, while the people who desired good government had constantly been confirmed in their high esteem of its value and efficiency. Several large extensions of the classified service were made by President Cleveland in 1888, as also by President Harrison in 1891. In 1896, during President Cleveland's second term, the number of classified positions was increased by executive order from about 43,000 to about 87,000. Under President McKinley the merit system was applied to additional customs ports, Hawaii, Porto Rico, and the Philippines, and under President Roosevelt to the rural delivery, census bureau, field employees of the War Department, the Spanish War, forestry and Isthmian canal employees, and to laborers. The rules were revised and strengthened under President Roosevelt and a marked improvement effected in their observance; the number of excepted positions has been reduced, notably higher positions in the customs service and deputy collectors of internal revenue, and a merit system applied to the consular service.

Congressional Committee of 1884

There are about 325,000 positions in the executive civil service, of which 184,178 are classified subject either to competitive examination under the civil service rules or to a merit system governing appointments at navy yards. In the latter class are about 18,000 workmen. The total expenditure for salaries in the executive civil service is about $200,000,000. Laborers and persons nominated for confirmation by the Senate are exempted from the requirements of classification. Within these limits certain classes of positions are excepted from examination. Examinations are held in every state and territory at least twice a year. They range in scope from technical, professional, or scientific subjects to those based wholly upon the age, physical condition, experience, and character as a workman of the applicant. During the year ended June 30, 1906, 117,277 persons were examined and 39,050 were appointed. In 1900 the Philippine Commission passed a civil service act and in the same year the federal civil service act was extended to Hawaii and Porto Rico. The Philippine act is based upon the federal act and goes much further in giving powers to the commission. There are no excepted positions in the Philippines and natives are preferred in appointment.

Statistics

The competitive system has proved infinitely better than the patronage system. It has produced great economy and efficiency, and the public service has been improved in honesty and general character. Unnecessary positions created for parasites have been abolished. Improved methods of business have been rendered possible by the stability given to the service. Superfluous work is no longer devised to create places for favorites. Employees, released from political and personal obligations, are required to do more and better work. Thus a very great economy has been effected and vastly more is being done in aid of the public welfare, in promotion of the ends for which government is constituted. A marked result is found in the elevation of the tone of official life. The holding of office within the merit system, instead of being a makeshift or a refuge, is regarded as a worthy career that may be attained by self-respecting methods. In time office-holding may be regarded as one of the most important and desirable of professions when freed from the subserviency, discreditable partizan work, and solicitation by which office is gained and held in parts of the service outside the merit system and when promotion is possible to higher administrative positions.

The merit system has not been carried as far in this country as in Great Britain and in several European countries. Postmasters, collectors of customs and internal revenue, and other heads of offices and bureaus are appointed by the president subject to the confirmation of the Senate and are therefore not required to be classified. These offices continue to be political agencies and their occupants being active working politicians are

greatly aided by the power of their offices in affecting the political prospects of leaders in their districts. Thus the Senate becomes actually, if not formally, a nominating body and holds to the powers thus acquired by individual senators. The ultimate and complete success of the merit system depends upon the prohibition of a party test in appointments to these purely administrative business offices.

State Civil Service

The abuses which have been largely corrected in the federal service continue to exist in some of the state governments and especially in the governments of many of the large cities. Fitness for office has been subordinated to a party test, political assessments levied, employees coerced in their political action, and municipal contracts and jobs distributed as political favors. These abuses have been partly corrected by the adoption of the merit system for minor non-elective offices in several state and city governments. The success attending the reform in the federal service has led to its adoption in the program for the reform of state and municipal governments. The federal civil service law and a state law in New York were approved in 1883, a law in Massachusetts in the year following, and laws in Illinois and Wisconsin in 1905. In Massachusetts civil service rules prevail everywhere. In New York a second law in 1884 extended the system, and since 1894 it has been entrenched in the state constitution and applied to villages, all the cities, and, in 1906, to four counties. In Wisconsin, in addition to other state employees, the rules apply to legislative employees. The first municipal civil service rules in the U. S. were established in Brooklyn in September, 1884; the second in New York City in November, and the third in Buffalo in December of the same year; and the cities of Massachusetts followed in 1885. There have been setbacks, but in those cities the system is now successfully enforced. In Buffalo, for instance, more than four fifths of the municipal offices in all departments are under rules which are well administered. There are now seven cities outside of New York and Massachusetts which have a complete merit system: Chicago (1895), Milwaukee (1895), Seattle (1896), Los Angeles (1903), Portland, Ore. (1903), Denver (1904), and Philadelphia (1905). In addition to this list there are some states, cities, and towns where a partial merit system has been established, or where a system has been established and then abandoned. In 1885 Illinois passed an admirable act, not applying to the state service, but permissive for towns and cities, under which Chicago and Evanston adopted rules in 1885, and Cook County, Rockford, Aurora, and Elgin in 1903. The state charitable institutions of Indiana have been made non-partizan by voluntary action of the boards. San Francisco secured a measure of reform by a charter passed in 1900, but it is now held unconstitutional as to certain county offices. In most of the large cities and in many small ones examinations are held for the police and fire departments and for teachers. In 1903 Ohio passed a municipal code, the provisions of which appear to be meager and inadequate and cover only the health, police, and fire departments. Under this law Cleveland, Cincinnati, and Toledo have rules in those departments. In New Jersey in 1905 a law was passed providing for rules in the police and fire departments of cities of the first class. The revised charter of New Orleans has a semblance of the merit system, and there have been creditable but only partially successful or wholly unsuccessful attempts to establish rules in Atlanta, Memphis, Minneapolis, Galveston, Tacoma, Jacksonville, and Duluth, and in Michigan, Kansas, Maryland, and Texas. The application of the merit system to state and municipal governments has proved successful wherever it has been given a fair trial, and numerous and important improvements have been introduced in the more recent legislation permitting the remedial action to be more drastic, reaching to the heart of abuses and effectually stopping them.

John T. Doyle,
Secretary, U. S. Civil Service Commission.

CIVIL SERVICE RETIREMENT ASSOCIATION: The United States Civil Service Retirement Association was organized in Washington, D. C., in the spring of 1900. The association has collected and tabulated numerous data bearing upon the subject of superannuation, in the service of this and foreign governments, and in the service of private enterprises; has endeavored to stimulate thought upon this subject, by means of investigations into the real conditions and giving the same publicity, public meetings, which have been addrest by men high in official life, and by correcting, wherever necessary, false impressions that have gained credence as to the labors, lives, compensation, cost of living, etc., of the civil service employees of the government; and it has also been in constant touch with actuaries, in an endeavor to formulate a plan under which superannuated employees may be retired with pay, such compensation to be derived from a fund constituted by assessment upon the salaries of those in the civil service.

The committee's labors resulted in the presentation of a draft of a bill to the President of the United States in May, 1906. The main features of this bill provided for an assessment of 5 per cent upon the salaries of civil service employees and the retirement of said employees, upon reaching the age of seventy, on a retired pay equal to one eightieth of the employee's average salary for the ten years preceding retirement, for each year of service. The bill also provides for retirement on account of disability, without respect to age, at any time after the employee has had ten years of service, on the same basis.

The present membership is about 18,000. Jacob W. Starr, of Camden, N. J., is president, and David D. Caldwell, of Peoria, Ill, secretary. *Address*: P. O. box 37, Washington, D. C.

Jacob W. Starr.

CLARK, EDGAR ERASTUS: Member of the Interstate Commerce Commission; born at Lima, N. Y., 1856. He attended school until sixteen years of age; commenced work on railroad in

1873; became a member of the Order of Conductors in 1885, and was chief of his local division for several terms. In 1888 he was a delegate to the international convention, and in 1889 was elected second vice-president of the Order of Railway Conductors. The following year he was elected chief executive, and held the office continuously till appointed by President Roosevelt in 1902 a member of the Anthracite Coal Strike Commission, giving most active and valuable service in that important and difficult cause. Clark is a member of the National Child Labor Committee, the National Civic Federation, the American Institute of Social Service, and the Academy of Political and Social Science. Mr. Clark believes in the organization of labor on protective lines, but approves of the strike only as a last resort. He is a strong advocate of arbitration in industrial disputes. He has written "Articles and Papers on Labor and Sociological Subjects." *Address*: Washington, D. C.

CLARK, JOHN BATES: Professor of political economy; born at Providence, R. I., 1847; educated at the public high-school, Brown University, Amherst College (Ph.D., LL.D.), Heidelberg University and University of Zürich. He traveled as a student and tourist in France, England, Germany, Italy, and Switzerland, returning to America in 1875. He has held the chair of political economy and history at Carleton College, Northfield, Minn.; that of history and political science at Smith College (1881–92); and that of political economy at Amherst (1892–95); and is now (1907) professor of political economy at Columbia University. He has been lecturer on economic theory at Johns Hopkins University, and president of the American Economic Association. He is perhaps best known for his writings upon Wealth (see Capital). His main writings are: "Philosophy of Wealth"; "Capital and Its Earnings"; "The Distribution of Wealth"; "Essentials of Economic Theory"; "Control of Trusts"; and "The Problem of Monopoly," in addition to numerous articles in economic reviews and journals. *Address*: 616 West 113th Street, New York.

CLARKE, LADY JANET: President of the Australian Women's National League, Victoria. She is interested in all questions affecting the welfare of women, is prominent in philanthropic movements, and rendered active assistance to the Melbourne University Fund (1904–5). In 1890, mainly through her munificence, Trinity College Hostel was supplied with a permanent building erected within the college precincts, and called The Lady Janet Clarke Building. *Address*: Cliveden, East Melbourne, Victoria.

CLARKSON, THOMAS: English philanthropist and abolitionist; born in 1760. He commenced his life-work in 1825, while at Cambridge, by writing a prize essay against the principle of slavery. He secured the cooperation of WILBERFORCE, who undertook the parliamentary campaign. Clarkson became one of the leading members in the antislavery society formed in 1823. His benevolence led him to take part in many other philanthropic endeavors, most notably in providing homes for sailors in the English seaport towns. Among his works may be mentioned: "Essay on the Impolicy of the African Slave-trade"; "History of the Abolition of the African Slave-trade"; "The Cries of Africa to the Inhabitants of Europe"; and also the "Grievances of our Mercantile Seamen a National and Crying Evil." He died in 1846.

CLEVELAND, OHIO: Has been well characterized as a city finding itself. A city of broad areas, with plenty of room to grow, it is only within the last few years that it has come face to face with metropolitan problems.

Cleveland, of New England origin, with New England ideals, was founded in 1796 by General Moses Cleaveland, acting for the Connecticut Land Company. The Western Reserve, of which Cleveland is the metropolis, was sold to this company by the State of Connecticut, and the proceeds were applied to the fund which is still used in the support of the common schools of that state. In 1840 the population had reached 10,000; in 1860 it was less than 50,000. At this time the New England traditions asserted themselves. Cleveland was one of the strongholds in the antislavery movement and was an important station on the underground railroad. In 1880 the population was barely 160,000; now it is approximately half a million.

History

Prior to 1891 the government was chaotic. It consisted of the council and mayor, whose powers were modified by numerous boards or commissions, created in various ways. Irresponsibility was largely the result. The so-called federal plan, introduced in 1891, was an attempt to adjust the English parliamentary forms to city affairs. This charter was worked out by a committee of the chamber of commerce. The mayor, with the chief executive officials of five departments, appointed by him, became the repository of all the administrative authority. These officials had a unique privilege, that of a seat and a voice in the council. The mayor exercised the veto, subject to an overruling by a two thirds vote of the council. The chief opposition to the plan was the possibility it gave for a powerful machine, but in this case the mayor, who might become the boss, was at least a responsible boss, instead of an outside and irresponsible one, as is usually the case. This plan, successful on the whole, was overturned in 1902, and the city was given a mixed product, which was a partial return to the old system of the divided responsibility.

The city has come to be essentially independent in local elections, and the principle, city before party, is becoming increasingly prevalent. The merit of individual candidates is being more and more considered, as is shown by the frequent election of Democrat officials in a Republican city. The Municipal Association is undoubtedly to a large extent responsible for this independent spirit. This association examines the individual merits of candidates irrespective of party, and its recommendations are coming each year to have a greater force.

Early in its history the city was prominent in its charities and philanthropy. Its orphan asylums, relief associations, and missions were numerous, but it is only within the last few years that any definite coordination and cooperation has been in existence. This has been brought about largely through the efforts of the Associated Charities and the chamber of commerce. The Associated Charities is a clearing-house for all charitable efforts, particularly in the form of re-

lief, and through this means duplication of effort is rapidly being eliminated. The Associated Charities has a department of relief in which intelligent investigation is the vital principle and where the principle that charity is "love with discrimination" is the key-note. Included in this department is special effort for the tubercular. The organization conducts, also, an employment department, a lodging-house, a wood yard, a penny savings-bank, a system of friendly visiting, and numerous other activities.

All of the Jewish charitable institutions in the city are affiliated through a federation which collects and disburses all funds for the support of these organizations. The Catholics conduct numerous orphan asylums and other organizations upon a high grade of efficiency. The Visiting Nurse Association provides nurses for any who are unable to pay for this service, and this undoubtedly is one of the best of its kind in the country. There are several settlements doing efficient work. One of these, the Hiram House, is following the plan, as far as possible, of having its residents live in small houses of the grade of those in the neighborhood, thus getting closer to the life of the people in the district. Numerous orphan asylums, fresh-air camps, the Young Men's and Young Women's Christian Associations, the Anti-tuberculosis League, the Cleveland Day Nursery and Free Kindergarten Association are important factors in social welfare. The Juvenile Court, working in close cooperation with other organizations, is resulting in a constant decrease in juvenile delinquency in crime.

An opportunity for social service study is given through the Social Service Club, the Council of Sociology, and various women's organizations. The colleges of the city and the high schools are also paying especial attention to the subject.

The city government is now developing a "farm colony." This consists of 1,900 acres, ten miles from the city, laid out as a beautiful estate by a landscape gardener. In one section is an open-air tuberculosis hospital, in another is the city infirmary, where the poor and helpless are housed in separate cottages. In an entirely separated section is the workhouse, while the city hospital and other buildings are being planned for. This farm also contains the city cemetery. A large proportion of the work in preparing the land and in building is being done by the workhouse prisoners. These prisoners build their own houses and support themselves, and during their leisure hours they are permitted to work on individual lot-holdings, and produce that which will be placed to their credit as a protection against relapse, or for the maintenance of their families. In connection with the workhouse the brotherhood is conducted. This was founded upon the initiative of released workhouse prisoners, and its aim is the friendly assistance of newly released men until they are able in turn to help others. The city has also founded the Cleveland Boys' Farm, an institution of several hundred acres where boys who are homeless and neglected or delinquent through the influence of their surroundings may find the influences of a home. The boys are housed in families with a matron at the head of each family who is very properly designated "Ma," and who fully lives up to the responsibility thus placed upon her.

The chamber of commerce may well be considered the center of the civic life of Cleveland. In connection with many commercial interests, it carries on a department which embraces every form of civic activity. The chamber is responsible for the plan by which the city hall, the county court-house, the federal building, public library, the union depot, and other public and semi-public buildings will be grouped about a common center. The plan opens on the lake front and in this center will be a broad mall, 600 feet wide and adorned with statuary, fountains, lagoons, and sunken gardens. The architecture for the buildings will be uniform, and of the most classic style. The chamber of commerce includes a committee on benevolent associations, which supervises the charitable institutions of the city. The committee gives a card of indorsement to such organizations as conform to the required standard. It is difficult for any organization to gain support without this indorsement, and the committee is able to develop in this field a standard of highest efficiency. The housing committee has made an extended investigation of tenement conditions in the city, has been influential in procuring legislation tending to prevent future abuses, and is now engaged in preparing legislation for remedying existing conditions. At the inauguration of the industrial committee, six years ago, there were twenty-five employers in the chamber membership engaged in definite welfare work. There are now approximately 200. The municipal committee has brought about the creation of a city department of forestry, under which the trees in the city streets and parks are cared for, and new trees planted. The public bath-house committee brought about the erection of two public baths, and plans for others are now being considered.

Civic Improvements

The sanitary committee was effective in controlling the smallpox epidemic which threatened the city a few years ago. This committee prepared a sanitary code which was adopted by the Board of Health, and which, among other provisions, created a department of meat and milk inspection, which through the cooperation of the committee has become most efficient. This code also provides for medical inspection in public schools, the reporting of communicable diseases, the abatement of nuisances, and similar matters in the enforcement of which the committee is now actively engaged. An efficient system of street cleaning by means of flushing is the result of this committee's work. A committee of the chamber is at present working upon the subject of smoke prevention. Water-supply, sewage disposal, and many other matters are constantly under the active consideration of this commercial body. The chamber has also been influential in preventing various franchise abuses, and has taken a hand in national matters, such as consular service reform and peace promotion.

The city government has shown itself most willing to cooperate in the accomplishment of many civic movements. It owns its own garbage reduction plant, does its ash collection, and supplies the city water. The mayor, some three years ago, endeavored to establish a municipal lighting plant, but the opposition from various sources compelled him to discontinue the project. The city recently annexed a suburb which owns such a plant and this is now being enlarged to supply part of the city with electric current. The city is developing a system of broad boulevards, which will completely encircle it, and large spacious

parks form a part of the system. These parks were formerly adorned with "keep-off-the-grass" signs and were used largely for pleasure drives. The signs have now been torn down and the parks are used extensively for baseball, golf, tennis, outdoor meetings, band concerts, and playgrounds. The city has established several playgrounds in crowded neighborhoods, and a dozen skating-rinks are in operation. The city also conducts several public bathing-beaches.

Mayor Johnson is a strong advocate of public ownership of public utilities, both local, state, and national.

He has worked to bring about the ownership of street-railway lines, but through the failure of necessary legislation and the opposition of the existing railway company and other forces he has not yet accomplished this. He has, however, succeeded in introducing a competing line at a three-cent fare, and in reducing the fare of the other company to three cents and a half.

The public-school system of the city was founded in 1836, and in 1847 one of the first public high schools of the country was started. The Board of Education maintains the highest educational standard, both in its educational systems and in the construction and maintenance of its buildings.

The labor element of the city is essentially radical, the central labor body being largely committed to socialism. Union leaders claim 60 per cent of the laborers in the organized trades. Several severe strikes have been conducted, resulting in few victories for either side. The efforts of the unions have, however, undoubtedly resulted in shorter hours, higher wages, and better conditions of labor. The meetings of the various unions are open to the presentation of general movements of social reforms, and usually these unions have been willing and active in cooperation.

Some important organizations are:

Cleveland Chamber of Commerce, Chamber of Commerce Building.
Municipal Association, 734 Garfield Building.
Sociological Council, Chamber of Commerce Building.
Goodrich House (Settlement), St. Clair and Sixth Street.
United Trades Labor Council, 717 Superior Ave.
Cleveland *Citizen* (Socialist and Labor, M. S. editor), 193 Champlain Street.
Anti-Saloon League, 516 The Arcade.
Woman's Christian Temperance Union, 513 The Arcade.
Young Women's Christian Association, 1245 Euclid Ave.

CLIFFORD, JOHN: English clergyman and Christian Socialist; born at Sawley, Derbyshire, 1836. At the age of eleven he worked in a factory near Nottingham, and at fourteen he was received into the Baptist Church, soon becoming a student of the General Baptist College. In 1862 he took charge of the Praed Street Baptist Church, in London, of which he is still pastor, altho the growth of the congregation has compelled the removal to the present chapel in Westbourne Park. In connection with his work Dr. Clifford pursued studies and took degrees and honors at London University. He has added an educational institute to his own church, where 1,500 names stand enrolled in various classes. Dr. Clifford is known to-day for his active interest in social reform. He was one of the founders of the Christian Socialist League; president, Metropolitan Free Church's Council (1896–97); and president, National Council of Free Evangelical Churches (1898–99). He is the author of many religious works and numerous tracts and articles on Christian Social topics. *Address*: 25 Sunderland Terrace, Westbourne Park, London, W., England.

CLUBS, MEN AND BOYS' (see Women's Clubs; Working Girls' Clubs): Clubs have played a large part in social development and reform. They existed in classic times and are mentioned by Aristotle and others. The first modern club to win fame seems to have been the club established at the end of the sixteenth century in the Mermaid Tavern at London, to which Shakespeare and other literary men and wits of the day belonged. Since that day clubs of various sorts have flourished in London as in no city of the world. White's, still one of the leading London social clubs, was founded in 1697. There are said to be nearly 300 clubs in London,

London

social, literary, political, sporting, or the like, with a membership of some 300,000. The largest political club is the Constitutional (Conservative) with 7,000 members. The Junior Constitutional has 5,000, and the United Empire the same number. The Conservative (1840) has 1,300. The National Liberal Club has 6,000 members, but more important Liberal clubs are the Carlton (1832) and the Reform (1837) with from 1,500 to 2,000 members. The most expensive London club is the Naval and Military. The oldest service club is the United Service (1815). The leading literary clubs are the United University, the Oxford, and Cambridge. Science has the Athæneum with 1,200 members. There are thirty ladies' clubs, the Pioneers, the Sesame (political), and Empress being prominent. The Ladies' Army and Navy, with its great smoking-room, has 3,600 members. The initiation fees for the larger clubs are from £10 to £50.

Working men's clubs in England, and especially in London, have had a large development. Many have large buildings or rooms. Some of these, usually called "proprietary" clubs, are strictly secret, and with a doubtful reputation. Others are philanthropic, more or less supported and superintended by church and other organizations. Prominent among such are the University Club and the United Brothers. These are usually teetotal and mainly educational and social.

Many clubs are political, Liberal, Radical, Conservative, Socialistic. In most of the clubs

Working Men's Clubs

an unorganized socialism rather than old-fashioned radicalism is the dominant note. All these clubs have a bar, and breweries often help in fitting them up. They also have concerts, lectures, entertainments, dancing, and dramatics. Billiards and whist are played. It is declared by their enemies that they are drinking-dens, and take the men from their homes; but Mr. Booth declares the former accusation to be without foundation, and that most of the members, if not at the clubs, would be on the street. They give an opportunity for political education such as American workmen are almost without. The American workman is organized for political purposes usually only in the heated campaigns with partizan spirit. The English and European working men's clubs discuss politics all the year round, and to an extent in a broad spirit because the clubs are not merely political. It was to these clubs that the lecturers

of the Fabian Society (*q. v.*) went, and largely changed their political spirit from one of cheap negative radicalism to one of constructive evolutionary socialism.

In all the clubs the fee is usually 6*d.* per month; the average membership is from 300 to 400; the hours are from 6.30 P.M. to 12.30 A.M., and on Sunday from 11 A.M. to 1 P.M. and from 6.30 P.M. to 11.30 P.M. The management is by a committee, and the sale of drinks makes them largely self-supporting. Gambling and excessive drinking in the open clubs are rare.

Clubs on the Continent have played a minor part. Some republican clubs in Paris, especially during the Revolution, gained notoriety, but most European clubs are more or less artificial copies of English prototypes. In the United States clubs began late in the eighteenth century. The Hoboken Turtle Club, still existent, was formed in 1797. The (New York) Union Club was formed in 1836. The Union League Club (1863), Reform Club (1888), and especially the City Club (1892) have often led in civic reform movements. Various literary, social, university, and church clubs have wide influence, many of these having luxurious clubhouses and appointments. In other American cities clubs are found in similar number in proportion to the size of the city.

United States

In distinctive reform movements, the club is equally important. According to *Social Progress* (1905) there were in connection with Settlements in the U. S. 185 men's clubs, 220 women's clubs, 496 boys' clubs, and 466 girls' clubs. According to an investigation made by Dr. H. D. Sheldon in 1898, there were in 1898 862 clubs in the U. S. formed by boys between the ages of ten and seventeen. Of these 85½ per cent stood for physical activity. Most of the clubs in the Settlements and institutional churches, however, have been started by adults for educational and character purposes. Their object has been to get boys off the street and from bad surroundings, and interest them in activities of their own. The general principle adopted is to leave the conduct of the clubs so far as possible to the boys themselves, with, however, a guidance from some older person, and so far as possible influencing the boys by the power of personality. This is more especially true of the younger and more recently formed clubs. Larger clubs were formally formed and in New York and other cities often occupy large buildings or rooms. A modern development is the federation of clubs.

Boys' Clubs

CLYNES, J. R.: English labor member of Parliament; born 1869, Oldham; served his time in a cotton factory. Showing ability for organization, he was selected, in 1891, by the Gas-workers' and General Laborers' Union as organizer for the Lancashire district; became chairman of the Federation of Trades Councils, and for ten years secretary of the Oldham and District Trades Council. He was recently appointed justice of the peace for the Oldham bench. Elected to Parliament 1906 for Manchester, N. E., under the auspices of the Labor Representation Committee. *Address*: 176 Union Street, Oldham.

COAL INDUSTRY (for Coal Miners, see MINERS' UNIONS): The question of coal production is one of the most important of economic questions, and in the coal industry have arisen some of the greatest industrial conflicts in the United States. (See COAL STRIKE.) The coal industry, which began in the U. S. in 1814, to-day employs 600,000 men and boys. Its yearly value is about $520,000,000 at the mine and over $2,000,000,000 when it reaches the consumer. For conditions so far as the miners are concerned, see MINERS. In regard to other conditions in the coal industry we quote largely from the address delivered by Mr. Henry D. Lloyd before the Interstate Anti-Trust Conference at Chicago, June 5, 1893. It still remains one of the best brief statements of evils in the coal trade ever made. The evils since that day have continued substantially unchanged. We add enough facts to bring the subject to date.

Within the last thirty years 95 per cent of the anthracite coal of America, practically the entire supply, it is reported to Congress, this year, has passed from the ownership of private citizens, many thousands in number, into the possession of the railroads controlling the highways of the coal-fields. These railroads have been undergoing a similar process of consolidation, and are now the property of eight great corporations. This surrender of their property by the individual coal-mine owners is a continuing process in operation at this moment, for the complete extinction of the "individual" and the independents in this field. It is destined, according to the report of Congress, to end in the entire absorption of the entire anthracite coal-fields and collieries by the common carriers. . . .

Monopolies

"The railroad companies engaged in mining and transporting coal are practically in a combination to control the output and fix the price. They have a practical monopoly of the production, the transportation, and the sale of anthracite coal."

Congress found in 1888 that the coal companies in the anthracite regions keep thousands of surplus laborers on hand to underbid each other for employment and for submission to all exactions; hold them purposely ignorant when the mines are to be worked and when closed, so that they cannot seek employment elsewhere; bind them as tenants by compulsion in the companies' houses, so that rent shall run against them, whether wages run on or not, and under leases by which they can be turned out with their wives and children on the mountain-side in midwinter if they strike; compel them to fill cars of larger capacity than agreed upon; make them buy their powder and other working outfit of the companies at an enormous advance on the cost; compel them to buy coal of the company at the company's price, and in many cases to buy a fixed quantity—more than they need; compel them to employ the doctor named by the company, and to pay him whether sick or well; "pluck" them at the company's stores, so that when pay-day comes around the company owes the men nothing, there being authentic cases where "sober, hard-working miners toiled for years or even a lifetime without having been able to draw a single dollar, or but a few dollars in actual cash; in debt until the day they died"; refuse to fix the wages in advance, but pay them upon some hocus-pocus sliding scale, varying with the selling price in New York, which the railroad slides to suit itself, and, most extraordinary of all, refuse to let the miners know the prices on which their living slides; a fraud, says the report of Congress, "on its face."

The companies dock the miners' output arbitrarily for slate and other impurities, and so can take from their men from five to fifty tons more in every hundred than they can pay for.

In order to keep the miners disciplined and the coal market undersupplied, the railroads restrict work, so that the miners often have to live for a month on what they can earn in six or eight days, and these restrictions are enforced upon their miners by holding cars from them to fill, as upon competitors by withholding cars to go to market. Labor organizations are forbidden, and the men intentionally provoked to strike to affect the market.

The laboring population of the coal regions, finally, is kept down by special policemen enrolled under special laws, and often in violation of law, by the railroads and coal and iron companies practically when and in what numbers they choose, and practically without responsibility to any one but their employers, armed as the corporations see fit with army revolvers, or Winchester rifles, or both, made detectives by

statute, and not required to wear their shields, provoking the people to riot and then shooting them legally. "By the percentage of wages," says the report of Congress, "by false measurements, by rents, stores, and other methods the workman is virtually a chattel of the operator."

Moved mainly by the disappearance of a free market in oil and coal, the people of Pennsylvania arose in 1873 and adopted a new constitution. To put an end to the consolidation of all the anthracite coal lands into the hands of the railroads, this constitution forbade common carriers to mine or manufacture articles for transportation over their lines, or to buy land except for carrying purposes. These provisions of the constitution have been disobeyed "defiantly." "The railroads have defiantly gone on acquiring title to hundreds of thousands of acres of coal, as well as of neighboring agricultural lands," says the congressional committee of 1888. "They have been aggressively pursuing the joint business of carrying and mining coal." So far from quitting it, "they have increased their mining operations by extracting bituminous as well as anthracite."

Defiance of Law

Instead of enacting "appropriate legislation," as commanded by the new constitution to effectuate its prohibitions, the legislature has passed laws to nullify the constitution by preventing forever any escheat to the state of the immense area of lands unlawfully held by the railroads. Every effort breaking down to meet the evil by state action, failure was finally confessed by the passage, in 1878, by the Pennsylvania Legislature, of a joint resolution asking Congress to legislate "for equity in the rates of freight," and to this day the will of the people of Pennsylvania, as declared in their sovereign utterance, has found among these corporations none so poor as to do it reverence.

The following statement is condensed from Leroy-Beaulieu's "The United States in the Twentieth Century":

The coal-fields of the United States cover an area of more than 275,000 sq. m. The Appalachian ranges along the Alleghanies from Pennsylvania to Alabama, across Ohio, Maryland, the two Virginias, Kentucky, and Tennessee, and contains 73,000 sq. m.; the East Inland field (Indiana, Illinois, and western Kentucky) contains 60,000 sq. m.; the North Inland field (Michigan) contains 11,000 sq. m.; the West Inland field, which stretches from Iowa to Texas, contains more than 89,500 sq. m.; the Rocky Mountain field, running from the Canadian frontier almost to the Mexican border, contains 45,000 sq. m. The small Pacific field has less than 1,000 sq. m. The richest by far, in point both of quantity and quality, appear to be the East Inland and the Appalachian. It is estimated that fully 55 per cent of the whole area is workable. Mention must also be made of the small but extremely valuable anthracite field which covers 500 sq. m. in eastern Pennsylvania, which has an average annual output of 50,000,000 tons. Finally, there are some deposits of brown coal which constitute a reserve supply.

Coal-Fields

In 1902 two thirds of the bituminous coal output of the U. S. was extracted from the mines of the Appalachian field, from which were taken more than 156,000,000 of the total 234,000,000 tons mined that year. As the anthracite field is contiguous to this particular field it is evident that this region furnished in all about 200,000,000 tons, or more than 70 per cent of the total American output. The most productive sections are the extreme northern and southern parts of the field, the more productive of these being the northern section in which the output was 89,000,000 tons for Pennsylvania, 21,500,000 for Ohio, 24,500,000 for West Virginia, and 5,000,000 for Maryland. In 1880 the aggregate output of these four states was but 28,000,000 tons; in 1902 close upon 150,000,000 tons. In the southern section 9,500,000 tons are extracted in Alabama. Virginia, Kentucky, and Tennessee have an annual output, respectively, of 3,000,000, 6,000,000, and 4,000,000 tons. Naturally, fuel is cheap in all these states. The average price, at the mine, varies (for 1902) from $1.05 per ton in Kentucky to $1.76 in Indian Territory.

One is surprised at the cheapness of coal. The wages paid are so high that it seems incomprehensible that it can be mined and sold at a profit for from only $1 to $1.20 per ton and even in certain years for 80 cents per ton. But the high cost of labor is offset by the employment of machinery. The coal-mines of America are well equipped in this respect, and the miners, after having at first opposed the introduction of machinery, have welcomed it, so soon as they perceived that not only were the risks of mining lessened thereby, but that since 1900 the U. S. has exported more coal than it has imported. In long tons the exports in 1902 were: coal, 6,126,946; coke, 392,491. The imports were: coal, 2,551,381; coke, 107,437.

Estimating a ton of coke as equivalent to 1½ tons of coal, the exports in 1900 exceeded 8,500,000 tons; 5,422,000 tons were shipped to Canada, 223,000 to Central and South America, 664,000 to Japan, 760,000 to Mexico, and 635,000 to Europe. Of the imports 1,484,000 tons came from Canada, mainly from British Columbia. If eastern Canada obtains its coal supply from the Eastern States, western Canada in turn supplies fuel to the Pacific slope, which, moreover, imported 252,000 tons of coal from Australia during 1900.

Coal Trade

There are reasons, too, for believing that the cost of carriage will fall and American coal may be sold on the Mediterranean at or below $4 per ton. In consequence of the deepening and the relative exhaustion of the English mines the price of English coal has a general tendency to rise; whereas in America, with the possible exception of the anthracite field, the development of the coal-beds has but begun. It is quite reasonable to predict that the time will come when, pending the exploitation of the coal-fields of China, all the world, with the exception of northern and northwestern Europe, which will almost certainly remain customers of Great Britain, will look to the U. S. for its coal supply.

Great Britain

The Royal Commission on Coal Supplies of the United Kingdom, appointed in Dec., 1901, reported in 1905. As summarized in Hazell's *Annual*, the commissioners estimated, after making necessary deductions, the available quantity of coal in the proved coal-fields of the United Kingdom to be 100,914,668,167 tons. The 1871 commission's estimate was 90,207,285,398 tons. The statistics show that, tho between 1870 and 1903, 5,694,928,507 tons of coal have been raised, the present estimates of available coal are nevertheless 10,707,382,769 tons in excess of those of the 1871 commission. This excess is accounted for partly by the difference in the areas regarded as productive by the two commissions, and partly by discoveries due to recent borings, sinkings, and workings, and more accurate knowledge of the coal-seams. In addition, the commission estimated that there were 5,239,433,980 tons of coal in the proved coal-fields lying at greater depth than 4,000 ft. below the surface. From the concealed and unproved coal-fields the Geological Committee appointed by the commission estimated there might be expected 39,483,000,000 tons at depths less than 4,000 ft. and over 1,000,000,000 tons beyond high-water mark in the Cumberland coal-field, and in St. Bride's and Carmarthen bays. The commissioners held that it was highly improbable, owing to physical considerations, that the average increase in the output for the last thirty years (viz., 2¼ per cent per annum) would continue. They said: "In view of this opinion and of the exhaustion of the shallower collieries, we look forward to a time, not far distant, when the rate of increase of output will be slower, to be followed by a period of stationary output, and then a gradual decline."

COAL STRIKE OF 1902: One of the greatest and most far-reaching strikes in the history of the United States. Some 147,000 men were involved. Of the business loss Mr. Carroll D. Wright has said ("Battles of Labor," p. 146):

According to the Chief of the Bureau of Anthracite Coal Statistics, the shipments of coal decreased 22,333,333⅓ tons, 40 per cent of the shipments of the previous year. Making an estimate on coal mined for local trade and consumption, the total decrease in 1902 must have been nearly 25,000,000 long tons. This meant a decrease in the receipts of the coal-mining companies of over $46,000,000, while the mine employees lost in wages a total of upward of $25,000,000, and $1,800,000 was spent by the mine-workers of the country in the relief of the miners of the anthracite regions. The decrease in freights paid to the railroad companies on the larger sizes, had it all been sent to New York harbor, would be about $19,000,000, and on the smaller sizes the total decrease in freight receipts would be about $28,000,000.

The occasion of the strike was the demand of the United Mine Workers of America for an increase in wages and a decrease in time, and the payment for coal by weight wherever practicable. But the cause lay deeper and may be found in the desire for recognition of the miners' union by the operators, and leading up to it many long-continued grievances. (See Coal Industry.)

In 1899 the United Mine Workers of America, who had already organized the bituminous coal miners and had won annual trade agreements, undertook to organize the anthracite miners. Finding some success, they struck, in 1900, for higher wages. Political conditions led Senator Hanna to induce the operators to yield and they posted a notice of a ten-per-cent rise in wages without recognizing the union. In 1901 Mr. John Mitchell, president of the union, tried to induce the operators to confer with his organization as to a wage scale. They refused, but gave notice that they would continue the existing advance. Again, in 1902, the union invited the operators to a conference, but they declined. In March the miners' convention met and demanded an increase in wages and an eight-hour day. They resolved to work only three days a week after April 1st, until the dispute was settled. The Civic Federation, through Senator Hanna, its chairman, tried to intervene, but unsuccessfully. May 8th, Mr. Mitchell, for the union, proposed to the operators to leave the matter to an arbitration committee to be chosen by the Civic Federation or by Bishop Potter and Archbishop Ireland. The operators refused and declined to deal any further with Mr. Mitchell.

On May 14th the United Mine Workers met in convention at Hazleton, and the next day the strike, which had already broken out, was officially declared. The demands of the strikers were:

1. An increase of 20 per cent in the pay of miners working by the ton—about 40 per cent of the whole number.

2. An eight-hour day for per diem employees, being equivalent to a reduction of about 20 per cent in working-time without change of wages.

3. Payment by weight to be based on a ton of 2,240 pounds.

The men were entrenched behind a law requiring every miner in the anthracite field to have a certificate of competence, granted after examination, and based on at least two years' experience as a laborer. As there were only about 40,000 holders of such certificates, and practically all of them belonged to the union, it was impossible to operate the mines as long as they held out, and the contest settled down into one of endurance. One hundred and forty-five thousand men were idle. An attempt was made to call out the bituminous miners in a sympathetic strike, but they unanimously voted to stand by their agreement with their employers and not strike. Two million five hundred thousand dollars, however, was contributed to the miners by unions and friends over the country.

September brought a general scarcity of coal, verging upon famine. By October the country was facing a calamity. The price of anthracite went up to $20 and even $30 per ton, and only small lots could be obtained at those rates. Political pressure was brought to bear upon the operators, but they defiantly refused to yield an inch. President Roosevelt had already, in June, directed Labor Commissioner Carroll D. Wright to investigate the causes of the dispute, and he now invited President Mitchell and the representatives of the operators to meet him in conference on Oct. 3d. Mr. Mitchell offered on the part of the miners to accept arbitration by a commission selected by the president. The operators rejected this proposition, and their whole attitude appeared so offensive as to make them the objects of intense popular indignation. They insisted that the whole matter was one of protection, and said that if troops enough were furnished they could operate the mines. A considerable force of militia was already on duty, but on Oct. 6th Governor Stone called out the entire National Guard of Pennsylvania, numbering 10,000 men. It soon became evident that miners could not be obtained under any conditions. Accordingly, Mr. J. Pierpont Morgan conferred with President Baer of the Reading, and went to Washington. He offered on behalf of the operators to accept the arbitration of a commission to be appointed by the President and to consist of:

1. An army or navy engineer officer.

2. An expert mining engineer, not connected in any way with coal-mining properties.

3. One of the judges of the United States Court of the Eastern District of Pennsylvania.

4. A man of prominence, eminent as a sociologist.

5. A man who by active participation in mining and selling coal was familiar with the physical and commercial features of the business.

The findings of this commission were to be binding for at least three years.

The union objected, unless the president was left free to appoint whom he would, and they have a representative.

This was accepted and a convention of the United Mine Workers at Wilkesbarre on Oct. 20th declared the strike off. As members of the commission the president appointed U. S. Court Judge George Gray, Carroll D. Wright, Thomas H. Watkins, General John M. Wilson, E. W. Parker, E. E. Clark, and Rt. Rev. John L. Spalding.

The commission after extensive hearings made an award almost wholly in favor of the men. All contract workers were to receive an advance of 10 per cent. Hours were reduced to eight wherever possible. Wages were to be advanced beyond this as coal prices rose. A board of conciliation was created to settle disputes and which perforce recognizes the union. Mr. Mitchell declares the miners will gain by the strike from $7,000,000 to $8,000,000 annually, but that the board of conciliation is the most important result. The strike was thus a test case between labor and capital, and it was proved that even capital must submit finally to organized public pressure.

COBDEN CLUB, THE: A society founded in 1866, with the object of encouraging the growth and diffusion of those economic and political principles with which Cobden's name is associated. The motto of the club is "Free Trade, Peace, Goodwill among Nations." Its principal work consists in the advocacy of free trade, and its funds are mainly devoted to the printing and circulation of books, pamphlets, and leaflets, in support of free-trade principles.

The club is always ready to place its information at the disposal of parliamentary candidates who are supporters of free-trade principles. With the further object of encouraging the scientific study of economic questions, the club spends considerable money in giving prizes for literary work on political economy at the universities and elsewhere. The club also occasionally organizes dinners, to which notable free-traders and other distinguished men are invited. The management of the club is vested in a committee which reports annually to the general body of members. The chairman of this committee is Lord Welby. Other committee members are: Sir J. T. Brunner, M.P.; the Right Honorable Herbert J. Gladstone, M.P.; Captain Sinclair, M.P.; T. Fisher Unwin; Henry Vivian, M.P.; and Sir Spencer Walpole, K.C.B.; General Secretary, J. A M. Macdonald, M.P.; organizing secretary, F. Maddison, M.P., Caxton House, Westminster, London, S. W.

COBDEN, RICHARD: English free-trader; born near Midhurst, Sussex, 1804. At an early age he entered a London warehouse and after a time became traveler for the firm. In 1832 he started a cotton-printing business of his own at Manchester and Sabden.

There are three great political agitations with which Cobden's name will be always connected—the repeal of protective duties, the movement against war and military expenditure, and the one in favor of commercial treaties.

The general spirit of his whole policy is well exprest in the motto quoted by himself (in "England, Ireland, and America") from George Washington: "The great rule of conduct in regard to foreign nations is, in extending our *commercial* relations, to have, with them, as little *political* connection as possible."

He believed that a nation's first care was for its own household, and that political and military entanglements interfered with the performance of a nation's duty in this respect. He preached the policy of non-intervention, opposing with Bright the war with Russia and China. He maintained that the prosperity of the nation demanded, not military glory and conquest, but a larger population and a wider trade. Cobden and the "Manchester school" of politicians erred in mistaking the welfare of merchants and manufacturers for the welfare of the whole nation; their standpoint was that of the employer of labor, not that of the people. They were the advocates of direct taxation. Cobden has been denounced as a mere pleader for a "let-alone" policy in matters of trade; but it must be remembered that in his day British trade was hampered by absurd governmental restrictions from which it is free to-day. A policy which was best then may be unwise at the present time. Cobden did much for the cause of free education. It was largely owing to his efforts that the Manchester Athenæum was established.

We need not here enter into the details of his busy political career, and shall only mention one more conspicuous service which he rendered, not only to his own country, but to the United States as well. Devoted as he was to the arts of peace, the outbreak of the American Civil War was to him an event most deeply to be deplored. From first to last his sympathies were with the North, because the South was contending for slavery. He was extremely anxious that Great Britain should adopt a just and worthy attitude toward the struggle; and when, therefore, vessels which sailed from English ports committed depredations upon American commerce, he sternly and forcibly brought the question before the House of Commons. Altho attacked for a time on every side because of his manly stand for honor and fair play he persisted in a series of speeches to maintain his position. His death was the occasion of many tributes of honor and esteem, all classes uniting in confessing him to be a statesman who was unswerving in his fidelity to conscience and to what he believed to be the best interests of his country. He died in London, 1865.

COEDUCATION (for the statistics of coeducation in the United States, see article EDUCATION): The following is abridged from an article that appeared in *Munsey's Magazine* for March, 1906:

The essential argument for coeducation in the university is the argument for the university itself. Special subjects can be taught in detached and specialized schools. The university makes better manhood. Its function, in Emerson's words, is to "bring every ray of genius to its hospitable halls, by their combined influence to set the heart of the youth in flame."

For these reasons, it is better for any body of students that they be taught in company with other kinds of students. Culture studies and technical studies gain from mutual association. The man who pursues each gains from contact with other types of mind.

This argument is especially cogent in institutions in which the individuality of the student is

recognized and respected. In such schools each man, by his relation to action and realities, becomes a teacher of women in these regards, as, in other ways, each cultivated woman is a teacher of men.

In woman's education, as planned for women alone, the tendency is toward the study of beauty and order. Literature and language take precedence over science. Expression is valued more highly than action. In carrying this to an extreme, the necessary relation of thought to action becomes obscured. The scholarship developed is not effective, because it is not related to success. The educated woman is likely to master technique rather than art; method, rather than substance. She may know a good deal, but she is not effective in action. Often her views of life must undergo painful changes before she can find her place in the world.

In schools for men alone, the reverse condition often obtains. The sense of reality obscures the elements of beauty and fitness.

Arguments For

It is of great advantage to both men and women to meet on a plane of equality in education. Women are brought into contact with men who can do things—men in whom the sense of reality is strong, and who have definite views of life. This influence affects them for good. It turns them away from sentimentalism. It gives tone to their religious thoughts and impulses. Above all, it tends to encourage action as governed by ideals, as opposed to that resting on caprice. It gives them better standards of what is possible and impossible when the responsibility for action is thrown upon them.

In like manner, the association with wise, sane, and healthy women has its value for young men. It raises their ideal of womanhood, and the highest manhood must be associated with the possession of an ideal.

It is not true that the character of college work has been in any way lowered by coeducation. The reverse is decidedly the case. It is true that untimely zeal of one sort or another has filled the West with a host of so-called colleges. It is true that most of these are weak, and are doing poor work in poor ways. It is true that most of them are coeducational. It is also true that the great majority of their students are not of college grade at all. But none of these defects is derived from coeducation; nor are any of these conditions made worse by it.

Very lately it has been urged against coeducation that its social demands cause too much strain both on young men and young women. College men and college women being mutually attractive, the result is that there are too many receptions, dances, and other functions in which they enjoy each other's company. But this is easily regulated. At the most, the average young woman in college spends in social matters less than one tenth the time she would spend at home.

With the young man, the whole matter represents the difference between high-class and low-class associates and associations. When college men stand in normal relation with college women, meeting them in society as well as in the classroom, there is distinctly less of drunkenness, rowdyism, and vice than obtains under other conditions. And no harm comes to the young woman through the good influence she exerts. To meet freely the best young men she will ever know, the wisest, cleanest, and strongest, can surely do no harm to a young woman. The best young men and the best young women, all things considered, are in our colleges. This always has been and always will be the case.

It is true that coeducation is often attempted under very adverse conditions. Conditions are adverse when the little girls of preparatory schools and schools of music are mingled with college students and allowed to have the same freedom. This is wrong, whatever the kind of discipline offered, lax or strict; the two classes need a different sort of treatment.

Another condition very common and very undesirable is that in which young women live at home and traverse a city twice each day on railway- or street-cars to meet their recitations in some college. The greatest instrument of culture in a college is the college atmosphere, the personal influence exerted by its professors and students. This atmosphere develops feebly in the rush of a great city. The *spur-studenten*, or railway students, as the Germans call them—the students who live far from the university—get very little of it.

Arguments Against

In the English universities the question of where the student should live has been made all-important, almost excluding consideration of methods of study, or even of the relative value or significance of the subject-matter of education. In America we have too much neglected this. We have housed our students in barracks, or, even worse, not housed them at all. We have exposed them, men and women alike, to the vulgarity of the small village or the wear and tear of a great city.

We cannot deny that there has arisen in the last few years a reaction against coeducation in our colleges. In so far as this is honest, it is a reaction not against coeducation, but against the lack of provision for wholesome living. It is a protest against turning girls loose unaided and unguarded in college towns, in which adequate safeguards exist neither for them nor for young men.

There are about three classes of college boys who seem to object to the presence of college women, and these may be classed as the boorish, the dilettante, and the dissolute. If these are to remain such, the sooner they are out of college the better for others, and often the better for themselves.

I have rarely found opposition to coeducation on the part of really serious students.

Sometimes, too, the college athlete objects to the presence of women in college. In athletic matters the young women give very little assistance. They cannot play on the teams, they cannot yell, and they are rarely generous with their money in helping those who can.

Of like grade is the feeling that men count for more than women, because they are more likely to be heard from in after life. Therefore their education is of more importance, and the presence of women impedes it.

A certain adverse influence comes from the fact that the oldest and wealthiest of our institutions are for men or for women alone. These send out a body of alumni who know nothing of coeducation, and who judge it with the positiveness of ignorance. Most men filled with the time-honored traditions of Harvard and Yale, of which the most permeating is that of Harvard's or Yale's infalli-

bility, are against coeducation on general principles. Similar influences in favor of the separate education of women go out from the sister institutions of the East.

The only serious new argument against coeducation is that derived from the fear of the adoption by universities of woman's standards of art and science rather than those of man, the fear that amateurism would take the place of specialization in our higher education. Women take up higher education because they enjoy it; men because their careers depend upon it. Only men, broadly speaking, are capable of objective studies.

It is quite true, as President Hall has lately shown, that the work of the woman student in college, in almost all fields except the creative, is better than that of men of the same age. Girls are more docile than boys; they take better care of their time; they see from a nearer view-point; they are cleaner, not only in their work, but in their acts; they write better examination papers; they are saved from vice not alone by environment, but by instinct. In general, they excel in the conventional courses, especially in those against which the average healthy boy has for generations rebelled.

They excel in others, as President Hall indicates, because these courses appeal to their tastes. The girls compete for outworn prizes, and will complete a useless piece of work with a care and patience which a boy will rarely show on better material.

It has been feared that the admission of women to the university would vitiate the masculinity of its standards, that neatness of technique would impair boldness of conception, and delicacy of taste replace soundness of results. It is claimed that the preponderance of high-school educated women in ordinary society is showing some such effects in matters of current opinion. For example, it is claimed that the university extension course is no longer of university nature. There is nothing ruggedly true, nothing masculine left in it.

Current literature and history are affected by the same influences. Women pay clever actors to teach them, not Shakespeare or Goethe, but how one ought to feel on reading "King Lear" or "Faust." Such studies may be good for the feelings or even for the moral nature, but they have no elements of that "fanaticism for veracity" which is the highest attribute of the educated man.

Current literature reflects the taste of the leisure class. The women with leisure who read and discuss vapid books are not representative of woman's higher education. Most of them have never been educated at all.

In any event, this gives no argument against coeducation. It is thorough training, not separate training, which is indicated as the need of the times. Where this training is taken is a secondary matter, tho I believe with the fulness of certainty that better results, mental, moral, and physical, can be obtained in coeducation than in any monastic form of instruction.

Finally, does not coeducation lead to marriage?

We need not worry over this, because it is in fact not true, and because if it were, its effects would be of little consequence in the development of the race. Love and marriage and parenthood will go on normally whatever our scheme of education.

No doubt university training of women, as distinguished from college training, postpones marriage, and probably the majority of the women taking advanced training have in some degree placed some other ideal, at least as a present aim, before that of matrimony. Some of these women are perhaps "agamic" or "agenesic" by nature; and, if so, doubtless they ought not to marry under any circumstances. But there is not the slightest evidence that highly educated women are necessarily rendered sterile or celibate by their education. The best wives in the world belong to this class.

It is true, no doubt, that cultivated women are more exacting than other women. They are less likely to marry for convenience, and they expect more from their husbands. For these same reasons, their marriages are less likely to prove unhappy.

The woman who finishes credibly the undergraduate course in a well-regulated American college, coeducational or otherwise, has accomplished no *tour de force*, and has performed no dangerous feat of mental gymnastics. She has lived for four years an essentially normal life under wholesome and uplifting conditions.

Nor is the future of our race dependent on having every woman bear the largest possible number of children. In so far as education is genuine, it helps a woman to rear an increasing proportion of the number she bears.

The mental activity necessary to a successful college course is not intense enough to interfere with fecundity. If it were so in individual cases, there is not a ghost of a reason for believing that such a condition is hereditary. We need not fear that college education on a large scale means progressive race sterility.

CŒUR D'ALENE, STRIKES AT: Some of the most violent industrial disturbances in the United States have taken place at the Cœur d' Alene mines in Idaho, especially in the years 1899 and 1902. In 1899 mining industrial troubles developed widely in Idaho. At Wardner a mill of the Bunker Hill mine was blown up. It was never proved by whom, but the striking miners were accused. The mine-owners telegraphed to Washington for federal troops. Brigadier-General Merriam was dispatched with troops, some of them colored. He at once declared martial law in Shoshone County. He reported that there were no signs of resistance, but made a thousand or more arrests. The prosecuting attorney pro tem. for the county, who was also an attorney for the Bunker Hill & Sullivan Mining Company, had the courts suspend the writ of habeas corpus. Hundreds of the arrested men were cast into a discarded bull or cattle pen, with straw in the stables to sleep on. The food was bitterly complained of and served, some said, in large pans from which the prisoners had to dip with their fingers. They were certainly treated inhumanly, and the evils and injustices of the "bull pen" have rankled in the minds of organized labor in the U. S. It is claimed, however, by the capitalists that the declaration of martial law was a necessity and that the arrested men who were

innocent were not detained long, being released as soon as their innocence was established.

On the other hand, it is charged against the union miners that in the strike of 1902 they marched on the Cœur d'Alene mines, shot fleeing non-union miners, so that nearly fifty were shot or drowned, took possession of the town, and committed other lawless acts. See Western Federation of Miners.

COFFEE-HOUSES: Coffee-houses as rivals of liquor taverns have been favored almost from the beginning of the active temperance agitation. As early as 1830 and 1831 there was a coffee-house movement in Scotland, under the auspices of temperance societies, resulting in the successful operation of such establishments in nearly all the principal towns and cities, but many of them at that time sold the lighter alcoholic beverages as well as tea and coffee. It was in protest against this practise that the Dunfermline Society, Sept. 21, 1830, formed itself into the "Dunfermline Association for the promotion of temperance by the relinquishment of all intoxicating liquors," and passed a resolution agreeing "to give no encouragement or support to any coffee-house established or receiving countenance from any temperance society, for the sale of intoxicating liquors "(Dawson Burns's "Temperance History," vol. i., p. 48). In 1844 (*ib.*, p. 248) "the coffee-houses of Glasgow, conducted on strict temperance principles, and provided with news rooms, etc., were in some respects much superior to the coffee taverns and palaces of the present day."

But it is more recently, and in England especially, that the coffee-house has become a prominent feature of the temperance movement. Liverpool, Birmingham, Bradford, and other large cities in England are plentifully supplied with these places, while in London, where the development has been slower, a large number of establishments have been opened by the Lockhart Coffee-House Company, with the prospect of a rapid increase in the number. Two weekly newspapers in London, the *Temperance Caterer* and the *Refreshment News* (the latter the organ of the Coffee-Tavern Protection Society), are especially devoted to the coffee-house movement and its interests. In 1872 Rev. Charles Garrett conceived the idea of a coffee saloon in Liverpool, which should combine every attraction of the liquor saloon except the bar. A company was formed, and such a place, with reading-room attached, was opened near the docks. Refreshments were served at the cheapest rates. The enterprise was so successful that there are at present in Liverpool more than sixty of these cocoa rooms, as they are called, while the British Workman's Cocoa-House Company, of Liverpool, which has them in charge, has in no year paid less than 10 per cent dividends. Coffee-houses were established in Bradford after their success had been manifested in Liverpool, and the Bradford Coffee-House Company has opened twenty places in that city and its suburbs. Birmingham also is plentifully supplied with coffee-houses, or coffee-house hotels, and they are successful from a business point of view, as well as influential in molding temperance sentiment. The coffee-house movement has extended into Canada and Australia, but has made little progress in the United States. Probably the nearest approaches to the English coffee-house to be found in this country are the temperance restaurants established in various cities by enterprising or philanthropic persons, those opened and very successfully managed by Joshua L. Bailey, in Philadelphia, being especially worthy of mention.

In England

Another form of the coffee-house work is found in the rooms opened in Boston by the New England Department of the Church Temperance Society. The emphasis is placed in these rooms upon the social aspect, very little attention being paid to the sale of food and drink. Pool tables and other games are provided, smoking is allowed, and the aim has been to afford all the *freedom* of the barroom without the slavery, which is the penalty that has to be paid in places where social freedom means social drinking. In each of these rooms a program of entertainment and instruction is provided once a week; and the great success of this kind of work is demonstrated by the fact that a number of cultivated men and women come to talk about anything which interests themselves, and in the ever-increasing attention and appreciation on the part of the young men who frequent the rooms. Now and then the talk will be a religious one, but, as a rule, these are not preaching places.

The Boston Coffee-House

There is always plenty of water, for those who visit these rooms are thirsty people. As a rule they prefer water to coffee. The rooms are smoky; tobacco is not sold, but there is no restriction upon smoking.

General good order prevails; when parties get turbulent beyond control the doors are labeled "closed for a week on account of disorder," and in every instance the disturbers, missing their privileges, have returned and apologized.

The general idea is, of course, to make the rooms as nearly like a liquor saloon as possible, without the liquor. But good reading matter (illustrated papers, etc.) is provided in abundance.

The mere fact that, at the lowest estimate, the attendance in the Boston coffee-rooms has averaged during some seasons over 300 young men each night, is a sufficient argument for going on with the work; for this average of 300 a night means an attendance during one month of 7,800; during six months, of 46,800; during four years, of 187,000.

After twenty years of this kind of activity, the workers in it feel every year a stronger conviction that it is a good work, and right in line with the sanest temperance sentiment of the day. Tho the Boston coffee-house is not supported by any endowment, there is a constantly increasing sympathy with the work on the part of an always lengthening list of subscribers. A monthly program of the lectures and entertainments is sent to something over 600 people. In case of special need of financial help a simple statement is made of the facts, and the responses are always speedy and generous.

S. H. Hilliard.

COGHLAN, TIMOTHY AUGUSTINE: Acting agent-general for New South Wales in London since Feb., 1905; born at Sydney, N. S. W., 1855; educated in the grammar-schools of that city. He was appointed to Public Works Department in 1873; became assistant engineer of harbors and rivers in 1884; and officiated as government statistician 1886–1905; and as registrar of friendly societies 1892–1905. From 1896 to 1900 he was a member of the Public Service Board; and he

served on three royal commissions: (1) to inquire into the Marine Board, 1896; (2) to inquire into the cause of the decline of the birth-rate, 1903; and (3) to subdivide the State of New South Wales into electorates, 1904. He was president of the Conference of Austin, and is president of the Australasian Association for the Advancement of Science. Among his works may be mentioned: "Wealth and Progress of New South Wales"; "The Seven Colonies of Australasia"; "Childbirth"; "Notes on the Financial Aspect of the Australian Federation"; and, jointly with T. T. Ewing, M.P., "Progress of Australia during the Nineteenth Century." *Address*: Office of the Agent-General, London, England.

COGNETTI DE MARTIIS, SALVATORE: Italian sociologist and economist; born at Bari, Italy, 1844. In 1868 he became professor in the Institute of Technology of that place; the next year he accepted a similar position in Mantua, and in 1876 he was called to take the chair of political economy in the University of Turin. Professor Cognetti, according to Cossa, may be classed with the Italian sociological school. He has especially studied the economic functions of animal and savage life, and by investigations in philology, etc., has thrown much light on the origins of socialism in antiquity. He has, however, studied modern economic conditions, and particularly those of the United States. He is the author of: "Delle Attinenze tra l'Economia Sociale e la Storia" (Florence, 1866); "Le Forme primitive nell' Evoluzione Economica" (Turin, 1881); "Il Socialismo negli State Uniti d'America" (Turin, 1887); and "Socialismo Antico" (1889).

COHN, GUSTAV: German economist; born at Marienwerder, West Prussia, 1840; studied in Berlin and Jena; Fellow of the Royal Statistical Seminary of Berlin, 1867–68, afterward at Heidelberg and the Polytechnic at Riga. In 1873 he visited England, and as a result of his studies published his "Untersuchungen über die englische Eisenbahnpolitik." In 1875 he was called to the Polytechnic at Zurich, and in 1884 as regular professor to the University of Göttingen. One of the foremost economists in Germany, his writings have been numerous. Perhaps his best-known works are his "System der Nationalökonomie" (1886), in which his chapters on cooperation, the normal labor day, and freedom of industry are of special value; and his "Finanzwissenschaft" (1889). He has written on the woman question (1897), besides various historical studies. *Address*: Göttingen, Germany.

COIT, STANTON: American ethical lecturer; born in Columbus, Ohio, 1857; was graduated at Amherst, 1879, and took the degree of Ph.D. at Berlin, 1885. Studying social conditions, and living himself in a tenement among the poor, he founded the Neighborhood Guild in the tenth ward in New York City in 1887, and became one of the founders, and for two years head worker of the University Settlement in that city. He was for several years lecturer with Professor Adler of the New York Society for Ethical Culture. In 1888 he succeeded Mr. Moncure D. Conway, in London, as lecturer of the South Place Ethical Society, and instituted a Neighborhood Guild in London, and later founded and became head of the West London Ethical Society. He was one of the founders of the *International Journal of Ethics*. His main works are "Neighborhood Guilds"; "The Ethical Movement in Religion," issued in Germany, and several lectures in one volume, translated into French and published as "La Religion basée sur la Morale." *Address*: 30 Hyde Park Gate, S.W., London, England.

COLBERT, JEAN BAPTISTE: French statesman; born at Rheims, 1619. He rose from office to office, till he became one of the greatest ministers France has ever had. In 1661 he became controller-general. His first reform was to reduce the *taille*—a direct property tax—and to establish a departmental office. He was especially noted for his love of system and regularity in industry and commerce. Frequently his regulations were strict even to severity. His economic method was to organize industry, sustain it by custom-house regulations and protection, and to create model manufactures by grants of money or privilege. All financial dishonesties he strove with laudable severity to check. His mind was not sufficiently profound to establish a complete system; he dealt with immediate difficulties, and overcame them by his energy and good sense. He interested himself in the shipping trade and in the arts and sciences, encouraging the arts by liberal presents and pensions. In 1663 he founded the Academy of Inscriptions and Belles Lettres, and in 1668 the Academy of the Sciences. He died in Paris, 1683.

COLINS, JEAN GUILLAUME CÉSAR ALEXANDRE HIPPOLYTE, BARON DE: French soldier and sociologist; born at Brussels, 1783. He entered the French army at an early age, and won many honors. In 1833 he settled down to a quiet life, and pursued at Paris his scientific and social studies. In 1835 he issued his first work, entitled "Le Pact Social." In it he advocated collectivism, and declared that "immovable property belongs to all." Numerous other works on social questions followed, and he continued to write until his death in 1859.

Colins and his disciples called their system Rational Socialism. They believed in spiritualism and atheism, denying the existence of a God, while at the same time affirming the immortality of the human soul. Morality, they say, is sufficiently based upon personal immortality. All men are equal, free, moral, and therefore responsible beings. M. de Laveleye, in his "Socialism of To-day," gives the following concise account of their economic doctrines:

> Originally there existed only man and the earth on which he lived: on the one hand, labor; and on the other, the soil or raw material, without which all labor would be impossible. But from the joint action of these two elements of production there soon came into being wealth of a peculiar kind, in which labor was, as it were, accumulated, which was movable and separate from the soil. This was capital. Labor is free when the raw material, the soil, belongs to it; otherwise it is enslaved. Man therefore can, in fact, only exercise his energy with the permission of the owners of the raw material; and he who requires the authority of another before he can act is clearly not free. In order, then, that all the members of the community should become permanent proprietors of the national soil, the soil must be collectively appropriated.
>
> The collective appropriation of the soil implies, in the first place, that it should be at the disposal of all who wish to utilize it; and secondly, that the rent, paid by the tenants to the community, should be expended for the common benefit of all.
>
> The above relates to the production of wealth. Let us now consider the way in which rational socialism regulates its distribution.
>
> When labor is free—as is necessarily the case when the land is accessible to all—every one can live without being obliged to accept wages from anybody. In that case, a man would work for others only if they offered him, as wages, more than

he could gain by working for himself. This situation is exprest in economic terms by saying that then wages would tend to a maximum, and when it exists, the distribution of wealth is so affected that the larger share of the product goes to labor and the smaller to capital. But when labor is enslaved, the laborers are forced, under pain of starvation, to compete with one another in offering their labor to those who possess land and capital; and then their wages fall to what is strictly necessary for existence and reproduction; while if the holders of wealth do not need labor, the unemployed laborers must disappear. Wages, then, tend to a minimum, and the distribution of wealth takes place in such a way that the greater part goes to the landowners and capitalists, and the smaller to the laborers. When labor is free, every man's wealth increases in proportion to the toil he has expended; but when labor is enslaved, his wealth grows in proportion to the capital he has accumulated.

From these two opposite modes of distribution flow, according to Colins, the two following consequences, each of which has reference to one or other of the two systems of holding land above described: When land is owned by individuals, the wealth of one class of the community and the poverty of the other increase in parallel lines, and in proportion to the growth of intellectual power; but when land is collectively appropriated, the wealth of all increases in proportion to the activity of each, and to the advance of civilization.

Colins has developed also some original views on the history of communities, which have been reproduced by M. L. de Pottre in his "Dictionnaire Rationnel."

COLLECTIVISM: A term sometimes used in the United States and in Great Britain, but frequently in France, to denote socialism as distinguished from anarchism or communism, both of which are sometimes, tho wrongfully, included under socialism. Collectivism is also used sometimes to indicate the general sociological scheme of socialism, as distinct from any particular form of or plan for carrying out its ideas.

COLLECTIVIST SOCIETY: Organized in New York City, 1902. Its principles are set forth as follows:

We believe that the true principle of production and distribution is exprest in the dictum: "From each according to his ability; to each according to his needs." This principle requires that all should have the opportunity of useful work, and that all should engage in useful work under the penalty or public disgrace; that all should receive comfortable incomes except those who will not work, and that none should receive excessively high incomes, as the latter are morally injurious both to the recipient and to the community. The ultimate operation of this principle will be toward the ideal of practical equality of incomes.

We believe that this principle can be made effective only by the people acting as a whole through governments truly democratic.

We believe that this is no far-off ideal, but is in all civilized countries an attainable rule to be embodied, step by step, into law, custom, and habit.

We believe that the establishment of this principle will require the transfer of the means of production and distribution into the hands of the community; and that every transfer of this nature should be accompanied by full provision for those expropriated on the basis of their needs.

We believe that our governments, national, state, and local, are worthy of hearty allegiance, as in the main good institutions, far more free and beneficent than governments in past times. We believe, however, that they can be made vastly more beneficent through changes for which the present time is ripe.

We believe that in those cases where the powers of government are now used for private gain to the detriment of the people at large, it is because the energetic demands of private interests are not met by an enlightened and united opposition.

We believe that this evil—the exploitation of the powers of government for private gain—should be abolished and our government made fully responsive to the people's will, through the establishment of direct legislation, proportional representation, and the power of recall.

We believe that the measures, other than the last named, which at present promise best results are:

Legislation to secure work to the unemployed; to establish a maximum day and a minimum wage for all workers; and to provide pensions for the aged.

The taxation of franchises at their full value, and the graduated taxation of land values, incomes, and inheritances.

The assumption by city and state governments of enlarged and new activities for the common benefit, including the ownership of public utilities.

The assumption by the national Government of the telegraphs, railroads, and mines.

The organization works mainly by publishing and circulating tracts carefully prepared on evolutionary, scientific, and Christian socialism, and by holding meetings and conferences in New York. Secretary, Miss M. R. Holbrook, P. O. Box 1663, New York City.

COLORADO COOPERATIVE COMPANY, THE: Organized and incorporated in Colorado in 1904, to reclaim by irrigation desert land on Tabeguache Park, whereon to found independent homes for its stockholders. This tract of land in Montrose County, southwestern Colorado, consists of 30,000 acres, two thirds of which is arable and fertile. It is specially adapted to fruit growing and general farming. Timber, coal, and building stone are in close proximity, as well as large deposits of the more precious metals. To reclaim the land an irrigation canal, more than twenty miles in length had to be built, costing at least $300,000. To accomplish this work, stock subscriptions were taken in shares of $100 each, payable in cash, labor, or products of practical use to the company. The source of supply is the San Miguel River, a never-failing stream.

None but stockholders are employed, each of whom receives thirty cents per hour, payable in stock and food supplies from the company's store. There are about 400 stockholders, holding varying numbers of shares. The land holdings range from a town lot to a quarter section, tho a forty-acre tract is the usual claim of each stockholder. Each share of stock entitles its owner to draw a *prorata* share of water flowing in the canal, and on full completion it is estimated that a share will properly irrigate four acres. The unclaimed land may be still homesteaded or otherwise entered at $1.25 per acre. There is as yet no railroad, but surveys are being made, and the prospects for one are fair.

Under the title of The Nucla Town Improvement Company the colonists have incorporated a town company. The stock is divided into shares of $10 each, and each share entitles the holder to a lease of one business lot, or two residence lots, for ninety-nine years, with privilege of renewal. A block of four acres is the maximum holding of any shareholder. The organization is based on the Henry George single tax idea. (See FAIRHOPE.) Nucla town site already embraces 400 acres, nearly all of which is under lease, and more land is expected to be soon ready for platting into lots and blocks. Those appreciative of magnificent scenery, a mild and healthful climate, and an intelligent and progressive community, will find it at Nucla.

F. B. LOGAN.

COLWELL, STEPHEN: American merchant and economist: born in Virginia, 1800; admitted to the bar in his native state, but gave up the profession of law to become an iron merchant in Philadelphia. He studied and wrote much on political economy, being a protectionist; and he was a frequent contributor to the periodicals of his time. His best-known work is "The Ways and Means of Commercial Payment" (1858), in which he attempts to give a full analysis of the credit system, and contends that error has always been made in not distinguishing between

money of gold and silver, and forms of credit. His work is valuable also because of its historical inquiry into the growth of the credit system; and throughout it reveals independence of thought and research. He refused to accept the view that the quantity of money is the controlling factor in determining prices. In 1865 he was appointed a member of the revenue commission, and in the year following made a valuable report on taxation. He died in Philadelphia, 1872. Among his more extended writings may be mentioned: "The Relative Position in our Industry of Foreign Commerce, Domestic Production, and Internal Trade"; and an American edition of Frederick List's "National System of Political Economy," for which he wrote a preliminary essay. His other writings of economic interest are: "The Claims of Labor, and their Precedence to the Claims of Free Trade"; "Gold, Banks, and Taxation and State and National Systems of Banks," "Expansion of the Currency, the Advance of Gold, and the Defects of the Internal Revenue Bill of June, 1864."

COMMERCE (from Latin *com*, together, and *mercari*, to trade) is sometimes used for the interchange of any goods or property, but more correctly for the interchange of goods on a large scale and between different countries or different portions of one country.

The first race to carry on commerce on a large scale was the Phœnicians, first in Tyre and Sidon, and then in the Phœnician colony of Carthage. Much of the commerce of Rome was tribute rather than trade. With the breaking up of the Roman Empire commerce languished till the rise of the free cities of Italy, Venice, Florence, and Pisa. Commerce was also much quickened by the crusades. The free cities of Germany and the Netherlands, which formed the Hanseatic League, created a still greater commerce. The introduction of the mariner's compass into Europe in 1302 and the discovery of the New World and of the Cape of Good Hope vastly developed commerce, particularly in Spain, Portugal, and England, and later in the Netherlands. By the seventeenth century Spain and Portugal had lost their prestige, and England had become the great commercial nation of the world. In medieval times commerce was greatly restricted by dues, taxes, and laws. After the discovery of the New World, governments tried to favor commerce by granting monopolies, trading privileges, etc., often doing more harm than good. Since the beginning of the nineteenth century *laissez faire* has been the general policy. But see PROTECTION.

Enormous strides have been made recently in the development of commerce. At the beginning of the nineteenth century men still lived to a large extent in isolated communities. Only a few good roads existed. Even in England rivers rather than roads were the channels of commerce. It took many days to go from Edinburgh to London in the speediest way. When the battle of Waterloo was fought (1815) it took three days for the news to arrive in London. Dr. Atkinson as late as 1847 was eight months in going from New England to Oregon. Foreign commerce was largely limited to voyages made by ships fitted out or chartered for the special trip, and often a commercial venture of the captain himself. Each nation and each section of the nation had to raise its own food. Hence the failure of a crop in one locality meant a famine, and famines were numerous. To-day the world has become a single market. The use of steam as a motor power on land and sea, and the use of electricity for conveying intelligence has revolutionized commerce. Merchants in England make purchases in India the same day, and on the next day the purchased goods start on their journey. The Suez Canal has reduced the voyage between London and Calcutta to thirty days instead of 200. It has destroyed 2,000,000 of tonnage (see PANAMA). Fresh fruit, raised in California, is sold in London. Fresh meat is carried from New York to Liverpool for one cent a pound. Boxed meats have been carried from Chicago to London at one half a cent a pound. The productions of North America, South America, Australia, Russia, and Egypt battle for the world's markets. It has been calculated that railways have added to the power of the human race a force somewhat greater than that of a horse working twelve days for every inhabitant of the globe. Statistics, however, best show the growth of commerce.

FOREIGN COMMERCE OF PRINCIPAL COUNTRIES

(Compiled from U. S. Statistical Abstract, 1906) *Statistics for 1905 except as stated*

NOTE.—United States equivalents of the following monetary units: Argentina: Paper peso (1905) = 42.5 cents. Bolivia: Boliviano (1905) = 44 cents; (1906) = 47.7 cents. Brazil: Milreis (1905–6) = 30.4 cents. China: H. tael (1905) = 73.6 cents. Costa Rica: Colon (1905–6) = 46.5 cents. Greece: Paper drachma (1905–6) = 15.7 cents. Haiti: Paper peso (1905–6) = 25 cents. Honduras: Silver peso (1904–5) = 43 cents. Nicaragua: Peso curr. (1905) = 17 cents. Paraguay: Paper peso (1906) = 8 cents. Portugal: Milreis curr. (1905) = 99.2 cents. Salvador: Peso (1905) = 44.1 cents. Siam: Tical (1905–6) = 30 cents. Spain: Peseta curr. (1906) = 17.1 cents. Turkey: £T = $4.40.

Total Imports	$1,418,279,187

GREAT BRITAIN

Imports and Exports of Merchandise of the United Kingdom

(Compiled from the "Annual Statement of the Trade of the United Kingdom")

The values of the imports represent the cost, insurance, and freight; or, when goods are consigned for sale, the latest sale value of such goods. The values of the exports represent the cost and the charges of delivering the goods on board the ship, and are known as the "free on board" values.

Years	Total Imports		Exports				Total of Imports and Exports

South America	241,600,000	421,500,000	140,700,000	312,600,000

For further information on commerce, see each country.

COMMERCE AND LABOR, DEPARTMENT OF: This department was formed by the act of Congress of Feb. 11, 1903, and constitutes one of the nine executive departments of the general government. It is in charge of a secretary who is a member of the Cabinet, and who also receives the same salary ($8,000) as the other Cabinet officers. This department was created with a view to the furthering and developing of trade both in the United States and also with foreign lands; of the different industries connected with the fisheries, mines, and manufactures; of matters respecting labor and the working people; of the bettering of the means of transit by coach, railway, and steamboat; of the overlooking of matters regarding the various kinds of insurance. Within the department are several bureaus, the Lighthouse Board and the lighthouse establishment, the Steamboat Inspection, the Bureau of Corporations, the Bureaus of Manufactures, of Labor, of Navigation, of Standards, of Statistics of the Treasury, of Foreign Commerce, of the Census, of the Fish Commission, of the Corporations, of the Coast and Geodetic Survey, of the Shipping Commissioner, of Immigration, of the Fulfilment of the Exclusion Acts against Chinese. The Fish Commission has oversight of the salmon and other fisheries of Alaska and the hunting of the fur-seal. The Bureau of Corporations is intended to have control of the different trust and trade combinations. There is a Commissioner of Corporations who receives a salary of $5,000, whose duty it is to look carefully into the organizing, getting up, and managing of all stock companies trading whether in the U. S. or abroad, with the exception alone of the common carriers who come under the Interstate Commerce Act. It is his duty to collect information and embody it in a paper to the president. He has the power to call upon and to subpœna witnesses to give testimony.

The first secretary under the act was Mr. George B. Cortelyou, of New York, appointed Feb. 16, 1903. After him came Mr. Victor B. Metcalf, of California. The present incumbent, appointed 1907, is Mr. Oscar S. Straus, of New York.

COMMERCIAL RELATIONS (United States): The friendly sentiment which exists between nations, while due in many cases to descent from a common stock and to the presence in one country of many former citizens of another, is also due to the existence of that other commercial factor, invested capital. The friendly sentiment existing between the United States and all English-speaking nations is, of course, the result, to a great extent, of a common parentage and the use of a common language as a medium of intercourse. In the case of our dealings with the Germanic nations there is not only the close relationship between the Anglo-Saxon and the Germanic, but also the presence in this country of millions of representatives of those nations.

The number of immigrants admitted into the U. S. from Germany alone since 1820 exceeds 5,000,000 and the number of natives of that country residing in the U. S. at the present time is nearly 3,000,000. The number of Austrians residing in the U. S. at the date of the last census was over a quarter of a million; natives of Holland over 100,000; and of the natives of Norway and Sweden and Denmark over 1,000,000; while of the natives of the United Kingdom the total in 1900 was 2,500,000 and of Canada more than 1,000,000.

The latest available statistics indicate that the number of natives of the U. S. now residing in the United Kingdom is approximately 30,000. The German census of 1900 showed the presence of practically 18,000 of our citizens residing in Germany. The Mexican census showed nearly 16,000 Americans residing in Mexico in 1900, and the Canadian census of 1901 showed about 41,000 natives of the U. S. residing in Canada. Sub-

sequent Canadian records show a migration of from 25,000 to 45,000 per annum from the U. S. to Canada, which suggests that the number of our own people now residing in the Dominion is probably over 100,000.

Our consul-general in Mexico reported some two or three years ago that over $500,000,000 of American capital was invested in that country, and persons well acquainted with the movements of investments out of the U. S. are of the opinion that this sum has been increased since at the rate of perhaps $100,000,000 per annum, and that the total American capital invested in Mexico approximates $800,000,000. Reports from our consuls in Canada and other available sources indicate that the investment of American capital among our neighbors on the north is also to be measured by hundreds of millions.

Our consul-general in Cuba has indicated that, in his opinion, the amount of American capital there invested is between $100,000,000 and $200,000,000, and a study of this subject recently made by the Bureau of Statistics develops the fact that probably $100,000,000 of American capital have been invested in the Hawaiian Islands, and from $10,000,000 to $15,000,000 in Porto Rico. In the great countries of Europe, where capital is plentiful, American inventions and American skill in manfacturing and management have combined with local capital to develop great industrial enterprises, which have strengthened the cordiality of sentiment existing between the two peoples.

There is no difficulty in proving that the existence of these factors—sentiment, immigration, and invested capital—has been followed by the maintenance of cordial commercial relationships. The United Kingdom, having with us a common language and of whose people we had in 1900 2,750,000 in the U. S., and to which we have sent 30,000 of our own people to become permanent residents in its communities, is the most important customer for American exports.

Germany is next in importance in both our export and import trade. Of German people we had in 1900 two and two thirds millions, and today have perhaps as many as 3,000,000, and in that country 20,000 Americans now reside. Canada follows, and of her people we had in 1900 over 1,000,000, and she has 100,000 former citizens of the U. S. In Canada are invested large sums of American capital. Still another country with which our trade relations have grown with wonderful rapidity is Mexico, which takes two thirds of its imports from us and sends three fourths of its exports to us. In that country probably 20,000 former citizens of the U. S. reside and hundreds of millions of American capital are invested, while the number of former Mexican citizens now residing in the U. S. is over 100,000.

There is negative proof to add to the positive proof that sentiment and good-will between nations needs immigration and invested capital for the growth of trade relations. Indeed, there is a reverse side to the picture. Our friendship for France is a matter of history. Altho our relations have always been cordial, we have often wondered that our trade grows so slowly and that we supply only about 10 per cent of its imports, while to Germany we supply 14 per cent, to the United Kingdom 25 per cent, and to Canada 60 per cent of their imports. While this apparently anomalous condition is doubtless due in part to the restrictive policy of France, may it not also be due in some degree to the fact that the total number of French residing in the U. S. in 1900 was but 104,000, as compared to the millions of the United Kingdom, Germany, and Canada?

To prove my proposition further, the surprizingly rapid growth of our trade with Italy in recent years is but an additional argument supporting the theory that the closeness of relationship between the peoples of the two countries is an important factor in the development of commercial relations. Our trade with Italy in recent years has expanded from practically $40,000,000 in 1896 to nearly $90,000,000 at present, and at the same time the number of Italians in the U. S., which in 1900 was nearly 500,000, has grown with phenomenal rapidity in recent years, with a correspondingly gratifying enlargement of our trade relations with that country.

The number of Russians in the U. S. in 1900 was nearly half a million, and the increase since then has been very great. The value of our exports to Russia has more than doubled in the last decade and the value of our imports from that country more than quadrupled. We have wondered and with reason at the slow growth of our exports to South American countries and especially at their small value when compared with the large amount represented by our imports from that section of the world. But possibly we do not take into consideration the fact that the South American countries are peopled by races less akin to us in nationality than those previously mentioned, and that American citizens and American capital are seldom found in those communities. The South American countries are generously populated with Europeans and are enjoying the beneficial effects of their capital. The number of South Americans residing in the U. S. in 1900 was less than 5,000, as compared with the 100,000 from Mexico.

The conclusions to be drawn from these facts and figures are clearly that the sentiment of friendship as well as that of cordiality has accompanied the development of commerce with those countries with which our commercial intercourse is greatest and most satisfactory and that it should be continued and fostered.

There can be no doubt that the presence in the U. S. of capital from foreign countries and the presence in such countries of American capital does strengthen commercial relations between the nations, while the presence of industrious citizens from other countries has been of great aid in developing the many industries that have made us the most wealthy and prosperous nation in the world, as well as the greatest manufacturing nation, and placed us in the front rank of exporters of domestic products and of manufactures.

For the purpose of properly expanding and enlarging our trade relations, it is of the highest importance that the executive branch of our Government charged with the cultivation of friendly relations with foreign countries shall not be hampered by any narrowness or short-sightedness on the part of our lawmakers, either national or in the separate states, for every obstacle that is put in the way of friendly international relations is bound to reflect and act as a check upon our foreign commerce, and at the same time upon our wage-workers, of whom so many are employed in industries and manufactures engaged in exporting. As it has been shown that the movement of population from one country to another is one of the forerunners of international trade, as well as a

great factor in promoting it, we must have a care not to put unreasonable checks on immigration.

So long as the exclusion law was clearly understood to apply only to the coolie class our trade with China grew with rapidity. Her merchants and travelers and representative people visited this country freely and sent their sons to be educated in our schools, colleges, and universities. In like manner Americans visited China freely, and the number of our people residing in that country increased from less than 1,300 in 1894 to over 3,200 in 1904. Our exports to China grew from less than $5,000,000 in 1895 to over $50,000,000 in 1905, and while we believe that the loss of over $20,000,000 shown in the returns for 1906 was due, in some degree, to the fact that the trade of 1905 was abnormally large, there can be no doubt that it was due in some part to the recent trade boycotts, resulting from the feeling on the part of the Chinese that their representative people do not receive proper treatment when they apply for admission into the U. S. So apparent was this fact that President Roosevelt, in a message to Congress a year ago, urged the enactment of a Chinese admission law.

The individual merchant or manufacturer knows that he cannot expect to hold customers whom he openly offends or brutally insults. The same is true of a nation. It cannot offend another nation and hold the trade of its people. International courtesy is as essential to international good-will as is a similar relationship between individuals, and the consequences in the former case are far more serious and permanent. The merchants and manufacturers of our country can perform no more valuable service to the nation and to the promotion of foreign commerce than in strengthening public sentiment to support the government in cultivating these friendly relations with other nations which are so essential to good-will and good trade relations.

Our trade with Japan has shown a surprizing growth in recent years, during which time a feeling of deep friendship has developed between that remarkable race and our own. Her people have been welcomed to all the privileges and immunities enjoyed by the most favored nation, except actual citizenship. The privileges of Americans residing in Japan, the number of whom has nearly doubled in the past decade, have correspondingly increased.

Our great silk manufactories, which employ thousands of working men and disburse over $30,000,000 a year in wages, have drawn largely for their raw material upon Japan, sending her nearly $40,000,000 for raw silk in the year just ended. Japan in turn has purchased freely of the products of our farms and factories, so that our exports to that country have grown from less than $8,000,000 in 1896 to over $38,000,000 in 1906. In view of these flattering commercial relations with the dominant power of the Far East, it is a matter of serious regret that recent incidents in a single community of our country—a community that has profited largely through the enlargement of our trade with Japan—should have endangered the cordiality of relations under which that trade has developed.

While this occurrence is too recent to have had as yet a perceptible effect upon trade relations, it requires no stretch of imagination to foresee that unless these deplorable incidents are satisfactorily adjusted they will have a disastrous effect upon our future trade with that country. On this subject I believe the President voiced the sentiment of the great mass of our people when he said in his message to Congress:

> Not only must we treat all nations fairly, but we must treat with justice and good-will all immigrants who come here under the law. All we have to question is the man's conduct. If he is honest and upright in his dealings with his neighbor and with the State, then he is entitled to respect and good treatment. Especially do we need to remember our duty to the stranger within our gates. It is a sure mark of a low civilization, a low morality, to abuse or discriminate against or in any way humiliate such stranger who has come here lawfully and who is conducting himself properly. To remember this is incumbent on every American citizen, and it is especially incumbent on every government official, whether of the nation or of the several states.

Altho the question of ethics in the growth of international commerce may at first sight prove novel, there is really nothing new about it other than that the nations of the world are growing more enlightened, because the basic principles of honesty and courtesy in individual business naturally extend to the larger enterprise of international trade relations. As I have traced out, the growth of trade relations is attributable, in some degree at least, to cordiality of international relationship and of relationship between our own people and those of the nations with which we come into business contact. The future success of our manufacturers and exporters rests in their own hands.

Our government can do certain things. It can, for instance, maintain a great department, such as that of Commerce and Labor; it can record the movements of articles into and out of the country, and the names of countries from which imports come and to which exports go; it can show the growth of exports of various articles, the demand in a given country for the same; it can send its consuls and special representatives to the various nations of the world to learn what markets exist for our goods, and how they must be made and packed and sold to meet the requirements of those markets—but it cannot bring to our manufacturers and exporters that close personal relationship with the people of these nations that is so essential to them if they are to maintain the greatest measure of success.

By sending special representatives to solicit trade, by establishing banking and other facilities therefor, and by cultivating and maintaining friendly relations the exporting nations of Europe have obtained their success in the markets of the world. And when I say special representatives I mean men representing the manufacturer, and so familiar with his own individual methods of production and with commerce that they can present to him the details of the existing trade opportunities and the processes to which he must adapt his own existing methods in order to make his goods salable in the communities in question. These are the things the government cannot do for the manufacturer and the exporter —things they can do only for themselves.

In round numbers the world's imports of manufactures now aggregate $5,000,000,000 in value, and of that amount we are at present contributing but $700,000,000, or about 14 per cent, altho we are the world's greatest producers of all the important articles used in manufacturing, such as cotton, iron, copper, timber, and coal, the last of which furnishes the power necessary to transform the others into the finished products.

We also have the world's greatest system of railways with which to assemble these raw ma-

terials and carry them to the water's edge. Whether our government shall aid in building a great merchant marine for carrying these products, already cheaply transported, from the water's edge to the principal foreign markets, or whether such aid should be confined to those sections with which our trade has shown little development and to which foreign capital is offering us no direct system of transportation, is a matter yet to be determined.

But certain it is that, whatever the government may do in aid of our foreign commerce, or in collecting general information regarding trade opportunities in foreign countries, the real opportunity for success in those markets rests with our producers and exporters, who, by sending their personal representatives among these people, will not only obtain for themselves the information necessary to that trade, but will, at the same time, aid in developing that international sentiment and close relationship which have proved so important a factor in our commercial relations with the countries where our greatest success has been attained.

OSCAR S. STRAUS,
Secretary of Commerce and Labor.

COMMONS: Commons, or land held in common by a village, town, or community, play a large part in the history of land tenure. This is true of Great Britain among other countries, but for the treatment of the subject in general and also in Great Britain, see LAND; PRIMITIVE PROPERTY. The subject is here treated in regard to the United States. The first colonists of America divided land among themselves in proportion to the size of their families; and in some parts of New England according to rank. In Plymouth, however, pasture lands were for many years assigned by lot in town meetings, and wood was cut down and hauled in common. The forests were for more than a century known as "commons." In 1710 Plymouth comprized over 30,000 acres of common land, and to-day there are still over 200 acres of "town land," chiefly forest.

In the old town of Sandwich there is still a parcel of land known as the "Town Neck." This is owned by a company of twenty-four proprietors, the descendants or heirs of the first settlers of the town. Originally the Town Neck, like other common lands, belonged to the whole town. In the town records, under the date May 22, 1658, stands the following note: "If an inhabytant wanteth land to plant, hee may have some in the Towne Neck, or in the common for six yeare and noe longer." Later, April 6, 1678, townsmen are given liberty to improve Neck lands "noe longer than ten yeares, and then to be at the townsmen's ordering againe." In the year 1695 the use of the Town Neck was restricted to the heirs of original proprietors, and the land was staked out into thirty-eight lots. The lots were not fenced off, and the whole tract continued to lie as a common field, under the authority of the entire body of proprietors, like the arable lands of a Germanic village community. On April 4, 1695, it was agreed that the Town Neck should be improved for the future as a common field, until the major part of those interested should see cause otherwise to dispose or improve the same. The common fence was to be made up, and a gate to be provided by May 1st. A field-driver or hayward was to keep the Town Neck clear of creatures, and to impound for trespass. In 1700 it was voted that the Neck be cleared of creatures by April 16th, and that no part of the land be improved for tillage other than by sowing.

Lately, it has been proposed to sell this land to a private company for the Cape Cod Canal, a proposal which the Massachusetts Nationalists have strongly opposed. The above is only one instance of the survival of communal lands in New England. In Salem there were ten fields which belonged each to a number of proprietors, who had individual rights, but were subject to communal authority, a majority vote being supreme. They were tilled, sown, reaped in common. And this was only a part of their communism. The forests around Salem were long kept "for the commons of the towne, to serve it for wood and timber." No townsman could make profit by exporting the logs or lumber, but every man was free to take all he needed for fencing, fuel, or building purposes. Like many other towns, Salem had large tracts of meadow land, where every man had liberty to mow. After the grass crop had been gathered, the cattle of the town were turned into the meadows to graze. Along the Connecticut River this custom continued until quite recent times. Boston Commons was thus used for many generations. The Town Neck in Salem, which is now a public pleasure-ground, remained a common pasture for milch cows until lately. At present there are 300 acres of common land, called the "Great Pastures," being the last remnant of a tract of 4,000 acres. It is owned by the descendants of the original commoners. In 1640 the town voted that "none of the commons within the cattle range should be granted to any individual use." Generally, however, the increase of population led to the gradual breaking up of the system of communism. It was, however, only after a long contest that the landless citizens triumphed over the village patricians. The immediate result of the abolition of common lands was very beneficial to the interests of the community, as the number of small landowners was increased.

It is not only in New England that traces of the early land communism appear, but in all English or Dutch settlements. There were commons in Nantucket, New York, New Jersey, Delaware, Pennsylvania, Maryland, Virginia, and the Carolinas. Almost everywhere in the South certain communal customs prevailed. Forests, streams, and foot-paths are generally regarded as common to all. The court greens in Southern towns are as free as village greens or commons. Annapolis has a town pasture which is typical of scores of others. In the Southern parishes the glebe lands are only an ecclesiastical phase of the original communism, separated and administered by church boards for church purposes, similar to the town lands of New England, which yielded support to the schools and clergy.

Allen, in *The Nation*, Jan. 10, 1878; *Johns-Hopkins University Studies in Historical and Political Science*, vol. i., No. 2, on *The Germanic Origin of New England Towns*, and Nos. 9 and 10, on *Village Communities of Cape Ann and Salem.*

COMMONS, JOHN ROGERS: Professor of political economy; born at Hollandsburg, Ohio, 1862; educated in public schools and at Oberlin College; studied political science at Johns Hopkins University, 1889–90 (A.M., 1890). He was successively tutor in economics at the Wesleyan University, and professor of political economy at Oberlin (1891–92), Indiana University (1893–1895), Syracuse University (1895–9). He was expert agent of the United States Industrial Commission in 1901; and assistant secretary of the National Civic Federation, 1902. Since 1904 he has been professor of political economy at the University of Wisconsin. Commons was one of the founders of the AMERICAN PROPORTIONAL REPRESENTATION LEAGUE, and has been active in numerous social-reform movements and organizations, particularly, recently, in the National Civic Federation, and as a director of the American Bureau of Industrial Research at Wisconsin University, in which capacity he made special studies of trade-unionism and kindred subjects for an industrial history of the United States, now in course of preparation. He belongs to no one school, except as holding to the so-called ethical view of political economy. He favors the referendum and initiative, proportional representation, arbitration and conciliation, trade-unionism, the nationalization and municipalization of natural monopolies, and the complete governmental control of currency. He is the author of: "Distribution of Wealth"; "Social Reform and the Church"; "Proportional Representation"; "Trade-Unionism and Labor Problems"; "Races and Immigrants in America," besides numerous articles in magazines and economic journals. *Address*: Wisconsin University, Madison, Wis.

COMMUNE, COMMUNALISM, AND COMMUNARDS: A commune (from Latin *communis*, common) is in general a community organized, or the

government of such a community. Under the Roman Empire every province appears to have had its own provincial diet or assembly, called a *concilium* or *commune*, and these are held by some to have been the first attempts at representative assemblies. But see COMMUNISM; MIR, etc. In the Middle Ages many cities and towns formed confederacies of citizens, and all such confederacies of towns or provinces were called communes. We read of the Commune of Florence, the Commune of Paris, etc. In France especially these communes at one time developed very considerable power and obtained large rights which they gradually lost under the centralizing tendencies of the government of the Louis. Beginning with the Revolution, however, there has been a constant agitation for, and some serious insurrections in order to gain, the supremacy of the old *communes*. This has led to a theory particularly popular in France, which would make the commune the political and social center, and do away with all central government save a loose federation of communes. This was the ideal of BAKOUNIN, and is the view of most anarchist communists. (See ANARCHISM, section "Anarchist Communism.") It was this theory that largely led to the rising of the PARIS COMMUNE in 1871. One who advocates this view is sometimes called a *communard*, tho this phrase has been particularly appropriated for the supporters of the Paris Commune. Prof. R. T. Ely and other writers, however, prefer the word *communalist* for the believer in this theory. (See also COMMUNISM; PARIS COMMUNE.)

COMMUNISM: The economic theory which advocates the total or partial abolition of the right of private property, actual ownership being ascribed to the community as a whole or to the state. Says Palgrave's "Dictionary of Political Economy":

> Communism is the theory which teaches that the labor and the income of society should be distributed equally among all its members by some constituted authority. For an example of what communists mean by equal division of labor and income, the following explanation may suffice: "Here equality must be measured by the capacity of the worker and the need of the consumer, not by the intensity of the labor and the quantity of things consumed. A man endowed with a certain degree of strength, when he lifts a weight of ten pounds, labors as much as another man with five times the strength when he lifts fifty pounds. He who, to satisfy a burning thirst, swallows a pitcher of water, enjoys no more than his comrade who, but slightly thirsty, sips a cupful. The aim of the communism in question is equality of pains and pleasures, not of consumable things and workers' tasks." (Buonarroti, "Conspiration de Babeuf," i., 297.)

Says John Stuart Mill ("Political Economy," book ii., chap. i.):

> The assailants of the principle of individual property may be divided into two classes: those whose scheme implies absolute equality in the distribution of the physical means of life and enjoyment, and those who admit inequality, but grounded on some principle, or supposed principle, of justice or general expediency, and not, like so many of the existing social inequalities, dependent on accident alone. At the head of the first class, as the earliest of those belonging to the present generation, must be placed Mr. Owen and his followers. M. Louis Blanc and M. Cabet have more recently become conspicuous as apostles of similar doctrines (tho the former advocates equality of distribution only as a transition to a still higher standard of justice, that all should work according to their capacity, and receive according to their wants). The characteristic name for this economical system is communism, a word of continental origin, only of late introduced into this country. The word socialism, which originated among the English communists, and was assumed by them as a name to designate their own doctrine, is now, on the Continent, employed in a larger sense; not necessarily implying communism, or the entire abolition of private property, but applied to any system which requires that the land and the instruments of production should be the property, not of individuals, but of communities or associations, or of the government.

This is probably the best use of the word, tho there is some authority for using the word "communism" simply as identical with extreme and radical socialism. It is unnecessary, however, to use two words for the same thing, and communism is being limited more and more by the best writers to apply to that school of Socialists who believe in holding all property in common except the merest personal effects, and giving to every man equally, in contradistinction to Socialists, who would only have capital, or the means of production, in common. Concerning communism in general, the best brief discussion is still undoubtedly that of Mill, from whom we therefore quote at length. He says:

Mill on Communism

> Whatever may be the merits or defects of these various schemes, they cannot be truly said to be impracticable. No reasonable person can doubt that a village community, composed of a few thousand inhabitants cultivating in joint ownership the same extent of land which at present feeds that number of people, and producing by combined labor and the most improved processes the manufactured articles which they required, could raise an amount of productions sufficient to maintain them in comfort; and would find the means of obtaining, and if need be exacting, the quantity of labor necessary for this purpose from every member of the association who was capable of work.
>
> The objection ordinarily made to a system of community of property and equal distribution of the produce, that each person would be incessantly occupied in evading his fair share of the work, points, undoubtedly, to a real difficulty. But those who urge this objection, forget to how great an extent the same difficulty exists under the system on which nine tenths of the business of society is now conducted. The objection supposes that honest and efficient labor is only to be had from those who are themselves individually to reap the benefit of their own exertions. But how small a part of all the labor performed in England, from the lowest paid to the highest, is done by persons working for their own benefit. From the Irish reaper or hodman to the chief justice or the minister of state, nearly all the work of society is remunerated by day wages or fixt salaries. A factory operative has less personal interest in his work than a member of a communist association, since he is not, like him, working for a partnership of which he is himself a member. . . .
>
> Another of the objections to communism is similar to that so often urged against poor laws: that if every member of the community were assured of subsistence for himself and any number of children, on the sole condition of willingness to work, prudential restraint on the multiplication of mankind would be at an end, and population would start forward at a rate which would reduce the community through successive stages of increasing discomfort to actual starvation. There would certainly be much ground for this apprehension if communism provided no motives to restraint equivalent to those which it would take away. But communism is precisely the state of things in which opinion might be expected to declare itself with greatest intensity against this kind of selfish intemperance. Any augmentation of numbers which diminished the comfort or increased the toil of the mass would then cause (which now it does not) immediate and unmistakable inconvenience to every individual in the association; inconvenience which could not then be imputed to the avarice of employers, or the unjust privileges of the rich. In such altered circumstances opinion could not fail to reprobate, and if reprobation did not suffice, to repress by penalties of some description, this or any other culpable self-indulgence at the expense of the community. The communistic scheme, instead of being peculiarly open to the objection drawn from danger of overpopulation, has there commendation of tending in an especial degree to the prevention of that evil.
>
> A more real difficulty is that of fairly apportioning the labor of the community among its members. There are many kinds of work, and by what standard are they to be measured one against another? Who is to judge how much cotton-spinning, or distributing goods from the stores, or bricklaying, or chimney-sweeping, is equivalent to so much plowing? The difficulty of making the adjustment between different qualities of labor is so strongly felt by communist writers, that they have usually thought it necessary to provide that all should work by turns at every description of useful labor: an arrangement which, by putting an end to the division of employments, would sacrifice so much of the advantage of cooperative production as greatly to diminish the productiveness of labor. Besides, even in the

Difficulties

same kind of work, nominal equality of labor would be so great a real inequality, that the feeling of justice would revolt against its being enforced. All persons are not equally fit for all labor; and the same quantity of labor is an unequal burden on the weak and the strong, the hardy and the delicate, the quick and the slow, the dull and the intelligent.

But these difficulties, tho real, are not necessarily insuperable. The apportionment of work to the strength and capacities of individuals, the mitigation of a general rule to provide for cases in which it would operate harshly, are not problems to which human intelligence, guided by a sense of justice, would be inadequate. And the worst and most unjust arrangement which could be made of these points, under a system aiming at equality, would be so far short of the inequality and injustice with which labor (not to speak of remuneration) is now apportioned, as to be scarcely worth counting in the comparison. We must remember too that communism, as a system of society, exists only in idea; that its difficulties, at present, are much better understood than its resources, and that the intellect of mankind is only beginning to contrive the means of organizing it in detail, so as to overcome the one and derive the greatest advantage from the other.

If, therefore, the choice were to be made between communism with all its chances, and the present state of society with all its sufferings and injustices; if the institution of private property necessarily carried with it, as a consequence, that the produce of labor should be apportioned as we now see it, almost in an inverse ratio to the labor—the largest portions to those who have never worked at all, the next largest to those whose work is almost nominal, and so in a descending scale, the remuneration dwindling as the work grows harder and more disagreeable, until the most fatiguing and exhausting bodily labor cannot count with certainty on being able to earn even the necessaries of life—if this, or communism, were the alternative, all the difficulties, great or small, of communism would be but as dust in the balance. But to make the comparison applicable, we must compare communism at its best with the *régime* of individual property, not as it is, but as it might be made.

The perfection both of social arrangements and of practical morality would be to secure to all persons complete independence and freedom of action, subject to no restriction but that of not doing injury to others; and the education which taught or the social institutions which required them to exchange the control of their own actions for any amount of comfort or affluence, or to renounce liberty for the sake of equality, would deprive them of one of the most elevated characteristics of human nature. It remains to be discovered how far the preservation of this characteristic would be found compatible with the communistic organization of society. No doubt this, like all the other objections to the socialist schemes, is vastly exaggerated. The members of the association need not be required to live together more than they do now, nor need they be controlled in the disposal of their individual share of the produce, and of the probably large amount of leisure which, if they limited their production to things really worth producing, they would possess. Individuals need not be chained to an occupation or to a particular locality. The restraints of communism would be freedom in comparison with the present condition of the majority of the human race. The generality of laborers in this and most other countries have as little choice of occupation or freedom of locomotion, are practically as dependent on fixt rules and on the will of others, as they could be on any system short of actual slavery; to say nothing of the entire domestic subjection of one half the species, to which it is the signal honor of Owenism and most other forms of socialism that they assign equal rights, in all respects, with those of the hitherto dominant sex. But it is not by comparison with the present bad state of society that the claims of communism can be estimated. . . .

Freedom

It is yet to be ascertained whether the communistic scheme would be consistent with that multiform development of human nature, those manifold unlikenesses, that diversity of tastes and talents, and variety of intellectual points of view, which not only form a great part of the interest of human life, but by bringing intellects into a stimulating collision, and by presenting to each innumerable notions that he would not have conceived of himself, are the mainspring of mental and moral progression.

For contrary views, see ANARCHISM; INDIVIDUALISM.

We give here a summary of the history of communism in general, down to the nineteenth century, referring the reader to separate articles for details, and especially to the article COMMUNITIES IN AMERICA, for a sketch of the important development of American communism.

Communism has always existed, to more or less an extent. According to LAVELEYE (see also PRIMITIVE PROPERTY) and many other sociologists, communism was the earliest known form by which property was held, as evidenced in existing conditions among the North American Indians and most savages, and as witnessed to by the Russian *Mir*, the Javan *Dessa*, and many other Asiatic and European survivals from primitive forms. This has been strenuously denied by some authorities, notably by Fustel des Coulanges, but the denial is more apparent than real, since they admit that property was held by some great chief or strong man for the community fraternally or feudally rather than in the ordinary sense of private property. The Buddhist monasteries, where the devotees renounced marriage and property, are another early communistic attempt. Pythagoras, Plato, and Aristotle and other Greeks largely favored communism. (See PLATO; ARISTOTLE.) Some of the Jews, the Essenes, and Therapeutæ taught and practised communism. (See ESSENES.)

Early History

The early Christian Church was, in places at least, undoubtedly largely communistic. (See CHURCH AND SOCIAL REFORM.) We are distinctly told of the first Christian Church at Jerusalem, that they had all things in common. It was, however, a perfectly voluntary communism. Christians were not required to renounce private property. Peter said to Ananias of the price of his land, part of which Ananias had kept back—"While it remained was it not thine own, and after it was sold, was it not in thine own power?" Yet the fact remains that, led by the power of love, some early Christians did practise communism. After the third century the Church became a much more worldly power, but in the fourth century the communistic tendency developed into the communistic monasticism of the anchorites and monks. Ever since there have been various communistic orders and sects appearing in the Christian Church—the Humiliates; the Beghards and Beguines; the various mendicant orders of the Middle Ages; the Brethren of the Free Spirit, in the thirteenth century; the Adamites, during the Hussite wars. This last order advocated the community of women, and some of the other sects and orders degenerated into disorder and excesses; but, on the whole, considering the ages in which they appeared, they usually stood for the purest and most vital Christianity of their times. Often these communities of brotherly love were the only spots of quiet in the darkness and bloodshed of lawless ages. (See MONASTICISM and MIDDLE AGES.)

The Reformation developed a new impulse toward communism, as indeed has been the case with every new religious movement. The Peasant War in Germany was largely an outcome of the communistic idea working out among the peasantry, but the influence mainly appeared in the organization of the Heavenly Prophets, by Storch, the Anabaptists in Münster, the Libertines of Geneva, the Familists of Holland and England, and the Buchanites of Scotland. The communistic principle is also present in a purer form among the Herrnhuters (Moravians) and in some communities of Auvergne. In Germany many communistic sects arose in the eighteenth century. (See ANABAPTISTS; PEASANTS' WAR; MORAVIANS, etc.)

The eighteenth century also saw a wave of communistic thought in France. MORELLY in his "Code de la Nature" (1755), taught that man naturally possesses every virtue, and is only depraved by bad institutions, the chief of which is private property. He declared that it would be "in conformity with the intentions of nature," if every citizen contributed to the resources of the State, in accordance with his strength, talents, and age, and in return were wholly maintained at the public expense. MABLY, who was a brother of Condillac, endeavored to show, in opposition to Mercier de la Rivière that private property in land is not the natural and necessary basis of society. On the contrary, he said, society could exist without property, as is proved by the cases of Sparta, the Jesuits in Paraguay, and the monastic orders; while the establishment of property in land and inequality of condition has been the great source of avarice, ambition, and vanity.

The Eighteenth Century

BABEUF and his fellow conspirators of 1796, calling themselves the "Equals," were the most remarkable representatives of this thought. In the Utopia of Babeuf, as described by Buonarroti, every one is allotted two different occupations, the one light and the other hard. To give variety and change of scene, all are employed by turns in the transport and postal services. Those who will not work are treated as thieves. Education, carried on in vast boarding-schools, subordinates the family to national life. Distribution is to follow the strictest equality. In England Robert Owen was the great teacher of communism; but for his views, see OWEN.

For the Communists of Paris in 1871, see PARIS, COMMUNE OF. (See also ANARCHISM; BABEUF; CHURCH AND SOCIAL REFORM; COMMUNITIES IN AMERICA; COOPERATION; PROPERTY; PROUDHON; SOCIALISM.)

Hennell, 1844; *History of Cooperation in England*, by G. J. Holyoake, vol. i., 1875, vol. ii., 1879

COMMUNITIES IN AMERICA: Communism implies common ownership; and hence, strictly speaking, there should be included under this term only such settlements, colonies and societies, based on common ownership of property, as have been subjected to the test of practical experiment in America. It is usual, however, to group the communities, the Fourieristic phalanges of half a century ago, the commonwealths, and the joint-stock and cooperative associations of recent date, all together as "American Communities" or "Communistic Societies"; and this grouping is at least partly justified by the fact that in their practical life these various organizations have all had communistic features, all being, as the author of "American Socialisms" affirms, to a certain extent compromises between communism and some form of individual ownership. Then, too, the communists, associationists, and other builders of social colonies have had similar high aims, well exprest in the threefold motto of the Fourierists: "Union of man with man in true society, union of man with God in true religion, union of man with nature in creative art and industry." Their plans and methods, also, have had much in common, alike involving the elimination of class distinctions based upon wealth and special privileges, the substitution of brotherly cooperation for competition in the affairs of life, the erection of large unitary dwellings as centers of attractive social life.

The principle of common ownership, far from being of the modern origin supposed by many, antedates the individual holding of real estate, as exemplified in the village communities of India, Russia, Germany, and England, confirmation of which may be found in the works of Sir Henry Maine of England, Maurer of Germany, and Laveleye of France. "These three eminent writers," says Roswell D. Hitchcock, D.D., in his work on socialism, "are agreed in the conclusion, after independent and great research, that common property in land was, in many parts of the world, perhaps everywhere, undoubtedly the original form of ownership." But the antiquity of the principle of common ownership, and the fact that the record shows that it was favored by both the Old and the New Testament, it may be urged, do not prove that communism is to be the final status of society; and it may be fairly asked, What good purpose have the communistic societies served? And what sufficient reason is there for supposing that communism in any form will play an important part in the world's future? It must be admitted that these American communities, considered with reference to their numbers and wealth, have thus far been comparatively unimportant; but it is, on the other hand, affirmed by the communists that their history is of transcendent importance, in demonstrating by more than a century's experience the practicability of forms of society dominated by the Golden Rule. For example, the Shakers, who established their first community 131 years ago, now make the astounding claim that during all these years they have lived prosperous, contented, happy lives, and have not spent among themselves a penny for police, for lawyers, for judges, for poorhouses, or for penal institutions.

Principle of Common Ownership

Who shall measure the value of such a record for good in the world's history? If, as we read in Proverbs, "he that ruleth his spirit is better than he that taketh a city," what shall be said of the 1,700 Amana Communists that for threescore years have lived such a life of peace that no lawyers or constables or courts have been required to maintain order in their midst, and in such prosperity that during all these years not a mendicant has been seen in the streets of their seven villages save such as have come from the outer world? Consider, too, the example given by the Separatists of Zoar, who maintained their community organization for seventy-nine years, and proudly boast that during that time no member was ever charged with crime, and that they had no disputes they could not settle among themselves, no divorces, no scandals, no controversies over property.

Whether the principle of communism will play an important part in the ultimate condition of society will depend, the communists assert, upon the inherent character of society in the distant future. If individual selfishness shall become more rampant and dominant as the centuries roll by, then communism may be wholly ignored in the final social fabric; but if, on the other hand, the principles that have wrought since time began for the elimination of strife, ignorance, superstition, cruelty, injustice, and all forms of wickedness, and fostered the growth of all that tends to make mankind unselfish, altruistic, brotherly, just and noble, and that have built up institutions for the amelioration of human conditions, shall continue to be operative and become predominant and all-controlling, then surely, they say, the principle of communism will eventually become the most important factor in society.

Blessings of Altruistic Unity

In considering the principle of communism as exemplified in the communistic societies of the United States, and as likely to be more fully exemplified as mankind more fully realizes the unspeakable blessings that result from altruistic unity, a clear distinction should be kept in mind between the voluntary, peaceable, conservative communism so exemplified, and which abhors every form of compulsion, and the political communism that was exhibited in France in 1870, and now is occasionally heard even in the United States, demanding that society shall be reorganized on the basis of equality of conditions and privileges, and which aims at controlling all the functions of government, and compelling everybody, *nolens volens*, to become communists. With such communism, whether French, German, European, or International, communism as sought to be realized in the communistic societies of the United States, and properly termed American communism, has scarcely anything in common, either in aim or method.

The colonies and settlements thus collectively called American communities may be classified as: (1) the religious; (2) the non-religious; (3) the transcendental; (4) the Fourierists; (5) the Spiritualists; and (6) the commonwealths, brotherhoods, etc., of recent date. The religious communities head the list because first in point of time, first in longevity, first in general success. The most important of these are:

Classification of Communities

The Labadist Community of Protestant Mystics, numbering 100 members, and owning 4,000 acres of land in the northern part of Maryland, founded 213 years ago, and which has long ceased to exist.

The existing Community of German Seventh-day Baptists, founded 175 years ago at Ephrata, Pa., by Conrad Beisel, and at one time having 300 members and considerable property, both the membership and property being now greatly reduced.

The Shakers, founded in 1776 at Watervliet, N. Y., at one time having a membership of over 5,000 and large landed properties, and now having fifteen separate societies in eight states, but with much reduced membership.

The community founded in 1805 by George Rapp in Butler County, Pa., afterward removed to Posey County, Ind., and later to Economy, Pa., possessing at one time property of the estimated value of more than $1,000,000, and numbering 1,000 members, of whom very few now survive.

The community founded by Joseph Bimeler at Zoar, Ohio, in 1817, and at its greatest period of prosperity numbering about 500 members and having nearly a million dollars' worth of property.

The Perfectionist Community founded by John H. Noyes at Putney, Vt., in 1836; transferred to Oneida, N. Y., in 1848; numbering at one time with its branches over 300 members, and having several prosperous businesses; transformed in 1880 into a joint-stock corporation.

The Amana Community, founded near Buffalo, N. Y., in 1843, removed to Iowa in 1855–64; now numbering over 1,700. members, and having seven villages, all under one control and all having a common interest.

The Bethel-Aurora Community, founded by Dr. Wm. Keil in Shelby County, Mo., in 1844, and in Aurora, Ore., in 1856, and numbering together at one time about 1,000 souls, neither now existing.

The Swedish Community, founded by Eric Janson, at Bishop Hill, Ill., in 1856, having over 1,000 members and existing for sixteen years.

The Bruderhof Communities of Russian Mennonites in South Dakota, which have existed for many years, and aggregate over a thousand members.

The Koreshan Community of Estero, Fla., numbering over 160 members, and apparently prosperous.

The Community of Israelites at Benton Harbor, Mich., having 700 members, and growing.

The more important of the distinctly non-religious group are:

The community founded by Robert Owen at New Harmony, Ind., in 1825, which had 900 members, and which led to the formation of eighteen other communities of similar character; and the French community founded by Etienne Cabet in northern Texas in 1848, transferred to Nauvoo, Ill., in 1849, to Corning, Iowa, in 1857, and having at one time 500 members.

The Brook-Farm Community, founded by George Ripley at Roxbury, Mass., in 1842, and Fruitlands, founded by A. Bronson Alcott and others at Harvard, Mass., in 1843, constitute the transcendental group, tho often classed with the Fourieristic settlements, one of which Brook Farm became in its later years, but it owed its origin to the transcendental movement in and near Boston, and particularly to the Transcendental Club, an organization of cultured people formed in Boston in 1836.

Of the Fourieristic colonies nearly thirty were formed within five years in eight different states, with an aggregate membership of about 4,500, and a longevity ranging from a few months to seventeen years.

Of the several spiritualistic communities those founded by Thomas Lake Harris at Brockton, N. Y., in 1867, and at Santa Rosa, Cal., a few years later, are the most important, unless we include in this group the Shakers, who have abounded in spiritualistic phenomena during their long career, and claim to have been the first to introduce spiritualism into this country. Several smaller communities owe their origin to spiritualism.

It may be stated in this connection that no classification of the communistic societies of the United States which may be made will prove entirely accurate, there being, for example, religious people in the non-religious and Fourieristic societies, and vice versa.

Of the communities, commonwealths, brotherhoods, and cooperative settlements of recent date may be mentioned: The Koreshan Community at Estero, Fla.; the Christian Commonwealth of Georgia; the Ruskin Commonwealth of Tennessee and Georgia; the Cooperative Brotherhood of Burley, Wash.; the Equality Colony, Equality, Wash.; the Industrial Single-Tax Association, Fairhope, Ala.; the Colorado Cooperative Company; the Freeland Association of Washington; the Mutual Home Association of Washington; the Straight-Edgers of Staten Island and New York; Shalam, or "The Children's Land," of New Mexico; and the Woman's Commonwealth of Washington city.

These settlements are all of too recent origin to furnish noteworthy examples of success; but they all emphasize the longing desire filling the hearts of thousands for a life free from the contention and competition so universally prevalent.

There have been but two widespread movements in this country resulting in the establishment of communistic societies: that in 1825, when Robert Owen, of New Lanark, Scotland, electrified the nation with his grand schemes of social amelioration; and again in the decade between 1840 and 1850 when Fourierism was heralded by the New York *Tribune*, Horace Greeley, Chas. A. Dana, Albert Brisbane, and a score of other able writers and speakers, as the great social panacea—the one system that was to bring in the era of universal brotherhood and justice. The first movement produced, as we have seen, nineteen societies which survived for a few years only; the latter produced about thirty, some of which were of much longer duration, but none exceeding seventeen years.

The present status of the community movement in the United States is less favorable than it was in former years, undoubtedly owing in part to the fact that several of the prosperous religious communities have been unable to fully maintain their organization and prosperity after the death of their founders, and have either modified their property arrangements or dissolved; and partly to the fact that political socialism now absorbs much of the attention that would otherwise be given to experimental communism, its advocates claiming that only through state and national aid can the objects which communists have so much at heart—true and just relations of man to man and man to society—be realized. Still there exist to-day: (1) the Ephrata Community (after 175 years), (2) the fifteen Shaker Communities (after 131 years), (3) the Harmony Community (after 101 years), (4) the Amana Community (after 64 years), (5) the Oneida Community (after 59 years, tho transformed into a joint-stock company after 32 years), (6) the Koreshan Community, and (7) the Straight-Edgers; in addition to various brotherhoods, cooperative colonies, and other societies of recent date; and such experiments continue and seem destined to continue despite all discouragements and failures.

COMPETITION: In social science this term denotes the strife of the individual or of a group of individuals to gain the utmost possible profit, rent, or wage in free rivalry with other individuals or groups of individuals. It is defined in Palgrave's "Dictionary of Political Economy" as "the free action of individual self-interest." But this is not enough. The free action of individual self-interest may lead a man into cooperation or socialism, the opposites of competition. The distinctive characteristic of competition is in its being the free action of self-interest *in fair rivalry with some other individual or group of individuals*. One man cannot compete. He must compete with somebody. This is seen in the derivation of the word, from *com* and *petere*, to seek together.

Competition, so conceived, is held by most to be to-day the supreme law of trade. As such it is defended by believers in present industrial methods, is bitterly condemned by Socialist reformers, while perhaps the majority of minds, and almost all political economists to-day, see evils in unlimited competition, and would modify its free play, but not supplant it by any other principle.

Still another school of thought denies that we have free competition to-day, and declares that what is needed to save us from our present industrial ills is not less competition, but more competition. We notice these four views:

The Argument for Competition

I. The believers in competition usually assert first that it is the law of nature, and they sometimes add that it is "the law of God." "Theorists and sentimentalists may talk as they will," say the believers in competition, "of abolishing the strife for self or the struggle for existence, the play of self-interest; but the fact remains that this principle always has existed in the world, always has ruled the world, has produced and exists most in the most progressive civilizations." "Progress," says Professor Flower ("Reply to an Address by the Trades' Council," Newcastle, September, 1889), "has been due to the opportunity of those individuals who are a little superior in some respects to their fellows, of asserting their superiority, and of continuing to live, and of promulgating as an inheritance that superiority." "To formulate this as the immutable law of progress since the beginnings of life has been," Mr. Benjamin Kidd tells us ("Social Evolution," p. 34), "one of the principal results of the biological science of the century." "It is," says Professor Flower, "the message which pure and abstract biological research has sent to help us on with some of the commonest problems of human life" (*idem*). "It is," Mr. Kidd adds (*idem*, p. 37), "an inevitable law of life among the higher forms, that competition and selection must not only always accompany progress, but that they must prevail among every form of life which is not actually retrograding." Socialism, therefore, which aims "at the final suspension of that personal struggle for existence," cannot, according to Mr. Kidd, "in any case avoid progressive degeneration" (*idem*, p. 210). This is the main argument urged in a hundred forms by the believers in competition. Competition is the source of progress. We must, therefore, have competition in order to have progress.

But, secondly, competition is defended as working on the whole for the good of all classes. Most orthodox economists take this position. Professor Fawcett ("Political Economy," book ii., chap. ii.), says of competition: "The poverty of the poor is often attributed to it; but we shall have reason to show that it is no enemy to the working classes. Without it, their poverty would be rendered doubly severe; for it is an active spirit of competition which maintains the capital from which the wages of the laborers are paid. Competition befriends the working classes in other respects; it cheapens commodities, and insures that the maximum of wages shall always be paid. Competition is not confined to one class; it may be as rife among buyers as among sellers, or among the employers as among the employed. Individuals who have goods to sell are anxious to realize as large profits as possible; but when there is competition, a trader cannot be paid more than what is termed a fair price for his goods, because if he attempts to obtain more than the ordinary price he will be undersold by other traders. When buyers compete with each other they are anxious to secure the greatest gains, or, in other words, to buy upon the best possible terms; and thus when buyers are each intent on purchasing on the most favorable terms, a commodity is sure to realize what it is worth. It therefore follows that if, on the one hand, competition prevents a trader obtaining exceptionally high profits, on the other hand it insures to him a fair price for his goods. Some, perhaps, may think it unfortunate that employers, stimulated by a desire to realize the largest gains, should seek to engage their laborers on the lowest possible terms. But such conduct upon the part of the employers inflicts no injury upon the laborers; for whenever there is activity of competition, an individual manufacturer or trader is as powerless to get laborers to work for him at less than the ordinary wages as he would be to buy cotton at a cheaper rate than his fellow manufacturers. The price of cotton is maintained because there are those who are anxious to purchase it; the rate of wages is also maintained by those who are anxious to purchase labor. Competition, consequently, exerts no tendency to reduce profits or wages; the tendency is rather one of equalization.

Wages

Another form of the same argument is to say that competition works for the good of all because it tends to make each individual and each nation do what they can do best. Where each individual and each nation is striving in a free market, that individual and that nation that can do given work or produce a given commodity the best will win. We thus have the survival of the fittest. But there is something which each man and each nation can do best. Therefore under free competition each man and each nation will do what he or it can do best, and all be benefited by the exchange.

Thirdly, believers in competition say nothing can be substituted for it. Palgrave's "Dictionary of Political Economy" says: "It is difficult even to imagine upon what other principle certain complicated transactions of modern trade and industry could be regulated."

"The difficulty of finding any adequate substitute for it (the motive of self-interest) is an almost invincible obstacle in the way of reconstructing society on any but its present individualistic basis" (Sidgwick).

Jevons says: "Scientific Primer," chap. vii.): "There is no way of deciding what is a fair day's wages, outside competition."

Lastly, the believers in competition defend it on the ground that it tends to make individuals self-reliant, independent, inventive, alert, quick to conceive, strong to execute, ready to dare. They point out that the most progressive nations are those where competition has had the greatest development.

The Argument against Competition

II. Coming to the views of those who disbelieve in competition, they, in the first place, deny that competition and the struggle for existence is the *only* cause of progress. Says Charles Kingsley: "That self-interest is a law of human nature I know well; that it ought to be the root law of human society I deny, unless society is to sink down again into a Roman empire and a cage of wild beasts." "Competition," said F. D. Maurice, "is put forth as the law of the universe. This is a lie. The time is come to declare it a lie by word and deed."

That competition and the struggle for existence have entered into and do still enter into the progress of the world, no one denies; it is simply denied that it is the only way of making progress. Mr. Kidd's "Social Evolution," that lauds competition as "the immutable law of progress," is full of instances of progress in civilization made by the spirit of altruism and self-sacrifice. Even animals (like the beaver and the ant) progress by cooperation. Human society has progressed immeasurably by organization, by combination, by cooperation. It is not true that those states are the most progressive where competition is the least controlled. One chief function of the State is to limit competition, and when the State has reached the fullest development, as in Germany, England, and America, then civilization is the best. Biology, if it asserts that competition is the law of progress, has studied the lower forms of life more than the higher. It is almost more true that progress is proportional to man's escape from competition. Competition patterns after the brutes; cooperation patterns after the nobler instincts of humanity.

It is not, however, claimed by the disbelievers in competition that competition has no place in society. They simply argue for an evolution of competition. Competition does tend to the survival of those most fit to compete in the form of struggle in which the competition takes place. The primitive competition was purely physical. Men fought with bare hands, with clubs, or with spears, poisoned arrows, etc. It produced physical giants—Agamemnons, Herculeses, Nimrods. "There were giants in those days." But by the gradually developing combination of law, order, and State, the competition of force was checked, and replaced by a competition more intellectual. Did the race deteriorate? No; it simply developed a higher form of leaders, the Alexanders, Hannibals, Cæsars, Napoleons of society. To-day cooperation, combination, arbitration are replacing the competition of conquerors; competition is now industrial. It is developing leaders in that form of competition—"Napoleons of finance"—the Rothschilds, Carnegies, Rockefellers, etc. What the disbelievers in industrial competition ask is not that competition be done away with, but simply that it be lifted up to a higher level. As the State now in the main prevents physical competition and protects the life of the weakest citizen, so they would have the State replace industrial competition by fraternal cooperation, and set men free to compete in art, in science, in learning. This, they say, will produce not degeneration, but a higher type of men. They deny that industrial competition produces the best citizens. It exists nowhere so fiercely as in the United States." What is the result? Smart business men—the "smartest" in the world. But are these the highest type of men? Says Mr. Bryce ("American Commonwealth," part iv., chap. 81): "In no country does one find so many men of eminent capacity for business, shrewd, forcible, and daring, who are so uninteresting, so intellectually barren, outside the sphere of their business knowledge." Industrial competition produces a survival of the industrially smart, with little reference to their morals. Morals do help to a slight extent, but very slight. Says John Stuart Mill (*Fortnightly Review*, Feb., 1879): "If persons are helped in their worldly career by their virtues, so are they, and perhaps quite as often, by their vices; by servility and sycophancy, by hard-hearted and close-fisted selfishness, by the permitted lies and tricks of trade, by gambling speculations, not seldom by downright knavery. Energies and talents are of much more avail for success in life than virtues; but if one man succeeds by employing energy and talent in something generally useful, another thrives by exercising the same qualities in out-generaling and ruining a rival. It is as much as any moralist ventures to assert, that, other circumstances being given, honesty is the best policy, and that with parity of advantages an honest person has better chances than a rogue. Even this, in many stations and circumstances of life, is questionable; anything more than this is out of the question. It cannot be pretended that honesty, as a means of success, tells for as much as a difference of one single step on the social ladder. The connection between fortune and

Competition does not Produce the Best

conduct is mainly this, that there is a degree of bad conduct, or rather of some kinds of bad conduct, which suffices to ruin any amount of good fortune; but the converse is not true; in the situation of most people no degree whatever of good conduct can be counted upon for raising them in the world, without the aid of fortunate accidents." As for what competition means to the working classes, says Louis Blanc, quoted by Mill in the above review:

"What is competition from the point of view of the workman? It is work put up to auction. A contractor wants a workman; three present themselves. 'How much for your work?' 'Half a crown; I have a wife and children.' 'Well; and how much for yours?' 'Two shillings; I have no children, but I have a wife.' 'Very well; and now how much for you?' 'One and eight pence are enough for me; I am single.' 'Then you shall have the work.' It is done; the bargain is struck. And what are the other two workmen to do? It is to be hoped they will die quietly of hunger. But what if they take to thieving? Never fear; we have the police. To murder? We have got the hangman. As for the lucky one, his triumph is only temporary. Let a fourth workman make his appearance, strong enough to fast every other day, and his price will run down still lower; there will be a new outcast, a new recruit for the prison perhaps! . . .

"Who is so blind as not to see that under the system of unlimited competition, the continual fall of wages is no exceptional circumstance, but a necessary and general fact? Has the population a limit which it cannot exceed? Is it possible for us to say to industry—industry given up to the accidents of individual egotism and fertile in ruin—can we say: 'Thus far shalt thou go, and no farther'? The population increases constantly; tell the poor mother to become sterile and blaspheme the God who made her fruitful, for if you do not the lists will soon become too narrow for the combatants. A machine is invented; command it to be broken, and anathematize science, for if you do not, the 1,000 workmen whom the new machine deprives of work will knock at the door of the neighboring workshop, and lower the wages of their companions. Thus systematic lowering of wages, ending in the driving out of a certain number of workmen, is the inevitable effect of unlimited competition. It is an industrial system by means of which the working classes are forced to exterminate one another."

If it be answered to this that such is not the fact; that the working classes are not exterminating each other; that their condition has steadily risen through the century, and that the higher workmen of England and America, for example, do not fear the competition of China and India, it is to be said: "Yes, it is true that wages have risen; but is this the result of competition? Is it not because competition has to no little extent been limited in England and America by trade-union combination and factory legislation? Have not higher wages and shorter hours as a rule been forced from unwilling employers by organized labor and by legislation?" Until trade-unions were developed, and before there were efficient factory laws, when competition was unrestrained, wages were lower and conditions more terrible among working men than ever in English history. In the Middle Ages competition was somewhat restrained by feudalism, and later by monopoly grants. Only in the latter part of the last century and first of this has competition been at all unlimited. Now of this period Thorold Rogers says ("Work and Wages," p. 63): "I am convinced that at no period of English history for which authentic records exist was the condition of manual labor worse than it was from 1782–1821, the period in which manufacturers and merchants accumulated fortunes rapidly, and in which the rent of agricultural land was doubled."

Competition Modern

The trouble with competition is that it puts even those manufacturers and employers who would be just at the mercy of those who are willing to do anything for gain. Says Prof. Henry C. Adams, Ph.D. ("An Interpretation of the Social Movements of Our Time," p. 11):

"Without legal regulation the struggle between men for commercial supremacy will surely force society to the level of the most immoral man who can sustain himself. The fittest to survive unregulated competition will be he who is morally the least fit to live. For purpose of illustration, suppose ten manufacturers competing with each other to supply the market with cottons. Assume that nine of them, recognizing the rights of childhood, would gladly exclude from their employ all but adult labor. But the tenth man has no moral sense. His business is conducted solely with a view to large sales and a broad market. As child labor is actually cheaper than adult labor, he gives it a decided preference. What is the result? Since his goods come into competition with the goods of the other manufacturers, and since we who buy goods only ask respecting quality and price, the nine men whose moral instincts we commend will be obliged, if they would maintain themselves in business, to adopt the methods of the tenth man, whose immoral character we condemn. Thus the moral tone of business is brought down to the level of the worst man who can sustain himself in it."

As for the assertion that competition is necessary to produce independence, self-reliance, and individual exertion, the Socialists who would supplant competition by cooperation do not argue for paternalism. Says a Socialist writer: "Socialists are the opposite of paternalists. The Socialists of Germany, for example, recently cast 1,500,000 votes against the so-called paternal socialism of the emperor. It is the wealthy Carnegies who would manage all business and give of their fortunes for the good of working men, who are the real paternalists of the day. Under democratic socialism the people would be the government, and work and manage for themselves. It would be the very 'open sesame' of character. Each man would then have to work. No drones here; no beggars living on the rich; no wealthy parasites fattening on the poor. If any man refused to work he would be left to starve, yet with no one to blame but himself, *for every man would then have an opportunity to work*. By simply doing a few hours of honest work each day for a few years of his life (each man choosing his own kind of work, the more disagreeable kinds of work being favored by less hours being demanded in them, so that men would be found to choose even them), every man would be sure of an honest competence. Does any man assert that this would not produce better and more independent character than we have to-day? No sycophancy of employee to employer; no dependence of professional men upon patrons; no servility of men of genius to men of money. There would still be competition, but for honor, not for money. Men would battle to see who should best serve the community, and so be honored by their fellowmen; they would not be forced to battle as men are forced to battle to-day, however much they hate it, to undercut their rivals, or enter into 'combines' against the public. Competition for honor would alone be appealed to, as that alone would mean success. Mrs. Annie Besant well says: 'It is instructive to notice that these very forces may already be seen at work in every case in which subsistence is secured, and honor alone supplies the stimulus to action. The soldier's subsistence is certain, and does not depend on his exertions. At once he becomes susceptible to appeals to his patriotism, to his *esprit de corps*, to the honor of his flag; he will dare anything for glory, and value a bit of bronze, which is the "reward of valor," far more than a hundred times its weight in gold. Yet many of the private soldiers come from the worst of the population.

"She continues: 'Or take the eagerness, self-denial, and strenuous effort thrown by young men into their mere games! The desire to be captain of the Oxford eleven, stroke of the Cambridge boat, victor in the foot-race or the leaping—in a word, the desire to excel—is strong enough to impel to exertions which often ruin physical health. Everywhere we see the multiform desires of humanity assert themselves when once livelihood is secure.'"

The final argument of the opponents of competition to-day is, that competition cannot endure, that competition inevitably leads to combination, and that, therefore, the only question is not a choice between competition, or combination, but between different kinds of combinations. Starting with competition, the few strong competitors find that it pays to combine. They therefore combine and establish a private monopoly. The problem thus for the people becomes, not whether they shall compete or combine, but whether they shall submit to the rule of private combinations or democratically combine themselves through the State. It is a question of monopoly *vs.* monopolies, of democracy *vs.* the worst kind of an oligarchy, the rule of the plutocrat. The choice comes, they say, not between socialism or individualism, but between socialism and plutocracy.

Competition Develops Combination

III. Many minds to-day and most profest political economists would not abolish industrial competition, but simply limit it. Says Professor Jevons, in the last chapter of his "The State in Relation to Labor": "The subject is one in which we need above all things—discrimination. Restrictions on industry are not good nor bad *per se*, but according as they are imposed wisely and with good intentions, or foolishly and with sinister intentions. *Prima facie*, indeed, restriction is bad, because Providence is wiser than the legislator—that is to say, the action of the natural forces of evolution will insure welfare better than the ill-considered laws of the prejudiced and unskilful legislator. But reason is a Divine gift, and where upon the grounds of clear experience interpreted by logical reasoning we can see our way to a definite improvement in some class of people without injuring others, we are under the obligation of endeavoring to promote that improvement. The greater part of the interference of trade societies is objectionable, because, tho directed toward the welfare of a part, it is directed against the welfare of the rest of the community. All other industrial problems must be solved by similar careful estimation of the total utilitarian results.

Political Economists

"If such be a true view of the case, it is clear that there can be no royal road to legislation in such matters. We cannot expect to agree in utilitarian estimates, at least without much debate. We must agree to differ; and tho we are bound to argue fearlessly, it should be with the consciousness that there is room for wide and *bona fide* difference of opinion. We must consent to advance cautiously, step by step, feeling our way, adopting no foregone conclusions, trusting no single science, expecting no infallible guide. We must neither maximize the functions of government at the beck of quasi-military officials, nor minimize them according to the theories of the very best philosophers. We must learn to judge each case upon its

merits, interpreting with painful care all experience which can be brought to bear upon the matter."

This is probably the view of most professional economists to-day, tho as to Jevons's assertion that Providence works through competition, it may be questioned if the State is not quite as much a natural development under Providence as any fiercest competition.

IV. We must not forget the view of those who assert that we do not have competition to-day. They say that under various laws, protecting private property in land, men are not free to compete. They trace most monopolies in America, for example, to a protective tariff, and the most radical among them assert that as long as the law recognizes private property in land, men cannot be really free to compete. Some would abolish all taxes, save on land values. The total value of the land, which no individual has created, they would take by taxation for the community that has given land its value, and then, thus putting all men on a natural equality, they would let man be absolutely free to work, sell, or cooperate as he will. They argue that men, when natural opportunities are not monopolized, are so nearly equal in ability, that no man could take much advantage of his neighbor, but each would be led to do that which he could do best, and exchange the fruits of his activity in equality and in freedom. (For a complete statement of this view, see SINGLE TAX.) It is said, on the other hand, that men are not equal in ability; that even on free land the smart, the shrewd, the strong would soon lord it over the altruistic and the weak, and free competition lead to the tyranny of the shrewdest and smartest competitor.

The Individualistic View

COMPULSORY ARBITRATION (for the facts of the compulsory arbitration laws of New Zealand and Australia, which are the only general compulsory arbitration laws in the world, see articles ARBITRATION AND CONCILIATION, and NEW ZEALAND). The following article by Samuel Gompers presents the reasons why organized labor in the United States and elsewhere has almost universally opposed compulsory arbitration. Mr. Gompers says:

The very terms arbitration and compulsory stand in direct opposition to each other. Arbitration implies the voluntary action of two parties of diverse interests submitting to disinterested parties the question in dispute, or likely to come in dispute.

Compulsion, by any process, and particularly by the powers of government, is repugnant to the principle as well as to the policy of arbitration. If organized labor should fail to appreciate the danger involved in the proposed schemes of so-called compulsory arbitration, and consent to the enactment of a law providing for its enforcement, there would be introduced the denial of the right of the workers to strike in defense of their interests and the enforcement by the government of specific and personal service and labor. In other words, under a law based upon compulsory arbitration, if an award were made against labor, no matter how unfair or how unjust, and brought about by any means, no matter how questionable, we would be compelled to work or to suffer the stated penalty, which might be either mulcting in damages or going to jail, not one scintilla of distinction, not one jot removed from slavery.

Arbitration is only possible when voluntary. It never can be successfully carried out unless the parties to a dispute or controversy are equals, or nearly equals, in power to protect or defend themselves, or to inflict injury upon the other party.

It is our aim to avoid strikes, but I trust that the day will never come when the workers of our country will have so far lost their manhood and independence as to surrender their right to strike or refuse to strike. We endeavor to prevent strikes, but there are some conditions far worse than strikes, and among them is a demoralized, degraded, and debased manhood. The right to quit work at any time, and for any reason sufficient to the workman himself, is the concrete expression of individual liberty. Hence any curtailment of this right, by and through law, or by and through contract enforced by law, is, in fact, a negation of liberty and a return to serfdom.

The industrial conciliation and arbitration law of New Zealand, the law creating and governing the Indiana Labor Commission and Arbitration Board, copied from the laws of 1897 and issued by the Indiana commissioners, and the arbitration law of Illinois, as well as an act concerning carriers engaged in interstate commerce and other employees, approved June 1, 1898, along with other information from this and European countries, show that the kernel of all this species of legislation is a desire to prevent strikes by punishing the strikers. Our existing form of society is unquestionably based upon manufacture, commerce, and transportation, and anything that disturbs the industries is resented, and means are sought to prevent a recurrence and to clothe it in such a garb that public opinion will accept it and permit its execution.

Various Laws

The industrial courts of France are, as I understand it, organized much in the same way. The bill to prevent strikes, which was introduced in the German Reichstag at the instance of the government, had the same underlying motive, and practically the same way, of attaining this purpose. In the law adopted by the Hungarian Diet—we again meet the same purpose to prevent strikes by punishing the strikers. The question of extending the master and servant laws of Sweden to the industrial workers of that country was under discussion in the Swedish Ricksdag, and was for some time fiercely combated by the lovers of liberty of that country, but it was finally adopted, and the other day a strike on the street-cars in Stockholm was suppressed by sending several of the strikers to prison for long terms.

Coming now to our own country, we find that a bill was introduced in Congress which would admit of every train being made a mail train, and which, under the postal laws, would have subjected the strikers in railroad transportation to imprisonment for delaying the mails. Through the efforts of the railroad brotherhoods and the American Federation of Labor the bill failed. Then followed the introduction of the Olney arbitration bill, which provided for arbitration, voluntary in submission, or in its initiatory stages, but with compulsory obedience to the award; that is, the award was to be enforced by a direct penalty for the individual violating the same. The Indiana law has the following provisions:

"An agreement to enter into arbitration under this act shall be in writing, and shall state the issue to be submitted and decided, and shall have the effect of an agreement by the parties to abide by and perform the award."

It will be observed that this may be called voluntary arbitration, because it is voluntarily entered into. The parties agree from the very beginning that if they, for some reason sufficient to themselves, should decline to abide by and perform the award, they are willing that the judge alone, without any jury and without any limit as to time, may send them to prison until they shall consent to perform the labor which the award enjoins upon them. The thought un-

derlying this law is that the individual man may alienate his right to liberty, and it is, therefore, destructive of the fundamental principle of the Republic of the United States. It is equally dangerous with the New Zealand law, the Hungarian statute, or the proposed law of Germany, because it aims at tying the worker to the mine, the factory, or the means of transportation upon which he works.

The Manufacturers' Association of the South in 1900 decided to submit to the legislature of each of the Southern States a law providing for term contracts, the violation of which would be punished as a felony, and that they did this with the specific purpose of preventing strikes and of inviting Northern capital. When their attention was called to the fact that they were as yet not "bothered" by labor organizations, they answered: "That's true, and that's just the reason why we decided to take steps to prevent the formation of any and to stop strikes in the most effective manner."

All these schemes are reactionary in their character.

I believe that the reason why many well-meaning, honest, and conscientious men and women favor some form of compulsory arbitration arises from the fact that their attention has been called to the refusal to arbitrate on the part of some large corporations or other employers of labor. It is felt that the rest of the public are made innocent sufferers and victims, and that there ought to be some way to give to the public the facts, in order that it might be known who is actually to blame. Whenever they are asked: "Do you want to send a man or a woman to jail for quitting work?" they immediately answer, "No, no." What they seem to desire is that these corporations or employers who refuse to arbitrate shall in some way be compelled to do so. This is manifestly impossible. Laws that are "jug handled," even if possible of enactment and execution, invariably have the handle so placed that the large corporations and employers of labor keep hold of the handle. Commissions, with power to examine and report, would seem to be more in line with what is actually desired, but I would call attention to the fact that even these have in them a feature dangerous to liberty, because from them may come, and sometimes do come, reports which have a tendency to warp public opinion and prepare it for measures which, without such preparation, the public would unhesitatingly repudiate.

We shall insist upon the right to quit work whenever the conditions of the labor are irksome to us. If we should commit an error—which is likely—then we will be the sufferers more than any other or all other peoples, and we shall have learned by that error to avoid them in the future. But I repeat, with all the emphasis that I can command, that we shall always insist upon our right to quit work for any reason or for no reason at all. SAMUEL GOMPERS.

COMPULSORY VOTING: This is advocated by some social reformers, on the ground that in democratic countries the government ought to represent the will of at least the majority of all the citizens entitled to vote. It is argued, too, that in most communities if all the citizens voted, the result would be the improvement of general conditions and the diminution of corruption, because those who have corrupt or low motives for voting can be counted on to go to the polls, while it is on the whole those who are the most intelligent and the most incorruptible who refrain from voting. In many communities the stay-at-home vote is as high as 25 per cent of the registered voters. Compulsory voting exists in Belgium and very recently in Austria.

COMSTOCK, ANTHONY: Secretary of the New York Society for the Suppression of Vice; born at New Canaan, Conn., 1844; educated in the academies of New Canaan and New Britain. From 1863 to 1865 he served in the Union army. Since March, 1873, he has been post-office inspector; and secretary and chief special agent of the New York Society for the Suppression of Vice since its organization in 1873. The society has made about 3,021 arrests, and seized and destroyed 103 tons of obscene matter and gambling materials. He has written: "Frauds Exposed" (1881); "Gambling Outrages" (1887); "Morals versus Art" (1888); and "Traps for the Young" (1890). *Office*: 140 Nassau Street, New York City.

COMTE, ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER: French philosopher; born at Montpellier, France, 1798; studied at the *École Polytechnique* in Paris, and early attracted attention by his speculations. He became acquainted with St. Simon, and entered enthusiastically into his theories. In 1820 Comte was appointed to prepare an exposition of the *Politique Positive* of the St. Simonians. The work did not satisfy St. Simon, who deplored the absence of the "religious and sentimental aspects" of his system. In 1825, on the death of St. Simon, Comte broke off altogether from the school, and in after-years was accustomed to speak slightingly of his old master's abilities. In 1826 Comte was attacked by a cerebral disorder, brought on by "overwork and heart anxieties." He recovered, however, and in 1832 was appointed teacher of mathematics at the polytechnic school, which position he held for twenty years, till he was forced to resign in 1852, on account of differences with his colleagues. He died at Paris in 1857.

Comte's works are: "Cours de Philosophie Positive" (6 vols., 1830–42; freely translated into English and condensed by Harriet Martineau, 2 vols., 1853); "Traité Elémentaire de Géométrie Analytique" (1843); "Traité d'Astronomie Populaire" (1845); "Discours sur l'Ensemble du Positivisme" (1848); "Système de Politique Positive" (4 vols., 1851–54; Eng. trans., 1875, *et seq.*, Longmans); and "Catéchisme Positiviste, ou Sommaire Exposition de la Religion Universelle" (1 vol., 1852). In brief, Comte's central and governing doctrine is this:

> The race (like the individual) necessarily passes through three intellectual stages—the theological, the metaphysical, and the positive. "The theological conception assumes the direct intervention of an intelligent agent, presiding over the universe, to whom is attributed the arbitrary distribution of each modification undergone by nature. The metaphysical conception searches for some entity to whose intervention the phenomena in question are to be ascribed. The positive conception disregards all causes, and addresses itself solely to the study of phenomena as they present themselves to the senses" (Ward's "Dynamic Sociology," vol. i., p. 93). The theological conception, Comte tells us, ruled to the thirteenth century; the metaphysical, in western Europe, to the close of the eighteenth. To-day man asks, according to him, simply what are phenomena, without seeking for intelligent agent or intervening entity. Sociology under the first period, he argues, assumed God as the center of society; in the second period, it forgot God, yet found naught. It was critical, negative, destructive; its only positive tendencies were in

wild, visionary and anarchistic schemes, like those of most of the French revolutionists. To-day, he says, sociology must be constructive, based not on assumption of God or man, but only on proved facts.

This leads us to Comte's great distinction as a sociologist, that he first gave sociology a place as a science. His merit is to have laid emphasis upon facts rather than upon theories; to have given us a plan of arranging facts, which, if not a good plan, at least teaches us to have some plan, to insist upon action and legislation based upon knowledge of facts.

In the fourth volume of the "Philosophie Positive" (1839), Comte marks out the broad division between social statics and social dynamics—the former studying the laws of social coexistence, the latter those of social development, together forming sociology, which to him is the master science, for in his remarkable ordering of science he shows how the different sciences, as they emerge into the clear light of positivism, take their proper place, all leading up to sociology, as, so to speak, the architect who builds up the thought of society, using other sciences as materials. Yet is Comte essentially a dogmatist. He starts out with asserting that "the essential spontaneous sociability of the human species, in virtue of an instinctive penchant for a life in common, can in no way be henceforth contested." In the matter of the dynamics of sociology, Comte finds the great forces of life in the instinct for material self-preservation, in the battle of the attributes of humanity over those of animality, and in the restlessness of *ennui*. Of *laissez faire* Comte was no friend. He favored a State ruling all life, conducted by a scientific priesthood. Such were, in brief, the teachings of the world's first great sociologist.

Comte's sociologic weakness is that he himself knew little of sociologic facts. He discovers the ocean and tells us that we ought to know it, but not much of the ocean does he himself report.

CONCENTRATION OF WEALTH. See WEALTH.

CONGO QUESTION, THE: It is the question whether the civilized world will permit the exploitation of perhaps 20,000,000 of defenseless people. Up to the present time, according to a conservative estimate, from 6,000,000 to 8,000,000 of Congolese have been murdered, directly or indirectly, for the sake of increasing the gains of a great rubber monopoly. Of this monopoly King Leopold II. of Belgium is the head and the responsible individual. He has robbed the people of their native land. In spite of his own law that the "tax" limit shall amount to forty hours of labor a month, he has extorted the labor of the natives to the extent of nearly 300 days in the year. Practically the only wages which the people receive for their never-ending toil is the abuse of the king's agents, a few inhuman white men and an army of blacks, for the most part cannibals drawn from alien tribes. Under the abuse of these cannibals, which takes the form of outrage, mutilation, arson, murder, and whippings with the terrible "chicotte" of raw hippopotamus hide, the Congolese are disappearing from the earth at the rate of many thousands a year.

King Leopold's Commission of Inquiry

Frequent denials of the atrocities practised by the agents of King Leopold have been made, for the most part, by persons more or less intimately connected with the so-called "Belgian Lobby" in Washington. Over against all denials are the statements of King Leopold's own Commission of Inquiry, published to the world Oct. 30, 1905. This commission was an *ex parte* body appointed by the king. It spent five months in the Congo Free State collecting evidence as to the conditions of the natives. It consisted of men of the highest capacity and honor. Its deliverances constitute really the official report of the results of the government's self-investigation. Its decisions must, therefore, be accepted as final. It establishes the existence of the gravest abuses.

After a careful study of the Report of the Commission of Inquiry, Prof. Felicien Cattier, of Belgium, made the following statement:

An examination of the Congo Free State administration reveals the clear and indisputable fact that the Congo Free State is not a colony in the proper sense of the term; it is a financial speculation. The real aims of those in authority are pecuniary—to increase the amount yielded by taxation, to exploit the natural wealth of the country, to effect all that can stimulate the powers of production. Everything else is subordinated to this end. The colony is administered neither in the interest of the natives nor even of the economic interests of Belgium; the moving desire is to assure to the sovereign king the maximum of pecuniary benefit.

As showing the character of the atrocities in the Congo Free State, we may cite these extracts from the Report of the Commission of Inquiry itself:

As the greater part of the land in the Congo has never been under cultivation, this interpretation gives to the state a proprietary right, absolute and exclusive, to almost all of the lands, and as a consequence, it can grant to itself all the product of the soil and prosecute as robbers those who gather the smallest fruit, and as accomplices those who buy the same. It could prohibit any one from locating upon any portion of the greater part of the state; restrict the activities of the natives to a very limited space; and immobilize their economic conditions. This principle applied abusively would oppose all evolution in the life of the native. . . . Missionaries, both Protestant and Catholic, were unanimous in accentuating the general wretchedness existing in the regions. One of them said that "this system will, if continued for another five years, wipe out the population of the district." . . .

It was barely denied that the imprisonment of women hostages, the subjection of the chiefs to servile labor, the flogging of rubber collectors, the brutality of the black employees set over the prisoners were the rules commonly followed. . . .

Evidence

The native must go one or two days' march every fortnight, until he arrives where the rubber vines can be met with in a certain degree of abundance. There the collector passes a number of days in a miserable existence. He is deprived of his wife, exposed to the inclemencies of the weather and the attacks of wild beasts. When once he has collected the rubber he must bring it to the station, and only then can he return to his village where he can sojourn for barely more than two or three days, until the next demand is made upon him. . . .

These auxiliaries convert themselves into despots, claiming the women and the food not only for themselves but for the body of parasites which a love of rapine causes to become associated with them; they kill without pity all those who attempt to resist. . . .

The commission could not, of course, verify in every case the correctness of these charges, many of which date back several years. However, the essential features of the accusations made against the sentries seem to be established from the combined testimony and the official reports. . . .

None of the agents who testified before the commission, or were present at the sessions, made any attempt to refute the charges made against the sentries.

The character of the atrocities is also indicated in the following statements of individuals:

Upon the least resistance the men were shot down, and the women were captured as slaves and made to work. It was a sad sight to behold these poor creatures driven like dogs here and there, and kept hard at their toil from morning to night. (Semliki region. Mr. Lloyd, a missionary, 1899.)

Imprisoning sixty women and putting them in chains, where all but five died of starvation. (One of the counts in the indictment drawn up against the agents of the Anversoise in the Mongala massacres in 1900.)

Men are first applied for, and if they do not present themselves, soldiers are sent, who tie up the women of the chiefs until the workmen are forthcoming. (Rev. A. Billington, Bwemba, 1903.)

M—— went to the factory and released 106 prisoners. We saw them pass our stations—living skeletons—among them gray-headed old men and women. Many children were born in prison. One poor woman was working in the sun three days after her child was born. (Mr. Ruskin, a missionary, 1903.)

Sixteen Esanga witnesses were questioned one by one. They gave clearly the details of how father, mother, brother, sister, son, or daughter were killed in cold blood for rubber. Then followed the chief of all, Bolima, who succeeded Isekifasu (murdered by the A. B. I. R.). He stood boldly before all, pointed to his twenty witnesses, and placed on the table 110 twigs, each twig representing a life for rubber. "These are chiefs' twigs," he said, "these are men's, these shorter are women's, these smaller still are children's." He said that the white man fought him, and when the fight was over handed him the corpses, and said: "Now you will bring rubber, won't you?" To this he replied "Yes." The corpses were cut up and eaten by M. Forcie's fighters. He told how he had been chicotted and imprisoned, and put to the most menial labor by the agent, of numbers of stolen and ravished wives, and of the many anklets, spears, shields, etc., that he had been forced to give the sentries. (Mr. John Harris.)

The young woman Imenega was tied to a forked tree and chopped in half with a machete, beginning at the left shoulder, chopping down through the chest, etc. This was how the sentries punished her husband. (Mr. Harris, a missionary, in letters to commission.)

While the men are in the forests trying to get rubber, their wives are outraged, ill-treated, and stolen from them by the sentries. (Mrs. Harris, at Baringa.)

Under the influence of terror entire villages hide in the bush at the approach of white men—natives are bound with ropes and chains—all aspirants for liberty are punished with the whip and hunger cure. (Dr. Edwardo Baccari, Surgeon-General of the Royal Italian Navy in report to his government.)

It has been maintained that the Congo reform movement is a Protestant propaganda against Roman Catholics. To the candid observer it must be patent that sectarianism is not in any sense the issue. The reform movement in the United States is founded on the report of a Roman Catholic body, King Leopold's own Commission of Inquiry. The commission, according to its own declaration on p. 6 of the translation published by Putnam, "received while in Congo the statements of judges, officials, directors, the agents of companies, of missionaries, Protestant and Catholic, and especially natives." The two strongest books against the king that have made their appearance in the reform campaign were both written by Catholics. The one is Professor Cattier, professor of history in the University of Brussels, the other is Father Vermeersch, a Belgian and a Jesuit priest. The personnel of the Congo reform movement in Belgium consists almost wholly of Roman Catholics.

The United States

It would seem that the primary moral responsibility for the sovereignty of Leopold in Africa belongs to the people of the U. S. A few years after the discovery of the Congo basin, England entered into a tentative treaty with Portugal which would have given to the latter country large rights in the government of Western Africa. Then came representatives of the "International African Association," of which King Leopold was the backbone and head, and appealed strongly to our government against the proposed treaty. Our influence was sought, rather, in favor of the "International Association," by Leopold purely on the ground of his philanthropic and humanitarian intentions toward the natives. On account of the king's representations, after a favorable recommendation by President Arthur, the U. S. Government formally recognized the "International Association," April 22, 1884. This action taken at a critical juncture was determinative of the future of the Congo Free State. Most of the great powers, following the lead of the U. S., recognized the flag of the "International Association." Finally a conference, participated in by fourteen different states, was convened at Berlin. By this conference practical recognition was given to the enterprise of King Leopold and articles regulative of its powers were adopted. Six months later, on Aug. 1, 1885, the association formally adopted the title of "The Independent State of the Congo." The U. S. Government, for prudential reasons, did not become actually a signatory of the act adopted by the conference of Berlin, but took a leading part in the deliberations.

The U. S. Government, by the act of Secretary of State Root, has formally put itself on record as in favor of an international convention of the great powers of the world to consider reform in the Congo Free State. On Dec. 6, 1906, Secretary Root definitely promised members of the Congo Reform Association that he would do his utmost to bring about reform. He recognized that our government has a right to cooperate in such a movement under the act of the Convention of Brussels, which pledges this nation to an interest in the preservation of the Congolese people from slavery. Immediately after the secretary had made this promise, Senator Lodge of Massachusetts drew up a resolution which is understood to represent the secretary's wishes. This resolution was introduced into the Senate on Dec. 10, 1906, where it was immediately referred to the Committee on Foreign Relations. It is as follows:

Whereas, The reports of the inhuman treatment inflicted upon the native inhabitants of the Congo Free State have been of such a nature and so well sustained as to draw the attention of the civilized world and excite both the indignation and the compassion of the people of the U. S., therefore be it

Resolved, That in the opinion of the Senate of the U. S. the time has come when the affairs of the Congo Free State should be made the subject of international inquiry, and the Senate respectfully advises the president that in any steps he may deem it wise to take in cooperation with or in aid of any powers signatory to the treaty of Berlin, which shall seek to ameliorate the conditions of the Congo Free State and redress any evils now existent there, he will receive its cordial support.

On Dec. 14th the Belgian Chamber of Deputies voted tentatively under certain conditions to annex the Congo Free State as a Belgian colony. This action was unquestionably influenced by Secretary Root's stand for the liberties of the Congo people. King Leopold seeks by it to remove the Congo from the realm of international jurisdiction. The powers, through courtesy, would be inclined to defer action proposed till Belgium has received full opportunity to determine the question of her future relation to the Congo Free State. In case of final annexation by Belgium, Leopold plainly hopes thereby to balk all action by the powers. Will this expectation be realized? It ought not to be. The status of the Congo Free State has been heretofore that of an international colony. Leopold has reigned as the steward of the other powers. How does the steward suddenly acquire the right to dispose of the stewardship without authorization of the world powers which constituted him therein?

Belgium

If annexation by Belgium is to be the final disposition of the Congo Free State, humanitarians may well be filled with consternation. For the king permits annexation only under conditions which nullify all hopes of reform. In the first place the rights of the concessionary companies which already exist are to be recognized in the future. Many of the most terrible conditions now

prevailing in the Congo are due to this concessionary system. In the second place the king's own *Domaine de la Couronne* is to be preserved to him and to his heirs inviolate. This private domain is six times as large as Belgium and has been the scene of many of the worst cruelties and abominations. In the third place the revenues of the Congo Free State are not to be reduced. But the revenues cannot be maintained at the present rate except by the present system of enforced labor, which has been the cause of all the abuses. The only effect of the annexation for an indefinite period in the future would be to transfer the Congo from Leopold, the sovereign of the Free State, to Leopold, King of Belgium.

HERBERT S. JOHNSON.

CONGREGATIONAL CHURCH AND SOCIAL REFORM, THE: Democracy in religion, the fundamental principle and *raison d'être* of Congregationalism, has made it a reformatory force in modern life. In the stand for freedom of worship taken by a few churchmen within the Church of England in 1567 and thereafter began the far-reaching movement that issued in ecclesiastical Separatism, Independency, Nonconformity, and Congregationalism, and in the many reformatory tendencies toward social democracy necessarily involved therein. The first organization of this force was effected in Bridewell Prison by those incarcerated for holding religious services at a wedding in Plumbers' Hall, London, who provided for a continuance of the same during their term of imprisonment and thereafter. Under the leadership of Robert Browne, others became Separatists at first only from the "world," but involving thereby the principle of their separation from the State Church, and of the Church from the State by establishing the ecclesiastical right of self-government and local autonomy. Thriving under the persecution which branded Nonconformity in religion as treason to the State, and punished it with death, the blood of their martyr ministers became the seed of the social revolution of the English people. Barrowe and Greenwood in 1593 formulated this growing sentiment into a polity which, because it vested the only recognized ecclesiastical authority in the local congregation, came to be known as Congregational. The only chance for the survival and growth of this tender plant of liberty being in transplantation to more hospitable soil, the little village congregation of Scrooby "resolved to go into the Low Countries, where they heard was freedom of religion for all men."

Resident long enough in Holland to be deeply impressed with the civil and religious liberties, popular education, local self-government, and democratic tendencies of the Dutch, who were then the freest and most progressive people in Europe, the Pilgrim Fathers again tried the experiment of planting the free life on English soil in the New World.

With their landing at Plymouth, the process of settling the New England by church congregations began. "In pursuit of religious freedom they established civil liberty. Meaning only to found a church, they gave birth to a nation; and in settling a town in Connecticut, they cemented an empire."

The reformatory force of the Congregationalists both in England and America has been most profoundly and practically felt in the political life of both countries.

The ecclesiastical policy of these locally autonomous congregations of worshipers became the formative principle and framework of their politics when they formed themselves into the colonial bodies politic. Nov. 21, 1620, when, in accordance with the farewell letter of instruction from their pastor, John Robinson, the pilgrims signed their compact in the cabin of the *Mayflower*, is declared by Bancroft to be "the birthhour of popular constitutional liberty." But constitutional government in America had another, tho Congregational source. It is to be traced through the independence of the town, as that political unit was first constituted in Connecticut. There the federation of three independent self-governing towns constituted the commonwealth. These three original towns were the Congregational churches of Hartford, Windsor, and Wethersfield. Their compact, made with each other in Hartford, Jan. 14, 1638, more than that of the *Mayflower*, is to be regarded as "the first written constitution, in the modern sense of the term, as a permanent limitation of governmental power known in history." This first constitutional government was forged out in fact and formulated in statute by men who, on May 31, 1638, had heard Thomas Hooker, the pilgrim pastor of these migratory towns, preach from Deut. i. 13 these political doctrines of Christianity:

Doctrine I. That the choice of public magistrates belongs unto the people by God's own allowance.

II. The privilege of election, which belongs to the people, therefore must not be exercised according to their humors, but according to the blessed will and law of God.

III. They who have power to appoint officers and magistrates, it is in their power also to set the bounds and limitations of the power and place unto which they call them.

Reasons: 1. Because the foundation of authority is laid firstly in the free consent of the people.

2. Because, by a free choice, the hearts of the people will be more inclined to the love of the persons chosen and more ready to yield obedience.

"Here is the first practical assertion of the right of the people," writes Alexander Johnston in his volume on Connecticut, "not only to choose, but to limit the powers of their rulers, an assertion which lies at the root of the American system."

Two hundred years later the anti-slavery reform was largely prompted and promoted by the

Puritan and pilgrim spirit embodied in Congregational churches.

In 1836 Congregationalists, upon securing control of the recently founded Oberlin College, made it the first educational institution which accepted the basis of Christian equality and opened its full privileges to all alike, irrespective of color or previous condition of servitude.

The reformatory movement in the American body politic cannot be accounted for without recognizing the large part which Congregational educational institutions have borne in them all. Harvard, Yale, Mount Holyoke, and the New England colleges; Oberlin, Marietta, Beloit, Whitman, and the Western colleges have woven their names into the social and political history of the country. The acquisition of the rich and vast Northwest Territory of Oregon and Washington was due to Marcus Whitman, the pioneer missionary and educator, whose famous ride to the nation's capital saved the "great American desert" to the sisterhood of states. One in four of the entire male membership of churches in the interior and trans-Mississippi States was enrolled in the Union army during the Civil War. To reformatory literature the churches and schools of this order have contributed names than which none are more illustrious. Of the periodicals which have formed and led public opinion in these directions, such as the *Independent*, *Christian Union*, *Youth's Companion*, and others, many owe their origin and success to the aggressive spirits, born of these churches, who founded and conducted them.

In the adjustment of church life and work to the changed social conditions in city centers and large towns, the Congregationalists have been foremost. The so-called "institutional" churches, which by corporate effort and organized agencies seek to Christianize conditions of common life, have been from the first and still are found in the Congregational fellowship. The contemporary sociological movement in life, literature, and education has found no quicker and more practical response than in Congregational theological seminaries. While Harvard University was the first to offer social ethics as an elective course to its divinity students in 1880, Andover introduced the same in 1887; Hartford prescribed sociology as necessary to graduation in 1880; Chicago established an entire department exclusively devoted to sociological training in 1890, and Yale a distinct professorship of social ethics in 1894. In Iowa College, likewise, a department of applied Christianity was founded. In connection with three of these seminaries social settlements have been successfully inaugurated—the Andover House, now the South End, in Boston, Chicago Commons, and the Hartford Settlement. Among the foremost specialists in sociology and social economics a notably large proportion are Congregational professors and ministers.

In 1891 the National Council of the Congregational Churches appointed a labor committee, afterward called the Industrial Committee, to designate its broader and more impartial function, to inform and interest the churches in the social and moral phases of industrial conditions and relationships, and, as opportunity offered, to apply to them Christian ideals and spirit. This action was taken at the suggestion of the Standing Committee on Labor Organizations of the Massachusetts General Association. The appointment of similar committees has been initiated in the associations of other states to serve as auxiliaries to the Industrial Committee of the National Council to these ends:

To help toward a better knowledge of industrial conditions, and of the spirit of the churches, especially in their own locality.

To come into sympathetic relations, as far as possible, with labor, organized and unorganized.

To help just and wise movements among working men, which means physical, social, and moral betterment.

To seek affiliation with humanitarian and religious bodies having similar ends in view.

And to keep the Labor Committee of the National Council informed as to the conditions found and the efforts made to promote the well-being of the industrial part of the community.

In exemplification of these aims a joint meeting of members of the Trades and Labor Assembly of Des Moines, Iowa, and of the National Council was held at the call of the former, when the latter body met in that city in Oct., 1904, and representatives of the Assembly also addrest the council by special invitation.

The vital relation of the industrial situation to the spiritual problem of the churches is thus recognized in the latest published report of the Industrial Committee to the National Council:

> Your committee has a twofold conviction out of which issues an inference vital to the spiritual problem of our churches:
>
> First, that this question has come to stay; that it cannot be blinked or waved aside; that no amount of religious activity or of practical religious helpfulness can solve it; that nothing short of justice—justice by and justice to capital and labor alike—can reach the case.
>
> Second, that only by the principles of the Gospel—its ethics, its love, its law of respect for every human soul as a son of God, and a brother of Jesus Christ, and its foundation stone of sacrifice—can the ends properly sought by all true employers and workers be attained.

The Committee on the Family has for many years kept the congregational Churches abreast of the best literature and movements for the protection and promotion of the highest family life. Its reports to the National Council on marriage and divorce, sexual purity, and the nurture of child life have become valuable contributions to that literature. Its efforts have been made to invest the Congregational Sunday-School and Publishing Society with the function and equipment of promoting, especially through its home department, all these interests of the home by investigation, publication, and practical methods of teaching and applying Christian ideals and ethics to the relationships and obligations of family life.

While it cannot be said of any class of the American churches that they are to American social reform movements what Mr. Gladstone called the Nonconformist churches of Great Britain—viz., "The backbone of the Liberal Party"—yet the Congregational churches of America, by virtue of their polity, principles, and history, have a supreme opportunity to exemplify and make more largely possible a Christian social democracy. What these churches have always in principle and often in practise stood for in America they have planted in many lands and nations by that splendid world movement of Christian civilization in which their American Board of Foreign Missions has led, and whereby the kingdom of God is coming to earth.

GRAHAM TAYLOR.

CONGRESS: We consider the subject only from the standpoint of social reform, in which it plays, however, an important part. Congress as it now exists is the result of a long evolution.

Origin of Congress

In 1765, on a proposition made by Massachusetts, a congress met in New York to consider the Stamp Act. This was the first general meeting of the colonies for the purpose of considering their relations to the mother country. As a result, the Stamp Act was repealed, but the British ministers imposed new duties quite as obnoxious. The colonies determined to form a closer union, and sent delegates to Philadelphia with the general authority "to meet and consult together for the common welfare." This was the first Continental Congress.

The session was short, and the business quickly dispatched. They adjourned after recommending that another Congress should convene on May 10th of the next year, provided that a redress of grievances was not previously obtained.

The breach, however, between England and the colonies became wider. Consequently, in accordance with the recommendation of the first Continental Congress, delegates were appointed by the several colonies, who met in Philadelphia on May 10, 1775. This body is known as the second Continental Congress. It became the national government of the people and continued its sessions for fourteen years.

The delegates to this Congress were chosen in some instances by the colonial legislatures, and in other cases by conventions of the people. With the story of the Declaration of the Independence of the United States accomplished by this Congress we are not here concerned.

The Congress had but the most meager power. It was an executive without power to execute. It was a single House, composed of delegates from states, each of which expressly retained its "sovereignty, freedom, and independence." Each had the right at any time to recall and replace its delegates; and even their compensation was paid by the states sending them, so that no bond should hold them to the common government. Voting was by states. The separate states retained their sovereignty, refused at will their quota of contributions for national debts and national expenses, managed foreign and interstate commerce to suit their local interests, and made partial compacts with neighboring states in a manner which produced a general confusion bordering upon anarchy. But more union was necessary. In his "The Critical Period of American History," Professor Fiske shows how the country was "drifting toward anarchy" (chap. iv.). The difficulty was met by the Constitution (*q. v.*) of 1787, the present Constitution of the U. S. According to this, all legislative powers granted by the Constitution of the U. S. are vested in Congress, which consists of the Senate and the House of Representatives. The powers of Congress are enumerated in Article 1, Section 8, of the Constitution, and all powers not granted to Congress, or prohibited to the states, are reserved to the states or to the people; but the power of Congress is absolute within the scope of its authority. The Senate is composed of two members from every state, regardless of size or population; the members of the House are apportioned on the basis of population. Thus, while in the House the influence of the people is felt directly, according to their numbers, the Senate provides the means of defending the smaller states from the possible encroachments of the larger; and to assure the safety of the smaller states, the Constitution, Article 5, provides that "no state without its consent shall be deprived of its equal suffrage in the Senate." Bills that have passed both houses are sent to the president, who may either sign or veto them, or do neither, in which case the bill becomes a law after ten days unless Congress has previously adjourned. (See VETO.) The veto of the president is the only check upon the power of Congress to legislate within the scope of its authority. Legislation exceeding the constitutional power of Congress will be declared unconstitutional by the Supreme Court, if that body is appealed to by either party to any controversy arising in an attempt to enforce such laws. Each house is, by the Constitution, "the judge of the elections, returns, and qualifications of its own members."

Powers of Congress

Each Congress must have at least two sessions. A new Congress comes into existence on March 4th in each odd year.

The first regular session begins on the first Monday of December following. This session may hold, if the two houses choose, through the entire year, or they may adjourn at any time during the year. Their second regular session begins on the first Monday of December following, and that session must close by March 4th following, when the new Congress comes into existence. The members of both houses receive a salary from the federal government.

These salaries are besides mileage and many other perquisites.

No senator or representative can hold any office under the U. S. during his membership. This prevents cabinet officers from being members of Congress.

"*All bills for raising revenue originate in the House of Representatives; but the Senate may propose or concur with amendments, as on other bills.*"

Every bill which shall have passed the House of Representatives and the Senate must, before it becomes a law, be presented to the President of the U. S.; if he approves he signs it, but if not he returns it, with his objections, to that House in which it originated, who enter the objections at large on their journal, and proceed to reconsider it. If, after such reconsideration, two thirds of that House agree to pass the bill, it is sent, together with the objections, to the other House, and if approved by two thirds of that House it becomes a law. If any bill is not returned by the president within ten days (Sundays excepted) after it has been presented to him, it becomes a law, unless the Congress by their adjournment prevent its return, in which case it does not.

Coming now to the important subject of how this system works, we notice, first, the general characteristic that Congress works mainly by committees.

The number of bills before each Congress reaches into the thousands; only the few most important can be adequately discust by Congress as a whole. All others, if they are favorably reported by the committees to which they are referred, can be and usually are passed with little or no discussion. It follows that the fate of most bills depends not upon Congress as a whole, but upon the small committees to which they are referred. The committees usually sit in secret. They ordinarily give a public hearing to the friends and opponents of a measure, but the final voting of the committee is usually in secret. This gives the utmost opportunity for underhand influence and corruption. Small changes can be made, bills can be defeated or wholly altered at the last moment and then rushed through Congress. Especially is this the case with personal bills and special legislation. The fate of a bill thus often depends on the make-up of the committee. Now the appointing of the committees is made for the House by the Speaker, which gives him enormous and sometimes dictatorial power. In the Senate, the committees are voted on by the Senate but in both cases they are almost invariably appointed in consultation with the leaders of the party in power and for strictly party purposes. The Senate has toward fifty standing committees; the House over fifty. Besides these, special committees are continually being appointed. The most important standing committees are the following: Ways and means; appropriations; elections; banking and currency; accounts; rivers and harbors; judiciary (including changes in private law, as well as in courts of justice); railways and canals; foreign affairs; naval affairs; military affairs; public lands; agriculture; claims; and the several committees on the expenditures of the various departments of the administration (war, navy, etc.).

Secret Legislation through Committees

Each congressman is usually put upon some committee (a committee ordinarily consisting of from 3 to 11 members); but the more important committees and the chairmanship of all committees are usually given to old party leaders who often hold the same committeeship year after year, and are always (in the case of standing committees) appointed for the two years' session of Congress.

It is obvious from these conditions what a grip party machinery has upon Congress, and how helpless against the machine is the individual congressman. Especially in the last days of Congress, when bills are rushed through, enormous influence is brought to bear upon any obstreperous member who dares to resist the party's will. Corrupt special legislation can thus

be easily gotten through, provided that the party leaders acquiesce. This gives enormous power to lobbyists, who know what ropes to pull. A bill can be defeated or rendered successful by inducing the leaders to refer it to the right committee. In the committee the purchase or influencing of one or two votes will usually decide legislation. Considering the enormous financial interests involved in most congressional legislation, the wonder, perhaps, is, not at the corruption, but at the lack of corruption in Congress.

The system, however, is more effective in stopping legislation than in enacting it. It is easier to stop a bill than to pass it. Most bills are choked in committees. Almost any bill can be conveniently pigeonholed and not reported. Hence the defeat of most reform legislation in which the great parties are not immediately interested. Almost all bills are, as a matter of course, passed to a first and second reading and then referred to a committee, where it is said that over nine tenths of all bills stop. Occasionally a committee is compelled to report a bill, but usually not. When reported, it is rarely stated how large a majority or who of the committee favored or rejected the bill. The parties thus responsible for the adoption or rejection of a measure are often unknown. The whole system may be considered one of secret legislation.

The system, too, enables the administration to exert a strong but unseen influence on Congress. In the English Parliament the cabinet appears in Parliament to propose and defend its measures. In Congress the Cabinet does not openly appear. But it can appear before and influence the committees, and yet this most important connection between the administration and Congress is wholly secret.

This committee system is the most important characteristic of congressional working, but others are of only less moment. Congress is rendered largely inefficient for wise patriotic legislation by the fact that since all senators and representatives must, when elected, be inhabitants of the state or district they represent, each member is all but expected to speak and vote, not for the good of the country as a whole, but of his particular section. Debates, therefore, become sectional rather than of real statesmanship. Again, the above fact often keeps out of Congress the best men. If a leading Republican happens to reside in a Democratic State, or vice versa, he has little or no chance of election to Congress. Any congressman who rises above sectional feeling and for the good of the country opposes the interests of his section can be retired, and no other section of the country can elect him. Machine politics, rather than fitness, elect congressmen. Terms of office, too, in Congress, especially for representatives, being short, and the intricacies of politics often preventing renomination, few congressmen have power to accomplish much. Before they have well learned the ropes their term of office has expired. The result is that few congressmen have a chance to develop statesmanship. This is, of course, more true in the House than in the Senate. The House is usually a confused mass of new men whom the country does not know, managed by a speaker who becomes an autocrat, ruling through committees which can easily be influenced by trained lobbyists who know the ropes.

Other Characteristics

In the Senate men have more training and are better known; but it is a notorious fact that the best men of the country are not in the Senate, and the difference between the Senate today and in former times can be seen by comparing the names of senators early in the century with those now in office.

Congress is almost the only great national legislative body owned wholly by the well-to-do.

Composition of Congress

In the legislative bodies of Great Britain, Germany, France, Italy, Switzerland, and Belgium there is a large and growing number of Socialists representing the toiling classes.

The following is the composition of Congress, as stated by the *World Almanac*, 1907:

PARTY DIVISIONS IN CONGRESS SINCE THE FORMATION OF THE REPUBLICAN PARTY IN 1856

Congresses	Years	Senate			House of Representatives.		
		Dem.	Rep.	Ind.	Dem.	Rep.	Ind.
XXXV	1857–1859	39	20	..	131	92	14

Parties as constituted at the beginning of each Congress are given. These figures were liable to change by contests for seats, etc.

[1] During the Civil War most of the Southern States were unrepresented in Congress.
[2] Liberal Republicans.
[3] Greenbackers.
[4] David Davis, Independent, of Illinois.
[5] Two Virginia senators were Readjusters, and voted with the Republicans.
[6] People's Party, except that in the House of Representatives of the Fifty-fourth Congress one member is classed as Silver Party.
[7] Three Senate seats were vacant (and continued so) and two Representatives seats were unfilled (Rhode Island had not yet effected a choice) when the session began. Rhode Island subsequently elected two Republicans.
[8] Five Populists, two Silver Party, three Independents.
[9] Including fifteen members classed as Fusionists.
[10] Including three members classed as Silver Party. There was one vacancy.
[11] Six Populists, three Silver Party.
[12] Five Populists, one Silver Party, two Independents, and three vacancies.
[13] Three Populists, one Silver Party, one Fusion Party, one vacancy.
[14] One Populist, one Silver Party, one Fusionist, two vacancies.
[15] Two Union Labor and two vacancies—one Democratic, one Republican.

IN THE HOUSE OF REPRESENTATIVES, SIXTIETH CONGRESS

[1] As constituted at the beginning of the Congress.

CONRAD, JOHANNES C.: German political economist; born in West Prussia, 1839; studied at Berlin and Jena. In 1868 he became privatdocent, and then professor of political economy at Jena, but in 1870 was called to Halle. From 1872 he assisted his father-in-law, Professor Hildebrand, in the editorship of the *Jahrbücher für Nationalökonomie und Statistik*, and in 1878 became sole editor. In economics he is identified with the historical school. From 1889 to 1895 he was chief editor of the important "Handwörterbuch der Staatswissenschaften." Among his writings are: "Die Nationalökonomie der Gegenwart und Zukunft" (1848); and "Liebig's Ansicht von der Landwirtschaftlichen Bodenerschöpfung"(1864); and "Grundriss zum Studien der Politischen Ökonomie" (1902).

CONSERVATIVE PARTY. See UNIONIST PARTY.

CONSIDÉRANT, VICTOR PROSPER: French Socialist; born at Salins, Jura, 1808; studied at the *École Polytechnique* in Paris. He entered the army as an engineer officer, but resigned his commission in 1831 to spread Fourierite socialism; and he took part in the socialistic experiment of 1832 at Condé-sur-Végre. Later he was associated with Fourier as editor of *Le Phalanstère*. In 1834 Considérant published "La Destinée Sociale" in 3 vols. On the death of Fourier (1837), he became chief of the Fourierites, and edited two papers, *La Phalange* (1836–43), and *La Démocratie Pacifique* (1843–50), a daily. He was chosen to the Republican constituent assembly of 1848 as representative for Loiret. In 1849 he was returned as member for Paris of the *Corps Legislatif*, but on account of certain indiscreet acts he was soon compelled to retire from the country. He went to Belgium, and thence to Texas (1853), where he afterward organized the unsuccessful socialistic colony *La Réunion*. He was naturalized, and remained in Texas until 1869, when he returned to Paris, where he died in 1893. Among his works may be mentioned: "Manifeste de l'École Sociétaire" (1841); "Exposition Abrégée du Système Phalanstérien" (1841); "Théorie de l'Éducation Naturelle" (1845); "Principes du Socialisme" (1847); "Théorie du Droit de Propriété et du Droit du Travail" (1848); "L'Apocalypse, ou la Prochaine Rénovation Démocratique" (1849).

CONSPIRACIES: A conspiracy may be defined in general as a combination of two or more persons to commit in concert some reprehensible, injurious, or illegal act. Conspiracy laws are the laws forbidding such combinations. According to the common law of England, which is also the basis of the American law, conspiracy laws forbid combinations

(1) To falsely charge another person with a crime punishable by law. (2) To wrongfully injure or prejudice a third person, or any body of men. (3) To commit any offense punishable by law. (4) To do any act with intent to pervert the cause of justice. (5) To effect a legal purpose with a corrupt intent or by improper means. (6) To endeavor, by unfair means, to raise wages.

Under the United States laws the following are the things a concerting to do which made between two or more persons constitutes the offense of conspiracy: (1) An agreement to overthrow the government of, or levy war against, the U. S.; to overthrow, put down, or destroy by force, or oppose the authority thereof; by force to prevent, hinder, or delay the execution of any law of the U. S., or by force to seize, take, or possess any property of the U. S., contrary to the authority thereof.

General Laws

(2) To deter a party or witness from attending or testifying in a court of the U. S., or to injure one on account, or to influence a verdict or indictment by grand or petit jury, and to impede the due course of justice with intent to destroy equal protection of laws. (3) To hinder or prevent any person from voting or qualifying to vote at any election, or to injure, oppress, or intimidate any citizen in the full exercise or enjoyment of the right or privilege secured by the Constitution or laws of the U. S. (4) To hinder by force or intimidation any person from occupying or holding office under the U. S., or to injure such officer on account. (5) To induce any officer of the U. S. to leave any state, or to injure such officer on account. (6) To defraud the U. S. by obtaining approval of any false claim against the same. (7) To cast away any vessel with intent to defraud the underwriters.

Besides these the various states have their special laws. Criminal conspiracies in the United States consist not in the accomplishment of any unlawful purpose, nor in any one act moving toward that purpose, but in the actual concert and agreement of two or more persons to effect the unlawful thing so concerted or agreed upon. Mere concert in itself is not a crime, for associations to prosecute a felon have been held to be lawful; but it is the object or purpose of the concerting that makes the offense. Where the object or intent, it carried into effect, would be a wrong, then concert is indictable, as an act in itself tending to produce it; as, for instance, to support a cause, in itself just, by false testimony. A combination to do a criminal act is indictable; also an agreement or confederation to do a lawful act by unlawful means; because, in the first instance named, the act being in itself criminal, a conspiracy to do it must in the very nature of things be also criminal, while in the second instance, the means being unlawful, it matters not what may be the act to be done.

In this encyclopedia we are specially concerned with application of conspiracy laws to industrial combinations. For their application to combinations to raise prices, fares, etc., see MONOPOLIES. The laws are here considered simply in regard to their application to combinations of workingmen —a subject which has a long and important history.

The general theory in the Middle Ages of the relation of the workman to the State was one of tutelage. The law undertook to control him at well-nigh every point. This was largely attempted through the gild. The old craft gilds were originally composed of apprentices, journeymen, and masters, joined in one association. As, however, the gilds grew in wealth, they became more and more purely instruments of the masters to oppress the journeymen. These naturally resented this, and formed combinations of their

own, usually secret, and sometimes under the guise of religious brotherhoods, but really organized to protect their rights. It was against these brotherhoods that the first laws concerning workmen's combinations were directed.

Workmen's Combinations

As early as 1383 the city authorities of London issued a proclamation forbidding all congregations, covins, and conspiracies of workmen in general. In 1387 three journeymen cordwainers were carried to Newgate for trying to found a brotherhood. In 1415 the brotherhood of tailors was for a while suppressed. An early law of Henry VI. forbade the yearly confederation of the masons, on the grounds that these gatherings tended to destroy the force of the famous Statute of Apprentices, which had tried to fix wages at the wages of 1327. In 1548 a more general statute of Edward VI. prohibited all conspiracies and covenants not to make or do work except at a certain price, under penalty, on a third conviction, of the pillory and the loss of an ear. This act was not repealed till 1824. In the Elizabethan period the famous poor-laws were passed decreeing that wages should be fixt by justices of the peace, etc. This led to numberless combinations and prosecutions, particularly during the eighteenth century. The earlier laws forbade combinations of masters and of workmen alike. The later laws were directed against workmen only. In 1799 they were combined in a general act, repealed and replaced the next year by 40 Geo. III. c. 106, which prohibited all combinations for raising wages or reducing hours. Mr. Justice Stephen says of this act ("History of the Criminal Law of England," vol. iii., p. 20): "The only freedom for which it seems to me to have been specially solicitous is the freedom of the employers from coercion by their men." This act was in force till 1824, during all the period when the workmen were feeling the first results of the factory system, and were breaking machinery, etc. In 1803 three linen-weavers were sent to jail simply for carrying a letter requesting help from other workmen. At last, in 1824, a change came, due to the activities of Joseph Hume in Parliament, and of Francis Place, a London tailor, out of Parliament. All previous statutes, so far as they related to workingmen, were repealed, and workmen combining to advance wages or lessen hours were not liable to prosecution for conspiracy. But the masters next year succeeded in having this replaced by the 6 Geo. IV. c. 129. This new act, while it repealed the previous statutes, did not in express terms legalize combinations of workmen—the legality of such combinations was left to be dealt with by the common law—it simply rendered men liable to punishment for the use of threats, intimidation, molestation, and obstruction directed toward the attainment of the objects of trade-unions. A few alterations in the act were made by 22 Vict. c. 34. The recommendations of the royal commission of 1867 on trade-unions led to the repeal of the 6 Geo. IV. c. 129, and the 22 Vict. c. 34, by the 38 and 39 Vict. c. 31, and the 38 and 39 Vict. c. 32, which declared that the purposes of a trade-union were not to be deemed unlawful by reason merely that they were in restraint of trade, and carefully defined what acts should be deemed criminal offenses. The protection afforded by these acts was greatly diminished by the gradual extension of the common law doctrine of conspiracy, and at length, in 1875, the act was repealed and replaced by the Conspiracy and Protection Act 38 and 39 Vict. c. 86. According to this act, an agreement between two or more persons to do any act in furtherance of a trade dispute is not indictable as a conspiracy if such act committed by one person is not punishable as a crime.

Present English Law

Such is a brief record of English legislation on this subject, but it does not show the bitter struggle of the workingmen against these combination laws. In 1834 the case of the six Dorchester laborers elicited general indignation. These poor and ignorant men, of good previous record and characters, were convicted nominally of administering unlawful oaths, really of committing the crime of combination. They were transported to Australia and sold to labor contractors for £1 per head. It aroused all English labor. A monster meeting was held in Copenhagen Fields, attended, it was said, by 400,000 persons; 50,000 workmen marched to the official residence of Lord Melbourne, presenting a petition for clemency signed by 266,000 persons. Pardon was finally granted against strong protests from the manufacturers, but was not properly promulgated, and some of the convicted only heard of it by accident after years of slavery. All through this period there were conspiracy prosecutions and condemnations. One of the most important of these was the prosecution of the Wolverhampton tin-plate workers in 1851, at a cost of some $19,220. During a strike the strikers picketed a factory, and, inducing workmen to keep away, brought the business to a standstill. They were charged with conspiracy, and convicted under common law misdemeanor, punishable by two years of penal servitude. It was this conviction that brought the first modification of the law of 1825. In the "sixties" a series of conspiracy trials led to the commission of 1867, which resulted (1871) in the change of the law and a careful definition of what was a conspiracy in trade disputes. This law, tho generally an advance, on one point—the right of the workman to address another employee during a strike—was retrograde, and led to the great act of 1875. Since 1875 disputes have turned mainly on the application of the law to such acts as picketing; and of late especially on the question of the liability of trade-unions. (See Taff Vale Decision.)

United States Law

In the United States, the first trial for conspiracy to raise wages was in 1741, when certain journeymen bakers of New York City were convicted for conspiring not to bake till their wages were raised. It does not seem, however, that any sentence was passed. The first case of which complete records exist was the trial of journeymen boot- and shoemakers of Philadelphia in 1806. They were found "guilty of a combination to raise their wages," and were fined $8 each and costs. The next important case was that of the people of the State of New York against James Melvin and others in 1809. It was decided July 12, 1810, before the Mayor of New York City, against the men, because, tho possibly a combination not to work except for certain wages might not be indictable, they were organized to compel members of their union not to work if the union voted to strike.

The same position was taken in a court of quarter sessions for Allegheny County, Pa., when Judge Roberts said: "It is not for demanding high prices that these men are indicted, but for employing unlawful means to exact these prices, for using means prejudicial to the community. . . . A conspiracy to compel an employer to have only a certain description of persons is indictable." Similar verdicts were rendered in various trials.

In 1834, in Hartford, Conn., the Thompsonville Carpet Manufacturing Company brought suit against W. Taylor and others for conspiring to raise the price of wages, hindering others from working, and declaring a strike. The defendants won. The court charged the jury that a peaceable arguing with workmen not to work except for a certain price was not a ground for civil action.

In 1840 certain journeymen of the Boston Bootmakers' Society were indicted for conspiracy in the municipal court. They were convicted in the lower court, but the Supreme Court did not sustain the verdict. It is claimed by labor leaders that the decision of Judge Shaw decided definitely that men have a right to combine to raise wages. The "Third Annual Report of the United States Commission of Labor" says (p. 1130) that this is a mistake, but that the verdict was not sustained simply because the indictment was not rightly framed.

The next important cases were those of the

Master Stevedores' Association *vs.* Peter H. Walsh and others, decided in 1867, important because Judge Daly reviewed adjudications; and the case of some members of the Knights of Labor of District Assembly No. 91, arrested March, 1887, for alleged interference with the employees of John H. Hanan and Gardner & Estes, shoe manufacturers of New York City, important for the opinion delivered by Judge Barrett.

The "Bulletin of the United States Department of Labor," in its first number (November, 1895, p. 98), thus summarized the state of the common law bearing upon combinations:

Every one has the right to work or to refuse to work for whom and on what terms he pleases, or to refuse to deal with whom he pleases; and a number of persons, if they have no unlawful object in view, have the right to agree that they will not work or deal with certain persons, or that they will not work under a fixt price or without certain conditions. The right of employees to refuse to work either singly or in combination is balanced by the right of employers to refuse to engage the services of any one for any reason they may deem proper. . . . In short, both employers and employees are entitled to exercise the fullest liberty in entering into contracts of service, and neither party can hold the other responsible for refusing to enter into such contracts.

Of the present (1905) situation, Prof. T. S. Adams says ("Labor Problems," p. 194):

About fifteen states have statutes modifying the old law of conspiracy, specifically conferring on the laborer the right to combine to raise wages, or to induce, by peaceable means, any person to accept or quit any employment. The Pennsylvania statute authorizing workmen, *inter alia*, to combine to quit work whenever the continued labor by them would be contrary to the rules of their union; the New Jersey, Texas, and Colorado statutes permitting combinations for the purpose of persuading others to strike or quit work; and the Maryland and California statutes declaring that no combination to do any act in furtherance of a trade dispute shall be indicted as a conspiracy, if such act committed by one person would not be punishable as an offense, have all wrought important modifications of the law, and might profitably be indorsed by the laboring classes in other states. But with these exceptions the statutes do not appear substantially to have altered the common law, particularly as regards the civil liability of strikers.

Three federal statutes, however, are of great importance: section 3,995 of the Revised Statutes which penalizes the knowing and wilful obstruction of the passage of the mails; the tenth section of the Interstate Commerce Act which makes it a misdemeanor to interfere with interstate transportation; and the first section of the Anti-Trust Act of 1890 which declares illegal every combination in restraint of trade or commerce among the several states or with foreign nations. No one can state at the present time the exact effect of these statutes upon the legality of labor combinations.

CONSTITUTION OF THE UNITED STATES, THE: In this article is considered the working of the United States Constitution, especially in relation to social reform. For a general view of constitutions, see CONSTITUTIONALISM. The Continental Congress, which declared the independence of the United States, was a revolutionary body, called into existence by the necessity of common action between the colonies in protecting their rights, and, when it was so voted, of obtaining their independence.

It gave itself, in 1877, a new legal character by framing the Articles of Confederation and Perpetual Union, whereby the thirteen states entered into a "firm league of friendship"; but this confederation was rather a league than a national government. Each state, according to the articles, retained "its sovereignty, freedom, and independence, and every power, jurisdiction, and right which is not by this confederation expressly delegated to the United States in Congress assembled."

Beginnings

There was no federal execution, no federal judiciary, no federal taxing power, no means of paying an army, or any federal bills, save as the states voluntarily contributed money. The confederation did not work. It was, in fact, little better than anarchy, as men like George Washington declared. Some firmer union was evidently needed.

In 1786 delegates from five states met at Annapolis, Md., and recommended that Congress call a general convention to consider the condition of the union and needed amendments to the Constitution. Congress did so, recommending the states to send delegates to a convention which should "revise the Articles of Confederation, and report to Congress and the several legislatures such alterations and provisions therein as shall, when agreed to in Congress and confirmed by the states, render the federal Constitution adequate to the exigencies of government and the preservation of the union."

The convention thus summoned met at Philadelphia on May 14, 1787, became competent to proceed to business on May 25th, and sat nearly five months. Every state was represented save Rhode Island. George Washington was chosen President, and the leading men of the country were the delegates. It boldly decided to prepare a wholly new Constitution, to be considered and ratified neither by Congress nor the state legislatures, but by the people of the several states. The delegates were 55, and 39 signed the Constitution; the debates were secret; the difficulties were very great.

Two tendencies manifested themselves, which led to the formation of the two great political parties which, under different names, have divided American political life. On the one hand was a strong desire for a national unity, with a highly developed central power; on the other, a still more powerful fear of centralization and the desire to retain the sovereignty of each state. As is well known, the constitution adopted was a compromise between these two tendencies. The framers of the Constitution had the experience of the English Constitution to go by, with its Cabinet, its House of Commons, and its House of Lords. They had the state constitutions, which had to an extent been modeled after the English pattern, modified by the peculiarities of the different states as they had grown up under the different charters originally granted to the different colonies. On the other hand, the minds, particularly of the Virginian delegates, were filled with theories regarding the natural rights of individuals, derived, in fact, from Rousseau and other French writers, and made them very jealous of granting power to any government. The Constitution framed was a resultant of these and other forces. The framers had in mind the principle of English common law, that an act done by any official person or lawmaking body beyond his or its legal competence is simply void, which principle Mr. James Bryce declares became the key to their difficulties. They carefully assigned to different branches of the government certain fixt forms which they held it necessary for them to hold, and all powers not mentioned were therefore retained in the hands of the people. They sought so to divide the powers between federal and state governments, and between the different branches of government, that no branch should absorb too much power or trespass upon the power of another branch.

Fundamental Principles

On September 17th the convention adjourned to submit its result to the people of the various states for ratification. Then began a struggle. It was declared by many that the Constitution gave too much power to the central government. Men said that liberty would perish. It was asserted that freedom won from George III. was being slain by her own children. The vote to ratify was nearly defeated in Massachusetts and New York. Several of the states suggested amendments, and most of these were adopted in 1791, soon after the adoption of the Constitution itself, in ten amendments, called, after the English precedent, a Bill or Declaration of Rights. The first state to ratify the Constitution was Delaware (Dec. 7, 1787). When nine states had ratified, the Constitution was to be adopted, and this was accomplished when New Hampshire ratified, June 21, 1788, by a majority of eleven.

Adoption

Four days after Virginia ratified, not knowing of New Hampshire's vote; next New York and North Carolina. Rhode Island had sent no delegates to the convention, but finally ratified, May, 1790. Congress voted that the Constitution go into effect March 4, 1789. Elections had previously been held, and on that day the first Congress under the new Constitution met, but for lack of a quorum did not organize till April. Then the electoral votes were counted in the presence of both Houses, and George Washington was found elected president, and inaugurated April 30, 1789, in New York City.

Analysis

The characteristic feature of the American Constitution is its union of federal and state government. The federal government was restricted to the minimum of power necessary to a national union, yet the state governments were prevented from exerting undue power. The Constitution being a creature of the states, only the states can amend it. The states, too, form the national government by choosing presidential electors, senators, and fixing the franchise which qualifies the citizens to vote for representatives. On the other hand, the federal court is supreme in the interpretation of the Constitution, and can overrule any state or national legislation which it decides to be unconstitutional. (See JUDICIARY.) The President and Congress, too, have power over the states in certain specified matters, the presumption, however, always being in favor of the state. The states cannot make treaties, tax exports or imports, save with the permission of Congress. They must surrender fugitives from justice in other states. They can be sued by other states or foreign powers in federal courts. Congress has power to establish uniform bankruptcy laws. Resistance to federal authority or attacks on federal property may be repulsed by federal troops. In all other cases states are to act, tho they may call upon the federal government for aid.

The federal government comes into direct contact with the people of the states by the federal courts, its taxing power, its power to raise an army, and, above all, by the election of presidential electors and representatives to Congress by the people. It was on these two last points that the framers of the Constitution found their greatest difficulty. Whether the states should be represented in Congress as states, or simply by the representatives of the people, was a burning question. The smaller states desired representation as states, while the opponents of this position declared that this would be unjust, since it would give the few people in the smaller states equal power with the large populations in large states. The question, too, of states rights *versus* the federal government was involved. It was finally settled by having the members of one house—the Senate—elected by the state government, and the members of the lower house—the House of Representatives—elected by the people, the number of the latter depending on the population of the state.

The election of the president caused even more discussion, but was finally decided by having the people choose electors who should choose the president. (For the working of this, see ELECTORAL COLLEGE.) The chief matters which, as national, were entrusted to the federal government were:

The conduct of the national defense, and the making of treaties.
The maintenance of federal courts.
Commerce, foreign and domestic.
Currency.
Copyrights and patents.
The post-office.
Taxation for general purposes.
Protection of citizens against unjust legislation by states (Amendments XIV., XV.).

The three branches of government established by the Constitution were the executive, the legislative, and the judicial. It was attempted to make these independent of each other and coordinate, with such a balance of powers that no branch could wield too much power.

The President

To the PRESIDENT is given the supreme executive power. He has command of the army and navy, he can make treaties and appoint ambassadors and consuls, but must have the advice and consent of the Senate. He appoints the judges of the supreme court and all high federal officers, but again must have the consent of the Senate. He can grant reprieves and powers except in cases of impeachment. He can summon both Houses on occasion. He can veto any bill or resolution of Congress. He must inform Congress of the state of the union, and recommend legislation. He must see that the laws be executed. He is prevented from exerting too much power, because he can raise no money to pay an army; he can appoint no officers unless the Senate approves; he cannot prevent legislation passed over his veto; he can be impeached for faithlessness in office. The legislative power is given to the Senate and House of Representatives. No federal officer can be a member of Congress. This is an attempt to preserve the independence of the legislature. It has the power to enact all federal laws, to vote taxes and appropriations, to borrow money, to regulate commerce, to coin money, to establish post-offices and roads, to declare war, to raise and support armies, to determine the certificates and to count the votes of the presidential electors, to impeach and to try the president, to judge of the elections, returns, and qualifications of its members. Congress is limited in the exercise of its power, because it cannot change the Constitution, it can pass no bill unapproved by the president except by a two-thirds vote, and no bill of Congress is valid if declared to be unconstitutional by the supreme court. The members of the House of Representatives must be elected every second year by the people of their several states, and all bills for raising revenue must originate in the House of Representatives; but the Senate may propose or concur with amendments. To the Senate is given the power of approving or advising in the matter of executive appointments and treaties.

Congress

To the federal judiciary is given the power of interpretation of the Constitution, and the trial of all cases in law and equity arising under the Constitution, the laws of the United States, U. S. treaties, controversies between states, controversies to which the U. S. is a party, and controversies between a state and citizens of another state, or between citizens claiming lands under grants of different states, and between states or citizens and foreign states or subjects. (For the working of the federal judiciary, see JUDICIARY.) Its power is limited simply to the interpretation of the Constitution and of the law. Trials of all crimes, except in cases of impeachment, must be by jury. (See INJUNCTION.) All federal judges have a life tenure, subject to impeachment by the House of Representatives, and trial by the Senate. Such are the main features of the American Constitution. Certain actions are expressly forbidden. A writ of habeas corpus may not be suspended save in cases of rebellion or invasion. No *ex post facto* or bill of attainder may be passed. No tax or duty may be laid on articles exported from any state. No preference by regulation of commerce may be given to one state over another. No money may be drawn from the treasury save in consequence of appropriation made by law. No title of nobility may be granted, and no person holding office under the U. S. may receive a present or title from any king, prince, or foreign state. All duties, imposts, and excises must be uniform through the states. Amendments to the Constitution forbid any law respecting an establishment of religion, or curtailing the free exercise of religion, free speech, freedom of the press, the right to peaceable assembly, to petition government, to keep and bear arms, to trial by jury on indictment by a grand jury for capital or infamous crime, and trial by jury in all criminal prosecutions. By other amendments, the powers not delegated by the Constitution, nor prohibited by it to the states, are reserved to the states or the people. No state may enact or enforce any law abridging the privileges or immunities of any citizen. The right of citizens to vote shall not be abridged on account of race, color, or previous condition of servitude. Neither slavery nor involuntary servitude, except as punishment upon conviction for crime, shall be allowed.

Judiciary

Such is a general account of the Constitution of the United States. Its practical working, while open to not a few serious criticisms, has undoubtedly been a success. Even its most serious defect may be said to be the result of it virtues. At the present time, when conditions are so different from those under which it was drafted, the Constitution, with its slow process for amendment, seems to bind the nation against its will and unduly check wise action. But this defect, if defect it be, is assuredly the result of the strength of the Constitution, and a strength absolutely needed both in the days of weakness when the nation was young, and in the days of strength when the nation was rocked with discussions over the question of state rights.

Successes

De Tocqueville, sixty years ago, was more hopeful of the future of the separate states than of the union. He believed that with the first serious difference in views the union would be dissolved. At the time of the Rebellion most Europeans and some Americans believed that the end of the union was come. A strong Constitution was needed. To-day the union exists more firmly knit than ever, and no small part of this must be attributed to the wisdom and strength of

the Constitution. Perhaps, too, the greatest triumph of the Constitution has been that it has so marvelously succeeded in its compromise between federal and state powers. This was the greatest difficulty presented to the framers of the Constitution; it has been till now the burning question of American politics. The Constitution has weathered the storm. A small republic is comparatively easy to conduct. In the United States alone are giant states confederated in one republic.

Again, the Constitution, for the first time in history, has enabled a great nation without radical constitutional changes to preserve popular liberties. In the late election of 1896 a people numbering ever 70,000,000 went into an intense and even passionate contest, one in which the numbers on each side were about equal, which raised issues of section and still more issues of class—an election in which each party believed it stood for the preservation of liberty and for the defeat of principles subversive of honest and free government, and yet under a Constitution framed a century ago, the nation has come out of the conflict whole and unharmed. Surely such a Constitution has stood the test of time. It has succeeded, too, in the main in realizing that division of powers which its authors thought so necessary. The president has not been able to defy Congress; Congress has not been able to ignore the president. If the supreme court has been able to exert at times enormous power, it has, after all, usually but recorded the popular verdict. If, as a large majority believe, in 1876 a president duly elected was set aside for his rival candidate, the claims of the two were nearly equal, so that gross injustice was not done. If, more recently, a decision of the supreme court prevented an income tax which a large majority of the people desired, there can be no doubt that the decision will ultimately be reversed, provided the people continue to demand such a tax. No constitution can work without favor. Considering the vigor with which the nation has acted in emergencies and the moderation and freedom of its general policy, the experience of the century must be thought to bear out the verdict of Mr. Gladstone, that "as the British Constitution is the most subtle organism which has proceeded from progressive history, so the American Constitution is the most wonderful work ever struck off at a given time by the brain and purpose of man."

There have been, however, notable failures in the working of the Constitution. Some of these we consider elsewhere. Perhaps the best brief discussion of the defects in the Constitution has been written by the Hon. Walter Clark, Chief Justice of the Supreme Court of North Carolina, author of many volumes of history and law, and one of the most careful and earnest students of constitutional law. He says, in an article in *The Independent*:

Defects in the Constitution

As a product of its time, the Constitution of the United States was and is without counterpart. Gladstone gave words their way in praising it. Too much has not and cannot be said of the wisdom of the fathers who framed it. But idolatry is dangerous. Blind faith ought not to be a part of our national characteristics, and when from the cradle up—even from the halls of Congress—we hear that the "Great Instrument" stands beside the Bible, inviolate, that the Constitution of the United States is for this nation, to-day, all that the anxious fathers wished that it might be 120 years ago we are being brought too far. It is giving the framers of the instrument credit for being inspired prophets of greater wisdom for the future than they possest for their own day and generation.

They were not satisfied with the Constitution when it left their hands, as properly meeting the demands which immediately faced them. Neither were they satisfied with the Constitution itself. In short it was a compromise between many contending factions. It was simply the best that could be obtained at the time, under the widely separated conditions and expectations of the detached elements working up in the struggling states. There were grave detects in the Constitution then, there are graver defects to-day, calling for careful revision.

There was a great difference between the two conventions. That which met in 1776 was frankly democratic. Success in its great and perilous undertaking was possible only with the support of the people; it must be with the people. The Great Declaration was an appeal to the masses.

Never was the right of revolution more clearly asserted, or that government existed for the sole benefit of the people who were declared to be equal and endowed with the right to change their government at will when it did not subserve their welfare or obey their wishes. Not a word was there about property. Everything was about the people. The man was more than the dollar then, and the convention was in earnest. Every member signed the declaration, which was unanimously voted; according to Dr. Franklin's pertinent remark that it behooved them "to hang together or they would hang separately."

The convention which met in 1787 was as reactionary as the other had been revolutionary and democratic. It had its beginning in commercial negotiations between the states, when they were weary with a long war, and when the fierce enthusiasm for liberty was somewhat relaxed by the pressing need to earn the comforts and necessities of life, and when oppress by the ban upon prosperity caused by the uncertainties and impotence of the existing government they were thoroughly exhausted. Under these conditions and with as many minds as there were men, the convention of 1787 came together.

Ignoring the vital maxim that government should exist only by the consent of the governed, it sat behind closed doors that no breath of popular will should affect its decisions. To free the members from any future responsibility, all were prohibited from making copies of any kind of the resolutions or to correspond with constituents or others about matters pending before the convention. Any record of yeas and nays, even, was forbidden; but one copy was kept without the knowledge of the convention. It was kept by the one member best able to grasp each situation and make fair note of it. The journal was kept secret at the time, and later a vote to destroy it fortunately failed. Mr. Madison's copy was finally published after the lapse of forty-nine years, when every member had passed beyond human accountability. Only twelve states were ever represented. One of these withdrew before the final result was reached. Of the sixty-five members, only fifty-five ever attended, and so far from being unanimous only thirty-nine signed the Constitution, and some of them actively opposed its ratification by their own states, later.

That the Constitution thus framed was reactionary was a matter of course. There was grave consideration, at the time, of a royal government with Frederick, Duke of York, second son of George III., as king. Alexander Hamilton, whose wonderful work as Secretary of the Treasury, crowned him with a halo, and whose tragic death obliterated the memory of his faults, declared himself in favor of the English form of government, which he denominated a "most notable institution." Failing in that, he advocated an executive elected by Congress for life, senators and judges for life, and governors for states to be appointed by the president. Of these he secured, as it has proved, one most important item, from his standpoint, the creation of the judges for life. The convention was aware that a constitution on Hamilton's lines could not secure ratification by the several states. But the Constitution adopted was as undemocratic as possible, and was very far from responding to the conditions laid down in the declaration of 1776, that all governments derived their just powers from the consent of the governed. In his speech to the convention, Hamilton stated that the members were agreed that "we need to be rescued from the Democracy." They were rescued. Thomas Jefferson, unfortunately, was absent as our Minister to France, and took no part in the convention, tho we owe to him very largely the compromise by which the first ten amendments were agreed to, in exchange for ratification by several states which otherwise would have been withheld.

The consent of the governed was not to be asked. In the new government the will of the people was not to control and little to be consulted. Of the three great departments of government—legislative, executive and judiciary—the people were entrusted with the election of only the House of Representatives—one sixth of the government at most, even if the House had been endowed with equal authority and power with the Senate. The declaration of 1776 was concerned with the rights of man. The convention of 1787 entirely ignored them. The guarantees of the great rights of freedom of speech and press, freedom of religion, liberty to assemble, right of petition, exemption from general warrants, the right of trial by jury and by grand jury, protection of the law of the

land, and protection from seizure of private property for other than public use, and then only upon just compensation —matters of the utmost importance to the rights of the people were entirely omitted. They were added in the first ten amendments by preliminary agreement, while the Constitution was still in controversy in the several states, only because it was necessary to give assurance that such amendments would be adopted in order to secure the ratification at all.

The Constitution was so far from being satisfactory, even in the circumstances of the time for which it was framed, that only eleven states voted for its adoption in the convention. Its ratification by the conventions in the several states was carried with the greatest difficulty, and in no separate state was it ever submitted to a vote of the people themselves. Massachusetts only ratified after a close vote and a demand for amendments. South Carolina and New Hampshire demanded amendments, as did Virginia and New York, both of which agreed to ratification by the narrowest of votes, reserving for themselves still the right to withdraw, and two states rejected the Constitution and subsequently ratified only after Washington had been elected and inaugurated—matters in which they had no share.

George Washington was president of the convention, but as such was debarred from sharing in its debates. He left no impress upon the instrument so far as is known. Yet it was freely admitted that but for his popularity and influence the Constitution would have failed of ratification by the several states, especially Virginia. Indeed, but for his influence the convention would have adjourned without putting its final hand to the Constitution at all—it came very near doing so. Even his great influence would not have availed but for the overwhelming necessity for some form of government, with imperative haste, as a substitute for the rickety "Articles of Confederation," which were utterly inefficient.

An instrument so framed, adopted with such difficulty and ratified after such efforts, and by such narrow margins, could not have been a fair and full expression of the consent of the governed. The men that made it did not deem it perfect. Its friends agreed to sundry amendments which were adopted by the First Congress, as a preliminary necessity. The assumption by the new supreme court of a power not contemplated by the framers caused the enactment of the eleventh amendment. The unfortunate method prescribed for the election of the president, which nearly caused a civil war in 1801, forced the adoption of the twelfth amendment, and three others were brought about as the result of the great Civil War. The convention of 1787 recognized, itself, that defects innate in the Constitution and developed by experience and the lapse of time would require amendments, and the instrument prescribed two different methods by which amendments could be made.

Our federal Constitution was adopted 120 years ago. In that time every state has radically revised its own Constitution—most of them several times. The Constitution of New York requires that the question of a constitutional convention shall be submitted to its people at least once every twenty years, in order that organic law shall keep abreast of the needs and wants of the people and represent the will and progress of to-day, instead of being hampered by provisions deemed best by the divided counsels of a handful of men in providing for the wants of the government of over a century ago.

When the Constitution was adopted in 1787 it was intended for 3,000,000 people, scattered along the coast from Massachusetts to southern Georgia. Now we are trying to make it do duty for 100,000,000 from Maine to Manila, from Panama to Porto Rico and the Pole. Then the population was rural. At the census of 1790 we had but five towns in the whole union which had 6,500 inhabitants each, and only two others had over 4,000. Now we have the second largest city on the globe, with over 4,000,000 inhabitants, and many that have passed the half-million mark. In 1790 we had seventy-five post-offices, with $37,000 annual post-office expenditures. Now we have 75,000 post-offices, 35,000 rural delivery routes, and a post-office appropriation of nearly $200,000,000. During the first ten years the total expenditures of the federal government, including the payment of revolutionary debts, including pensions, averaged $10,000,000 annually. Our expenditures now are more than seventy-five times as much. When the Constitution was adopted Virginia was easily the first state in influence, population and wealth, having one fourth of the population of the entire union. New York, which then stood fifth, now has double the population of the whole country at that time, and several other states have a population greater than the original union—states whose very names were then unheard of. Steamboats, railroads, gas, electricity—except as a toy in Franklin's hands—coal mines, petroleum and a thousand other things which are a part of our very lives to-day, were undiscovered. Corporations, which now control the country and its government, were then so few that not till four years later, in 1791, was the first bank incorporated; the charter for the second bank was only obtained by the subtlety of Aaron Burr, who concealed the banking privileges in an act incorporating a water company. Corporations have had an affinity for water ever since.

Time has revealed flaws in that original instrument, as well as developed new necessities. The glaring defect in the Constitution was that it was not democratic. The only voice of the people was in the election of one sixth of the government, one half—by far the weaker half—of the legislative department. The other half, the Senate, was made elective at second hand, by the state legislature. The president was to be elected at third hand. In fact, until after the memorable contest between Adams, Clay, Crawford and Jackson, in 1824, in the majority of the states, the presidential electors were chosen by the state legislatures. They were so chosen by South Carolina until after the Civil War, and in Colorado in 1876. The intention was that the electors should make independent choice, but public opinion forced the transfer of the choice of electors from the legislatures to the ballot-box, and then made of them the figureheads which they are, thus capturing the executive department, and that department, with the House of Representatives, mark to-day the extent of the share of the people in this government.

The judiciary were placed a step further removed. The judges were to be selected at fourth hand, by the president—who was intended to be selected at third hand—and subjected to confirmation by the Senate chosen at second hand. And to make the judiciary absolutely impervious to any consideration of the "consent of the governed" they were appointed for life.

A constitution so devised was not intended to express but to suppress or at least disregard the wish and consent of the governed. It was admirably adapted for what has come to pass—the domination of the government by "The Interests." Should the president favor legislation and the House of Representatives pass a bill, the Senate can defeat it; and if by chance it yield to the popular will and pass the bill, as was the case with the "Income Tax," there remains the judiciary, who have assumed, without any warrant exprest or implied in the Constitution, the power to declare an act of Congress unconstitutional at their own will and without responsibility to any one.

The people's part in the government, in the choice of a House of Representatives, even when reenforced by the executive, is still nullity in the face of the senate and judiciary in whose selection the people have no direct voice.

The government of the United States is a government by Senate and judges—by whatever power can control the selection of senators and judges. What is that power? We know that it is not the American people.

Let us not be deceived by forms. Government rests not upon forms, but upon a true reply to the question, "Where does the governing power rest?"

In England to-day, there is a monarchy in form, but the real government of England is vested in a single House of Parliament elected by the people. The executive is not the king, but the prime minister and his cabinet, practically elected by the House of Commons, and holding office at the will of the majority in that house. The king has not even the veto power except nominally, since it has not been exercised in a single instance for more than 200 years; and the sole function of the House of Lords—a club of rich men representing great vested interests—is in the exercise of a suspensive veto—exercised only till the Commons make up their mind that the bill shall pass, when the House of Lords always give way as the condition upon which their continued existence rests.

In this country we retain the form of a republic, we choose our president and House of Representatives, but the real power does not reside in them or in the people. It rests with those great "interests" which select the majority of the Senate and the judges.

The sole remedy for this is by amendment of the Constitution that shall make it democratic; in other words, counteract the effects of the reactionary influence following the strenuous patriotism of the declaration, which was so strong during the framing of the Constitution.

In the convention of 1787, Pennsylvania voted for the election of senators by the people. A strong argument used against this was that the farming interests, being the largest, would control the House, and that the Senate could only be given to the commercial interests by making its members elected by the legislatures—which proved prophetic—tho the deciding influence was the fear of the small states, that if the Senate was elected by the people, its membership would be based on population. The same argument would still resist the call for a reviewing convention to-day, and be aided by "the interests," with the press which they control; but in truth and justice it may be that some modification now in that respect would be efficacious. There may no longer be good reason why Delaware, Nevada, Rhode Island, should have as many senators as New York, Pennsylvania or Illinois. It might better serve the interests of the whole country to grant to every state having 1,000,000 inhabitants or less one senator, and to allot to each state having over 1,000,000 of inhabitants an additional senator for every additional million. This would not change the number of senators, but while not putting the Senate frankly on a basis of population, would remove the present unjust ratio and the opposition to the admission of new states, whose area and development entitle them to self-government, but whose population does not entitle them to two senators.

The election of president, too, even as it has been improved still leaves much to be desired. It readily lends itself to the

choice of a minority candidate. It is an anomaly that 1,100 votes—as in New York in 1884—should swing seventy electoral votes, thirty-five from one candidate to another, and thus decide an election. But preserving the electoral vote system as now, and giving the smaller states still the advantage, it might yet be possible to divide the electoral vote of each state, according to the popular vote for each candidate, giving each his pro rata of the electoral vote on that basis, the odd elector being apportioned to the candidate having the largest fraction; so that in New York Mr. Blaine would have had seventeen electoral votes and Mr. Cleveland eighteen. Other states would also have been more or less evenly divided, but the result would be that the choice of president would no longer be restricted to two or three states as in our past history, and as is likely always to be the case as long at the whole electoral vote of two or three large pivotal states must swing to one side or the other and determine the result. This change would avoid the present evil of large sums of money being spent to carry the solid electoral vote of a large pivotal state; for there would cease to be "pivotal" states. At the same time, it would avoid the open gulf into which a per capita ballot by the whole union would lead us.

By the convention of 1787 the term of the president was originally fixt at seven years, and he was made ineligible for reelection. This was reduced to four years by a compromise that he could be reelected without limitation. It was in the interest of those who favored a strong government and a long tenure. Washington imposed a limitation by example, but it will not always be binding. An amendment making the term six years and the president ineligible to reelection has long been desired by a large portion of the public. Indeed, when the constitutional convention of the union shall assemble, as it must some day, to remodel our Constitution, it is more than probable that the powers of the executive will also be restricted. His powers are now greater than those of any sovereign of Europe except Russia, and the real restrictions upon him at present are not constitutional provisions at all, but the Senate and judiciary.

But by far the most serious defect and danger in the Constitution is the appointment of judges for life, subject to confirmation by the Senate. It is far more serious to-day than it was when the convention of 1787 framed the Constitution. It is too serious a matter to be considered in this article, which has already gone beyond desirable length. I only suggest it, as one of the greatest defects in our present Constitution.

CONSTITUTIONALISM: Most civilized states are governed under constitutions varying in form and precision.

The utility of a constitution for any given people must, of course, depend very greatly upon the nature and traditions of that people. There may be but a brief framework stating the trend of governmental authority and functions, or a definite plan of organization of the various departments. The constitution may be to guard the masses from the tyrannical power of an executive or despot, or to protect the people from themselves—i. e., from the turbulent and ambitious elements and from the rash and hasty expression of popular feeling.

It is important, however, that a distinction be made between simple charters and bills of rights, and a form of government crystallized into a document which defines the scope and functions of departments and officers. The former long antedate the latter.

"A constitution is a system of principles, laws, and rules combined in a written document or established by prescriptive usage, for the government of a nation or state" ("Century Dictionary"). In strong contrast are the unwritten British constitution, composed of charters, traditions, and usages, and the recent state constitutions, which closely define the duties of officers and rigidly prescribe the limits of the several departments.

Altho writers upon the history of constitutions usually trace their origin to Magna Charta, or to the Roman laws of the twelve tables, or possibly even to the Ten Commandments, written constitutions, in the present understanding of the terms, have nearly all been made since the United States Constitution of 1787, and all have been greatly influenced by, if not mostly founded upon it.

History

The French people, in the years between 1789–91, framed a constitution to effect the change from an absolute monarchy to a limited monarchy. It was not modeled upon that of the United States or directly upon any other, yet the U. S. and English constitutions were strong influences. The Massachusetts Constitution, mentioned below, was carried to France by John Adams and circulated to a limited extent in 1780; and Benjamin Franklin had already discust with the French philosophers the Pennsylvania Constitution.

In 1783 Franklin published in the French language all the constitutions of the thirteen states of the new republic, with notes. These publications, with a vast array of historical causes, contributed to the form and matter of the Constitution of 1791. Ten other constitutions have been made by or for the French since that date—five of them republican and five monarchical. The organic law of the present republic, formed since the overthrow of Napoleon III., in 1870, was adopted by the National Assembly at Versailles in 1875. It is the shortest of the written constitutions of important nations or states. The provisions are few and simple. The outlines of organization are given, and the remainder is to be provided for by ordinary statutes of the chambers. Precedents established in former constitutions and such provisions of earlier laws as are not incompatible with the new republican law still remain in force. The influence of the series of revolutions in France and elsewhere brought about constitutions in many of the smaller German states between 1820 and 1836. The general political upheaval in Europe in 1848 and the few years following resulted in many more, the characters of which cannot be examined in a brief article.

Switzerland deserves notice, however, for one feature connected with its latest constitution. The first one formed in Switzerland was in 1798, on the pattern of that of the French republic. A civil war gave birth to the constitution of 1848, and in 1874 the present one was adopted by a popular vote. In all but one (Freiburg) of the cantonal constitutions based upon and guaranteed by the federal constitution, the people have the right to demand that all important legislation be referred directly to them. "It may even be said that in some cantons the councils merely formulate the laws, while the people pass them" (Woodrow Wilson, "The State," § 519). In general, however, the laws are submitted to popular vote only upon demand by petition of a specified number of voters.

The English Constitution is of another type, and yet, directly or remotely, has influenced nearly all others. It is a collective name for the principles of public policy on which the government is based. It embraces statutory law, custom, tradition, and precedent. No one document outlines the whole system of government. "The British Constitution is a barrier which yields under the pressure of circumstances as often as that pressure reaches a certain degree of intensity, but a barrier which never breaks, being steady and firm despite, or rather on account of its flexibility" (C. Borgeaud, *Political Science Quarterly*, vol. vii., p. 613). It is maintained not by safeguards formulated within itself, but because it has the sanction of time and the protection of a conservative privileged class and the loyalty of the people.

The British colonies in North America, Australasia, and elsewhere have written constitutions in general features conforming to the practises and precedents of the English Government, the most noteworthy being the responsible ministry.

The most recent government on earth (1894), organized under a written constitution, is the republic of Hawaii. Its fundamental law embraces provisions similar to parts of those of Great Britain and of the United States.

The South American States and Mexico, which achieved their independence of Spain in the first quarter of the nineteenth century, are all now living under formal republican constitutions. The limits of this article will not permit of an examination of either these or the afore-mentioned English colonial constitutions. Sufficient to say, however, in all the recent ones the tendencies are markedly in the same directions as in those which will be considered more closely.

A constitution comes from a sovereign power, and its nature must depend, then, upon what power is recognized as sovereign. It may come from a king in the form of a charter or grant while he is absolute, and in order to get a recompense of some kind; later he may grant it because the people are so far recognized as the source of power that he is forced to a compact, and so one is agreed upon by the ruler and the representatives of the people. Later, when the people are acknowledged as sovereign, the constitution proceeds from them—i. e., they, by representatives, draw it up and then ratify it by a stipulated majority. The theory of the constitution is really far to seek. It is found directly connected with the origin of a state. Three theories are proposed for the origin of a state—the theological, the historical, and the contract theory. The contract theory, the work of J. J. Rousseau, is interesting in this connection as a curiosity, and because so many of its expressions have crept into constitutions. The theory, in brief, is that a state originates in the agreement of individuals to establish it. The theory itself has often been refuted by showing that men have always been associated in groups, larger or smaller, and that society in this sense needs no definite agreement, but rather is a state of nature. It is certain that the idea of a contract only entered the comprehension of men ages after they had already well-established forms of society, ruler and ruled, law trials and judges.

Theory

The preamble of the Massachusetts Constitution of 1780 is so much like a quotation from Rousseau's "Contrat Social," that the framers of that instrument must either have believed in Rousseau or have interpreted him in another manner than the common one—that is, instead of understanding his contract to be the basis of association, it may have been only a philosophical device for explaining the relations of the independent members of an already free state. Tho professing itself to be a contract between individuals, such a contract is really, by the ratification of the citizens of the state, the fundamental law, and not a mere contract and equalizer of rights.

We shall make no effort to detail the probable steps between the recognition of binding contracts as in practise by the Romans, charters of medieval towns and monasteries, and the nineteenth century state and national written instruments. All medieval charters, especially the Magna Charta, signed by King John in 1215, and early colonial charters have their place in the order of development of constitutions; but the Fundamental Orders of Connecticut (1639) is the first document which created a complete form under which a government was organized. This document, which was not superseded by a constitution till 1818, must be taken as the real and immediate origin of the present constitutions of Christendom. The Puritan is to be credited with the introduction of the written constitution into political life. The Fundamental Orders of Connecticut was the first, and there were two others emanating from the Puritans in England in 1647 and 1653.

Whether a constitution, after it is ratified, shall be effective or not depends entirely upon how firmly its principles are already an accepted part of the national consciousness, and hence how far it faithfully reflects the national will.

Numerous instances might be cited where constitutions have either been imposed upon a people who did not thus already experience the sentiments contained in them, or where people themselves, having overturned an existing government, have framed a constitution containing principles which call forth no patriotic response from the mass of the people. Constitutions, like poets, are not made. A constitution, to be at all effective, must be an evolution. No wonder that the new states of the United States should find their constitutions to work fairly well, and the numerous states nominally set free by France in her revolutionary period should find almost the exact opposite. In one case the whole experience of the past two or three generations has been in a constitutional atmosphere and in contact with the much praised and almost worshiped United States Constitution, while in the other a newly prepared paper constitution was presented to those who were almost totally unfitted for it by their previous political experience. It is not at all uncommon to find Americans and others who are such worshipers of their constitutions that they believe their principles to be of universal application, amazed to find that these constitutions, when imposed on people of different training, do not work satisfactorily.

Authority

In a period of eighty-four years, France has had eleven constitutions. The abandonment of one and the adoption of another has in each instance been accompanied by a revolution or a *coup d'état*, or a national calamity.

The history of the South American constitutions is almost a continuous tale of adoption, revolution, and a new instrument. May it not be a pertinent question whether even a sovereign people have authority over the next and succeeding generations.

The authority of a constitution is certainly not sufficient to prevent revolution, yet often it has taken revolution to amend a constitution. Those who make a constitution, appreciating their own necessity for altering the form of government, should also appreciate that others may wish to modify theirs without the accompaniment of revolution.

The most important feature of American constitutions is the division of governmental powers into the three heads —legislative, executive, and judicial —and the definition of the powers of each. The main difficulties that have arisen

Principles

among these departments have been from the encroachment of one department upon another. The numerous alterations in the state constitutions during the last 100 years have mostly been in the direction of limiting the functions of legislatures and enlarging the power of the executive. Possibly this has grown from observing that in the Federal Government during the same period Congress has been encroaching on the executive, and it has been easier to modify the state constitutions than that of the United States. In both state and national government the judicial department has been steadily gaining in importance.

It is rather a disappointment to those who, in idolizing the Constitution, think that its framers were so inspired that they could strike off at once such a remarkable instrument, to learn that the Constitution is not nearly so much the result of inspiration and foresight as it is the result of a series of compromises. The compromises were the result of the collision in the convention of two forces which are present in all political bodies—viz., the centralizing and decentralizing, otherwise the aristocratic and democratic forces. The first class is fearful of the power of the masses, and the second of the tyranny of officeholders. The aristocratic faction, fearing the thoughtless despotism of majority rule, endeavored to make a government popular in form, yet of such a nature that it could be controlled by a minority which would presumably be from the better side of society, and to so plan that amendments could with great difficulty be made and no radical change adopted as the result of popular clamor. With one party, then, in the convention fearing the masses, and the other a possible tyrant, the resulting constitution was reasonably satisfactory to both, but for different reasons. John Adams, in a private letter, recapitulates the arrangements whereby one department acts as a check upon another: "First, the states are balanced against the general government. Second, the House of Representatives is balanced against the Senate and the Senate against the House. Third, the executive authority is in some degree balanced against the legislature. Fourth, the judiciary is balanced against the legislature, the executive, and state governments. Fifth, the Senate is balanced against the president in all appointments to office and treaties. Sixth, the people hold in their own hands the balance against their own representatives by periodical elections. Seventh, the legislatures of the several states are balanced against the Senate by sexennial elections. Eighth, the electors are balanced against the people in their choice of president and vice-president" ("Works," vol. vi., p. 467). If these checks were all operative now, just as was expected by those who placed them in the Constitution, the work of the government would be even slower to express the real feeling of the nation than now. But even with the last-mentioned check entirely nullified, and some of the others not fully operative, through certain practises that have grown up, the work of government has in several instances been so clogged as to have well-nigh stopt.

It is very doubtful whether, in the development of society along the lines which are apparent, one generation ought to legislate for another. Each generation, perceiving its own needs and difficulties, and devising some means of satisfying and obviating them, also feels that if the arrangements by which they have surmounted difficulties can be made into fixt laws, then difficulties of the same kind will not occur in the future. Thus those who planned the Constitution of 1787 intended to guard against innumerable possible dangers. One evidence that they cannot prepare for changed conditions is that the method planned for the election of president, when tried, worked successfully for only four elections. An amendment was made and put into effect in 1804, so modifying the mode of election as to vote by the electors for president and vice-president separately. This portion of the provision is still operative, but the whole aim of separating the choice of president from the necessary excitement of popular election has been defeated, and the electors have become mere machines, to cast ballots according to instructions. This would be no calamity, but rather in accord with the growing tendency to elect all officers if the real voice of the people were heard, or even the voice of the majority. This, however, has not been the case. In several elections the successful candidates have not received a majority of the votes cast, and in two elections not even as many popular votes as the defeated candidates; but the only way in which the people have been able to express their dissatisfaction with the prescribed form in the Constitution has been by an evasion of the real intent in Article XII. of amendments in such a manner that the article is nullified without being violated in the letter. After the twelfth amendment, in 1804, no amendment was possible until the social upheaval caused by the Civil War, and it seems indeed apparent that no amendment further is possible without revolutionary proceedings and excitement.

United States

In the absence of ability to amend there must be some way of permitting government authorities to act according to the exigencies of the occasion, where there is no provision for or against, or where a literal reading would seem to obstruct. This way has been through the right of interpretation. Instead of seeking the probable intent of the writers of the document, there should rather be sought the view of the present political power —i. e., the people. Under a government where the constitution is established and ordained by the people it is absurd to consider the people ruled by the thoughts or intents of a past generation. Their utterances, even tho they be in the form of a fundamental law, can really be binding only when they are the reflection of the will of the living power. Hence in a government which rests ultimately for its support upon the whole people, or that portion of the people which molds public opinion, the interpretation of a constitution must be that which best reflects the "prevalent sense of right," or that which is the interpretation of the present possessors of political power. "The cases are not rare in which forced construction has been resorted to in order to justify the exercise of powers which are deemed necessary by public opinion. Nor can we expect to prevent altogether this tendency to strain and force the literal meaning of the Constitution in order to bring it into conformity with that unwritten constitution which is the real constitution, and which embodies the living rules of conduct; for the unwritten constitution is steadily but slowly changing under the pressure of popular opinion and public necessities, checked only by the popular reverence for the written word" (C. G.

Tiedeman, "The Unwritten Constitution," p. 136).

The following table of facts, obtained from the constitutions of all the states in the union, will partially illustrate the tendencies of the present in constitution-making. The constitutions called "earliest" are those which were first actually put into practise in the government of each state, and were mostly adopted between 1776 and 1850, and the "latest" are mostly those which have been adopted since the Civil War. The earliest and latest of each state are the ones meant:

In the earliest constitutions seven states had a four-year term for governor.
In the latest constitutions twenty states have a four-year term for governor.
In the earliest constitutions twelve states had a two-year term for governor.
In the latest constitutions eighteen states have a two-year term for governor.
Two states have decreased the term of governor.
Five states have increased the term of governor from one to four years.
In latest constitutions four have term of governor one year.
In latest constitutions two have term of governor three years.
In earliest constitutions nine elected governor by legislature or by assembly and council.
In latest constitutions all elect governor by all voters.
In earliest eight executives had a veto to be overruled by a majority.
In earliest thirteen executives had a veto to be overruled by a two-third majority.
In earliest ten constitutions had no provision on subject of veto.
In latest four constitutions have no provision on subject of veto.
No constitution before 1845 (Texas) gave the executive authority to veto items in a bill, and with this exception none till after the Civil War.
In latest constitutions five pass a bill over veto by a mere majority.
In latest constitutions twenty-four pass a bill over veto by a two-third majority.
In latest constitutions sixteen allowed items in bills to be vetoed. (Some confined to appropriations.)
In latest constitutions thirty have biennial sessions of the legislature.
Fourteen of this thirty have been changed from annual to biennial.
One of this thirty has been changed from semiannual to biennial.
One has changed from semiannual to annual.
Fifteen legislatures have always been biennial.
In earliest constitutions four have members of Lower House hold two sessions.
In latest constitutions six have members of Lower House hold two sessions.

Tho the people themselves are responsible for the legislators whom they are unwilling to trust, they have in all the more recent constitutions so shown their distrust as to make the constitution in length more like a code of laws, and have imposed restrictions of various kinds upon the legislative power. Several causes may be assigned for this untrustworthiness in legislatures, such as the spoils system, the political boss system, small salaries, suggesting dishonest dealings with public money, etc.; hence special legislation in certain enumerated cases is prohibited. These prohibitions amount, in the Constitution of Montana, to thirty-five, and in that of North Dakota to 100.

Another method which legislators have used for making questionable laws is by means of riders to appropriation bills, and by introducing doubtful appropriations into general appropriation bills. The people have guarded against this to a certain extent by giving to the governor in at least sixteen of the states the right to veto particular items in a bill, while indorsing the remainder and causing it to become a law.

All the later constitutions are really of a different class from the older ones, and represent new tendencies in the people. This is especially apparent in the development of the fourth department of government—viz., the administrative. In a few states this is made a distinct department of government, but in general it has not yet been separated from the executive. Certain bureaus and officers, such as those of agriculture, railroads, land, and insurance commissioners, indicate direct connection of the economic interests of the people with the administration of the states. The people in the early days of the republic knew nothing of these interests, and were quite content to leave them all to the legislature. But now the skill of experts to collect and classify information in these various fields is demanded in order that legislation may be intelligent rather than experimental, and to the immediate welfare of the whole people. These officers are now in every state chosen by the qualified electors instead of by the legislatures, and indeed nearly all officers which were in the earlier constitutions appointed by the legislature are now chosen at a general election. The state judiciary is also now elective.

In addition to reducing the frequency of legislative sessions, the length of session in many of the states is limited to a period of from forty days (the briefest) to (in general) ninety days, or by prescribing a definite salary for the whole period, thus offering an incentive to briefness; or a per diem compensation, to be stopped after a specified number of days. The multitudinous restrictions placed in all the more recent constitutions on legislative, executive, and other state officers shows clearly the desire of the voters to retain power in their own hands.

While the great length of the later instruments would seem to indicate a crystallization of the governmental powers, and hence the removal of them from the people, in truth the opposite of this is the case. The ease of amendment by general vote, the checks put on the officers, the change in several instances of the impeaching power from the Senate to the Assembly—these and other considerations point rather toward a retaining of the powers of the government in the hands of the people.

In the preamble or bills of rights introducing most of the constitutions, the statement is curtly made that all political power is inherent in the people.

A feature of the Constitution of Washington of 1889 is the provision for home rule in the cities —i. e., the charters, instead of being granted by the legislature, as in other states, are to be framed by the inhabitants—a noticeable step in the direction of real democracy.

Trusts and monopolies, developments of the last few decades, are not left open to arrangements by and with the legislatures, but are regulated by a code of laws enacted by all electors and embodied in the constitution under the head of provisions for "Corporations other than Municipal."

Between 1776 and 1894, 111 constitutions have been adopted in the United States. This, of course, means that many of the states have remodeled or made anew their constitutions, as well as that territories have made constitutions and become states. One state only (Massachusetts) has lived the whole time under one constitution, while Kansas has changed her constitution oftener than any other state. Only fourteen of the states retain their original constitutions, and

six of these are the recently admitted ones—Montana, Washington, the two Dakotas, Idaho, and Wyoming.

The United States Constitution, lacking flexibility, has failed to allow for changed conditions, and has been modified only by the effects of war, by nullifying portions in spirit, if not in letter, and by forced construction. According to the apparent trend of present national life, amendments would seem to be demanded for the election of United States Senate, president, and vice-president by direct vote.

Summary

The modifications of state constitutions—viz., increasing power of executive, curtailing power of legislative departments, shortening legislative sessions in length and frequency, election of many officers formerly otherwise chosen, embodying in the Constitution laws concerning tendencies regarded as dangerous—all are indications of the sovereign people's determination to retain in their own hands the actual management of government, and to delegate power solely for purposes of administration, and that in such a manner that all responsibility can be located.

The reforms which are next likely to be proposed are the referendum and proportional representation. (See REFERENDUM; PROPORTIONAL REPRESENTATION.)

GEORGE EMORY FELLOWS.

CONSUMERS' LEAGUE, THE: The first Consumers' League was that of New York City, founded in 1890 and incorporated in 1898. It defines its aims as follows: "By the exercise of the combined influence of its members, to ameliorate the condition of working women and other employees in and about shops, stores, and workrooms in the City of New York, and to secure conditions which shall conduce to the physical and moral well-being of all such employees."

For sixteen years, the league has promulgated the following "Standard of a Fair House":

Wages: A Fair House is one in which equal pay is given for work of equal value, irrespective of sex, and in which no saleswoman who is eighteen years of age or over—and who has had one year's experience as saleswoman—receives less than $6 per week.

In which wages are paid by the week.

In which the minimum wages of cash children are $2.50 per week, with the same conditions regarding weekly payments.

Hours: A Fair House is one in which the hours from 8 A.M. to 6 P.M. (with three quarters of an hour for lunch) constitute the working-day, and a general half-holiday is given on one day of each week during at least two summer months.

In which a vacation of not less than one week is given with pay during the summer season.

In which all overtime is compensated for.

In which wages are paid and the premises closed for the five principal legal holidays, viz., Thanksgiving Day, Christmas and New Year's Day, Washington's Birthday and the Fourth of July.

Physical Conditions: A Fair House is one in which work, lunch, and retiring rooms are apart from each other, and conform in all respects to the present sanitary laws.

In which the present law regarding the providing of seats for saleswomen is observed, and the use of seats permitted.

Other Conditions: A Fair House is one in which humane and considerate behavior toward employees is the rule.

In which fidelity and length of service meet with the consideration which is their due.

In which no children under fourteen years of age are employed.

In which no child under the age of sixteen years shall work for more than nine hours a day.

In which no such child shall work, unless an employment certificate issued by the Board of Health be first filed with the employer and the name, etc., of the child be entered on a register kept by the employer.

In which the ordinances of the city and the laws of the state are obeyed in all particulars.

The stores which approach nearest to the standard of the league are printed in the "White List" which has been distributed in a million copies by the Consumers' League of New York City. Philadelphia and Cleveland have had "White Lists" for several years.

The Consumers' League of New York City has brought to light the level of wages in the retail trade by establishing its minimum at $6 a week for girls over eighteen years of age who have had a year's experience. This keeps so many merchants off the "White Lists," and requires such constant supervision of those who are on it, that there must obviously be a mass of workers who are ready to take this pittance, less than unskilled, inexperienced washerwomen and scrubwomen receive.

The National Consumers' League (founded 1899, incorporated 1902) states as its object and principles:

To secure adequate investigation of the conditions under which goods are made, in order to enable purchasers to distinguish in favor of goods made in the well-ordered factory. The majority of employers are virtually helpless to maintain a high standard as to hours, wages and working conditions under the stress of competition, unless sustained by the cooperation of consumers; therefore, the National Consumers' League also proposes to educate public opinion and to endeavor so to direct its force as to promote better conditions among the workers, while securing to the consumer exemption from the dangers attending unwholesome conditions. It further proposes to promote legislation, either state or federal, whenever it may appear expedient. The National Consumers' League further recognizes and declares the following:

That the interests of the community demand that all workers shall receive fair living-wages, and that goods shall be produced under sanitary conditions.

That the responsibility for some of the worst evils from which producers suffer rests with the consumers who seek the cheapest markets, regardless how cheapness is brought about.

That it is, therefore, the duty of consumers to find out under what conditions the articles they purchase are produced and distributed, and insist that these conditions shall be wholesome and consistent with a respectable existence on the part of the workers.

The president of the National Consumers' League is John Graham Brooks; secretary, Mrs. Florence Kelley, 105 East Twenty-second Street, New York City.

There are now sixty-five leagues in twenty states, each electing its own officers and adopting its own constitution, and all cooperating with the national organization.

During 1906 the Consumers' League has extended the field of its activities in two important directions. It has undertaken to investigate the conditions of food production, and has started a movement among its members and others for the purchase of stock in cotton-mills for the purpose of voting for humane and enlightened conditions in such mills, particularly for abolishing the employment of young children.

The "Handbook of Child Labor Legislation," compiled by Miss Josephine C. Goldmark, is issued annually in January. It contains accurate schedules showing the legislation of each state, and a compilation of the best provisions of the most advanced statutes under the title, "The Standard Child Labor Law." It is one means of promoting uniform child labor laws throughout the republic.

The National Consumers' League awards the use of its label to manufacturers of stitched white muslin underwear who meet its conditions, as follows: "Goods bearing the label are made in factories in which (1) the state factory law is obeyed; (2) all the goods are made on the premises; (3) overtime is not worked; (4) children under sixteen years of age are not employed.

This guaranty is based upon the following procedure: Before the use of the label is awarded to a manufacturer, his factory is visited by an agent of the league, who also asks both the local Board of Health and the state factory inspector for a report on the establishment. When this is satisfactory, the manufacturer signs a penalty contract embodying the four points guaranteed. After the use of the label has been awarded, the factory is visited from time to time by the agent of the league, and the local committee of the league reports upon it to the national secretary.

FLORENCE KELLEY.

CONSUMPTION: In social science consumption may be defined as the use of commodities or of anything having exchange value.

"Consumption," says Adam Smith, "is the sole end and purpose of all production, and the interest of the producer ought to be attended to only so far as it may be necessary for promoting that of the consumer." "Later criticism," says Professor Nicholson (in Palgrave's "Dictionary of Political Economy") "has thrown doubt on the possibility of making such a sharp distinction between the interests of producers and consumers. Apart from women, who are largely employed in domestic duties, and old men, invalids, and children, the number of those returned in the census of any civilized country as 'unoccupied' is extremely small, and thus the great majority of the adult males are both producers and consumers. Accordingly the conditions as regards health, variety, moral and intellectual effects on the worker of the work done, etc., are of coordinate importance with the amount and quality of the definite commodities consumed."

J. S. Mill ("Polit. Economy," bk. 1, chap. iii., sec. 5) makes the important distinction between productive and unproductive consumers. He says: "All the members of the community are not laborers, but all are consumers, and consume either unproductively or productively. Whoever contributes nothing directly or indirectly to production is an unproductive consumer. The only productive consumers are productive laborers; the labor of direction being, of course, included, as well as that of execution. But the consumption even of productive laborers is not all of it productive consumption. There is unproductive consumption by productive consumers. What they consume in keeping up or improving their health, strength, and capacities of work, or in rearing other productive laborers to succeed them, is productive consumption. But consumption on pleasures or luxuries, whether by the idle or by the industrious, since production is neither its object nor is in any way advanced by it, must be reckoned unproductive; with a reservation, perhaps, of a certain quantum of enjoyment which may be classed among necessaries, since anything short of it would not be consistent with the greatest efficiency of labor. That alone is productive consumption which goes to maintain and increase the productive powers of the community; either those residing in its soil, in its materials, in the number and efficiency of its instruments of production, or in its people."

The subject of consumption is specially treated in Roscher's "Political Economy" and in Schönberg's "Handbook," by Professor Lexis.

CONTRACT LABOR: When a government—national, municipal, county, or otherwise—individual, or corporation of individuals desires to erect a building or undertake any other work of magnitude, the custom has grown of giving out the work to be done by some contractor or contractors, who usually sign an agreement to do the work or furnish the required supplies for a certain sum, taking the responsibility of purchasing the material, hiring the workmen, and concluding the whole work. Business done on contract forms a very large proportion, particularly of the building, constructing, and furnishing trades. This method of business has grown up mainly for two reasons: Firstly—and this reason applies particularly to private corporations and individuals—because it is usually the easiest method. An individual or a corporation, and to a less extent government, has not often either the time or the ability to conduct an operation apart from his, her, or its own line of industry, and it is therefore much easier and sometimes the only possible way to give the whole job to some contractor, whose exact business it is to do the kind of work that may be required, leaving to him all responsibility for details, and paying him a lump sum for the completed work, usually with certain specified requirements and by a specified time. Secondly, it is usually claimed—and this reason is applied particularly to governments—that it is cheaper to let out the work than for the government or individual to do it for himself or itself.

Arguments for

This reason springs in part from the first reason. What we know little about we cannot do cheaply. A contractor whose special business it is to undertake a work can naturally do it more cheaply. This, it is true, might be obviated, especially on the part of governments that are always having such works performed, by hiring paid specialists, not to take a contract for the work, but to conduct it for the government itself; but this, it is usually said, is expensive. It is a common opinion in business and public circles that public work is never as cheaply done as private work. Public work, carried out by paid officials and employees, it is said, is always comparatively expensive, because it is no one person's interest to see that the work is cheaply done. The only party that suffers if it is not cheaply done is the general public, and the public often knows little about it, and when it does know is often unable speedily and readily to act in the matter. Consequently, it is said, government work is usually carried out by corrupt officials and lazy, inefficient employees. Contract labor is cheaper, it is argued, because rival contractors will bid against each other to do a job as cheaply as possible in order to get the job, and will then see for the advantage of their own pockets that their men work cheaply. To insure this, legislation, and often the special legislation authorizing the undertaking, requires that the work be bidden for in the open market, and the job be given to the contractor agreeing to do it for the lowest figure. Therefore exact specifications of what is wanted are usually advertised by the government, and sealed bids from various contractors are received for doing the work, and at a certain time the bids are opened and the contract awarded to the contractor offering the best terms. This, until recently at least, has been almost universally regarded as the best way of getting work done.

But three main difficulties have resulted from this system. In the first place, it has developed some of the greatest political scandals of modern times. It being, of course, for the interest of the contractor to get all he can from the government for doing the job, it has repeatedly happened that contractors in some way bribe the administration or the officials in charge of the works to award them the job, even when they do not offer the lowest price. So frequently does this happen, that public officials expect, as a matter of course, to be bought in this way, and a job is created simply to afford a chance to the officials to sell the contract. Sometimes contractors seem all but compelled to bribe their way to receiving a contract. Not infrequently officials will form bogus companies of their own, and award a contract to themselves at exorbitant rates, and then secretly sublet the contract to some company or contractor, pocketing themselves the enormous difference. "Jobs" of this kind, especially in municipal governments, have at times been al-

Arguments against

most the rule in America. Secondly, it being the interest of the contractor not only to get a high price for his work, but having gotten a high price, to perform it as cheaply as possible, he often defrauds the public, and sometimes with the connivance of public officials, by furnishing anything but the specified quality of material and the specified quality of work. Jobs that have been thus put upon the people disgrace almost all American cities, and exist wherever the contract system is found. Thirdly, it being the interest of the contractor to pay low wages to his men, the contract system has often become synonymous with the employment of the lowest forms of imported labor, to the exclusion of the more educated workmen of the country. Roads are built and dwellings put up by contractors who employ imported Italian and Hungarian labor, while American workmen go idle for lack of employment. This, not unnaturally, has greatly incensed trade-unionists, and they continually urge, and occasionally succeed in compelling municipal governments to give the preference to workmen resident in the city; but more and more are they agitating for the abolition of the whole contract system, which has proved itself fruitful of such corruption, and is built often upon the low wages of working men. They argue that it is the first duty of a government to be just to its own citizens, and that it has no right to leave the management of public works to irresponsible contractors. They would have government employ its own workmen at fair prices, for fair hours, and avoid the costs of paying middlemen and contractors. They claim, too, that this will really give the public both better and cheaper work. They do not, of course, claim that all corruption will disappear, but that work conducted by public officials can be more easily investigated and watched than work given out to private contractors. Such are the general arguments on both sides.

We give two quotations, one from a believer and the other from a disbeliever in the contract system, which, tho now ten years old, are still classics for their respective views. For the contract system the Hon. Nathan Matthews, Jr., the Mayor of Boston, said in his valedictory address, Jan. 5, 1895:

> One of the chief difficulties in municipal government under democratic institutions is the treatment of the labor problem in its various aspects. The relations between the municipal corporation and its employees engaged in manual labor are everywhere the cause of unceasing agitation and discussion; and this is particularly the case in Boston, where from the earliest times a larger proportion of the public work has been done by day labor than in the other large cities of the country. The collection of garbage, at first let out to contractors, was entrusted to a department of the city government to be handled directly by its employees, as early as 1824; and in the same year a street-cleaning service was inaugurated upon the day-labor plan. The lighting of the public lamps, which prior to 1868 had been done by the gas companies or other contractors, was at various times between that year and 1870 handed over to the lamp department, and has since been attended to by the employees of that department. Work upon the streets was done very largely by day labor as early as 1850; sewers have been built by day labor from an early period; the laying of pipes for our water-works has almost always been done by the day; since 1865 the construction of the great basins has frequently been attempted by day labor; and a large part of the work of park constructions since 1882 has been done by the day.
>
> The present practise is to do all the work of maintenance, repairing, jobbing, pipe-laying, and all matters the proper execution of which is a question of opinion, and therefore difficult to secure through written specifications, by day labor employed directly by the city departments, and to let all works of large construction out by contract.
>
> The day-labor system, even if excluded entirely from works of large construction, costs the city very much more than contract work, as, owing to the higher rate of wages paid, the smaller number of hours, and the large number of holidays and half-holidays without loss of pay, the city pays about sixty per cent more than the market rate of wages.* A further loss is experienced through the necessity of furnishing, so far as practicable, permanent employment throughout the year, and also by the continued employment of men who have grown old in the service of the city. On the other hand, a good deal of the city's work could not be done by contract without constant complaints from the citizens that it was not properly done. This applies to the collection of garbage, the cleaning of streets, the lighting of lamps, and other work of the sort, the proper execution of which is in the nature of things a matter of opinion and therefore incapable of accurate specification in a written contract. In the next place, work in the nature of jobbing—of which there is a great deal in the street department—probably costs no more under this system than if let out by contract, for the reason that the profits of the middleman in small jobs are necessarily large. Then there is a class of work difficult of inspection, such as the laying of water-pipes, which it is for the interest of the city to have done by day labor, even if it costs more, in order that the city authorities may be certain that it is well done.

Day Labor

Notwithstanding all that can be said against the execution of public works by day labor, I am satisfied that it is on the whole for the advantage of the city that work of the character mentioned should be done in this way; and as to the high rate of wages, shorter hours of work, and other privileges which swell the cost, it may be said that the wages paid to the city laborers have not been increased since 1882†; that the hours of labor are regulated by statute; and that if the city is to employ day labor at all, it has been found practically necessary that the laborers should receive high wages, permanent employment so far as practicable, and generally a more liberal treatment than in private work. Whether city laborers work as faithfully as those employed by contractors depends on circumstances, principally on the discipline of the department and the energy of its foremen.

Passing now to the consideration of works of construction, we find wholly different conditions. Here the cost of the day-labor system is very much greater than contract work, and the results are in no respect more satisfactory.

While there are opportunities for collusion and corruption in the contract system, still these opportunities can be and, so far as my experience goes, are avoided with comparative case. Contracts for work of this character can be so drawn as to permit of accurate inspection, and with upright and watchful heads of departments there is no reason why public work of this sort cannot be carried on fully as cheaply and quickly as private work.

I have been at some pains to secure accurate comparisons of the cost of works of large construction done by day labor and by contract, and the following instances are given by way of illustration: At Lake Cochituate, in 1887, about 50,000 cubic feet of shallow flowage work was done by day labor, at a cost of $28,837.16; while the following year about 57,000 cubic yards of similar work was done by contract for $16,202.25. Stripping 54 000 cubic yards of loam from the bottom of Basin 6 cost by day labor seventy-one cents per cubic yard; while the average of five sections let out by contract, involving the removal of about 400,000 cubic yards, cost about forty and a half cents a cubic yard. Rubble masonry was built on Basin 6 by day labor at a cost of $12.50 per cubic yard, and by contract for $7.50 per cubic yard. The work on Basin No. 5 (that now under construction, estimated to cost $2,500,000 for land and construction) is being done by contract; while the greater part of the work at Basin 6 was done by day labor; and the following table shows a comparison of the results obtained.‡

* The cost in the street department alone of holidays and half-holidays amounts to nearly $75,000 per annum. A city laborer (unskilled) receives about twenty-four cents per hour of actual work, while the contractors pay about fifteen cents.

† When they were fixed by vote of the city council at not less than $2 per day.

‡ The city engineer, from whom these figures are obtained, makes the following explanation:

In the item of 496,007 cubic yards of stripping is included one section of 90,810 cubic yards, which was very difficult. Excluding that section, the average cost of stripping 405,197 cubic yards was thirty-five and a half cents per cubic yard. The city work necessarily costs more than that done by contract for the reason that the city pays in the country $2 for nine hours' work, gives one half-day per week during four months, all holidays, and two days for voting. The men work from eight to nine months per year. This makes the price paid for one hour of actual work about twenty-four cents, while the contractor pays in ordinary years, in the country, fifteen cents per hour.

The division of cost of building the dams is about as follows: Labor, 67 per cent; teaming, 13 per cent; tools, etc., 20 per cent; and on this basis the city must pay 1.42 times as much as the contractor for the same effort. For stripping, the division of cost would be for labor, 75 per cent; teaming, 20 per cent; tools, etc., 5 per cent; and the city must pay 1.49 times as much as the contractor.

	Dam No. 5	Dam No. 6	
	Contract	Contract	City
Stripping of basin and dam	0.24	.....	0.57
Sodding embankment	0.28	.....	0.90
Concrete core-wall	4.70	.....	6.61
Plastering Portland cement	0.67	.....	0.99
Delivering gravel on embankment	0.206 (est.)	0.206	....
Spreading and rolling	0.119 (est.)	.....	0.226
Stripping 496,207 cubic yards	.....	0.405	0.64
Stripping 110,232 cubic yards	.....	.....	....

The plan now being prest by certain labor organizations (not composed of city employees) for the construction of public buildings by day labor employed directly by the city is too preposterous for discussion. The city has no opportunity to give constant employment to the skilled labor required in building operations, and would, therefore, be unable to secure the best workmen; it has no plant; the administration of such work would greatly enlarge the scope of political patronage; the cost may be safely set down as two or three times that of the present system; and all the advantages to be gained from competition under our present admirable contract law would be lost.

Between the demands of the taxpayer for the execution of all public works by contract, and the demands of the labor organizations that all public works should be done by the day, I believe that the safe, reasonable, and prudent course to follow in the public interest is the system now and for some time past in operation. According to this, all work of large construction is done by contract, through competition, except, perhaps, in certain special cases of peculiar difficulty; while jobbing, maintenance, repairs, and other work of the kind, including all that cannot be accurately specified and inspected, is done by day labor employed directly by the city departments upon liberal terms, in respect to wages, hours, holidays, and length of employment.

To this it may be said that even if contract labor be cheaper, it is at least questionable if a city should seek cheapness by importing or encouraging the importation of cheap, ignorant laborers, who are often a danger and a burden to the community, and who prevent its own citizens from earning a fair living; but it is even argued that experience shows that contract labor is not cheaper. Mr. Sydney Webb, in a paper read before the Economic Section of the British Association for the Advancement of Science in 1894, relates the experience of the London Council. He says:

We come to an altogether different range of criticism when we consider the council's determination to dispense, wherever possible, with the contractor, and execute its works by engaging a staff of workmen under the supervision of its own salaried officers. This has been fiercely attacked as being palpably and obviously opposed to political economy and business experience. It is worth while to place on record the facts. The first case is that of watering and cleaning the bridges over the Thames, a service which the Metropolitan Board of Works let out to a contractor. The new council perversely went into calculations which led the members to believe that the contractor was making a very good thing out of the job, and finally to decide upon engaging labor direct. There have now been over three years' experience of the new system, with the result that, whereas the contractor charged 4*s.* 7½*d.* to 4*s.* 10½*d.* per square yard, the work is now done at an average cost of 3*s.* 2*d.* a square yard, everything included.

In July, 1892, it was necessary to do the annual cleaning and repairing of the council's offices. The architect's estimate for the work as executed was £740. Instead of giving this work to a contractor, the architect was asked to engage a foreman and artizans, and have it done under his own supervision. The result of the experiment was that the total cost was £686, an apparent saving of £54.

This, however, was merely a matter of hiring labor, no constructive work being involved. It is interesting to trace the stages by which the council was driven, by force of circumstances, to its present position of builder. The first piece of actual building executed by the council was a schoolhouse at Crossness. The architect's estimate was £1,800, and tenders were invited in due course. The lowest tender proved to be £2,300. After considerable hesitation the Main Drainage Committee resolved to try to save this large excess over the estimate, and set to work to do the job under its own officers. Certain items which had been put down at £112 were omitted, reducing the estimate to £1,688, and the lowest tender to $2,188. The actual cost proved to be £1,652 only, a saving of £536. But the case which finally convinced three out of every four members of the council of the desirability of executing their own works was the York Road sewer. The engineer estimated the cost at £7,000, and tenders were invited in the usual manner. Only two were sent in, one for £11,588, and the other for $11,608. The council determined to do the work itself, with the result that a net saving of £4,477 was made.

Remarkable Results

This remarkable result naturally created a sensation among the contracting world, and attempts were made to impugn the engineer's figures. In his crushing reply he pointed out that the contractors had reckoned out their tenders at absurdly high prices in nearly every detail, charging, for instance, 60*s.* and 70*s.* per cubic yard for brickwork and cement, whereas the work was done at 39*s.* It is clear from the particulars given, and from facts notorious at the time, that an agreement had been come to by the contractors not to compete with one another for this job, in order to induce the council to abandon its fair wages clause. The council preferred to abandon the contractor.

The outcome was the establishment, in the spring of 1893, of a Works Committee, to execute works required by the other committees in precisely the same manner as a contractor. The Works Committee has an entirely distinct staff, and keeps its own separate accounts. The committee requiring any work prepares its own estimate, as if tenders were going to be invited, and the Works Committee is asked whether it is prepared to undertake the work upon that estimate. Up to the present date sixteen separate works, varying in amount from £100 to £4,094, have been completed, and the accounts settled and checked by the controller. The result shows an aggregate net saving of £2,420, or over 8 per cent.

Now, it is obvious that, incomplete as statistics necessarily are, and difficult as it must always be to decide a question of policy upon mere statistical results, the figures, as far as they go, afford no assistance to those who denounce the council's action, and are distinctly encouraging to its progressive members. No sound induction on such a matter can, however, be made upon mere statements of profit and loss, extending, too, over a very brief period.

When we thus find even the county councils in rural districts giving up the contractor, it ceases to be surprising that the town council of Manchester, in the city of Cobden and Bright, now manufactures its own bass-brooms, or even that the ultra-conservative commissioners of sewers of the city of London actually set the county council an example by manufacturing their own carts. The superiority of direct municipal employment, under salaried supervision, to the system of letting out works to contractors has, in fact, been slowly borne in on the best municipal authorities all over the country by their own administrative experience, quite irrespective of social or political theories.

Comparing the present cooperative system in New Zealand with the former contract system, the Under Secretary for Public Works in that colony says: "The contract system had many disadvantages. It gave rise to a class of middlemen, in the shape of contractors, who often made large profits out of their undertakings. Under this cooperative system works are carried out for their actual value—no more and no less. . . . Work also is better done under the cooperative than under the contract system." (See New Zealand.)

CONTRACTION AND EXPANSION OF CURRENCY: There are few monetary questions more important than that of the contraction and expansion of currency. We consider: (1) The economic principles involved; (2) the practical importance of the subject; (3) the facts as to the United States.

I. The Economic Principles Involved.

These are not in debate. Upon them all economists are more agreed than upon almost any other principles in economic science. They are:

(*a*) That a contraction of the currency tends to lower prices, and, vice versa, that an expansion of the currency tends to raise prices. Says Ricardo:

"That commodities will rise and fall in price in proportion to the increase or diminution of money I assume as a fact that is incontrovertible. That such would be the case the most celebrated writers on political economy are agreed."

Says President Walker: "That prices will fall or rise as the volume of money be increased or diminished is a law that is as unalterable as any law of nature."

The reason for this is simple. When a currency expands there is more money to meet the demands of trade. People are able to give more to purchase what they desire; hence the seller can raise his prices. It is, of course, implied that the currency has expanded *more than the demand for it*. If, as is often the case, a slight expansion of currency is accompanied by a greater expansion in the volume of exchanging, so that more currency is needed, the slight absolute expansion of the currency is more than counterbalanced by the greater expansion of the need or demand for it, and there is, therefore, virtually not an expansion, but a contraction of the currency, and prices fall instead of rising. Of course also, by expansion of currency is meant currency *in circulation* actually available for making exchanges. If in any country currency is coined or issued, no matter in how great quantities, and is locked up either in government vaults or withdrawn from active circulation by private or other cornering of the money market, there is no real expansion of the currency.

(*b*) Economists are agreed that it follows from the above that a contraction of the currency tends to benefit the credit class, and that, vice versa, an expansion of the currency tends to benefit the debtor class. Says President Andrews ("An Honest Dollar," p. 8): "Increase in the value of money robs debtors. It forces every one of them to pay more than he covenanted—not more dollars, but more value, the given number of dollars embodying at date of payment greater value than at date of contract. Decrease in the value of money robs creditors, necessitating each to put up, in payment of what is due to him, with a smaller modicum of value than was agreed upon."

Contraction Tends to Benefit Credit Class

So substantially say Jevons, Walker, Chevallier, and all authorities, altho all have not realized the importance of the subject. It should, however, be realized what this means. The credit class is, generally speaking, the small class who live directly or indirectly upon investments. The debtor class is the large class of producers in any nation.

(*c*) Economists are agreed that what is wanted is an "elastic currency"—that is, a currency that can decrease in volume when prices go up and increase when prices go down, thus operating to check the increase and decrease. Exactly on what basis this should be done there is, however, disagreement.

II. The Practical Importance of the Subject.

This is also admitted by all thinkers, altho it has not always been sufficiently realized. Says President Andrews ("An Honest Dollar," p. 13): "Jevons, at any rate, is too moderate. After enormous admissions touching the ravages of changing currency values, he almost apologizes for the change in money value, on the ground that the sorrows springing from it are mostly occult, and that the people habitually refer them to other causes. The question is not whether the infelicities accompanying these monetary vicissitudes are appreciated or not, but whether they are real and serious. That they are both will be the conviction of every student in proportion to his acquaintance with them. . . . It is certain that none who have not made the subject a study at all adequately conceive the magnitude of the evil."

Says Professor Commons (*The Voice*, Sept. 14, 1893):

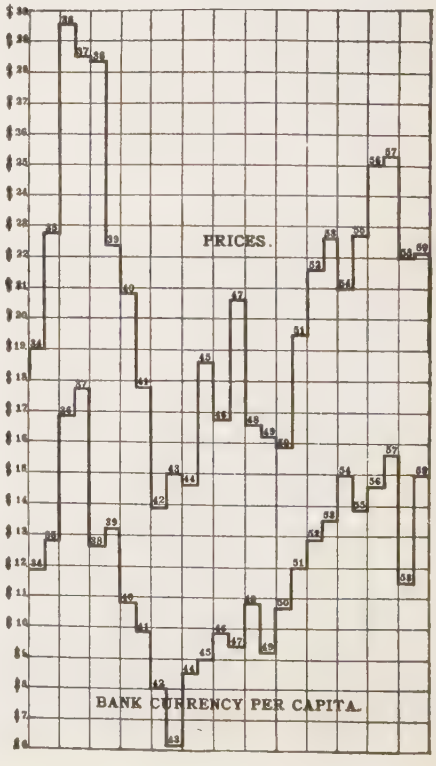
> What is the significance of price fluctuations? Nothing less than the very essence of modern industry. . . . It is estimated that the debts of the world are $100,000,000,000. Every nation, state, county, city, and township is a debtor. These debts run from three months to three decades. All business and productive enterprises are a speculation. The farmer borrows money expecting to sell wheat at a certain price and pay his debt in money. Meanwhile, the price of wheat falls 50 per cent. Where one bushel would have paid his debt when contracted, it now requires two bushels, and the burden of the debt has grown 100 per cent. During the past twenty years this is exactly what has occurred. . . . When we consider that the private debts of the country are one half the value of the country, it is no wonder that panic depression, idleness, and despair are upon us.

III.—The Facts as to the United States.

These can be fully studied only in a complete review of the currency of the United States. (For this, see CURRENCY.) We here consider only such facts as are in dispute, and mainly those which have arisen since the war. For the ante-bellum period we present the following chart from Amasa Walker's "Science of Wealth":

DIAGRAM.

Showing the Corresponding Fluctuations in Currency and Prices for 26 years, 1834–1850.



This diagram shows at once how closely prices follow fluctuations in currency, and also the vast importance of the subject to the general prosperity of the nation.

For the period since the war we ask:

(*a*) *Has there been contraction or expansion of our currency since the war?*

This is a disputed point. According to authorities at Washington, no contraction has taken place. In the reports of the Secretary of the Treasury, that official gets the per capita circulation by dividing the total amount in circulation by the total population; but during the war millions of people in the South were not using United States money—at least not entirely. They had a currency of their own. The secretary should either have divided the currency only by the Northern population, or have added the Southern currency to the Northern and have divided by the total population. Either process would show a larger per capita circulation during the war days.

This assuredly seems to show that our currency in the United States has not been contracting, but steadily expanding. Equally assuredly, however, vast portions of currency are not available for the common people, and some portion is not available for any one.

According to the treasurer's report for 1892, for example, of the $1,601,347,187 reported in circulation on July 1, 1892, $408,568,824 was in gold coin. Now, except on the Pacific slope, the common people do not see gold from year's end to year's end. All moneys coined since 1872 in the case of gold, and since 1878 for silver, are considered by the treasurer as in circulation. That this is not the case; that large amounts have been hoarded, lost, or taken from the country is notoriously true, tho statistics of the amounts may not be available.

Since 1878 there has been expansion, but this does not take into account the increase of business over the increase of population. We shall consider this more fully, but must first note an objection that seems to vitiate our argument. It is said that the amount of currency really makes very little difference, because the vast majority of our monetary transactions are done, not by money, but by instruments of credit for which money merely furnishes the basis. The one thing we are told is to have this basis reliable and trustworthy; its amount matters little. Professor Commons (in the article above mentioned in *The Voice*) has well stated the objection and well answered it:

> There is a current statement emanating from the reports of the Controller of the Currency, and based on the statements of bank officers throughout the union to the effect that only 7 per cent of the business of the country is paid for in cash; the other 93 per cent is represented by credit instruments, such as checks and drafts. From this statement it is sought to minimize the share of money in influencing the range of prices. The conclusion is reached that 93 per cent of general prices is based on credit and only 7 per cent on money, and therefore that the question of the volume of money in a country has very little significance compared with the importance of a good credit system.
>
> **Use of Credit**
>
> But there are two objections to this conclusion. What would be thought of the sanity and the conclusions of a man who should gather statistics only from the meat markets in the land and then should expound the statement that 95 per cent of all the industry of the country consisted of fresh meat and only 5 per cent of the country's industry consisted of all other kinds of commodities? The conclusion is no less credible than is the aforesaid statement regarding credits. The statistics are gathered only from enterprises whose sole business almost is dealing in credits. But if you go to the retail merchant he will say 25 per cent to 75 per cent, and even 100 per cent, of his business is paid for in cash. The farmer uses very few checks and drafts. The millions of day laborers use none at all. Taking the country as a whole, perhaps not 50 per cent of all transactions are settled by credit instruments, while the cash of the country must be actually transferred in settling the other 50 per cent.

Until recently, however, prices have notoriously fallen; in other words, *money has appreciated*. How much this is the case is well illustrated by President Andrews ("An Honest Dollar," p. 13):

> Our national debt on Sept. 1, 1865, was about $2,750,000,000. It could then have been paid off with 18,000,000 bales of cotton or 25,000,000 tons of bar iron. When it had been reduced to $1,250,000, 30,000,000 bales of cotton or 32,000,000 tons of iron would have been required to pay it. In other words, while a nominal shrinkage of about 55 per cent had taken place in the debt, it had, as measured in either of these two world-staples, actually been enlarged by some 50 per cent. . . . Between 1870 and 1884 the debt of the United States decreased not very far from $750,000,000. Yet if we take beef, corn, wheat, oats, pork, coal, cotton, and bar iron together as the standard—assuredly not a bad one—the debt not only did not decrease at all, but actually increased by not less than 50 per cent.

Now, it can be seen what expansion and contraction of the currency means to the producing and debtor class of this country. As with public debts, so with private debts. Measured by what a dollar will buy from 1870–84, every debt increased, according to President Andrews' statement, threefold. Immediately after the war American enterprise filled the West with new farms. The farmers borrowed money, and mortgaged their farms to get stock and "plant." But their unpaid debt increased threefold in value. It is plain what made the battle for more currency (silver especially) of such vital moment to the West until very recent times. For proposed remedies, see BANKING; BIMETALLISM.

CONVICT LABOR IN THE UNITED STATES: Labor of some kind is required of all persons convicted of crime and sentenced to penal institutions in the several states of the United States. In most cases the sentence of the court itself requires that "hard labor" be added to the penalty of confinement in prison. In order to preserve the health and sanity of the prisoner, it is necessary that exercise at least, if not actual toil, be provided. It is only when the cupidity of the "taxpayer" enters so far into the management of prisons, and so far dictates the policy of prison management as to make it imperative that prisons be made "to pay," that convict labor becomes a serious moral and industrial question.

There are six general systems under which convicts are found at work in the United States: (1) Lease system; (2) contract system; (3) piece-price system; (4) public-account system; (5) state-use system; and (6) public works and ways system.

1. *The Lease System*: Under this system the state enters into a contract with a lessee, who agrees to receive the convict, to feed, clothe, house, and guard him, to keep him at work, and to pay the state a specified amount for his labor. The state reserves the right to make rules for the care of the convict and to inspect the convict's quarters and place of work. No institution is maintained by the state other than a place of detention, where the convicts can be held until placed in the hands of the lessee, and in which to confine convicts who are unable to work.

2. *Contract System*: Under this system the state feeds, clothes, houses, and guards the convict, and maintains an institution and a force of

guards and other employees. A contractor engages with the state for the labor of the convicts, which is performed in or near the institution. The contractor pays the state a stipulated amount for the services of each convict, supplies his own raw material, and superintends the work.

3. *Piece-Price System*: This system differs from the contract system only as to superintending the work and determining the speed at which convicts must work. The state maintains the institution, and feeds, clothes, and guards the convicts. The contractor supplies the raw material and pays the state an agreed amount for the work done on each piece or article manufactured by the convicts. The officials of the prison not only maintain discipline, but dictate the quantity of work required.

4. *Public-Account System*: In the public-account system the state enters the field of manufacturing on its own account. It buys the raw material, manufactures and puts the product on the market, and assumes all the risk of conducting a manufacturing business. The state has the entire care and control of the convicts, and with them conducts an ordinary factory.

5. *State-Use System*: Under this system the state conducts a business of manufacture or production, as in the public-account system, but the use or sale of the goods produced is limited to the same institution or to other state institutions. The principle of the system is that the state shall produce for its own consumption only.

6. *Public Works and Ways System*: This system is very nearly like the state-use system. It might not improperly be included therewith. Under this system the labor is not applied to the manufacture of the common marketable articles of merchandise, but to the construction and repair of prison or other public buildings, public roads, parks, breakwaters, etc.

The contract system obtains in twenty-seven states and in fifty-four institutions producing over $1,000 worth of goods in a year. The lease system is confined to the five states of Alabama, Florida, Georgia, Virginia, and Wyoming. The piece-price system has been partially adopted in seventeen states and in thirty institutions. The public-account system is to be found in ninety-nine institutions, located in forty states. The state-use system is found in 149 institutions in forty-seven states, counting the two U. S. prisons as a separate state. The system designated as public works and ways is to be found in 166 institutions located in thirty-eight states.

The report of the U. S. Bureau of Labor for 1905 deals exclusively with the subject of convict labor, and contains the best information on the subject yet published. Quoting from that report:

Statistics

It will be necessary to wait until the report of the United States Census Bureau is published to ascertain the total number of convicts in the U. S. The present report shows only the total number of convicts in those institutions in which convicts are engaged in productive labor. This number was 86,036.4 in the year covered. Possibly a few hundred should be added to this number to cover the convicts who may have been at work in the institutions that produce so little as not to be included in this report. The number is believed to be so small, however, as to be of little consequence in an industrial sense.

Of the 86,036.4 convicts in the institutions covered, 80,426.3, or 93.5 per cent, were males, and 5,610.1, or 6.5 per cent, were females. In the penal institutions 70,069.0, or 93.7 per cent, of the convicts were males, and 4,702.7, or 6.3 per cent, were females; and in the juvenile reformatories 10,357.3, or 91.9 per cent, were males, and 907.4, or 8.1 per cent, were females.

While 86,036.4 convicts were in the institutions in which productive labor was performed, the number actually engaged at productive labor was only 51,172.2, or 59.5 per cent of the total number of convicts. Of the remainder, 21,403.3, or 24.9 per cent of the total, were engaged in prison duties, such as cooking, washing, cleaning, and other domestic service, 2,774.0, or 3.2 per cent, on an average, were sick or invalid, and 10,686.9, or 12.4 per cent, were idle because no work was provided for them or because they were purposely kept in confinement without labor. Those reported idle in juvenile reformatories include also inmates who were in school and were not engaged in productive labor.

The report covers 296 institutions of which 257 were penal and 39 juvenile reformatory; 103 were under state or territorial control, 139 under county control, 25 under city control, 1 under township control, 2 under federal control, 17 under the control of lessees, 1 under private control with assistance from the county, and 7 under mixt control. The value of goods produced under each of the systems of convict labor, and the number of convicts working under each system are shown in the following table:

VALUE OF GOODS PRODUCED AND OF LABOR ON THE SAME, NUMBER OF CONVICTS EMPLOYED, AND NUMBER OF FREE LABORERS THAT WOULD HAVE BEEN REQUIRED TO PERFORM THE SAME WORK

System of Work	Institutions	Market value of goods produced	Value of labor on goods produced	Number of convicts employed			Free laborers necessary to perform same work		
				Male	Female	Total	Male	Female	Total
Lease	20	$3,093,764	$1,355,796	3,644.2	7.5	3,651.7	4,183.7	7.5	4,191.2
Contract	54	16,642,234	4,535,089	16,563.9	352.0	16,915.9	10,845.7	514.5	11,360.2
Public-account	99	4,748,749	1,616,758	8,228.4	302.0	8,530.4	4,183.6	355.5	4,539.1
Piece-price	30	3,239,450	858,764	3,809.6	76.1	3,885.7	1,291.9	747.5	2,039.4
State-use	159	3,665,121	1,836,801	11,067.9	976.6	12,044.5	5,081.9	626.9	5,708.8
Public works and ways	166	2,886,887	1,712,221	6,142.0	2.0	6,144.0	4,960.4	2.0	4,962.4
Total	296	$34,276,205	$11,915,429	49,456.0	1,716.2	51,172.2	30,547.2	2,253.9	32,801.1

While it is necessary in this article to follow the figures presented by the Federal Bureau of Labor in all phases of the subject, because they are the best obtainable, it must nevertheless be borne in mind that upon certain points the bureau itself is wholly dependent upon the contractors for information as to the value of goods produced by convicts under the contract plan, and also for its estimates of the number of free laborers required to perform the same amount of labor outside of prison walls. Upon these two points, therefore, the figures given by the bureau are not entirely convincing. Many persons who have had prison contracts and also operated free factories in the North, testify that with the use of machinery, and the enforcement of the task system, the output per convict in the prisons is nearly equal to that of free labor; while in the South the statement that one negro in prison will do as

much work as two or three on the outside is not regarded as a uniform experience. Bearing in mind, however, that the value of goods made under contract in a prison may be considerably understated, and that the numerical displacement of free laborers by convicts is at best but an estimate, the statistical data in this report must guide the student in any study of convict labor.

Opposition

The organized opposition to convict labor, especially under the contract system, was for many years led by the trade-unions. The trade-union objection is not primarily to the labor of convicts, but to the use of the products of that labor to reduce prices, and hence ultimately the wages of free labor. It is conceded that if the convict were not a convict he would labor; but in that case he must work for "a living-wage" and would enter the industry most in need of his service. As a convict he works at a fixt task, the state selling his labor to a contractor at a rate which would not support him, much less his family, on the outside, the contractor using the product of the labor of convicts thus secured to cut prices, and terrorize other manufacturers into cutting wages in the hope of being able to meet the prices of these competitors. It is simply the application of the economic theory that competition will eventually reduce all to the level of the lowest price and lowest wages prevailing in a given industry. The trade-unionist replies that if this is true, the massing of convict labor into special occupations will reduce all labor in those occupations to wages no higher than the contract price of convicts.

As a matter of fact, the opposition to contract convict labor has been as great and as persistent among employers as among members of labor-unions. At present the Free Labor Association is the principal opponent of convict labor, and is a national organization composed for the most part of manufacturers whose business is being menaced by the output of prisons. For many years the fight was upon the contract and lease systems only. Later experience has shown that the public-account system is even worse, as the state agents really sell for less and demoralize the markets more than do contractors. State-use is the system sometimes favored by trade-unionists and manufacturers, for while this eliminates a large customer (the state) from the market for free-made goods, it does not demoralize prices in the market that is left. Public works and ways, however, is the system that seems most in favor, except among those who, pretending to speak in the interest of the "taxpayer," demand that the state shall "make money" out of the crime committed within its borders; and who hope to make the criminals a source of revenue by farming out their labor, or by selling the products of that labor in competition with free industries.

For the first time an intelligent general investigation of the commercial effect of prison-made goods was made by the United States Bureau of Labor, and is contained in chapter 2 of its report for 1905. The Illinois Bureau of Labor Statistics dealt with this phase in 1886. Summarizing the results of its work in 1905, the U. S. Bureau says, under the heading "Commercial Effect of the Competition of Convict-made Goods":

Supplementary to this general investigation, a special investigation was made in the principal lines of convict-made goods to ascertain the effect of the competition of convict-made goods. The industries selected for such investigation were boots and shoes, clothing (working-shirts, pants, and overalls), chairs, tables, etc., brooms and brushes, binding-twine, stove hollow-ware, stoves, harness, saddletrees, whips, cooperage (in the Chicago market), farm wagons, and stone-work. In each of these industries statements were secured from leading manufacturers, covering their experience and expressing their opinions of the effect of convict-labor competition.

Reviewing the general question of convict labor as a competitive factor, it may be said that manufacturers consider such competition unfair and ruinous, demoralizing to markets and business stability, compelling the reduction of prices below a fair margin of profit and often even below the cost of production. Wages are forced to the lowest limit in a vain effort to lower the cost of production to that of the prison contractor. In some cases a deterioration of quality of material used and in others an entire abandonment to the prisons of the manufacture of certain grades of goods has become necessary.

In the boot and shoe industry the testimony of manufacturers is that the low cost of production of prison-made goods—a cost decreasing steadily with the increasing efficiency of the convict through the equipment of prisons with improved machinery—has enabled the prison manufacturer to drive the employer of free labor out of the market or force on him a reduction in the regular prices of many lines of goods.

In furniture the character of work done in prisons has changed entirely in recent years. The high grade of work now being done in prisons, together with the increased use of machinery (in use in six prisons in 1885 and in sixteen prisons in 1903–4) and the low prison cost of production, have made it impossible for the product of factories employing free labor to compete with it. Prison-made furniture has compelled the abandonment to the prisons of some lines, the reduction of prices in others, and a cutting of wages in an effort to keep pace with the reduction of prices. The competitive power of the prison product is greatly increased by the fact that the output of seven prisons in five states is controlled by one contractor.

In brushes the volume of prison-made brushes (scrubbing, shoe, etc.) has been so great and the wholesale and jobbing prices so low that a large number of the factories formerly making this class of goods on a large scale have entirely abandoned that grade of product, and many of them now purchase the prison goods to sell with the higher grade of their own manufacture. Those still engaged in direct competition with prison-made brushes can compete only by giving a better finish to the brushes, or by selling them at cost and relying for their profit on their better grades.

In broom- and whisk-making manufacturers employing free labor have been subject to the greatest price-depressing competition. It is a favorite prison product, the authorities turning to it as an occupation for convicts which can be followed with the smallest outlay of materials and machinery, and one in which unskilled labor can be used to make a crude product at a cost far below the cost of a similar product of free labor.

The investigation has also brought out the tendency of prisons to absorb the entire production of goods on a declining market where the articles are being substituted, either by changes in style or character of goods, or shrinkage in the market from any cause. For instance, in stove hollow-ware the substitution of stamped enameled cooking-utensils for the cast-iron articles has taken from the manufacturer of such cast-iron stove hollow-ware all of the market that would come from increased population, and probably more. The result has been the absorption of all the market left for these goods by the prison-made product.

In like manner the Chicago stock-yards market for wood-bound cooperage has been practically abandoned to the prisons. Owing to the use of refrigerator cars, iron-bound cooperage, tubs, lard pails, both wooden and tin, the demand for wood-bound lard tierces and pork barrels has not expanded with the packing business—indeed is not holding its own—and what market is left is practically absorbed by the prison-labor contractors.

In the making of saddletrees a similar condition appears. Horseback riding has given way to other forms of conveyance. The saddle market is a shrinking one. Hence, by a slight expansion and combination of the prison industry in this article, the market is practically absorbed, 90 per cent of all saddletrees being made in prison.

In blacksnake whips the prisons have been able, first, to drive out of existence practically all the factories employing free labor, and then to expand to supply the demand of the market. This is also essentially true of whip-lashes, quirts, and other small articles.

In binding-twine the effect has been to cause an accurate measurement to be taken of both the entire market and prison output, thus enabling the manufacturers employing free labor to ignore for the most part the prices made by the prisons. That is to say, when the annual consumption of binding-twine was practically 110,000 tons, the prison output was approximately 11,000 tons; this sold at a price which would have ruined the factories employing free labor had not they, figuratively, stepped aside until the prison product was absorbed and then sold their 99,000 tons at a profit.

The competition of prison-made products, in some instances, forces the weaker manufacturers to deteriorate the quality of their goods in order to meet prison prices. In this way

the price-breaking power of the prison output is augmented by the output of those manufacturers who have had to debase the quality of their wares to meet the prison competition. This will be found true to a certain extent in boots and shoes, binding-twine, whips, and some other lines.

The concentration of the product of the prisons in a number of states under the control of a single contractor renders the competition of the prison-made goods more powerful and more aggressive. In stove hollow-ware one firm (under various names) has the contract for three prisons; another controls two prisons. In furniture one company controls the product of seven prisons in five states, and in clothing one contractor controls the product of eight prisons in six states.

It is the settled policy of prison contractors and prisons operated on public account, as far as possible, to sell their prison-made goods outside the state in which they are manufactured. There are local manufacturing and political reasons for doing this. It has been repeatedly pointed out by manufacturers, and their statements are reenforced by specific detail, that when this is done it is clearly an act of one state to injure the manufacturing and labor interests of another.

It is to be noted that this entirely reverses the position taken by the former Commissioner of Labor, Carroll D. Wright, not only in his public addresses, articles, and books, but in his official reports. Ignoring the concentration of convict labor in a few simple industries, the former reports have compared the whole prison population and output with the total industrial population and total manufactured products, to show that the percentage of convict labor was too small to be worthy of notice. A very significant indication of modern tendency is the fact that one contractor making workmen's shirts has the control of eight prisons in six states, while one furniture company controls the furniture product of seven prisons in five states.

References: The *Twentieth Annual Report of the United States Bureau of Labor* (1905), by Charles P. Neill, Commissioner; the second chapter shows the commercial effects of the system, and the report contains the convict-labor laws of all the states. The *Second Annual Report of the Department of Labor*, by Carroll D. Wright, Commissioner, is valuable for its survey of the subject in other countries of the world. *Bulletin 5 of the Department of Labor* should be consulted. Nearly every state labor-bureau has published from time to time something on the subject. The best of these publications is the *Fourth Illinois Report* (1886) and the *First New York Report* (1883). An index to state labor-bureau reports was published by the U. S. Labor Bureau in 1902, and this gives nearly four pages (67–70) of references to state reports, most of which should be consulted in any thorough study. The chapter on the *Convict Lease System* in Geo. W. Cable's *Silent South* should be read, also chapter 22 of *Practical Sociology*, by Carroll D. Wright. Vol. iii. of the *Report of the United States Industrial Commission* is devoted to prison labor.

Ethelbert Stewart.

COOKING-SCHOOLS: Schools for teaching the art of cooking have been established many years. As early as 1863 such a school was opened at 111 Great Portland Street, London, by Mrs. Mitchell. In 1876 there were many training-schools in England, sending out teachers all over the world, those of Glasgow, Liverpool, and South Kensington taking the lead. There are similar schools in France and Belgium. The Young Women's Association in the United States have taken up the instruction of public-school children. Juliet Corson, in 1872, then secretary of the Free Training-School for Women, devoted herself to the study of cooking with respect both to health and economy. In 1876 she established the New York School of Cookery. Maria Parloa opened a school in Boston in 1876, and lectured there, as well as in various seminaries and evening-schools. She began a school of her own in New York in 1882. A school of cookery for the teaching of the public-school children was begun in Boston in 1883 at the North Bennet Street Industrial School. In 1885 Mrs. Hemenway established a vacation cookery school, which was accepted later by the school committee as Boston School Kitchen No. 1, they assuming the charge of it and establishing other like schools. It is required that students have a grammar-school education and knowledge of household matters, with respect to cooking and the principles thereof, and also of the chemistry of food materials.

In the New England Kitchen Mrs. Ellen H. Richards and Mrs. Mary H. Abel have worked out valuable experiments. Similar experiment stations have been started in other places in the U. S. for the purpose of studying the theories of nutrition and food value as exprest by the Munich physiologists. The most of the women's colleges, many Western agricultural colleges, the Drexel Institute in Philadelphia, the Pratt Institute in Brooklyn, give courses in domestic science.

COOPERATION (see also Cooperative Agriculture; Cooperative Banks; Building and Loan Associations; Cooperative Stores in the United States; Cooperative Union, etc.): We consider cooperation in this article under four heads: I. Definitions and kinds. II. History. III. Statistics and development in all countries. IV. Arguments pro and con.

I. Definitions and Kinds

Cooperation (from Latin *co* and *operare*, to work together) is used specifically in social science for the voluntary union of persons, in joint production, distribution, purchase, or consumption, apart from government, on equitable principles and for their mutual benefit. Such is, perhaps, a rightly exclusive and inclusive definition. Yet it must be admitted that the word is used by good authority both in a larger and a narrower sense.

George J. Holyoake, for example, defines it as "the concert of many for compassing advantages impossible to be reached by one, in order that the gain may be fairly shared by all concerned in its attainment" ("History of Cooperation," vol. i., p. 68). But this definition is obviously too broad. This definition would include the State, socialism, communism, every trade-union, almost every church, society, trust, monopoly, or combination of any kind. To use words so loosely, is to misuse them, even tho it be admitted that the essence of the cooperative idea does often lie deep in all concerted life, especially in the true State, the true Church, the true trade-union. On the other hand, the word has been too narrowly used. It has been said to mean simply "the voluntary union of consumers or producers for the purchase or production of commodities and the division of profits on the basis of the amount purchased or produced by the cooperators." But this identifies one form of cooperation with cooperation itself. There are other forms. Each form of cooperation is claimed by some to be the true form.

Cooperation may be divided into at least three distinct kinds, and these, into an almost infinite number of methods and combinations of methods. The three main kinds are:

1. Societies of distribution or consumption, in which consumers unite to bring together or maintain stores of goods where members can buy at a cheaper rate, or with some advantage to themselves. Such are cooperative stores, wholesale, retail, etc.

2. Societies of production, where producers combine to gain the advantage of combination in production, and to sell the collective or individual work. Such cooperators are their own capitalists. They may cooperate in manufacturing, in agriculture, or in any department of production.

3. Societies of credit or banking, where accounts of credit are opened with the members, and loans advanced to the members at favorable terms on fair securities. Such societies, in numerous modifications, as cooperative banks, friendly societies, burial societies, building societies, etc., exist in most cities. Owing, however, to these societies being in many ways different from the other kinds of cooperation, we consider them under separate heads. (See BUILDING AND LOAN ASSOCIATIONS; COOPERATIVE BANKS, etc.)

Between these various classes of cooperation it is necessary carefully to distinguish, for one class is often perfectly practical when the other is not. Distributive cooperation has been very successful, but was not the first attempted, and is by many severely criticized. Productive cooperation was first attempted, and is unquestionably the highest kind, but not unnaturally has been the slowest to be developed. Credit cooperation has been the most successful, but as being nearest to ordinary business methods and least developing the principle of cooperation is by many not considered true cooperation.

Distributive cooperation is the easiest to establish, and the Rochdale plan (for this, see below) is considered by almost all the safest and best method. Many consider this the only form of distributive cooperation meriting the name of cooperation. According to this plan, membership is open to any one interested who will take one or two small shares (in England generally £1, with 1*s.* on entrance, and the remainder, if he chooses, out of his accumulating dividends). A maximum share of capital which one person can hold is fixed in England at £200. Goods are sold at ordinary retail prices, and each purchaser receives a check or voucher corresponding to the amount of purchases. These are paid into the store, and every quarter or every six months the surplus of receipts over cost is divided among the members at so much per pound of purchases. This is the rebate, or dividend as it is called. Anybody may deal at the stores, and receive discount as a rule at half the members' rate. In England the rate of dividend is usually between 2*s.* and 3*s.*, but runs up to 3*s.* 6*d.* or 4*s.* Four or five per cent interest is generally paid on capital. The store is managed by a committee elected by the members, each member having one vote. The first department of a store is usually grocery and provisions. Many stores, even the smaller ones, bake their own bread, and find it most successful. Other industries are also frequently developed. Of this plan, Mr. N. O. Nelson, of St. Louis, its leading American advocate, says:

Distributive Cooperation

The most feasible method of getting into cooperative manufacturing is through the cooperative store. Storekeeping takes less money to start with, is simpler in its operations, and when once under good headway easily accumulates capital for factory plants. . . . Working men who really want to better the condition of their class should get together, familiarize themselves with the working details, and make a beginning in a small way. The difficulties to be encountered are not so much the business itself as the people's indifference. Where as many as fifty can be gotten together and imbued with the proper spirit a safe start can be made. Some members can pay their shares in full, and others fifty cents or $1 a week. Some vacant room can be rented cheaply or obtained for nothing; the work can be done evenings by volunteers or by some one out of work for small pay. The beginning should be confined to staple articles of food, and books should be kept under advice of a friendly bookkeeper. Care should be taken to keep the expenses so proportioned to the business that a fair net profit will be made from the start. Purchases and sales should be rigidly cash, and prices should be the same as at the neighboring retail stores. Every one of the fifty should be a missionary to explain the plan to his friends and get them to join. Members should loyally do all their trading at the store, even at some inconvenience. Undertaken in this way, a cooperative store can be started anywhere and be assured of success.

On the other hand, many criticize distributive cooperation and say that productive cooperation, the original form, is the only true cooperation. Said Mr. E. V. Neale at the English Cooperative Congress of 1886:

Productive Cooperation

The original pioneers looked forward to self-employment and the many advantages that might thus be brought within their reach, as the goal to be attained through the accumulation of the profits on their own purchases. Their successors, to whom the idea of self-employment has melted into the haze of a distant future, have too commonly got to look on the profits on their purchases as so much addition to their ordinary income; and have even been disposed to measure the benefits of the store by the amount of this addition—the actual dividend on their purchases—without caring to inquire closely how much of it is legitimately earned in the ways as specified above, and how much has come out of their own pockets by arbitrary additions to the prices of the goods sold. These departures from the original idea have produced a reactionary movement, a tendency to place the benefits of the store not where they really lie in the collective action which they make possible, and the educational and recreative resources that the members may obtain by their union beyond what they could secure individually, but simply in the power of getting what they want at a cheaper rate, by selling to themselves as nearly as may be at cost price.

Productive cooperation therefore is being developed, and in spite of some failures with increasing success. Most thoughtful cooperators now find no contradiction between the two forms and believe that any form of cooperation should be favored which local conditions make possible and opportunity and need call for.

Cooperative credit societies have been largely developed, in the United States under the form of BUILDING AND LOAN ASSOCIATIONS, and in Germany under the Schulze-Delitzsch and the Raiffeisen systems (see Section III. of this article under Germany), from which they have spread into most European countries.

II. HISTORY

For the beginnings we quote from George J. Holyoake, the eminent author of the "History of Cooperation in England."

Writing in the *Fortnightly Review* (1887), he tells us that cooperation dates from the latter portion of the eighteenth century.

"Ambelakia," he says, "was almost a cooperative town. So vast a municipal partnership on industry has never existed since. The fishers on the Cornish coast carried out cooperation on the sea, and the miners of Cumberland dug ore on the principle of sharing the profits. The plan has been productive of contentment and advantage. Gruyère is a cooperative cheese, being formerly made in the Jura Mountains, where the profits were equally divided among the makers. In 1777, as Dr. Langford relates in his "Century of Birmingham Life," the tailors of that enterprising town set up a cooperative workshop, which is the earliest in English record. . . . Shute Barrington, Bishop of Durham, established at Mongewell, in Oxfordshire, the first known cooperative store; while Count Rumford and Sir Thomas Bernard published in 1795, and for many years after, plans of cooperative and social life, far exceeding in variety and thoroughness any in the minds of persons now living."

Early Cooperation

"The only apostle of the social state in England," continues Mr. Holyoake, "at the beginning of this century, was Robert Owen, and to him we owe the cooperation of to-day. With him it took the shape of a despotism of philanthropy. Lord Sidmouth and the Duke of Kent gave him their personal influence to advance his views. Mr. Owen carried into practical use his ideas in his New Lanark Mills for educating his workpeople, and with a success that has had no imitators except

Godin, of Guise, whose Palace of Industry is known throughout civilization. Jeremy Bentham, who held shares in New Lanark, said it was the only investment he had made that paid him. It was here that Mr. Owen set up a cooperative store on the primitive plan of buying goods and provisions at wholesale and selling them to the working men's families at cost price.

"The benefit which the Lanark weavers enjoyed was soon noised abroad, and clever workmen elsewhere began to form stores to supply their families in the same way. The earliest instance of this is the Economical Society of Sheerness, commenced in 1816, and which is still doing business in the same premises and also in adjacent ones lately erected. Its rules stated that its object was 'to supply the members with wheaten bread and flour and butchers' meat.' The great war had long deprived them of both, and this society was commenced by intelligent dockyard workmen, who, altho better paid than ordinary workmen, were yet subject to privations. . . .

"Cooperation was also put to use on the Sussex coast, where Lady Noel Byron aided it, in order that the savings of the store might assist poor men in the way of self-employment, by keeping market gardens, and setting up tailors', shoemakers', and carpenters' shops. The desire of workmen to become their own masters, and the double prospect of independence and profit, spread the idea over the country as a new religion of industry. The cooperative stores now changed their plan. They sold retail at shop charges, and saved the difference between retail and cost price as a fund with which to commence cooperative workshops. By 1830 from 300 to 400 cooperative stores had been set up in England. There are records of 250 societies, distributive and productive, existing at that period, cited in the 'History of Cooperation.'"

Yet the real history of cooperation does not commence until 1844 in

England

England is the classic home and birthplace of cooperation as a practical movement. Its beginnings we have seen. But the early movement died away.

It should not be forgotten that cooperation received its first practical solution at the hands of the few poor weavers of Rochdale, in North England, who saved up a few shillings, afterward investing them in a bag of flour, which they distributed among themselves at cost price. It was this humble enterprise which marked the beginning of the great Rochdale system, that now counts its establishments by thousands, its investments and profits by millions of pounds sterling, and takes its name from those poor weavers, the Rochdale Pioneers. April 25, 1844, the day when this society commenced work, is a red-letter day in the history of cooperation.

Rochdale Pioneers

When their society began it only had twenty-eight members—£28 of funds—and the first year made no profit. In its second year it had seventy-four members, £181 in funds, £710 of business, and made £22 profit, 2½ per cent of which was used as a fund for education. In 1876 its members were 8,892, its funds were £254,000, its year's business exceeded £305,000, its profits were more than £50,500.

The methods of the Rochdale and other early stores were very simple, as the following early account will show. "The societies have a public store, where goods are sold even to those who are not members. The condition of membership is the payment of a few pence. At certain intervals, further payments of a few pence are required from the new member (in most cases twopence and a half a week, or tenpence a month), until their aggregate, together with the interest and dividends placed to his credit, amount to the prescribed minimum share in the undertaking. The sum in Rochdale was at first £4 ($19.36), afterward £5 ($24.30); in Manchester, however, only £1 ($4.84). Each member has the privilege of letting his share increase to £100 ($484); altho, in case of an excess of capital, the society can diminish the amount. Each member can, after previous notice, demand that his share, over and above the minimum share, be paid back to him, after an interval varying according to the amount; the minimum share itself, however, is not paid back to the member when he resigns, but may, with the approval of the society, be carried over to the credit of another, who thus becomes himself a member.

"A distribution of the net profits is made quarterly. After an interest at the rate of 5 per cent per annum has been deducted from the shares of the members, and 2½ per cent of the profits have been applied to the educational fund, the balance is placed to the credit of the members, in proportion to the purchases that each has made at the store during the preceding three months. The members are liable for no losses beyond the value of their respective shares. This right of allotment is governed by a special statute of Aug. 7, 1862, which secures to the companies the same legal rights possest by an individual.

"Every year there is a general meeting, in which every member has a vote. By this meeting, an executive committee of twelve is elected to manage the business of the society for one year, which holds a weekly session. This is the gist of the rules of the English societies, which differ only in minor particulars."

In 1849 commenced the Christian Socialist movement of the Rev. F. D. Maurice—the "Master," Charles Kingsley, Vansittart Neale, Thomas Hughes, and, above all, J. M. Ludlow, the real founder of the movement. (For their general principles and the history of their movement, see CHRISTIAN SOCIALISM.) It is sufficient here to state that their efforts were important, not for the immediate results, since these were meager, but for the impetus they gave to the cooperative ideal, and to its ethical and enduring character. They started a society for aiding cooperative production, and as the result some cooperative tailor shops were begun. These, however, either did not live or were merged in the larger Rochdale movement. A more enduring result was the gaining by the Christian Socialist leaders successive improvements in laws which gave cooperative stores legal protection, and enabled cooperators to become bankers, to hold land, and to increase their savings to £200; which last provision led to some stores becoming rich, through the prospect it opened to members to acquire houses. This legislation with the ethical principles they so brilliantly advocated was the real contribution of the Christian Socialists to cooperation.

Christian Socialists

It is, however, in the Rochdale movement that we follow the real development of English cooperation. By 1856 the Pioneers had a capital of £12,900, and sold not only articles of grocery, but bread, meat, and clothing. In 1855 they commenced cooperative production, first hiring a small room, in which they placed a few looms, the beginning of their cooperative cotton mills.

It was a success and part of a mill was accordingly rented. Each laborer's share of the profits, after capital had received 5 per cent, was proportioned to the aggregate amount of wages he had earned, and as, in addition to this bonus, wages current in the trade were paid, it was natural that the best efforts of those employed were stimulated. The undertaking developed so rapidly that soon a larger mill was required than any that could be rented. It was resolved to build; a mill was commenced in 1856, and completed in 1860, at a cost of £45,000. A second mill was then commenced. These mills had scarcely time to get into full working when the breaking out of the Civil War in America brought the cotton trade of Lancashire into a state of unprecedented depression.

Growth of Cooperation

Meanwhile, the success of their movement had created efforts at cooperation all over England, particularly at Manchester, Halifax, Huddersfield, Leeds, Newcastle, and Oldham. The last named became a cooperative town. The "Oldham Building and Manufacturing Society," the first of its kind registered under the Joint-Stock Companies Act, was founded in 1858: capital, £1,000 in £5 shares.

The success of somewhat numerous stores led to united effort. In 1863 the present Cooperative Wholesale Society, Limited, was founded as the North of England Cooperative Wholesale Society, Limited. It confined itself at first to purchasing articles at wholesale price and selling them to cooperative societies and companies, whether members or not, at a small profit, which was divided half yearly among all customer societies in proportion to their purchases, mere customers receiving only half dividends, customer members whole. Its sales in 1865 (the first complete year of its working) were £120,754. In 1872 these had reached £1,153,132. In 1872, however, the society began production, purchasing some biscuit works, and starting in Leicester a boot factory in 1873, then soap works in 1874, other boot works at Heckmondwike in 1880. Leather-currying was entered on in 1886, a woolen mill taken over in 1887. Cocoa works were opened in 1887, a ready-made clothing department in 1888 (clothing having been already made up in two branches as an adjunct to the woolen cloth and drapery departments); a corn mill was opened in 1891, jam-making entered on in 1892, and a printing department undertaken, besides building departments in three English branches—Manchester, London, and Newcastle. In 1894 the society purchased a factory at Leeds for the manufacture of ready-made clothing.

The Wholesale Society

This society soon led to another. The Scottish Cooperative Wholesale Society was established in 1868. It entered upon production in 1880 with a shirt factory, followed in the same year by a tailoring department (the two were united in 1888), by a cabinet factory in 1884, boot works in 1885, currying works in 1888, a soap factory in 1890, and a mantle factory in 1891. A printing-office opened in 1887 to which business ruling and bookbinding were afterward added. Preserve-making and tobacco-cutting were also entered on. Many of the productive departments have been grouped together on twelve acres of land at Shieldhall on the Clyde, about three miles from Glasgow. The requisite buildings have been put up by the building department of the society, as well as several of its warehouses; and a large flour mill at Chancelot, near Leith.

Scottish Wholesale

The Scottish Wholesale Society has paid bonus to labor since Nov., 1870. The principle on which such bonus has been granted has varied, but by an alteration of rules made in 1892 bonus is credited to all employed at the same rate on wages as on purchases, half the bonus remaining on loan at 4 per cent.

In 1869 the first annual cooperative congress was held, and congresses have been held annually since.

What has been done in the way of gaining legal advantages for cooperative societies may be summed up under two main heads.

1. The incorporation of the societies by which they have acquired the right of holding in their own name lands or buildings and property generally, and of suing and being sued in their own names, instead of being driven to employ trustees.

Legal Rights

2. The Industrial and Provident Societies Act, 1876, which consolidated into one act the laws relating to these societies, and, among many smaller advantages too numerous to be mentioned in detail, gave them the right of carrying on banking business whenever they offer to the depositors the security of transferable share capital.

A Cooperative Union (q. v.) was formed in 1869, as a propagandist center.

The literature furnished by the union is varied and extensive. It publishes some hundreds of leaflets, pamphlets, and books for propaganda purposes. Lists and specimens may be had from the secretary. Among the writers are Messrs. Holyoake, Hughes, Kaufmann, Tom Mann, E. V. Neale, Beatrice and Sidney Webb.

Sept. 2, 1871, was published the first number of the *Cooperative News*, the recognized organ of English cooperators, a penny weekly published in Manchester by a federation of cooperative societies.

III. Statistics and Development

Great Britain

The following are the most recent figures for English cooperation. Distributive societies (1905), 1,457; members, 2,153,185; sales, £61,086,991; profits, £9,559,238; share capital, £26,077,174; employees, 72,712; assets, £35,249,964. The distributive societies also carry on various productive departments—e. g., baking, corn-milling, cabinet-making, boot-making, tailoring, dressmaking, etc.; the total output being more than £5,000,000 annually. Of these figures Mr. W. Henry Brown writes in "The Reformer's Year Book" for 1907:

> The decrease in the number of societies is due to the tendency for amalgamation that has lately been noted. Membership and sales have increased, but the difficulties of business are indicated in the lessened rate of advance, so far as profits are concerned. The assets include land, buildings, stocks, houses, investments, and £861,651 owing to societies for goods at the end of the year—representing a lapse from first principles to the tune of nearly a million, and proving the need for the anti-credit campaign of the Women's Guild. This growth of the credit system—the debts were only £771,778 in 1903—is a matter of regret. The salaries and wages paid by the distributive societies totaled £2,990,697 last year, and of the employees 19,456 were engaged in productive work, such as bread-making and the like; £81,747 were spent on educational purposes, and £39,084 went to charitable accounts.

The English Wholesale Society in 1905 had 1,138 members (its shareholders are the cooperative societies, none others being allowed to become shareholders or purchasers). Its share and loan capital was £3,301,429; its sales, £20,785,469; profit, £368,309. It manufactures boots, soap, candles, biscuits, sweets, preserves, pickles, lard, underclothing, corsets, furniture, cocoa, chocolate, woolens, clothing, flannels, tobacco, hosiery, brushes, starch, printing, corn-milling.

The capital it employs in production is £1,564,256, its output of manufactures £3,543,501, profit £98,543, persons employed 11,468. It owns four steamships, and has numerous creameries in Ireland, purchasing agencies in Canada, the United States, Denmark, Germany, France, Spain, Sweden, Greece, and Australia, and has its own tea plantations in Ceylon. Its banking department has a turnover of £90,000,000. In the first half of 1906 the Wholesale Society invoiced goods to the value of £10,720,966, and transferred from its own productive works a further value of £2,123,069 in the same period. Its capital rose to £4,705,688, and the membership of societies comprized in the federation was 1,693,684.

The most important of the society's operations is the boot and shoe branch, which turned out in the third quarter of 1906 1,119,304 pairs of boots at the three factories at Leicester, Rushden, and Heckmondwike, the total value of the production of boots, leather, etc., being £283,933. Of growing extent are brush factories at Leeds and Huddersfield, cabinet works at Newcastle and Manchester, clothing works at Manchester and Leeds, the weaving shed at Bury, the corset factory at Desborough, the printing works at Manchester, lard refinery at West Hartlepool, hosiery works at Leicester, preserve and pickle works at Middleton. From its tobacco factory nearly 50,000,000 cigarettes are sent out every year.

The greatest increases among recent efforts have been in the home coal trade, which has shown a rise of 50 per cent in 1906, and probably indicates the ownership of mines ere long.

The Leeds Industrial is the banner cooperative store of the world, and has 49,186 members. It operates its own flour mill, clothing, furniture, and other factories.

The Scottish Wholesale Society in 1905 had 281 society members and 528 shareholders among employees; share and loan capital £2,372,904, sales £6,939,738, profits £267,564. It manufactures boots, shoes, tweeds, blankets, drapery, shirts, furniture, preserves, sweets, chemical sundries, soap, tobacco, printing, and corn-milling. In 1905 its productive capital was £685,678, output of manufactures £1,942,321, profit thereon £72,982, and productive employees 4,599. There are also eight corn mills owned by federations of retail societies and consumers which in 1905 had a capital of £347,071, sales £1,364,527, and profit £80,563; and 17 baking societies (also consumers' federations) with a total capital of £417,249, sales £624,967, and profits £74,340.

Besides these wholesale societies, the English cooperative development has produced innumerable societies and organizations of different kinds. The Cooperative Congress of 1906 was attended by 1,329 members. These congresses are addrest by the most prominent statesmen, bishops, and sociologists, and have wide-spread influence and importance.

The line of demarcation between the two schools of productive cooperation may be so clearly drawn that no confusion need arise as to the principles of wholesale and those of the copartnership side of the movement. The Cooperative Wholesale Society is a distributor as well as a producer of goods, and is really a federation of the distributive societies of the country, of which 1,354 are in membership. No individuals are admitted as shareholders, and goods are sold only to societies. The profits are divided among the shareholding societies in proportion to their purchases. In the copartnership societies profits are distributed among capital, customers, and labor, the workmen generally having representation on the management committees—a system that cannot obtain in the wholesale society owing to the fact that all concerned act as delegates from societies, instead of being personal members.

Productive Societies

The following figures indicate the extent of cooperative product of all kinds in 1905, that being the latest period for which complete returns are available:

	No. of societies	No. of employees	Trade	Profit	Loss
			£	£	£
England and Wales	122	6,433	2,453,219	126,186	2,722
Scotland	17	1,864	722,840	78,383	246
C.W.S., England	1	11,468	3,543,501	98,543	2,594

France

France, while the classic home of profit-sharing (*q. v.*), has had until recently little development of cooperation. In the early half of the century, while there was much discussion of the principles of cooperation, it usually took the form of plans for cooperative communities or communism, and little resulted. What did result is best studied under COMMUNISM; FOURIERISM; ST. SIMON; BUCHEZ; GUISE, etc. Cooperation proper in France dates from the Revolution of 1848, when the National Assembly opened a credit of $600,000 to be loaned to cooperative societies. In six months there were 480 requests for loans, amounting to $5,400,000. Only 29 could be complied with, and that partially. Few of these efforts prospered, and on the establishment of the empire a decree of March 25, 1852, abolished all workmen's societies. The law of 1867 gave an opportunity for cooperation, but little was done. In 1888 certain privileges and exemptions from taxation were given to all cooperative societies in France. In spite of this little developed. The Socialists of France have till recently repudiated cooperation and profit-sharing as reactionary, and the attention of capitalists and of the well-to-do has been mainly called to profit-sharing (*q. v.*). Nevertheless cooperative societies developed.

According to the *Bulletin de l'Office du Trevail* there were in 1904 in France 1,101 cooperative distributive societies (stores), 765 cooperative bakeries, and 338 other cooperative productive societies (111 in the building trades). According to the *Annuaire des Syndicats Professionels* there were in 1905 3,116 cooperative agricultural associations with 659,953 members, with 47 federations of societies.

According to the returns to the Cooperative Congress at Budapest in 1904, there were, at the end of 1903, 328 productive societies, of which 123 were in Paris, 19 being among cabdrivers. Distributive societies numbered 1,880, of which only 64 have more than 1,000 members each, and only 3 have more than 10,000. Their sales only totaled £3,405,400; the aggregate profits are unobtainable—in many cases no surpluses were made. Cooperative building societies numbered 56, many having received advances from the savings-banks. Credit societies have risen from 873 in 1902 to 1,038 in 1903. Nearly one half are on the Raiffeisen principle. Two hundred and seventy-three are in touch with the agricultural syndicates—cooperative societies existing merely for the common purchase of agricultural requirements.

In Luxemburg there were in 1903 365 agricultural cooperative societies and 89 cooperative dairies.

Belgium

The beginning of the cooperative movement in Belgium was simultaneous with the formation in Paris, after the revolution of 1848, of a large number of productive cooperative societies. A considerable number of tailors', shoemakers', and printers' cooperative societies were established in Brussels and Ghent, but were with one exception, shortly afterward dissolved. The first distributive societies were the cooperative bakeries established in 1854 at Ghent and Antwerp, but these also enjoyed only a brief existence. A certain number of societies for the purchase of stores for the winter were established a little later, chiefly among the members of friendly societies; in 1865, 12 of these societies were in existence. Between 1864, when the first "people's bank" was instituted at Liège, and 1873, a large number of societies were established, mainly through the influence of the *Internationale*, but the lack of recognition and protection by the law, as well as of proper organization among the working classes, and in some cases the bad management and dishonesty on the part of the managers, brought about the dissolution, by 1873, of almost all the societies, with the exception of the various distributive societies established in 1869 at the Mariemont and Bascoup collieries. In 1867, M. Anspach, the burgomaster of Brussels, established cheap dining-rooms for working men.

Cooperation and Socialism

The real development of cooperation in Belgium has been in connection with the Belgium Socialist movement. (See BELGIUM.) In 1879, largely under the lead of the Socialist Anseele, a cooperative bakery was begun in Ghent. This movement has given cooperation in Belgium a firm hold. Agricultural cooperative societies were commenced in 1885. There are also cooperative dairies, drug stores, insurance societies, banks, and distributive societies of many kinds.

There were in 1904 some 238 of these Socialist cooperative societies, several of them of very great strength. Most of these are organized into the "Federation of Socialist Cooperative Societies," which is also a wholesale society. It does a business of about 1,500,000 francs, while the collective sales of the individual Belgian societies reach 40,000,000 fr. annually.

The most important societies are those at Brussels, Antwerp, Ghent, Liège, Louvain, Charleroi, Namur, Verviers, La Louvière, and "*Le Progrès*" at Jolimont. In industrial centers such as Charleroi, Borinage, and the Center of Hainault, the cooperative society began by selling flour and butter, but it was soon found that a cooperative bakery could produce bread far more cheaply than it could be produced by each family for their own consumption. With the exception of the cooperative society at Jolimont, where bread is sold at the lowest possible price, these societies have almost all adopted the system of the Pioneers of Rochdale, selling at the current trade prices, and dividing the profits realized at the end of a certain period, generally a year or six months.

The movement, however, is wholly in the hands of the (Socialist) *Parti ouvrier*, and no small portion of the profits are spent for Socialist

education, literature, and propaganda. The club houses are centers of socialism, and usually one must belong to the party to have the benefits of the society.

The great society "*La Maison du Peuple*," at Brussels, begun 1882, is representative, with its large central store, selling almost all kinds of goods, its restaurant, café, magnificent hall, and cooperative features of every kind.

Other cooperative societies are, however, also numerous in Belgium. There are numerous agricultural cooperative societies, largely "savings and credit societies" of the Raiffeisen type. These are mainly Catholic societies of the *Boerenbond* or Peasants' League, formed by Abbé Mellaerts of Louvain. There were in name at least 313 of these in 1904. They loaned 1,256,562 fr. to small agricultural cultivators in 1903, and 544,440 fr. to others.

People's banks do a much larger business in Belgium, and are organized into a federation. According to the *Revue du Travail*, of the Belgium Labor Department, there were Jan. 1, 1905, 17 people's banks making returns, with 15,721 members, and a loan of some 11,600,000 fr. There were 884 agricultural supply societies with 51,451 members; 496 cooperative dairies with 53,922 members.

The Netherlands

Cooperation in the Netherlands is somewhat advanced, tho largely in the form of cooperative dairies and rural societies. According to the Netherlands Cooperative Association there were in 1904 174 cooperative stores, 227 societies for the purchasers of fertilizers, seeds, etc., 30 for the sale of produce, 70 cooperative bakeries, 584 dairies, 76 other productive societies, 309 savings and loan associations, 143 building associations, 26 insurance associations—1,639. These figures include two societies in Batavia. The figures are also stated to be too high, as the law compels the registration of the formation but not of the dissolution of societies. The formation of 6 printing societies and 6 dressmaking societies indicates some tendency to cooperative production.

Denmark

Here cooperative development has been mainly on the Rochdale system, and on the authority of M. P. Blem, the chairman of the Danish Cooperative Committee, it can be said that there are now 1,000 societies with about 150,000 members, and an annual collective turnover of about £2,000,000. The Cooperative Wholesale Society of Copenhagen sells to 915 distributive stores. Cooperative creameries number 1,057, and the butter produced from milk delivered therefrom, during the last fiscal year, was valued at £8,400,000. The bulk of the agricultural exports from Denmark are of cooperative origin, the total production of the butter, bacon, and egg societies for export in 1903 being £11,414,000, while the total exports from the whole of the country were under £20,000,000.

Germany

The cooperative movement as a whole began much later in Germany than in England or France, and took a different form. The first attempts in Germany arose from the desire on the part of the artizan class to relieve the distress due to factory competition, by obtaining credit and the raw material necessary for their work at a more reasonable cost. In 1848 certain loan associations, or people's banks (*Darlehnskassenvereine*), were established, but as they lent money without interest, and were subsidized by philanthropic outsiders, they came to be regarded by the artizans as mere charitable associations, and were held in small esteem. In 1849 Herr Schulze-Delitzsch, who for years was the life and soul of the cooperative movement in Germany, founded the first cooperative society for the purchase of raw material among thirteen cabinetmakers in Delitzsch, his native town. A shoemakers' cooperative society followed, and the results were so favorable that during the next few years a considerable number of such societies were formed in the neighboring towns. In 1850 Herr Schulze founded the first of his loan associations (*Vorschussvereine*), which differed from the earlier banks in that the persons to whom loans could be granted must themselves be members of the association paying regular monthly contributions. They thus themselves indirectly furnished the security for the credit afforded them. After a time both the societies for procuring raw material and the loan associations federated, and the security thus afforded by the unlimited liability of all the members of all the associations for the obligations of any one association rendered it easy to procure the necessary capital. Tho the societies for procuring raw material form the necessary basis for productive cooperation, their expansion was less rapid than that of the loan associations founded later. Productive cooperation has at no time been able to show a very successful record in Germany. Between 1860 and 1870 a movement was set on foot for the establishment of retail distributive societies (*Konsumvereine*), and the attention of the working classes was attracted to these stores by the quarrel which resulted between Schulze and Lassalle. The history of cooperation in Germany has since been a continuous progress. The movement has spread from industry to agriculture. In 1859 a congress of members of loan associations was summoned by Herr Schulze at Weimar; a central committee was appointed, with Herr Schulze at the head, which in 1864 developed into the General Association of German Cooperative Societies (*Allgemeiner Verband Deutscher Erwerbs und Wirtschaftsgenossenschaften*), including all forms of cooperation within its limits.

Schulze-Delitzsch

Meanwhile another cooperative system had arisen in Germany. In 1849 F. W. R. Raiffeisen in Westerwald established a cooperative bakery, and then a cooperative bank. This had a capital of only £300. Contesting against great odds, his system was little known till 1874, but before his death, in 1888, "Father Raiffeisen," as he was called, saw his system a distinguished success.

The following gives the essential points of difference in the two systems:

The Schulze-Delitzsch credit associations put the *lender's* interest foremost; Raiffeisen, on the contrary, places the *borrower's* interest as the keystone of his system. He aims at social benefit, not at business profits. Every member joining one of the Schulze associations is expected to take one share valued at from $40 to $125

(each association determining the value of its shares). This share may be paid for in small instalments. The shares draw dividends ranging from 1 to 30 per cent. Some associations have declared dividends of nearly 60 per cent. This is gained by charging a somewhat high rate of interest. Loans are only made to members and are for short periods, never more than ninety days. As security, mortgages, pledges, bills, and sureties are taken. These associations are managed by a well-paid committee whose salaries are increased by commissions based on the amount of business done. In order to increase their commissions, a committee often takes bad securities.

Raiffeisen System

The Raiffeisen loan banks were established to assist borrowers, and at the same time to free the small agriculturists from the merciless grasp of usurers. Raiffeisen offered to supply the peasantry with money if they would subscribe to his rules. As his aim was to benefit the poorest classes he exacted nothing from those joining, and as most members were agriculturists, he made long credits the rule. Each bank membership is confined to a small district. Within this district members are elected with great care and discrimination. No difference is recognized between the poor and rich except that the latter are allowed to take the brunt in the administration. No officers receive a cent of remuneration. Only one man connected with a bank is paid, viz., the cashier, and he has no say whatever in the employment and the distribution of the money. Banking in the ordinary sense is strictly forbidden. The banks are *loan* banks and their sole instrument is credit. No dividends are paid. All profits go into a reserve fund, which is used to meet deficiencies or losses, or it is voted to some public work or charity. Money is loaned only to members, and no request for a loan is granted until after a careful examination is made into the object of the loan, whether it is economically justified, and if found to be so the applicant for a loan is never refused. When the money is granted it must be used for the specific object for which it was requested. The rate of interest usually charged is 5 per cent. The banks obtain their money from various sources, paying from 3½ to 4 per cent. They have more money than they can use, as their reputation is excellent. The lending is on character, no pledges or mortgages are taken as security, but simply a note of hand backed by one or two other members. It is thought by many that one of the strong points of these *loan* banks is that they are based on the *unlimited liability* of members.

Before the passing of the law of 1889, loans were made to non-members, but the law forbade this extension of the business of the associations on the ground that it destroyed their cooperative character. Since 1889 also the liability of the members has been no longer universally unlimited; but according to Dr. Crüger experience has shown that associations with limited liability have not always proved able to procure the necessary capital. Tho agreeing in their main object, the Schulze-Delitzsch and Raiffeisen banks differ considerably in other details. The former admit members of every class, and think this safer, since it is improbable that a demand on the bank will occur in every industry at once; the latter limit their advantages to agriculturists. The former charge high interest (8 to 12 per cent), and pay high dividends, with salaried officers. The latter charge low rates and have no salaried officers, and claim to be more ethical, while the former they consider merely commercial.

A connection between the associations, however, is maintained by means of the Central Agricultural Bank for Germany. The General Secretary's Union, presided over by Dr. Raiffeisen until his death, and since then by his son, aims to extend the system. The firm of Raiffeisen & Co. has been founded to supplement the funds of the association, and render them independent of subsidies hitherto granted by the Prussian Ministry of Agriculture. The firm publishes a journal, *The Cooperative News* (*Genossenschaftsblatt*).

In 1889 a general German agricultural cooperative union was established, and gave a great impetus to agricultural cooperation.

According to the Prussian *Central Genossenschaftkasse*, there were Jan. 1, 1906, in Germany 15,108 cooperative credit societies of one kind or another, with 2,018,821 members. The largest number of these belonged to the Reichsverband of Agricultural Societies, of which Dr. Haas is president. At the Budapest International Cooperative Congress in 1904, there were reported from Germany 7,008 credit societies of Dr. Haas's union; 3,982 societies of the Raffeisen type, and 960 of the Schulze-Delitzsch type. The peasant cooperative societies established by the Roman Catholic Church are also numerous. A German Cooperative Wholesale Society, somewhat on the lines of the English wholesale, transacts business with 1,400 cooperative societies.

Present Statistics

According to statistics published by the Prussian Government there were in the empire Jan. 1, 1905, the following cooperative societies: 14,272 credit societies with 1,901,122 members; 1,833 stores with 897,092 members; 3,062 agricultural productive societies with 218,863 members; 199 other productive societies with 23,153 members; 1,806 associations for the purchase of raw materials with 139,426 members; 452 societies for the purchase of instruments of production, with 22,984 members; 295 societies for the sale of members' products with 33,231 members; 142 societies for purchase and sale with 6,392 members, 652 building associations with 120,954 members, 425 other societies with 42,979 members, a total of 23,221 societies with 3,409,871 members.

Switzerland

Cooperative distributive societies formed on the English pattern were founded in Switzerland at an earlier date than in any other continental country and took firm root. The most usual form of the distributive society is an association for the wholesale purchase of food and household commodities. The articles bought at wholesale prices are sold to customers at prices varying from five to seven per cent below those of ordinary retail dealers. Some societies have also undertaken the management of restaurants, where a meal of soup, meat, and vegetables can be had for about 40 c. (eight cents).

The capital is formed either by weekly subscriptions or by the issue of small interest-bearing notes for sums as low as three frs. The net

profits go to form a reserve fund or to extend the operations of the society. Most of these societies enjoy a high degree of prosperity. One of the oldest and most important associations is the Consumverein of Zurich. This society was founded in Oct., 1853, by eight members of the Grütliverein, with a joint capital of 75 frs., which they employed in the purchase and sale of cigars.

Cooperative banking in Switzerland has had large success. The Schweizerische Volksbank has branches in almost every Swiss trading center.

In all there are said to be 4,400 cooperative societies in Switzerland, altho this large number is partly due to the fact that Swiss law makes it easy for almost any kind of common action to be registered under the name of a cooperative society. Of these, in 1903, some 1,800 were agricultural societies, including 1,536 cheeseries, which practically monopolize the cheese industry. There are some 1,200 societies for cooperative purchase. The 204 Swiss distributive societies are organized into a *Verband der Schweizerischen Konsumvereine*, which publishes an organ, the *Schweizerische Konsumvereine*. The agricultural cooperative supply societies are organized in a *Verband Ostschweizerische Konsumvereine*. In 1899 these two combined in a general union.

Italy

Cooperation in Italy connects itself with the past, yet has only recently been thoroughly organized. In 1886 and 1887 the first and second congresses of Italian cooperators met at Milan, and the Federation of Italian Cooperative Societies was constituted, and a journal, *La Cooperazione Italiana*, established.

Day Laborers' Unions

The most unique success of cooperation in Italy has been of cooperative societies of day-laborers. The origin of day-laborers' associations has been traced back to the companies of Lombard masons who, in the Middle Ages, wandered through Europe building cathedrals and palaces.

In Oct., 1888, Signor Marin opened a "cooperative campaign," which lasted for a whole year. The first conference was held at Contarina on Nov. 24th, and soon afterward a day-laborers' cooperative society was formed. Other conferences followed, and fresh associations were constituted. In all fifteen day-laborers' societies were established, besides four associations of day-laborers and builders. These nineteen unions had almost 8,000 members, drawn from the ranks of the poorest peasants in Italy.

The organization of these societies and the system of payment to members which is observed are very simple. The society makes a contract for a given piece of work at a given price, and then sublets the work by the piece to gangs (*squadre*) of its members. It provides the necessary tools if the workmen do not possess them, and gives a price equal to that which it has received, minus the expenses of administration. While the work goes on the members receive instalments of pay for their immediate maintenance. When the work is finished the quantity done by each man is estimated, and he is paid a proportionate share of the profits.

In 1902 there were 270 cooperative Labor Societies in Italy (not all day-labor) and they received 132 contracts at 3,293,705 lire.

Distributive

The first distributive societies in Italy were founded early in the second half of last century. A cooperative store was started in 1853 by the General Society of the Working Men of Turin, followed by another at Alessandria, which was opened in 1854. The capital of many of these original societies was obtained by means of subscriptions from wealthy persons, and in some places they were even organized by the municipal authorities. To this form of distribution others opposed the more purely cooperative English type based upon the scheme of the Rochdale Pioneers. They believe that the consumers would benefit more by receiving the profits of the society in the form of dividends than by a constant diminution of retail prices. The Italian Industrial Association was formed at Milan, to promote the development of industry in Italy, by the foundation of people's banks, benefit societies, and strictly cooperative societies of consumption and production. In 1865 there appear to have been about fifty-two such societies in Italy, and by the end of 1873 this number had risen to eighty-five, including sixteen associations on the English system. Unfortunately the hopes raised by this brilliant beginning were destined to disappointment. The Italian distributive societies were a foreign importation and lacked unity in direction, in form, and in aims. The severe English type, with its complicated system of reckoning, could not be maintained, for the consumers, urged by necessity, preferred a great immediate fall of prices to the slow accumulation of profits.

Bakehouses

The question of improving the dietary of the peasantry is one of great and increasing importance in Italy. Since 1860 the question of establishing cooperative and other bakehouses in the rural districts has been before the public. Don Rinaldo Anelli started a small cooperative bakehouse at Bernate, which proved a great success. In 1884 the government offered to pay half the expense of starting new establishments, and by 1885 the total number of cooperative bakehouses in Italy had risen to thirty-eight.

In 1863–64 Signor Luzzatti, in a series of lectures delivered at Milan, recommended the establishment of people's banks on the Schulze-Delitzsch system.

The movement quickly spread through Lombardy, Tuscany, Emilia, Romagna, and Venetia, and finally into the southern provinces. By the end of 1890 the total number of Italian cooperative credit societies was 738, with a paid-up capital of 92,000,000 li., and a nominal capital of about 100,000,000 li.

In 1887 there was, on an average, one people's bank for every 46,809 inhabitants in the kingdom, and these banks were most numerous, relatively to the population, in Apulia and Basilicata, a fact which is the more striking when it is considered that the means of obtaining credit were formerly in a most primitive state in these southern districts, where the peasantry were completely in the power of the local usurers.

The people's banks have been to some extent transformed, or rather they have been supplemented by the institution of other popular credit societies, based generally on the same principle, and organized on similar lines, but differing in their character and in their aims from the original associations. Some of these societies are called "workmen's banks" (*banche Operaie, casse*

operaie), "workmen's credit banks" (*banche di credito per gli Operai*), "popular banks" (*casse popolari*), names which show the predominance of working men in the new associations.

Another form of credit cooperation has been introduced into Italy by rural loan banks on the Raiffeisen system. These banks were first started in 1883 by Signor Leone Wollemborg, to protect the rural laborers and small landed proprietors of Venetia and Friuli against the exorbitant demands of money-lenders, by making it possible for them to borrow capital at a moderate rate of interest.

According to the *Liga Nazionale* (*National Union of Cooperative Societies*), the total number of Italian cooperative societies (including 322 outside of Italy) was 4,371 on Jan. 1, 1903. Of these some 1,500 were people's banks, 948 were distributive societies, 471 industrial productive societies, 396 credit societies, 175 societies for common labor and enterprise, 186 agricultural societies (besides banks and 99 dairies), 28 bakeries. The number of societies of the Wollemborg Union is given at 148. The "Catholic" cooperative societies number 1,039.

Austria

The first cooperative societies in Austria were loan societies modeled after the German, and came into existence between 1850 and 1860. There were in 1903 in Austria (not including Hungary) 9,713 cooperative societies. Of these 6,445 were credit associations, of which 2,320 were of the Schulze-Delitzsch and 4,125 of the Raiffeisen type, 814 distributive societies, 2,459 other societies. Of the credit societies those of the Schulze-Delitzsch type had in 1901 1,063,505 members, with a share capital of 102,066,000 kronen. The agricultural credit associations of the Raiffeisen type had 261,026 members, and dealt out credit of 938,435,000 kr. The societies of the Raiffeisen type, tho by far the most numerous, have developed almost wholly within the last fifteen years. Of agricultural cooperative societies of all kinds in Austria there are almost 5,000. The Allgemeiner Verband Landwirthschaftlicher Genossenschaften in Oesterreich included 14 unions in 1904 with 3,549 societies.

Hungary

Cooperation in Hungary began about 1850. The first society, the Beszterce Savings Bank and Aid Society was formed in 1851. The movement slowly grew. The (National Cooperative) Hungarian Land Credit Bank was formed in 1862, and up to 1903 had loaned 662,500,000 crowns on mortgage and 74,000,000 more for improvements. For long, however, credit societies were the only cooperative efforts in Hungary. Only in 1883 was the Budapest Central Cooperative Creamery formed. In 1886, however, Count Alexander Karolyi, sometimes called "the father of Hungarian cooperation," gave a new impetus to the movement. In 1896 the Central Credit Bank of the Hungarian cooperative societies was formed, and in 1898 established societies in 465 localities. Other central institutions appeared. In Transylvania a Raiffeisen movement was developed. In 1898 a national central credit cooperative association (Raiffeisen) was formed, with capital to which the government largely contributed, and which it controls. Jan. 1, 1904, there were affiliated with this association 1,653 societies, with 366,721 members, organized in 5 446 distinct communes, with a collective saving deposit of 21,000,000 crowns, and a credit of 39,000,000 cr. The chief business of these societies is to supply credit,but agricultural supply societies are not a few, and some productive societies exist. Distributive cooperative societies in Hungary came later, but now have a central distributive society, the "Hangya," with 267 societies in 1902. There were also, at that date, 150 so-called Christian cooperative societies with a central organization of their own. Cooperative insurance began 1894. The government in 1904 granted 12,000,000 cr. to promote the cooperative sale of farm produce.

Russia

Russia has some 1,320 cooperative societies with 450,000 members. There were in 1904 926 cooperative distributive societies; in 1903 there were 801 with 146,550 members in the 248 societies making returns, with a collective share capital of 3,174,940 rubles, and sales of 25,958,508 ru. during the year. The Moscow Union of Cooperative Distributive Societies had 131 societies in 1903, and the Cooperative Wholesale Society in St. Petersburg had 15. There were also in Russia 7,809 cooperative credit societies in 1902 (including 4,568 savings and provident societies).

Finland

Finland has a very active cooperative movement.

Two hundred and sixty cooperative stores have 35,000 members and annual sales of $2,400,000. The wholesale sold $300,000 in the last six months. One retail store sold $140,000 in the past year. There are 144 cooperative banks, 238 cooperative creameries, a total of 700 cooperative associations. The weekly *News* has a circulation of 7,000. The movement is comparatively new, the wholesale being only in its second year. Rochdale lines are strictly followed and a vigorous growth is assured.

Scandinavia

Cooperation in the modern sense began in Norway in 1866, when a cooperative canvas manufactory was begun at Christiania. By 1875 there were 290 cooperative societies with 33,000 members. Many of these, however, did not endure. In 1896 the government employed Mr. Dehli to study cooperation in other countries, and his lectures and writing on his return produced a new interest. In 1900 there were 260 societies with 28,000 members, and a "turnover" of about 12,250,000 kroner. The movement has been largely agricultural. There are now some 830 cooperative dairies and cheeseries, and as many more for the improved breeding of cattle. There are central unions for northern, eastern, and western Norway. Sweden had in 1906, 2524 registered cooperative societies, besides many not registered, and the movement is growing fast. Of the registered, 903 were building societies, 410 agricultural, 382 retail, 338 dairies, 155 productive.

Other European Countries

Poland has 160 cooperative societies, including 34 Polish societies in western Prussia, for the most part cooperative banks. Servia has 788 (including 100 provident and friendly societies). They are almost all agricultural; 416 are Raiffeisen banks. Rumania has 1,121 rural people's banks. Bulgaria has an agricultural bank with 25 societies and there are 47 other cooperative societies. Greece has only 10 societies. Spain has 140 small societies, of which 50 are in Barcelona and 40 in Catelonia. In Portugal cooperation is said to have existed for centuries among her agricultural and fisher folk, and to-day cooperative agricultural societies and cooperative pharmacies are numerous, while in Lisbon there are several strong distributive societies. The Portuguese Socialist movement is somewhat cooperative.

Other Continents

In Japan cooperation of some form has come down from ancient times. There are said to be cooperative silk stores which can trace their existence 230 years. In 1903 there were reported 583 cooperative societies in Japan, 357 being credit societies. In India modern cooperative ideas are spreading, but as yet with small actual results. South Africa has a cluster of cooperative distributive societies growing in strength. In Australia cooperation seems to have made less headway. Iceland has a cooperative movement begun in 1844, and now with some strength, including 15 dairies.

United States

Cooperation in the United States is hard to summarize. The word has been used, even by responsible writers, in such a loose way and to cover such a variety of forms, as often to make the word cooperation almost meaningless unless the sense in which it is used be stated. Even the most purely mercenary, unfraternal, and, occasionally, even fraudulent schemes are sometimes masked under the fair name of cooperation. Statistics therefore greatly vary.

Professor Parsons finds (*Arena*, July and Aug., 1903) 8,500 societies in the U. S. for cooperative production and distribution. Mr. N. O. Nelson, on the other hand, using the word in a more guarded sense, reported to the International Alliance in 1902 only 558 societies with 89,447 members, a capital of $3,203,520, and sales of $22,705,645. Of these, 283 were creameries, 192 stores, 38 selling associations, 45 factories.

Nevertheless cooperation in the U. S. has had a very much longer and fuller history than is usually realized. It has reached very large proportions. In cooperative credit associations it is scarcely equaled; in attempts in cooperative communities it has led the world. It is, however, except in the cooperative bank movement almost utterly unorganized as a national movement, and most of its early attempts have proved of short duration. Dr. R. Heber Newton, in his "Social Studies" (1887), gives the following interesting table of the main events in the history of American cooperation:

1730 (*about*).—Share system introduced into New England fisheries.

1752.—Fire-assurance introduced in Philadelphia.

"The Philadelphia Contributionship for the Insurance of Houses from Loss by Fire." Benjamin Franklin, first director. Corporation still prospering.

1767.—Life-insurance introduced in Philadelphia.

"The Corporation for the Relief of Widows and Children of Clergymen in the Communion of the Church of England in America." Composed of clergymen. Still flourishing.

1819.—Mutual assurance bodied in a national order—the Odd Fellows.

1820–30.—Owen's movement; socialistic.

1830–40.—Loan and building societies formed in Philadelphia.

New England Association of Farmers and Mechanics agitate the formation of stores.

Labor organizations in New England open some stores.

1840–50.—Brook Farm, Hopedale, etc

Fourierite phalanxes.

New England Protective Union builds up a system of stores; which at their height did a business of about $2,000,000 per annum.

The earliest essay in cooperative production—Tailors' Association in Boston (1849).

1850–60.—Loan associations arise in Massachusetts. Associate dairies started in New York. Anaheim.

1860–70.—Stores started in several states.

Productive societies also.

Revival of building and loan associations in Pennsylvania.

Mutual assurance assumes business forms.

Renewed attempts at cooperative production.

Shipyard in Baltimore (1865), in Boston (1866); machine shop in Philadelphia (1866); foundries in various cities; shoe manufactory in Lynn and in North Adams (about 1868); cigar manufactory in Westfield, Mass. (1869).

1870–80.—Knights of St. Crispin agitate cooperation.

Founding and growth and decline of the Patrons of Husbandry; which order claimed to save in one year (1874) $12,000,000 to its members, through its cooperative agencies.

Founding and growth of the Knights of Honor—a great mutual assurance association. Still flourishing.

Founding, growth and dissolution of the Sovereigns of Industry; which order did a cooperative business in one year (1877) of $3,000,000; representing a saving to its members of $420,000; all of its stores being on the Rochdale plan; some of which are still prosperous.

Scattered stores in many states; Massachusetts reporting fifteen independent stores organized since 1870.

Philadelphia Industrial Cooperative Society organized (1875).

Independent productive societies in many states.

Rapid growth of associate dairies, of which there are now 5,000 in the U. S.

Rapid growth of mutual assurance companies; the Patrons of Husbandry having at one time in one state alone thirty-eight fire-insurance companies; three companies in one county carrying over $1,000,000 of risks; New York State claiming 300,000 members of various mutual assurance societies at end of decade.

Rapid growth of building and loan societies in Pennsylvania, which now number over 600 in Philadelphia, with a membership of 75,000 and a capital of $80,000,000; which number in Pennsylvania from 1,500 to 1,800; which have led to investment of $100,000,000 in real estate in Philadelphia alone.

Revival of loan associations in Massachusetts; where are now over twenty-two societies incorporated, having a total membership of over 6,000.

Institution of loan associations in New Jersey, Ohio, California, etc.; New Jersey reporting 106 associations in 1880; Ohio reporting the incorporation of 307 associations during the seven years preceding the report (1880); total estimated societies (1880), 3,000 in U. S., with membership of 450,000; and aggregate capital of $75,000,000.

Experiments in colonization.

1880–90.—Formation of the New England Cooperative Association.

Revival of the Patrons of Husbandry.

Greatly quickened growth of cooperation in all lines.

Development of the Knights of Labor.

The more recent developments may be thus summarized (for Cooperative Distribution see especial article Cooperative Stores in the U. S.):

Productive Cooperation

The first productive association of which we have any record was that of the Boston Tailors' Associative Union, which was formed in 1844, but did not endure long. Dr. Newton in his article (see above) mentions similar attempts at shipyards in Baltimore (1865); in Boston (1866); a machine-shop in Philadelphia (1866); foundries in various cities—Troy, Albany, Cleveland, Cincinnati, St. Louis (1865–68); shoe manufactories in Lynn and North Adams, Mass. (*cir.* 1868); a cigar manufactory in Westfield, Mass. (1869); a machine-shop in Greenfield, Mass. (1870). Says Dr. Newton:

The most promising of these early experiments was the stove foundry of the Iron Molders' International Union. This was started in 1867, in Allegheny County, Pa., the 10,000

members of the union having been expected to become stockholders. The paid-up capital, however, proved insufficient in a critical moment—the oft-repeated experience—and the enterprise failed.

The decade 1870–80 experienced a marked increase in the number of productive societies. In the mid-year of this decade Massachusetts had sixteen productive societies reporting to the State, and nine not reporting, tho duly chartered. All but one of these had been organized since 1870. The sixteen societies reporting gave an aggregate paid-in capital of $114,210. The nine not reporting were incorporated for $47,110. Other societies were known to exist.

Ohio had a number of associations for manufacturing, but the cooperative feature did not long survive in the few societies that were successful. One of these associations had a capital, in 1877, of $100,000, but lapsed into a joint-stock concern, votes counting not by persons, but by shares. . . .

A number of these societies were the results of strikes. The strike at North Adams, e. g., on the introduction of Chinese labor, led to the establishment of a cooperative shoe factory. A report says: "The men speak with pride of their new feelings of self-reliance and freedom, as well as of the quality of their work." . . . The Patrons of Husbandry were reported in the *Economist* of Nov. 8, 1876, as having "thirty manufacturing associations, whose capital ranges from $200,000 to $500,000; . . . sixteen grist-mills, one of which produces 100 barrels of flour per day; . . . three tanneries, and six smitheries."

The Sovereigns of Industry contemplated entering upon this field, and made some essays in it, e. g., the Kingston Cooperative Foundry Company, in Kingston, Mass. Its members consisted chiefly of picked men from other foundries. It organized with a capital of $8,000. Details of the experience of this and other societies have vanished with the order.

This brings us down to the attempts of the Knights of Labor. The attempts of the Knights were most various and most wide-spread, including boot and shoe companies in Massachusetts, painters and decorators' associations in Minneapolis, clothing companies, tobacco factories, plumbers' associations, printing companies, mining associations, etc. All these, however, as Knights of Labor organizations have come to grief. Nevertheless, not a few strong productive cooperative enterprises have secured enduring form.

"Among the most successful cooperative enterprises of a productive character were those existing among the coopers of Minneapolis. Between 1874 and 1886 no fewer than nine associations have been formed there which conduct business on cooperative principles. As early as 1868 the experiment of renting a small shop and selling the product direct to the mills was tried by a few journeymen coopers; they allowed themselves the ordinary rate of wages, calculated on the piece system, and then divided the profits in proportion to the work done. A suspension of trade in the flour-mills caused a discontinuance of the enterprise, and on its resumption in 1870 it proved a financial success, but a failure from the cooperative point of view, owing to the determination of the treasurer, who had secured a large contract for himself instead of for the firm, to set up as a master cooper. The rapid increase of the milling industry and the consequent influx of coopers to supply the demand for barrels caused the labor market in Minneapolis to become overstocked; the wages of coopers fell so low that the former cooperators decided in 1874 to renew their experiment. Having obtained the promise of a contract, the Cooperative Barrel Company was formally incorporated under the laws of Minnesota, and entered upon a prosperous career." This, however, has not seemed permanent. By 1896 the nine shops had dwindled to four, and in 1907 to three.

Minneapolis Coopers

Cooperative production in some forms, however, has grown in the U. S., and of late years very rapidly. Mr. J. M. C. Hampson, editor of *The National Cooperator*, Chicago, reported to the International Cooperative Congress in 1902 that there are something like 50,000 cooperative societies in the U. S. He included in this 5,000 building and loan associations (*q. v.*), which he adds, however, are scarcely of the true cooperative kind, 2,000 mutual fire-insurance companies, 5,000 cooperative creameries and cheese factories, about 3,000 cooperative telephone companies (particularly in the rural districts of Michigan), hundreds of cooperative elevator associations (particularly in Minnesota). He also refers to thousands of cooperative irrigation associations.

According to Professor Parsons (see above), the U. S. leads the world in cooperative insurance, with 3,800 associations, more than 8,000,000 members, and $100,000,000 premium receipt. In cooperative banking, he puts Germany first, with 12,083 banks, and a business of $850,000,000 or $900,000,000, and the U. S. second, with 5,302 loan associations, having over 1,500,000 members and $330,000,000 of business. Professor Parsons estimates in the U. S. 8,500 societies of production and distribution, with nearly 1,000,000 members and a business of some $150,000,000 per year. Professor Parsons tells us, that there are 3,800 cooperative creameries with 300,000 members and a production of about $80,000,000 per annum. In Minnesota, through the work of one professor in the University of Minnesota, 600 cooperative creameries were started in ten years, with a membership of 50,000 farmers. There are about 4,000 farmers' purchasing and distributing societies with 500,000 members. Fruit-growers' cooperative organizations have been formed in nine states with about 100,000 members. It is estimated that there are more than 20,000 cooperators in California and that one third of the whole fruit business of the state is handled cooperatively. The cooperative Southern California Fruit Exchange handles more than half of the orange business of the state. In five states the milk producers have cooperative associations for selling wholesale to city dealers. Six or seven states have cooperative grain elevators. Near Solomon, Kan., in 1901, some fifty farmers established a cooperative grain elevator. The railways and the Grain Trust tried to break it down by buying grain above the market price. The farmers sold to the trust, but paid over a cent a bushel to the cooperative on their sales and the trust gave up the fight. There are also cooperative bee-keepers, sheepherders, basket-makers, sawmills, grist-mills, wood-yards, starch factories, canning factories, dealers in poultry, eggs, cattle, horses, and cotton. Outside of the creameries and butter and cheese factories, there are, however, only some sixty cooperative factories. There are in the U. S. 5,302 cooperative credit societies. Cooperative life-insurance alone exceeds $7,000,000,000 on 5,500,000 lives. There are mutual fire, hail, and live-stock insurance companies. The "Insurance Year Book" reports only 179 such mutual companies, but George K. Holmes, studying the subject for the U. S. Agricultural Department, says there were 3,000 of them among the farmers alone in 1899, with a membership of 2,700,000, or about half the farmers in the U. S. There are also thousands of cooperative irrigation societies in the West, and some 1,000 cooperative farmers' telephone companies.

Such are Professor Parsons's figures, but the round numbers indicate that they are not based on exact returns, and while suggestive include many movements not cooperative except in a very general sense of the word. For a careful study of productive distribution in the U. S., see especial article, Cooperative Stores in the United States.

IV. Arguments For and Against Cooperation

The argument against cooperation is never against cooperation as an ideal, but simply against it as a practical method of social reform. On this line the opposition to cooperation has been varied and often strong; the answer, however, being probably stronger.

1. Against distributive cooperation it has been

claimed that it enables the cooperative *consumer* to obtain lower prices and save some of the profits that would otherwise go to middlemen, but does not tend to raise wages, and may even tend to lower wages through the interest the purchasing cooperators have in purchasing as cheaply as possible.

As a matter of fact, however, cooperation has not lowered wages. The cooperative wholesale society in England pays union wages; so, with the rarest exceptions, do all cooperators.

2. On the other hand, it is claimed that productive cooperation tends either to develop little companies or groups of producers competing against each other, or, if these little companies combine into one whole, to develop a monopoly which is either against the community, or, if large enough to include the whole community, is socialism and not cooperation.

But this, again, is argument not against cooperation, but against its misuse, not against cooperation, but for the necessity of combining trade-unionism with cooperation—a combination which is, fortunately, rapidly on the increase in England and in most countries.

3. A stronger argument against cooperation is that it so fixes the mind of investors and cooperators on saving or earning a few cents that they forget questions of much larger economic importance. Says Beatrice Potter (Mrs. Sidney Webb):

> It would be a fatal error if the million members of cooperative societies allowed their comparatively small interests as dividend receivers for one moment to divert their attention from their much vaster interests as wage-earners and citizens. The dividends of a cooperator amount on an average to about £3 a year, or just about a farthing per hour on his wages. A "good" cooperator, dealing pretty constantly at the store, will make perhaps double this amount, or a halfpenny per hour of his working-time. Now I need not remind you how very easy it is to lose a halfpenny per hour in wages for the want of a strong trade-union. Take, for instance, the Amalgamated Society of Carpenters, with its 500 branches all over the kingdom. Their standard rates of wages vary from 5*d.* per hour in some towns up to 9½*d.* per hour in others—a difference equal to no less than eighteen times as much as the average cooperator makes out of his store. . . . It will hardly be maintained that the £5 a year dividend of the Keighley "good cooperator" is equivalent to the £26 a year additional wages earned by the Manchester "good trade-unionist."

Yet this, again, is no argument against cooperation, but simply an argument (as, indeed, Mrs. Webb uses it) for a combination of cooperation *with* trade-unionism. Cooperation may not accomplish all things, but a penny saved is a penny earned, and trade-unionists in England have learned that they cannot afford to sneer at the millions of pounds in the English cooperative movement, gained by saving pennies.

4. The main argument against cooperation, as applied to the U. S. at least, is the difficulty of successfully conducting it. Nowhere is monopoly so entrenched as in the U. S., and nowhere is competition when there is competition so keen. With mills, stores, and all forms of business carried on by these gigantic corporations and monopolies, it is almost impossible for the small cooperative store to successfully compete. Against corporations able to run a year or more at a loss, in order to run out the small venture, small cooperation is often helpless. Too often, too, these corporations do not need to run out the small venture. Small cooperative ventures too often run themselves out. They can rarely be well managed, because good managers can get larger salaries than the small venture can afford to pay, and even when well managed the small venture cannot buy or manufacture or sell on a small scale so cheaply as the corporation on a large scale. Small cooperation is, thus, often hopeless, swallowing up the hard-earned money invested in it, and sometimes, in spite of the best intentions, becoming a veritable sweating-den, simply because of the inability of the small venture to compete with large stores and yet pay living wages.

One must not be misled for the U. S. by the success of the English movement. In the first place, the foundations of that success were laid before business was so monopolized as it is today, even in England. Secondly, it must be remembered that most English cooperation is consumptive, not productive—in other words, the least beneficial form of cooperation to the producer.

Yet all this is not an argument against cooperation, only a statement of actual difficulties, and against attempting cooperation except under the right conditions of management, capital, and support.

Where a small cooperative venture is fortunate enough to secure a good manager, where it can secure some capital, where there is a community or a body of working men willing to support it, where there is willingness and determination to carry it through, then in trades and under circumstances where the competition is not too intense the cooperation may succeed. Such cases are by no means wanting in the U. S., tho exceptional. See COOPERATIVE STORES IN THE UNITED STATES.

COOPERATIVE AGRICULTURE: Cooperation in agriculture in Great Britain has had a varied career, and has hitherto been mainly associated with the sympathetic work of some leading landowners. Here and there distributive stores have managed farms, but the losses have been greater than the profits. In 1905, 8,706 acres were thus farmed by sixty-eight societies, the results giving an aggregate profit of £4,075, and an aggregate loss of £7,889. The farms range in size from ten acres of the Middlesbrough Society, upon which a loss of £1 was made, to the 449 acres of the Hucknall Torkard Cooperators, who lost £177. The Chester-le-Street had the largest deficit, £256 on 212 acres; and the Sunderland society made the most notable profit, viz., £632 on 420 acres, followed by the £515 of the Newcastle-on-Tyne society secured on an acreage of 122. Neither of the great wholesale societies made profits, and the aggregate loss on the two farms at Lancaster and Lanark was £6,455. Rather better returns were furnished by the three farming societies, two of which made profits of £4,203, the other having a small deficit of £7.

The most hopeful aspect of associated farming, however, is that directed by the AGRICULTURAL ORGANIZATION SOCIETY, which is working in loyal cooperation with the Cooperative Union, altho quite a distinct body with definite constitution and aims. At the beginning of Nov., 1906,

there were 136 societies affiliated to the Agricultural Organization Society, being classified as follows:

Societies for the supply of requirements and sale of produce	97
Dairy, bottled milk, and cheese-making societies	12
Rural Industries Societies	4
Allotments and small holdings societies	4
Agricultural credit societies	11
Auction market	1
Fruit grading society	1
Motor service societies	3
County Pig Insurance Association (which already includes fifty-five branches)	1
Agricultural Cooperative Federation, Ltd	1
Scottish Agricultural Organization Society	1
	136

Five years ago the combined trade of the agricultural societies thus united for mutual action was £10,000; in 1906 it was over £300,000 and some of the societies have grown important enough to secure substantial concessions from railway companies. At Hereford, the Great Western Company has built a depot for the Hereford Cooperative Fruit Grading Society, and the L. & N. W. R. has been similarly well disposed toward another society at Newport (Salop). Latterly a system of interchange of produce and commodities has been developed, with the result that dwellers in rural districts have been brought into direct contact with the advantages of distributive as well as agricultural cooperation. Thus the Forest Supply Society of Worcester is supplying bottled milk to the Kidderminster Society; the Eastern Counties Dairy Farmers' Society sends a large supply of milk to the Stratford Society, which has a milk trade of £40,000 a year; the Framlingham Agricultural Society sends eggs to the Lowestoft and Penge societies, while other societies are arranging to take meat and poultry.

This practical trade development is being carried out by means of the Agricultural Cooperative Federation, which arose out of the Advisory Department of the Agricultural Organization Society and was formed toward the end of 1905. This is doing useful work in assisting the agricultural cooperators to dispose of their produce to the best advantage.

Associated with this work is the Central Cooperative Agricultural Bank, which was formed in July last to provide a central bank from which to supply capital to the local agricultural societies. W. Henry Brown.

COOPERATIVE ALLIANCE (INTERNATIONAL). See International Cooperative Alliance.

COOPERATIVE ASSOCIATION OF AMERICA, THE: Organized at Lewiston, Me., in 1900, by Mr. Bradford Peck, author of "The World, a Department Store," and Rev. Hiram Vrooman. Mr. Peck was the owner of a department store in Lewiston, one of the largest in New England outside of Boston; and this business, which was earning large profits, he turned over to the association, taking three per cent ten-year bonds in payment. The association also started a cooperative café and a large grocery store patterned after the Rochdale stores in England; but these enterprises have been abandoned.

The present condition of the department store in Lewiston is prosperous and encouraging. The employees are organized into a club which, together with a managing board of three, which is appointed by the association's board of directors, has the entire management of the store. During the past two years these coworkers have voted to themselves vacations of two weeks in the summer and two weeks in the winter on pay, and five per cent dividends on their salaries. The directors of the association require the management to lay aside adequate sinking- and reserve-funds. The business of the store is on the increase, and the enthusiasm and loyalty of the coworkers speak eloquently in favor of their organization. The last general statement of the association (May, 1906) shows assets of $226,182 and liabilities of $168,333. Ralph Albertson.

COOPERATIVE BANKS: Organizations formed to enable members, while carefully practising thrift, to make the small amount of security which each may have available, as a rule in a form not readily accepted by ordinary banks, effective for purposes of credit. The practise of thrift is essential, not merely as a means of obtaining funds, but also as contributing to the steady creation of capital. The credit societies organized by Schulze-Delitzsch, the earliest formed, have come to be popularly known as "compulsory savings-banks." M. Luzzatti, who introduced the banks into Italy, calls them "perfected savings-banks." There is no doubt, however, that the most powerful attraction offered is credit, which is, or should be, limited to useful purposes, as not covering deficit but producing new value. M. d'Andrimont, who introduced cooperative banks into Belgium, rightly christened their credit "democratized credit," and Schulze-Delitzsch called his banks "people's banks." They are to enable the small man or small society, to whom or which credit is not accessible under ordinary circumstances, to obtain such for productive purposes, or purposes insuring economy, however poor he or it may be.

The means by which this is done is by the grouping together of either liabilities or else small pecuniary resources, so as to make them tell as security. And in doing this an intermediate body is necessarily formed, composed of all the members of the cooperative bank which, while securing the original lender or depositor by collective liability and funds, and so providing for the borrower access to capital, at the same time prevents waste or abuse by, in its own interest, holding the borrower to his duty. Members collectively would suffer if the individual borrower were to make default. So they see that he does not. Security may be said to be created by the substitution of careful selection of members and of vigilance, quickened by a keen sense of responsibility, for the more or less real security accepted by ordinary banks.

Cooperative banks, by providing such credit, have greatly added to the current resources of the countries in which they are established; they have substantially cheapened the use of money; and they have brought the world nearer to the ideal stage in which credit is to become accessible to all, rich and poor alike, who can make out a good claim, and in which money becomes a mere commodity, purchasable by any one at the price of security.

The security provided by combination may be made effective in two distinct ways, or by a combination of the two: either by the creation of a share capital, which forms the first stake and

which accordingly shareholders are not likely to jeopardize, or else by the unlimited liability of all members pledged for any debt contracted.

The latter method, which may be combined with a levy of small shares, is practicable only in small country districts, where there is a steady and unshifting population, mutually acquainted and capable of watching one another. In such districts, however, it has been found exceedingly beneficial because it quickens the necessary sense of responsibility more effectively than anything else, and therefore makes members very careful in the selection of other members and in the granting and watching of loans. By such means it has had a very powerful educational effect, economically and morally. To produce such, however, it must make services gratuitous, forbid dividends or any other distinctly personal benefit, and make the money accumulated indivisible common property.

The method of providing for security by shares is applicable in populous districts as well as in the country, for industrial as well as for agricultural purposes; but it does not dive down equally low in the social scale or bring the same help to the very poor. In such banks, tho there may be dividend, it ought to be strictly limited, or the interest of the shareholders will be placed in opposition to that of the borrowers for whose use the bank was really formed.

The credit given by cooperative banks is, generally speaking, personal; and in its general aspect it is better the more personal it is. In Germany and in the Scandinavian kingdoms there are, however, excellent cooperative mortgage banks, which have raised enormous sums of money, and cheapened and facilitated mortgage credit materially. They make the loans repayable by terminable annuities carried over a long period of time, and protect the borrower against any danger of notice or raising of interest so long as he pays his instalments punctually.

Various Countries

Altho cooperative banks are generally supposed to be distinctly European, there are known to have been exceedingly useful cooperative banks in existence in New York before the Civil War. The well-known loan and building associations of the United States, which in some states pass by the name of "people's banks," are in a manner cognate institutions, but only in one particular aspect.

The most serious obstacle at present in the way of the formation of cooperative banks in the U. S. is the law which allows no bank to be opened with a capital of less than $10,000.

In Europe cooperative banks have become numerous and as a collective body very powerful. In Germany some 950 cooperative banks of the Schulze-Delitzsch type alone—but these are by far the largest—keep about $500,000,000 steadily in circulation in credits fructifying in the country. Germany has about 12,000 such banks in all, and the larger number of these, tho least powerful individually, are employed in financing agriculture. Grown numerous, banks have combined to unions and formed central banks, which have added to their financial power. In Austria, Italy, and Belgium cooperative banks are less numerous but equally useful. In Russia there are a large number of cooperative banks, but their cooperation is not everywhere perfect. France is making great headway, more specifically in the formation of agricultural banks. Several cooperative banks have been formed in Canada, and succeed well. The best known and oldest is that of Lévis near Quebec. Cooperative banks are now also forming in India; there is one in Barbados and one recently formed in Jamaica.

HENRY W. WOLFF.

COOPERATIVE BROTHERHOOD, THE: Incorporated under the laws of the State of Washington, Sept. 20, 1898, at Burley, Kilsap County, Washington. As originally organized, it endeavored to carry out the provisions of a deed of trust which secured for its members certain privileges, including guaranty of home and employment; to establish a socialistic commonwealth; "to organize persons for the cooperative production of wealth; to secure the equitable distribution thereof among those producing it, thereby dispensing with the wage system; to provide for the collective ownership of the means of production and distribution; and to make it possible for those so organized to recognize in a practical way the brotherhood of humanity."

Seven years after its establishment the capital stock was increased from $5,000 to $50,000, and a reorganization, involving the setting aside of the deed of trust, was undertaken. Under the new by-laws neither home nor employment are guaranteed to members. With the exception of its printing department, the brotherhood has ceased to manage any industries. The company leases its property, as its board of directors sees fit, giving preference to members. Still, recognizing that "one of the principal purposes for which the C. B. was organized was to provide a permanent home for its members," it is sought to do this by a plan of long leases at a nominal rent.

A member who was in good standing Jan. 1, 1905, is "entitled to the lease of a home-lot consisting of one acre, more or less, for fifty years, without allowing more than one lot to a family, for the payment of the taxes plus $1 per annum, to be placed in a common fund to cover necessary expenses, and the remainder to be used for keeping roads."

Any new member (that is to say, one who joins after the reorganization) can secure a home-lot just as soon as he holds "paid-up shares of stock amounting to $200." The new by-laws of the C. B. are modeled after the "Standard Rochdale By-Laws."

Financially, the organization is strong. Its surplus, at a conservative estimate, is between $19,000 and $20,000, and its liabilities less than $2,500. It holds, under an agreement for purchase, nearly 300 acres of fine land fronting on tide-water, of which thirty acres are partially cleared, while twenty acres are under cultivation with fruit-trees and crops. Its income from leases of real estate during 1906 is estimated at $650 for the year. The brotherhood owns a sawmill, shingle-mill, and planer which, at present, are leased to an outsider who holds, at the same time, a contract to cut timber.

The total membership of the Cooperative Brotherhood is about 150, of whom twenty are resident at Burley. The total population of Burley, not including outsiders, is thirty-four. Including outsiders who are connected with its leased industries and in other ways, Burley has a population of seventy or more.

Aside from the printing department, the only

industry which is managed by members of the brotherhood is the Fruit and Dairy Company, incorporated under the laws of the state. The right to engage in any industry is not restricted to members, altho at present the two industries mentioned are under their control.

The provision of the original by-laws, providing for "the free exercise of the individual preferences, convictions, or desires in religious, political, or domestic affairs," has been carefully observed. The denominational religious services, attended by Roman Catholics as well as by Protestants, have been held from an early date, almost continuously, the endeavor having been made to set forth the practical teachings of Christ; to indicate a working method of Christian socialism.

A. B. Ellis.

COOPERATIVE GILD, THE WOMEN'S: An organization of women connected with the industrial cooperative societies of Great Britain. It was founded in Oxford in 1883, and has now 400 branches attached to industrial cooperative societies throughout England and Wales. These branches, with a membership of 22,000 women, are all federalized in the one cooperative gild. The purpose and spirit of the movement are well set forth in the words of Miss Reddish, a former president of the gild: "I believe that all the physical, social, and moral evils have their source for the most part in a bad economic and industrial system, and therefore I would have society and the industry of the kingdom (that is, England) established and worked on new lines—on the lines of true and universal cooperation, on the principle of equal efforts in producing and equal participation in results. . . . When we have done our best to bring about this great and desired end of universal cooperation, we shall feel that we have done our duty to our fellows in the endeavor to realize the hopes and wishes of the great founders of the cooperative movement, that poverty and idleness should disappear from the land; that idleness should cease to revel in luxury, and labor pine in want; that vice should no longer glitter in the palace, and virtue droop in the hovel; that man's inhumanity to man may be a thing only of the past." The principle underlying the whole organization of the gild is that of self-government, that is, it is a democracy of working women, banded together not simply to increase the benefits and to share in the material advantages of cooperative stores and societies, but to take a place and to have a share in the great social, industrial, moral, and political movements that are making for the welfare and advance of the great common people of England. The gild takes its part when factory bills are up before Parliament, forwarding memorials, and in other ways bringing its influence to bear and making it felt for better legislation in the interests of labor and economic and social reform. The secretary is Miss M. Llewelyn Davies. *Address*: Kirkby-Lonsdale, England.

COOPERATIVE PRODUCTIVE FEDERATION. See Labor Copartnership.

COOPERATIVE STORES IN THE UNITED STATES: No trace of the establishment of cooperative stores in the United States is to be found prior to the organization of the New England Association of Farmers and Mechanics in 1831. This was composed of many of the local labor organizations formed at that time, and at its first convention it enthusiastically indorsed the application of cooperative principles. Other organizations took part in the agitation for the establishment of cooperative stores, with the result that several short-lived attempts were made in different parts of the New England States.

Out of the Boston division of this association grew what was later known as The Workingmen's Protective Union of America, organized for the collective buying and selling of merchandise. The association spread rapidly, and 106 divisions were in existence in 1850.

Early Attempts

A purchasing agent was located in Boston, and to him were sent orders to be filled and produce to be sold. The business of the union amounted to $112,507 in 1848, $220,801 in 1849, and $535,338 in 1850. In 1849 its name was changed to The New England Protective Union. Eighty-three of the 106 divisions had in 1850 a membership of 5,109, and eighty-four of them reported a capitalization of $71,890. During the last four months of that year, sixty-seven divisions purchased over $102,000 worth of goods, and in the first nine months of 1851 this amount was further increased to $620,000. In 1852 the number of divisions had grown to 413, with the sales of 167 amounting to $1,696,825. With the disruption of the organization in 1853, The American Protective Union was formed, and from 1853 to 1858 the latter society transacted an annual business varying in amounts from $1,000,000 to $1,536,000. With the approach of the Civil War, decay and disintegration set in, and within a short time the organization had disappeared.

During the next few years, altho cooperation as a movement was dead, nevertheless several stores existed and were fairly successful, while one or two new ones were organized in various parts of the Eastern states. Throughout the "sixties" trade magazines make mention of meetings held for the discussion of cooperation, and of calls being made for lectures and information. From 1863 to 1866 thirty-six stores were started in ten of the Eastern states. In 1864 the Rochdale methods were introduced into the U. S. by the members of a Philadelphia cooperative store who had obtained the constitution and by-laws of the original Rochdale association. The store was fairly prosperous for a time, but soon failed owing to lack of business knowledge on the part of the cooperators.

The first labor organization of national importance to declare itself as being favorable to the organization of cooperative stores and workshops was the National Labor Union organized in Baltimore in 1866. This association lived for but a few years and consequently had no effect whatsoever upon the cooperative movement.

The National Labor Union was followed in 1867 by the organization of the Patrons of Husbandry, or "The Grange," as it is often called, a secret order formed among the farmers for their mutual benefit. From the very nature of its conception, i. e., mutual helpfulness among the farmers, the Grange was a society based upon cooperation. According to its constitution it was organized for the establishment and extension of cooperative principles among the agricultural classes. One of the first methods which it adopted to carry out this policy was to have all the members of the Grange concentrate

Patrons of Husbandry

their orders upon a certain manufacturer or wholesaler, with the understanding that they were to receive a discount on their trade. The plan was comparatively successful for a time, but soon aroused the determined opposition of the local retail merchants, who often induced the manufacturers and wholesalers to cease trading with the Grangers. The local branches of the order then banded together and supported a state purchasing agent, to whom were sent all the orders of the subordinate associations, and who was thus enabled to buy in car-load lots and at greatly reduced prices. Confidential lists, bearing the names and prices of those firms from which discounts could be obtained, were sent to the local granges. Orders were then made up from these lists and were sent to the purchasing agent. The business of these agencies was enormous. Thus, in one year that of the Ohio Grange amounted to almost $1,000,000, and in Indiana it was no uncommon occurrence to have the day's receipts of the agency exceed $1,000. At one time the Grangers had five steamboat lines, thirty-two grain elevators, and twenty-two warehouses to assist in their system of cooperative buying and selling. Dissatisfaction with the state agencies arose, however, and in a short time many of them were abandoned.

But during the years just preceding the abolition of the agencies another form of cooperation began to attract the attention of the Grangers. This was the establishment of cooperative stores.

Grangers

As early as 1874 six granges in Wisconsin had united to form a mercantile association with $5,000 stock. During the first year of its existence it transacted a business of over $12,000. Stores sprang up in almost every city in which local granges were located. In Illinois at one time there were Grange stores in one half of the counties. In Massachusetts in 1875 there were fifteen associations with a capitalization of $75,000 and with assets valued at $140,000. The sales of eight of these amounted to about $500,000 a year. There were also thirty dividing stores in Fall River, Mass., with about 1,500 members and an annual trade of $300,000. During this year several stores were also started in California. However, the enthusiasm of the Grange for cooperative stores died away with returning prosperity following the panic of 1873, altho in Missouri in 1880 there were fifty-seven Grange stores together with a state purchasing agency, while in Texas in 1885 there still remained a Grange wholesale house run in connection with 150 cooperative stores. To-day only a few of the stores established by the Grange remain. Altho but temporarily successful, nevertheless the Grange stores did great and good work. They not only succeeded in saving the farmers millions of dollars on their purchases, but they were also greatly instrumental in lowering the prices of articles to those who were not members of the order.

Shortly after the reaction against the Grange had set in, another order came forward, having as its motto the word "Cooperation." This was the order of The Sovereigns of Industry, organized in 1874, with the purpose of doing for the factory-workers what the Grange had done for the farmers. At first it also pursued the methods followed by the Grange, and established state purchasing agencies, but these soon gave way to the formation of cooperative stores. The national council of the order, by printing and distributing thousands of pieces of literature dealing with cooperative matters, encouraged the local councils to undertake the work. Stores owned and operated by the "Sovereigns" sprang up throughout the Eastern and Central states, but with the subsequent disruption of the national order the greater number of these stores disappeared. In 1875 there were forty-eight stores in Massachusetts with a capitalization of $30,268, and an average monthly trade of $26,250. In 1876 this number had decreased to thirty-nine. Half of these were joint-stock companies, seventeen did not deliver goods, twenty sold only to "Sovereigns," and twenty-two sold below the regular market prices. In 1877 but thirty of these stores were in existence.

The Industrial Brotherhood, organized in the early "seventies" for the purpose of federating all unions into a national body, also declared itself favorable to "the establishment of cooperative institutions, both productive and distributive." It lived for but a few years, and was soon succeeded by the Knights of Labor which had been formed in 1868, but which ten years later adopted in toto the platform and purposes of the brotherhood. The members of the Knights of Labor entered enthusiastically into the work of establishing cooperative stores, workshops, foundries, and various other enterprises, their aim being the complete destruction of the competitive wage system, and the introduction of one based entirely on cooperation. Very few of the stores and cooperative establishments started by them are in existence at the present time.

Farmers' Alliance

From 1886 to 1892 the Farmers' Alliance was active in propagating cooperative doctrines among the Southern farmers. Its members attempted to eliminate the middleman in the buying and selling of products by the establishment of a system of trade discounts similar to that followed by the early Grangers and Sovereigns of Industry. In 1890 it was estimated that the alliance transacted a business of more than $10,000,000. In 1886 a very complete investigation under the supervision of Prof. R. T. Ely disclosed the existence of eighty cooperative stores in the United States. Thirty-two of the fifty-three associations in New England reported a capitalization of $187,466; twenty-two of these had 5,470 members, while the total trade of the New England stores was estimated at $2,000,000. Seven of the associations outside of the New England states reported aggregate sales amounting to $357,674.

It was in 1886 that the first attempt was made to form a federation of the stores in and around Boston, but to no avail. During the next ten years there was but little activity in the cooperative world. In 1894 an attempt was made by Messrs. Barlow, Rhodes, Peabody, and Ely of Massachusetts to form a federation of cooperative associations. The Cooperative Union of America resulted, and was composed of fourteen societies. It published a paper, *The American Cooperator*, for a short time, but both ventures were soon abandoned, only to be followed in 1896 by The American Cooperative Union, a national federation of cooperative enterprises. This association was organized in St. Louis, July 1, 1896, but scarcely lived long enough to receive its name.

As a result of an investigation which he had made for the U. S. Department of Labor, Dr.

E. W. Bemis announced in 1896 that there were some seventy cooperative stores in the U. S. at that time, with a possible membership of 19,000, and with the sales of forty-one of the societies amounting to $2,372,000 for their 15,707 members. The next few years saw a slow and steady increase in the number of cooperative stores, encouraged as it was by no central organization or national movement, but by the desire of the people for lower prices.

It was on the Pacific Coast that the first successful federation of cooperative stores, The Pacific Coast Cooperative Union, was begun (Nov. 7, 1899). It was here that such great activity had been shown in the early years of the Grange and Alliance agitation. The union was formed for the purpose of studying and propagating cooperative ideas. On Jan. 1, 1900, the association established The Rochdale Wholesale Company of San Francisco, which since that time has played an important and indispensable part in the upbuilding of the strongest cooperative movement in the U. S. In this work it has been greatly assisted by a most efficient weekly (formerly monthly) paper, *The Cooperative Journal*, founded in 1900 and published at Oakland, Cal.

In 1900 The Cooperating Merchants' Company of Chicago, Ill., was organized. This corporation, composed of over 450 retail stores, some owned cooperatively and some privately, serves as a medium through which the constituent stores purchase their supplies, buying direct from the wholesaler and manufacturer. This company owns two large wholesale houses, and publishes its own monthly trade-organ, *Mixed Stocks*. In the same year The Right Relationship League was organized at Chicago for the purpose of propagating a certain kind of cooperative ideas. These consist in the establishment of stores in which there is an equality of ownership and voting power, a strict adherence to the principle of cash payments, provisions for the accumulation of a reserve and an educational fund, the payment of 8 per cent on the capital stock, and the apportionment of the remainder of the profits of the trade among the members on the basis of the amount of goods purchased. In 1901, 1903, and 1906 respectively, state cooperative federations were established in Kansas, Washington, and Pennsylvania.

In June, 1904, a national convention of the cooperators in the U. S. was held at St. Louis, Mo., resulting in the formation of The National Cooperative League, and in the establishment of a bureau to gather statistics dealing with the cooperative movement. The National Cooperative League indorsed the Rochdale principles, and established a uniform method for the organization of cooperative stores in accordance therewith. A second meeting of the league was held at Seattle, Wash., in 1905. The bureau of statistics proved to be of little if any value to the movement, and thus far has made no report of its activities.

National Convention

In 1904–5, Mr. Ira Cross, working under the supervision of the Wisconsin Bureau of Labor Statistics, made an investigation of cooperative distribution in the U. S. (See the "Twelfth Biennial Report of the Wisconsin Bureau of Labor and Industrial Statistics.") The following table gives the results of that investigation, the total returns only being given for each state. Group I. comprises the Eastern manufacturing states; Group II., the Southern cotton states; Group III., the Central grain states; and Group IV., the Western mining states. An asterisk at the head of the column denotes that in this column is placed the number of cooperative stores making returns upon that specific matter.

Judging from the returns received from these 170 establishments, the above 343 stores represent an estimated capitalization of $8,520,809, a membership of approximately 76,146 persons, and a trade of about $265,526,743.

The majority of these stores are largely patronized by farmers. Out of 124 stores answering the question as to whether the majority of their customers came from the city or the country, seventy answered from the latter, thirty-nine from the former, while the remainder stated that their trade was about evenly divided. The greater portion of the stores were originally begun on a cooperative basis. Credit was seldom given, and then only for a short time. Market prices were usually followed, and in no case were goods sold only to stockholders. In the majority of cases the effect of these stores was to lower prices of merchandise in their localities.

A unique development of the cooperative movement in this country is to be found in a number of so-called "College Cooperative Societies," connected either directly or indirectly with many of our higher educational institutions. Such associations operating cooperative stores are to be found at Yale, Harvard, Cornell, the Massachusetts Institute of Technology, Northwestern University, Amherst, Williams, the Ohio Wesleyan, Kenyon College,

* Store just being organized.
† This store was begun in January, 1905, and the returns are for the succeeding five months.
‡ Declares no dividends but sells all goods at cost.

Otterbein University, Miami University, and Worcester University, together with the state universities of California, Illinois, Michigan, Missouri, Ohio, Tennessee, Texas, and Wisconsin. In most cases, under judicious management, they have proven to be very successful and of the greatest benefit to the student body which patronizes them. No interest is paid on the shares of stock held by the students, but the profits of the societies are divided among these students upon the basis of the amount of goods purchased.

The preceding table presents the status of the largest of these stores at the close of the 1904–5 semester (June, 1905).

COOPERATIVE UNION, THE: The Cooperative Union is an organization of the associated trading societies in Great Britain under the Industrial and Provident Societies' Act. It has 1,230 societies in membership, their adherents aggregating 2,115,995, or 93.6 per cent of the total number of cooperators in the country. In addition to sustaining the propaganda work in districts as yet untouched by cooperation, the union pays special attention to matters of importance to the movement, and has special committees to deal with (*a*) education, (*b*) production, (*c*) international and foreign inquiries, (*d*) propaganda of a joint character with the Cooperative Wholesale Society, (*e*) the relations of societies to trade-unions, (*f*) parliamentary affairs, (*g*) exhibitions, and (*h*) cooperative defense, this latter committee having come into existence in consequence of recent attacks on cooperators at St. Helens and elsewhere in the north.

The Cooperative Union comes most prominently before the public in connection with the annual congress. *General Secretary*: J. C. Gray, J.P. *Central Offices*: 2, Nicholas Croft, High Street, Manchester.

COOPERATIVE WHOLESALE. See article COOPERATION, Section II.

COOPER, PETER: American manufacturer and philanthropist; born in New York City, 1791. He received a meager education, whereupon he entered the trade of carriage-making. Gradually, however, he took up one enterprise after another, with continuous success. In 1830 he established the Canton Iron Works, at Canton, Md., where he constructed from his own designs the first locomotives ever made in the United States. Soon after he established a rolling- and wire-mill in New York, and in 1845 he moved it to Trenton, making it the largest rolling-mill of the day in the U. S. He built three blast furnaces in Phillipsburg, and conducted other similar enterprises. Cooper was one of the chief supporters of the laying of the Atlantic cable and other important enterprises. Deeply interested in the free education of the industrial classes, he gave the money for and laid the corner-stone of the Cooper Union in 1854, and saw its completion in 1859, to be "forever devoted to the instruction and improvement of the inhabitants of the U. S. in practical science and art." He gave $200,000 as an endowment during his life, and $100,000 by his will. The original cost when he conveyed it to the trustees was $630,000. In 1876 Mr. Cooper was candidate for the presidency of the Greenback or National Independent Party, and received some 100,000 votes. He died in New York City, April 4, 1883. Among his writings may be mentioned: "Ideas for a Science of Good Government, in Addresses, Letters, and Articles on a Strictly National Currency, Tariff, and Civil Service" (New York, 1883).

COOPER, THOMAS: English author and editor; born in Leicester, England, 1805. The son of a poor widow, he learned the shoemaker's trade. At the age of twenty-three he opened a school in Lincoln, and a year later became a Wesleyan Methodist local preacher. In 1839 he went to London to engage in journalism, but finding little success, he later returned to Leicester and joined the Chartists. He published a newspaper in their interests, and was nominated for Parliament. He addrest many meetings and aroused great excitement. In one instance a riot occurred at Hanley after he left; and at Manchester military guards were placed in the street. He was arrested and taken back to Staffordshire on a charge of arson in connection with the Hanley riot, but he proved that he was not there when the offense was committed. He was then arraigned for conspiracy and sedition and tried before Sir Thomas Erskine, March, 1843. He defended himself eloquently, but was condemned to two years' imprisonment in Stafford jail, during which time he wrote the greater part of an epic, the "Purgatory of Suicide," dealing with the social and religious questions of the age. After his release he wrote several books of poetry and prose. He joined Mazzini's International League, but took no part in the Chartist agitation of 1848 on account of differences with O'Connor. For some time he lectured on political and historical subjects; and later, after having been a skeptic for ten years and a follower of Strauss in 1855, he changed his views and lectured against atheism. When his health broke down, W. E. Forster and Samuel Morley obtained for him a small annuity. In 1882 he published his autobiography. He died in Lincoln in 1892.

COPARTNERSHIP TENANTS' HOUSING COUNCIL, THE: Was established under the auspices of the Labor Copartnership Association. Its object is to help toward the solution of the problem of housing the people by means of the establishment of copartnership societies for tenants and by promoting the forming of the same.

Objects.—To aid in the solution of the Housing Problem by encouraging and promoting the establishment of Copartnership Tenants' Societies.

Methods.—To make the principles and work of such societies known by means of lectures and the distribution of literature.

To draft rules for registration, to meet the various conditions under which such societies may be established.

To give legal and other advice.

To centralize information as to plans, material, cost of construction, etc., so that small societies with limited capital shall not be put to the full expense in each case.

The council will take no financial responsibility, but will be willing to give advice in financial matters.

Henry Vivian, M.P., is chairman of the council, whose address is 22, Red Lion Square, London.

COPYRIGHT is the exclusive right to publish intellectual productions, such as books, papers, plays, paintings, sculptures, designs, music, photographs, etc.

The first copyright law of England dates from 1710. Before that date some exclusive rights of printing had been granted for limited periods. By the present law, intellectual productions in the United Kingdom have copyright during the life of the author and for seven years after his death, or for a term of forty-two years, whichever may be the longer time of the two. Foreigners have the same right by publishing in England.

In Germany laws for copyright begin in 1837. By the law of 1845 they can be extended to thirty years after the author's death.

In France copyright exists for the life of the author or his widow, for twenty years for his children, and for ten years for other heirs. The Belgian law is the same, except that all the heirs can hold copyright for twenty years after the author's death.

Copyright laws in the United States date from 1790 and at first pertained only to citizens or residents.. To-day copyright is given also to citizens of states granting reciprocal rights. It endures for twenty-eight years, with right of renewal for fourteen years. The Congress issues *copyrights* to authors and *patents* to inventors. All books, maps, charts, musical compositions, engravings, photographs (or negatives), chromos, statues, etc., whatever the subject may be, are included, and so are all inventions. There is no limitation to science in the strict sense of the word.

In Canada the right of copyright lasts for twenty-eight years and may be renewed thereafter for fourteen years. In order to be protected by this law an author of the United Kingdom must register his work in Canada and publish it there inside of a month of its having been published elsewhere.

Other British colonies possess local copyright laws peculiar to themselves.

International Copyright has been a slow growth, and is determined by the laws of each nation.

The English International Copyright Act provides that a work having been published first in any part of the British Empire is entitled to the benefit of the English laws just as if it had been issued first in the United Kingdom. Thus it follows that the work so published possesses copyright in those foreign lands which belong to the Berne Convention of 1887. By a convention in Berne in 1887, Great Britain and possessions, Austria-Hungary, Belgium, Denmark, France, Germany, Haiti, Italy, Luxemburg, Spain, Sweden, Switzerland, and Tunis formed an international agreement. Foreign books to receive copyright in the U. S. must have an edition manufactured in the U. S.

CORPORATIONS: A corporation may be defined, in general, as a body formed and authorized by law to act as a single individual in carrying out the purposes for which it is incorporated. It is the creature of the State, and can do only that which it is allowed to do by the State in the act which gives it birth, but within those limits it can act as freely as any individual. Corporations are usually divided into public and private corporations.

Over the former the legislature, as the trustee or guardian of the public interests, has the exclusive and unrestrained control; and acting as such, as it may create, so it may modify or destroy, as public exigency requires or recommends. . . . Private corporations, on the other hand, are created by an act of the legislature, which, in connection with its acceptance, is regarded as a *compact*, and one which, so long as the body corporate faithfully observes, the legislature is constitutionally restrained from impairing, by annexing new terms and conditions, onerous in their operation, or inconsistent with a reasonable construction of the compact. (*Angell and Ames on Corporations*, §31, ch. 1.)

Corporations are of comparatively recent growth. Says Professor Ely, in his articles on "The Growth of Corporations," in *Harper's Magazine* for 1887:

History

In thirty years, in the second half of the eighteenth century, only one corporation was formed in Massachusetts, and that was of an eleemosynary character. When Alexander Hamilton wrote his celebrated report on the establishment of the first United States Bank in 1790, there existed only three banking corporations in the United States. Some estimate that railway corporations own one fourth of the wealth of the country, but they did not begin to exist until more than half a century had elapsed after the promulgation of the Declaration of Independence. Gas companies, which have been so fruitful a source of corruption in states and municipalities, did not exist at all in the eighteenth century, and not in large numbers much before 1830. Manufactures were carried on in the last century in insignificant shops by men of little wealth and of no great social importance.

It was the general opinion a hundred years ago that corporations or joint-stock companies could not succeed, because they did not appeal to the stimulus of self-interest as much as private concerns, and therefore must go down in competition with them. The opinion of Adam Smith, in his "Wealth of Nations" (1776), is well known when he says:

The trade of a joint-stock company is always managed by a court of directors. This court, indeed, is frequently subject in many respects to the control of a general court of proprietors. But the greater part of those proprietors seldom pretend to understand anything of the business of the company. . . . The directors of such companies, however, being the managers rather of other people's money than of their own, it cannot well be expected that they should watch over it with the same anxious vigilance with which the partners in a private copartnery frequently watch over their own. Like the stewards of a rich man, they are apt to consider attention to small matters as not for their master's honor. . . . Negligence and profusion, therefore, must always prevail, more or less, in the management of the affairs in such a company. . . . That a joint-stock company should be able to carry on successfully any branch of foreign trade, when private adventurers can come into any sort of open and fair competition with them, seems contrary to all experience. . . . The only trades which it seems possible for a joint-stock company to carry on successfully, without an exclusive privilege, are those of which all the operations are capable of being reduced to what is called a routine, or to such uniformity of method as admits of little or no variation.

Nevertheless corporations, altho only comparatively recently of large growth, have existed at least some four hundred years.

To-day, however, the corporate field, particularly in the U. S., covers enterprises of every conceivable nature. Manufacturing corporations embracing every thinkable need or luxury of the human being, distributing concerns selling every kind and class of necessity and luxury in the lines of food, clothing, or what not, are carried on in the corporate form. Transportation methods of every kind, from the stage-coach to the powerful locomotive and electric engine, from the coal-cart to the automobile, are operated by corporations. Our department stores, our restaurants, our candy manufacturers, our theaters, our magazines and newspapers, the advertising in the street-cars, many of the metropolitan barber shops, the bootblack stands and the news stands and book stores, are operated by corporations. Not a large building is now

put up in American cities but that an enormous corporation puts in the foundation; another corporation erects the superstructure and still others put on the finishing touches, while usually a large realty or investing corporation owns and operates the building itself. The hats we wear, the umbrellas we carry, the clothes, all are shaped and produced to a large extent through corporate activity.

Not only is the corporate field diversified in the different classes of business and commercial undertakings, but it is also of gigantic scope and size. The estimated national wealth of the U. S. at the present time is in excess of $110,000,000,000, and it is estimated that of this total wealth, something like one half is owned in corporate form. If we eliminate agricultural wealth and confine our estimate to only the wealth represented in manufacturing, transportation, and like industries, we find that over eighty per cent of such wealth is in corporate form. The tendency at the present time is for the corporate growth to increase several times more rapidly than the growth of private concerns. This is due to the fact that not only do most new undertakings start under the corporate form, but the tendency of former private concerns to combine as they grow and enter the corporate form seems absolutely irresistible.

The following figures from *Moody's Manual* for 1907 not only demonstrate the great magnitude of the corporate field, but illustrate the pronounced tendency of the smaller concerns to combine with or become swallowed in the larger ones. For the year ended May 1, 1907, the *Manual* reports facts and figures on about 222,000 miles of steam railroad in the U. S., representing a combined par value capitalization in stocks and bonds, all of which is in the hands of the public, of about $13,900,000,000. These totals embrace 1,419 active, existent corporations, all of which have stocks and bonds outstanding in one form or another. Of this number of corporations, however, no less than 688, representing 196,429 miles of railroad and having outstanding $12,931,000,000 of stocks and bonds, are controlled by fifty-seven large corporations; and the remaining 674 companies, which are independent of control, represent only 25,588 miles and about $977,000,000 of capitalization. It will thus be seen that nearly 90 per cent of the railroad mileage of the country and more than 92 per cent of the par value capitalization of the railroad corporations of the country are embraced in the control of fifty-seven larger corporations or controlling systems.

Statistics

The facts and figures bearing on other corporate undertakings in the U. S. are also interesting, both as regards magnitude and tendency, and all serve to demonstrate the fact that businesses of every nature are year by year going into the larger corporate form. The figures given in the *Manual* for 1907, covering the street-railway industry, the gas- and electric-light industry, the telephone, telegraph, and other public utility undertakings, as well as the field of manufacturing and miscellaneous enterprise, show that over $20,000,000,000 of capitalization is to-day in corporations, the stocks and bonds of which in each individual case aggregate at least $500,000, and are more or less in the hands of investors and the public generally. Thus it will be seen that including the steam-railroad industry, represented by a capitalization of about $14,000,000,000, the aggregate amount of capital in corporate form in this country is approximately $34,000,000,000, without considering the many thousand smaller corporations of less than $500,000 capital and also the banking and trust companies and other financial institutions of like nature.

Contrary to a very general impression, the owners of corporate wealth in this country are not alone a few millionaires, but a multitude of small investors whose average holdings are probably less than $10,000 each. Many of these are $5,000 investors and still more of them hold less than $1,000 each. In 1905 the Interstate Commerce Commission reported that the railroads of the country then had 327,851 shareholders. As this estimate is necessarily inaccurate and incomplete because of the fact that thousands of stockholders do not have the certificates in their names, the truth probably is that there are at least double this number of holders. It is a well-known fact that the Pennsylvania Railroad system alone has had on its books as high as 40,000 stockholders. The number of holders of railroad bonds is entirely unknown, but should at least equal that of stockholders, thus giving us as a fair estimate in the neighborhood of 1,500,000 of investors in the steam-railroad industry alone. If we add to this 1,500,000 more to represent the number of investors in other corporate undertakings which are not private or close, we have in all about 3,000,000 investors who are the owners of the corporate wealth of the U. S. Of course, a proportion of these investors are outside of the U. S., altho what percentage is difficult to guess. If, however, we include all enterprises in which foreign capital would naturally enter, including mining undertakings, it would probably be fair to estimate 15 per cent of the above total as foreign, thus leaving approximately 2,550,000 persons to represent the ownership of the large corporate wealth of the country.

Shareholders

It should be pointed out that the above figures do not embrace the ordinary "close" corporations. The close corporation is different from the others in the fact that its entire stock is usually owned by a few individuals who are the actual managers of the enterprise itself. Thus it is, in effect, precisely similar to the old-style partnership as far as its responsibility to outsiders is concerned, and its success or failure in a financial sense therefore involves only those who are actively connected with it.

Concurrently with the rise of the modern corporation have come in various economic and social problems which would otherwise never have arisen. Under the old form of partnership the business man or firm usually found it necessary to either limit the amount of the business he might do to his personal financial capacity, or else make use of additional capital through the aid of a money-lender. Under the corporate form, however, securities are issued which produce the necessary capital to extend business and handle increased business, as well as to improve credit generally. These securities are of two classes, stocks and bonds. The stockholder stands in the same relation to the concern itself as did the old-fashioned partner, with the exception that the stockholder is not necessarily an active partner, and is not responsible for the

debts of the concern beyond the amount of his shares. The bondholder, on the other hand, stands in the same position as the old-fashioned money-lender; that is, he is a creditor and his loan is usually secured by some sort of mortgage on the property. The difference between a stock and a bond, therefore, is simply the difference between the owner and the loaner.

While the modern form of corporate enterprise has slowly evolved, and is an enlargement of the old partnership method, yet it has in modern times taken on features which were entirely unknown to the partnership. For instance, in the matter of capitalization, the stock company of to-day is usually capitalized far beyond the invested value of the undertaking itself. For instance, if a former partnership represents an actual invested cash capital of $1,000,000, and is showing a net profit to its owners of $400,000 per annum (which is not an unusual occurrence), when it is converted into a corporation its capitalization will be based not on the original investment, but on the earning power in connection with the current rate of interest, future prospects, etc. In this particular case, for instance, the capitalization of a corporation taking over such a business would not be less than $4,000,000, basing our estimate on the showing of earnings alone. Should there be other considerations, such as patent rights, franchises, or special conditions which would insure a steady future growth, the capitalization would be very much more than this; possibly twice as much. The bond issue alone which might be put on to such a property might run as high as $3,000,000 or $4,000,000. Thus has come in the custom of what is popularly known as "stock-watering." The difference between the actual invested amount of cash in the plant and the capitalization itself is generally understood to be the "water."

Capitalization

While stock-watering is generally regarded as a vicious practise and its elimination looked upon as a great remedy for the evils of corporate enterprise, yet, as a matter of fact, its elimination would not be a remedy at all, for the reason that stock-watering is not the evil itself, but simply one of the results of certain evils which are bound up in corporate as well as many other industrial and commercial undertakings in this and other countries. The capitalization of a corporation in the shape of stocks and bonds does not of itself have any effect on the relationship of the corporation with its customers or with the public generally. A corporation of $1,000,000 capital, for instance, cannot, by raising its stock certificates to $10,000,000, make any changes in the prices of its products unless some other factor enters in besides the mere one of the increase in the face value of its stock certificates. If it does so increase its capitalization, the actual value of its business will be no greater than before and the price of its stock certificates will of course depreciate accordingly. If, however, it increases its capital to represent some tangible acquisition which it did not possess before, then, but then only, it will have made a distinct gain in its assets. To illustrate this, the recent incident brought out by the Harriman investigating committee, of the increase in capitalization of the Chicago & Alton Railway some years ago, is worthy of mention. Prior to this increase in capitalization, the Chicago & Alton Railway had for years been growing in value as a result of the increase in population along its lines and general expansion of industry and commerce in that part of the country. Its terminals and all other assets had shown the natural and automatic increase to which all enterprises of this nature are heirs in a growing country like the U. S., but the old management had never discounted these increased values in the capitalization. When the Harriman interests took hold of the property, however, they immediately decided to capitalize the automatic growth in value of this railroad system and added approximately $60,000,000 in stocks and bonds to the former capitalization. In other words, prior to this time its "monopoly" or special privilege had not been capitalized, and all the Harriman interests did was to bring the face value of the securities of the Chicago & Alton Railway up to the current value of its monopoly or special privilege. They put no water into the property in the sense of trying to capitalize a vacuity, as is popularly stated.

Stock-watering

The remedy for corporate evils, therefore, does not lie along the line of prohibitive legislation in regard to the amount of face value in stocks or bonds which may be placed upon a property, but will be found rather through an examination of the conditions which enable the heads of corporations to issue vast amounts of securities, which, while not representing actual cash investment, do nevertheless represent something of a tangible nature. This tangible something may be patent rights, tariff protection, franchise privileges, or something else of an exclusive nature. Only when this feature of the situation is examined and analyzed will this vital problem of corporate capitalization be permanently solved.

Another condition which has been brought about by the change of industrial and commercial activity through the corporate form is the concentration of control of industry, commerce, finance, etc., without the same concentration of responsibility. That is to say, while it is necessary for the corporate manager in order to be successful to bear great responsibility, yet he is usually now more in the position of an employee than an owner. Under the partnership form the manager felt a financial responsibility and liability which he now seldom feels. He is usually employed under a large salary, and while the failure of the organization may involve him financially, yet not to the same extent as it will the great body of stockholders or bondholders, who must supply the necessary capital, and who unlike the salaried manager, get nothing in the shape of income until it is actually earned and can be drawn out of the business. It is, therefore, often the case that the corporation will be so managed as to benefit the officers and directors at the expense of the stockholders.

The foregoing situation is illustrated in many ways in modern corporate enterprise where conducted on a large scale. With corporate capitalizations running up into the billions of dollars and controlling entire industries, it is necessary to keep the control in close touch with large financial and banking interests. Thus the gigantic railroad, industrial, and public utility corporations of the U. S. are all managed from what is commonly known as "the Wall Street end." That is, the control of the companies, as represented in the boards of directors and officers, is all in the hands of the banking interests of the

country, who supply the necessary capital, combine the plants, form underwriting syndicates, float the securities, devise the plans of capitalization and stand at the forefront of the financial organizations. The boards of directors are usually chosen by the banking interests, and of course all matters of policy are either devised or approved by these same banking interests. Naturally the banking interests advocate policies which will serve to strengthen their control of the particular industries and conserve whatever special privileges the enterprises may have. The methods employed, while often of the best kind possible, do not universally result in the advantage of or even equitable treatment of the consumer.

A further result of large corporate enterprise is the necessity for the large privileged corporation to interfere with legislation. On the one hand we find a public sentiment very antagonistic to corporations generally, and on the other hand we find the corporations endeavoring, in one way or another, to influence and guide legislation. There is a reason for corporate interference with legislation which is a perfectly rational one. Inasmuch as practically all antagonistic legislation, which is favored by the public, is of the nature of attack on results and not on causes, and often, if carried through, has the vicious effect of doing harm in greater amount to the community itself than to the corporation, it is perfectly natural that the corporate managers of the country should regard the legislation as stupid, inane, and futile, and should use all means in their power to retard it. This condition of things will logically continue until people awaken to the fact that in attacking corporate forms and not special privileges, they are barking up the wrong tree.

Privileges

A word needs to be said in relation to the corporation as a field for actual investment of funds. Practically all investments, outside of those placed in real-estate bonds and mortgages, are corporation investments. There are two methods by which money is invested in corporation enterprises. These are direct and indirect. The person who places his investment directly in a specific undertaking, or through a banker or broker, is a direct investor. He personally becomes a stock- or bondholder in a corporation of his own choosing. But the man who deposits his money in a savings-bank, trust or insurance company, or state or national bank, is an indirect corporation investor. His money goes from the institution into an investment of some sort, where it earns the interest which he receives and possibly a little more. In the former case he sees his money at work; it stays presumably in the place where he put it. In the latter case he delegates the matter of actual investment—to the bank—which acts in the capacity of a trustee, and invests his money for him. And in both cases the money may easily be invested in the same enterprise. Thus, in the latter case, he may place his money in a savings-bank, and the bank may then invest it in New York Central Railroad bonds. In the former case he may himself, through an investment banker, purchase New York Central bonds. His money is in the same enterprise in both instances, the chief difference being that in one case he knows it and in the other he does not.

The growth of large corporate activity in the U. S. during the past twenty years is concisely reflected by the growth of Wall Street as a financial center. The stocks and bonds of all corporate enterprises are there dealt in in greatly increasing volume year by year, and where a generation ago the dealings in corporate securities were almost entirely confined to steam-railroad stocks and bonds, to-day they cover every conceivable form of corporate undertaking, and a great majority of the transactions in stocks and bonds, including those outside of the Stock Exchange, now represent corporate enterprises which are entirely independent of steam railroads. That this tendency will continue there seems to be little doubt, and that within the next generation all business undertakings of any size whatever will be in the hands of greatly enlarged and steadily growing corporate organizations seems to be almost certain JOHN MOODY.

CORRUPTION IN GOVERNMENT AND COMMERCE: In this article we consider corruption in the United States only, because, considered as a *social* factor in contradistinction from a question of individual ethics—and in this encyclopedia we are only concerned with the social aspect—corruption in commerce and government has admittedly developed in the U. S. as a social phenomenon, very much more than in any other civilized country. This is not to say that the average American business man, or even the average American legislator, is more dishonest than the average European. That is another question and would lead us far. There are many kinds of dishonesty. Hypocrisy, e. g., is not characteristic of America. Corruption in government in Europe is undoubtedly much more concealed than in the U. S., and much more common than many realize. Generalizations in morals are unsafe. Yet when all is said, corruption in commerce and government is undoubtedly carried on in the U. S. in a larger and, certainly, in a more open way than in Europe. It can, therefore, be best studied here and will cover and include almost every variety of corruption to be found anywhere, even tho some forms of corruption may be even more existent in other countries. We consider the subject under Corruption in Commerce; in Elections; in Municipalities; in Legislatures, State and National; Causes.

Corruption in Commerce

Corruption in commerce has, at least until recently, been generally considered far less frequent than corruption in governmental transactions. Many facts to-day, however, are leading people to question this view, and also to ask themselves if even the corruption in government is not largely due to the corruption of government by large and often most reputable corporate commercial interests and institutions. According to Mr. C. R. Woodruff, in his survey of municipal progress for 1904:

> The United States Fidelity and Trust Company is authority for the statement that in 1901 the banks of the country lost $1,665,109 from defalcations, and in 1902 $1,709,301, while the editor of *Midland Municipalities* is responsible for the statement that the loss of federal, county, and municipal governments from the same cause was $1,283,055 in 1901, and $1,067,789 in 1902. So that for these two years the employees and officers of banks defaulted in the amount of $1,024,569 more than did all the public officials in the country. These figures do not take into consideration all the forms of governmental corruption, but they do not all the forms of commercial corruption. They cover solely one form of dishonesty, but show that the average run of public office is as honest—yes, a little more so—than the average run of bank officers. As the editor of the *Midland Municipalities* pertinently remarks, "The fact is that neither the bankers nor the offi-

cials are as a class dishonest, but, on the contrary, look after the interests in their care much better than the average man looks after his business. With the vast sums handled each year by the officials or the banks, the amount lost in defalcations is exceptionally small, so small that when compared with the whole they are hardly worth notice, much less an excuse for general condemnation."

Defalcation, however, is but a single form and probably a minor form of commercial corruption. Bribery and adulteration of goods, the dishonest manipulation of stock, stock-watering, stock-gambling, the falsifying of accounts, the misrepresentation of values, the obtaining of "graft" (or unearned and dishonest participation in financial transactions) is much more common. For ADULTERATION OF FOOD, STOCK-WATERING, and STOCK-GAMBLING, see those subjects.

A writer in the *Independent* (Sept., 1904), who is stated to be a business man of responsibility and large experience, but who for obvious reasons does not sign his name, gives many concrete illustrations of corruption in commerce. He says:

The growth of large corporations, where the buying is separate from the ownership, where the buyer's personal interests may be worked on if he is at all susceptible to corruption or blinded if he is not very shrewd, has opened the business field for the Old World diplomacy of intrigue and corruption, and corruption flourishes there in a way that few appreciate. There is no publicity of the corruption. When the heads find it out they may remedy it, but that is all and they keep it quiet. . . . This corruption is rapidly growing.

As an instance of one form of corruption he quotes the following from a New York buyer:

"Of course I give presents, or, if you prefer to call it so, commissions and bribes. You can't do business in any other way. I'm not paid a salary of $10,000 a year to hesitate at a little check-giving, when I can't get the business otherwise. They all do it. You know the case of Brown, who bought for A. & B. (mentioning one of the largest department stores in New York City). He used to turn over to C. & D. (a prominent manufacturer of cloaks and dresses) business to the amount of $300,000 or $400,000 a year. They gave him a brown-stone house up-town in New York, where he lived for years. Every one knew it, and it is said that both A. & B. knew it at the time, but they said they did not care if Brown did get houses and money, that he had made his department pay big profits and that was what they looked at. Later on C. & D. actually made Brown one of the partners in their firm, so that he shared in their profits, and he was still the buyer for A. & B."

Later, when others had talked, he said: "I have an understanding with my house that I can draw up to $25,000 a year and no questions asked. I always carry several thousand dollars with me." And here he showed a roll of bills. "Oftentimes I meet a squeamish cuss and have to handle him with gloves. I'll get him around to my hotel in the evening and we'll have drinks and cigars served and a little game of poker; of course I always lose. Nothing is said, but I book a good-sized order before I go, and really that is one of the cheapest methods; when the man comes right out and asks for money then I usually have to pay a big price."

In Ordinary Business

Foremen in factories are often bribed to demand certain brands of goods or certain articles for use in their factories. The corruption or "graft" in real estate deals has become notorious. The use of blackmail in the lesser press of the country and of paid editorials and "fake" telegraphic reports in the larger papers is well known. The use of more or less fraudulent advertisements is almost universal. The prices put upon articles in stores has often little or no relation to the cost of production. These are but a few instances of dishonesty in ordinary commercial proceedings. Very many business men believe it is impossible to-day to conduct business with strict regard to truth.

When one comes to the larger commercial transactions, corruption is, if possible, still more prevalent. Says Mr. N. O. Nelson:

The exposures are fresh in mind of the boodlers in St. Louis and Philadelphia, of the meat packers, and the insurance officers and directors, and Wall Street financiers. Were these, like ordinary crimes, the occasional lapses of individuals, they would have little or no weight. *But the remarkable thing is that wherever the probe happens to be inserted, the same condition is found.* Everywhere, in every case, every railroad, every packer, every valuable franchise, every life-insurance company, every tax return that has been investigated, has been found lawless, perjured, brazenly rotten, when judged by either legal or moral standards. Did not the statute of limitation intervene, Mr. Folk, Mr. Hughes, Mr. Jerome, and Mr. Hitchcock could be kept busy the remainder of their days, and could every day give material for yellow head-lines. It is the yellow history that is at fault, not yellow journalism.

Corruption in Corporations

Life-insurance companies supposed to be the most reputable have been found to have altered their books overnight, to avoid the requirements of the law. The New York Life-Insurance Company was declared to have paid their "legislative agent" $416,927 during five years, besides $235,000 for which no receipt was given, and $134,000 for personal use. The president of the Metropolitan could borrow $80,000 of his and other companies at 1½ per cent. Mr. McCurdy, president of the Mutual, received a salary of $150,000 a year, and his son $30,000, besides $91,766 in commissions, while his son-in-law, Mr. Thebaud, received $147,687. (See INSURANCE.) The investigation of the Pennsylvania Railroad, considered by many one of the best managed roads in the country, showed department officials receiving large sums for granting illegal favors to certain companies. The revelations of Mr. Thomas W. Lawson in his "Frenzied Finance" have been discounted but never answered. Mr. Henry D. Lloyd, after his sensational but substantiated exposure of the Standard Oil's dishonest and corrupt methods, became convinced that he was but attacking individual cases of a uniform system, and the question arises: What great corporation's money is not tainted?

The evil has not grown in a day. As long ago as 1871 Charles Francis Adams, since himself president of a great railroad organization, wrote ("Chapters on Erie"):

The system of corporate life and corporate power, as applied to industrial development, is yet in its infancy. It tends always to development, always to consolidation; it is ever grasping new powers or insidiously exercising covert influences. Even now the system threatens the central government. . . . The belief is common in America that the day is at hand when corporations far greater than ever—swaying power such as has never in the world's history been trusted in the hands of mere private citizens, controlled by single men like Vanderbilt, or by combinations of men like Fisk, Gould, and Sage—after having created a system of quiet but irrepressible corruption, will ultimately succeed in directing government itself. . . . It is a new power for which our language contains no name. We know what aristocracy, autocracy, democracy are, but we have no word to express "government by moneyed corporations."

In 1895 Judge William J. Gaynor of the New York Supreme Court, writing to the St. Louis Mercantile Club a letter for Jefferson Day, said:

The untold millions of sham, dishonest, and oppressive paper stock and bonds now existing in this country, issued generally upon rights and privileges conferred by law gratuitously, and to pay dividends and interest upon which it is proposed to sap agricultural, mechanical, manufacturing, mercantile, professional, and all other honest industry, may well be the subject of grave thought by those who meet to recur to and keep alive principles which are wholly antagonistic to such a condition, and which cannot be said to be paramount while such a condition exists.

In 1904, Supreme Justice David J. Brewer, addressing the Albany Law School, June 1, said:

To-day's great temptation to the lawyer as a lawmaker comes from the marvelous development of corporate interests. The corporations themselves are colossal in size, alluring by

the magnitude of their achievements, tempting not merely by the money they possess and with which they can reward, but more by the influence they can exert in favor of the individual lawmaker in the furtherance of his personal advancement. No one can be blind to the fact that these mighty corporations are holding out most tempting inducements to the lawmaker to regard in lawmaking their interests rather than the welfare of the nation. Senators and representatives have owed their places to corporate influence, and that influence has been exerted under an expectation, if not an understanding, that by them as lawmakers the corporate interests shall be subserved. I am not here to deny the value of corporations. I realize the magnitude of the work that is possible through such combinations, and I do not deny their right to be heard before any legislative body in defense of their rights or in furtherance of their interests. But the danger lies in the fact that they are so powerful and that the pressure of so much power upon the individual lawmaker tempts him to forget the nation and remember the corporation. And the danger is greater because it is insidious. There may be no written agreement. There may be in fact no agreement at all and yet when the lawmaker understands that the power exists which may make for his advancement or otherwise, that it will be exerted according to the pliancy with which he yields to its solicitations, it lifts the corporation into a position of constant danger and menace to republican institutions. I do not mean to insinuate that all legislators are influenced thereby. On the contrary, I know there are many and I trust they are a large majority who stand in the full integrity of their being, acting always in accordance with their judgment of the best interests of the nation; but within the limits of our profession, as elsewhere in the world, are many weak characters who, while they might not deliberately do a dishonest thing or deliberately prove false to an oath or obligation, yet yield to the pressure of corporate interests, deluding themselves with the idea that those interests are synonymous with the interests of the nation.

Justice Brewer

As example of very recent commercial corruption we quote from a public letter of Mr. R. R. Bowker (until recently manager of the Edison Electric Company), addrest to Governor Hughes. Speaking of his company he says:

There was the prospect of a condition under which the company could reduce the rate to one half of what it formerly had been and yet could pay a 10 per cent dividend. In the mean time, by semipolitical movements, Mr. Anthony N. Brady, with ex-Mayor Grant and a well-known trust company, had organized a company, bought the franchises of a petty lighting organization, and made a deal "with the late W. C. Whitney, then in control of the Metropolitan Street Railway Company, for the supply of its 'surplus electricity,'" tho the Metropolitan Company had need for all its electricity. Thereupon the hint came from a director common to both the Metropolitan and Edison companies that the sale of the Edison Company would be wise. Deterred from opposition by the fear of the political power of Mr. Whitney and others, the directors acceded. Mr. Bowker had to choose between opposing the deal and getting the best possible price for the stockholders. He himself sacrificed the opportunity to dispose of his own stock at a high price. The company was greatly overcapitalized by an excessive issue of bonds, which were marketed, if not illegally, at least by a palpable evasion of the law. The order reducing the rates was rescinded. In the midst of these transactions there was a "Wall Street whirl," and a financial battle between the various interests contending for the lighting monopoly and its vast profits. Finally, peace was made by consolidation; the Brady-Whitney interests were absorbed and were represented on the gas board. The final result has been that the Consolidated Gas Company is now entire master of the gas and electric lighting of New York City, both public and private. Mr. Bowker says that since the consolidation he believes that the management has dealt fairly with the public. "But the facts remain," he adds, "that it was, and is still, possible to juggle with great properties in the most unscrupulous manner, and that the consumer is required to pay a price that will produce earnings on three times the capitalization needed by the industry." —*The Outlook*, May 4, 1907.

New York Gas Monopoly

As a sample of management of railroad corporations we quote from the *Independent* of May, 1907, as to the Chicago & Alton Railroad:

A syndicate composed of Mr. Harriman, Mortimer L. Schiff, James Stillman, and George J. Gould bought nearly all the stock of the company. Within six years, under their management, the capital stock was increased from $40,000,000 to $122,800,000, altho only $22,000,000 was spent for improvements. Large quantities of bonds issued by the syndicate were virtually sold to the syndicate at sixty-five and then marketed at from ninety to ninety-six, a considerable part being taken by the great life-insurance companies. The controlling owners also declared and paid to themselves a dividend of 30 per cent. The profits of these transactions appear to have exceeded $24,000,000. In due time 103,000 shares of the Alton stock were sold to the Union Pacific. The testimony showed that heavy commissions, amounting to several millions, had been paid to the affiliated banking-house for its services in handling securities.

Corruption in Elections

The corrupt use of money in elections is almost as old as elections themselves. Such corruption in Great Britain, where it was once rampant, as well as in Canada and on the Continent of Europe, has been checked by efficient CORRUPT PRACTISES LAWS. But in the United States, tho perhaps now less openly than formerly, corruption still exists very widely spread, while the amounts of money spent in elections have generally risen.

A series of articles by Mr. John G. Speed in *Harper's Weekly* (1905), and mainly based on studies of conditions in the last presidential election, shows the evil as great as ever. In industrial states like New Jersey and Connecticut, with portions of New York, he finds that 25 per cent of the vote was bought. In states surely Republican or surely Democratic less sums are spent, but in close states like Indiana he estimates that both parties spent in that election $600,000. The retiring governor of that state, Colonel Durbin, declared that the revelations of corruption were "astounding." Smaller states, like Rhode Island, are "pocket boroughs" owned by party bosses. In Maryland he estimates that $200,000 was spent and a similar amount in West Virginia. In Montana, in the investigation for corruption which deprived Senator Clark of his senatorial seat in 1899 (tho he has been elected since), it was shown that as high as $50 was paid for an ordinary vote and for a vote in the legislature $1,000. In New York City in close wards, as high as $10 or even $25 is paid for votes. Ordinary prices are exprest by the saying "$2 for a negro vote, $2.50 for a dago, $3 for an American." A presidential election in New York City is said to mean the expenditure of $574,000 dishonestly and nearly as much more for legitimate expenses. In each of the last two mayoralty campaigns in New York City over $800,000 was spent. These expenses are largely levied by the party machines upon the candidates and are contributed to even more by the corporations which expect and demand therefor the granting of franchises, favorable legislation, exemption from unfavorable legislation, or reductions in taxation, etc. Senator Platt testified that an insurance company like the Equitable usually gave $10,000 a year to his machine as its ordinary political assessment, and more if it expected unusual favors. A small railroad paid Tammany $50,000 for certain favors. Candidates are assessed at a fixt ratio upon value of their offices. For Supreme Court judgeships $50,000 and even $100,000 has been paid. The system is not new.

Corrupt Voters

The president of the Sugar Trust, before a special committee of the United States Senate, testified that this "politics of business" was the custom of "every individual and corporation and firm, trust or whatever you like to call it" (Senate Report No. 485, Fifty-third Congress, second session, June 21, 1894). Asked if he contributed to state campaign funds, said: "We always do

that. . . . In the State of New York, when the Democrat majority is between 40,000 and 50,000, we throw it their way. In the State of Massachusetts, when the Republican Party is doubtful, they probably have the call. Wherever there is a dominant party, wherever the majority is very large, that is the party that gets the contribution, because that is the party which controls local matters" (Supplemental Report of Senator W. V. Allen of the Senate Special Committee (ordered May 17, 1894) to investigate alleged attempts at bribery by the Sugar Trust).

The handling of election money has been reduced to a system. Professor Jenks, investigating the system in 1892 (and the main methods have not changed), says:

> Doubtful voters will not be divided carelessly into "blocks of five, and each block put into the hands of a trusty man," but each doubtful voter, being known, with his habits, his work, his associates, is considered individually. If he is one whose vote can be affected by honest persuasion, the man in the party who would be likely to have most influence with him is selected to work with him, and to influence his vote by fair means, if possible. If he is a man whose vote must be purchased, he is assigned to the worker who can purchase him to the best advantage. If the number of "floaters" or "commercials" as they are variously called, is relatively large to the number of workers, it may well be that they will have to be purchased in blocks of fives or blocks of tens; or, again, owing to social reasons, they at times can best be bought in groups or clubs, or traded; but in all cases where the best work is done, each individual "floater," whether bought singly or as one of a group, is looked after personally by the man best competent to handle him.

For electoral corruption in New York City, see TAMMANY. To Philadelphia, however, is usually given the palm of the worst electoral corruption, tho in Western cities like Denver ballot-box stuffing has perhaps been more open. Philadelphia, however, with 47 per cent of its citizens native born, and the so-called "city of homes" has had at least more persistent ring-rule than any other. Its "machine" has been the most daring. A report of the Municipal League says:

Philadelphia

> The assessor of a division kept a disorderly house; he padded his (voting) lists with fraudulent names registered from his house; two of these names were used by election officers. . . . The constable of a division kept a disreputable house; a policeman was assessed as living there. . . . The election was held in the disorderly house maintained by the assessor. . . . The man named as judge had a criminal charge for a life offense pending against him. Two hundred and fifty-two votes were returned in a division that had less than 100 legal votes.

The assessor pads his list, it is said, with the names of dead dogs, children, and non-existent persons. Repeating is done brazenly and most openly. The officers of the league have published a booklet of cases of policemen helping to beat off citizens and election officers trying to do their duty. Thousands of voters have stayed away from the polls declaring it was no use to vote, but have been recorded as voting for the machine.

It is not, however, only a question of the city. Says Professor Jenks (*Century Magazine*, Oct., 1902): "The probability is that, all things considered, in such a state as New York the farmers are as corrupt as the residents of the cities."

Municipal Corruption

Among the best studies of municipal corruption in the U. S. have been the articles in *McClure's Magazine* by Mr. Lincoln Steffens and republished as "The Shame of the Cities" (1904) and "The Struggle for Self-Government" (1906). From these articles we condense the following statements:

St. Louis

St. Louis' municipal corruption, tho long known locally, came to general attention through the fearless exposures by Mr. (now Governor) Joseph W. Folk, as circuit attorney. He showed how Charles H. Turner, the millionaire president of the Suburban Railway, used $135,000 to buy the (municipal) House of Delegates; how one member of the House of Delegates made $25,000 per year; how a councilman was paid $50,000 for a vote on a single measure; how a franchise bill was carried over the mayor's veto by the expenditure of nearly $300,000, and then within a year sold to Eastern capitalists for $1,250,000. Out of this deal grew the St. Louis Transit Company. Mr. Steffens shows how even after conviction many of the boodlers felt so secure as to go right on with their corruption. "In the House of Delegates sit, under sentence, as follows: Charles F. Kelly, two years; Charles J. Deeny, three years and five years; Henry A. Faulkner, two years; E. E. Murrell, state's witness, but not tried. Nay, this house with such a membership had the audacity to pass an appropriation to enable Mr. Folk to go on with his investigation." Finally, Mr. Folk reached Colonel Edward R. Butler, the "boss" of the whole system of corruption, and unearthed his methods. Mr. Steffens tells us how this Colonel Butler, an Irishman by birth and a horseshoer by trade, wearing his apron in the '70's, became first the boss of his ward, then got the city railways to buy a certain patent horseshoe, and, making money, developed into the boss of his party, at times almost openly marching up repeaters to vote his party ticket. He next worked through both parties and made boodling his profession. He sold franchises and privileges at regular prices. It was alleged at the trials that every transportation and public convenience company that touches St. Louis had dealings with Butler's combine. Some paid him a regular salary, others a fee; others an interest in their concessions. Tho he "sometimes could rent or own the mayor, he preferred to be independent of him, so he formed in each part of the legislature a two thirds majority—in the Council nine, in the House nineteen—which could pass bills over a veto. These were the 'combines.' They were regularly organized and did business under parliamentary rules." Choosing their chairman they would meet and decide for how much they would enact certain bills or grant franchises. Butler got the most and became a millionaire two or three times over. Dissensions, however, arose as to the division of the plunder. Cliques arose which had to hire "trailers" to follow their agents, while Butler had to hire men to betray these. All decency was gone. Nevertheless, boodling was good business and boodlers from St. Louis would visit Chicago, Cleveland, and Pittsburg, to learn what new forms of graft had been invented, while boodlers from those cities would visit St. Louis. Every bit of city property was sold or offered for sale for graft. A St. Louis banker estimated that the combines sold (gave away so far as the city was concerned) $50,000,000 of franchises or assets. Mr. Folk, however, finally got evidence against Colonel Butler through a division in the ring. The men skipt to Europe and elsewhere to avoid indictment and giving evidence. Butler was convicted, but went on with his corruption; his son was nominated for Congress, and the Supreme Court of Missouri reversed the judgment, as indeed it did gradually with all the boodle cases. The municipal corruption was shown to involve state corruption, and also the leading citizens and practically every large corporation in St. Louis. Mr. Steffens names the St. Louis Transit Company, first and foremost, the Western Union Telegraph Company, the Missouri Pacific Railroad, the St. Louis & San Francisco, the Iron Mountain & Southern, the Sugar Refining Company, the American Book Company, the Royal Baking Powder Company, among others. Through the confession of Governor Lee, who was trapped, U. S. Senators like William J. Stone, and the highest officials were involved. The result has been to some extent the purification of the state, the election of Mr. Folk as Governor, a municipal administration mainly honest. But the criminals have been let off, what convictions were made have been reversed, and the end is not yet.

Colonel Butler

Corporations

Minneapolis

Municipal corruption in Minneapolis, according to Mr. Steffens, has taken mainly the form of the corruption of the police in connivance with the mayor, "Doc Ames" being the leading corruptionist. Albert A. Ames, an M.D. before he was twenty-one and of good Puritan stock, began his professional life by being free and easy and popular with all, rich and poor, the evil and the good. Drifting into politics, he gained several offices, and then was elected mayor, once as a Republican, and later twice as a Democrat. He broke with his own family in a disgraceful way, but was again elected mayor (1901) and began a career of deliberate and shameless corruption. He organized a city government of thieves, gamblers, confidence

men, to work under police direction; for the profit of his administration. His agent systematically collected graft from gambling-dens, thieves, and houses of prostitution. The owner of a house of evil repute was captain of police with "no duties except to sell places on the police force." Laws were passed forbidding vice and then vice was permitted for a consideration. Pedlers and pawnbrokers had to pay graft. Ames declared that the police collected too much from the houses of ill-fame and ordered that they collect only every other month, it being discovered later that his private agent collected the alternate months. All this was more or less known in the city, but little effective work was done till 1902, when an effort led by Hovey C. Clarke finally broke up the corrupt ring, many of the ring, however, escaping by flight, Mayor Ames, himself under indictment and heavy bonds for extortion, flying by night out of the state.

Pittsburg

Corruption in Pittsburg, Mr. Steffens tells us, has centered around its local boss, Christopher L. Magee, an American, made, thro private pull, cashier of the city when he was twenty-one. Says Mr. Steffens: "The railroads began the corruption of the city. . . . The municipality issued bonds to help the infant railroads to develop the city, and, as in so many American cities, the roads repudiated the debt and interest and went into politics. The Pennsylvania Railroad was in the system from the start, and as the other roads came in and found the city government bought up by those before them, they purchased their rights of way by outbribing the older roads, then joined the ring to acquire more rights for themselves and to keep belated rivals out. As corporations multiplied and capital branched out corruption increased." It was under this situation that Magee got his power. A man of great natural popularity, and working with William Flinn, a Protestant of Catholic stock, he spent months in New York studying Tammany's methods, and then returned and organized Pittsburg. Magee worked for fame, Flinn for wealth. Getting the control of his party (Democratic) in the city and then in the county and working with Republicans when necessary, he cemented his power by favors to corporations and individuals. There

The Ring

were ring banks, ring trust companies, ring brokers. The Pennsylvania Railroad stood in with the ring and the city interests were sacrificed to give it exclusive freight traffic. But Magee needed state power; so he stood in with Matthew S. Quay and Quay with him. Magee was elected state senator, being nominated by both parties and elected unanimously. Pittsburg was turned over to Quay by Magee and Flinn. There was graft, of franchises, public contracts, vice, and public funds. Magee and Flinn mainly working in the two first ways, tho the vice graft alone was valued at $250,000. Magee got the Councils to give him railroads and he capitalized them for $30,000,000. Finally the Municipal League commenced a fight to beat the ring in the election of 1896. A paper read by Mr. McClintock before the Municipal League said: "We found that prominent merchants and contractors who were 'on the inside,' manufacturers enjoying special municipal privileges, wealthy capitalists, brokers, and others, who were holders of the securities of traction and other companies, had their mouths stopped, their convictions of duty strangled, and their influence before, and votes on, election day preempted against us. In still another direction we found that the financial and political support of the great steam railroads and largest manufacturing corporations, controlling as far as they were able the suffrages of their thousands of employees, were thrown against us, for the simple reason, as was frankly explained by one of them, that it was much easier to deal with a boss in promoting their corporate interests than to deal directly with the people's representatives in the municipal legislature. . . . As one of them put it, 'If you want to be anybody or make money in Pittsburg, it is necessary to be in the political swim and on the side of the city ring.'" On the night of the election, the returns up to one o'clock in the morning showed George W. Guthrie, the reform candidate, far ahead. Then all returns suddenly ceased and a few days later the ring's candidate was officially declared elected. An appeal to the court for a recount was denied.

The Pittsburgers then tried for a new charter from the state legislature, giving the citizens control of the city. Quay promised to have it passed. But Quay wanted to be elected to the U. S. Senate. The ring supported him. He was elected and Pittsburg did not get its charter. In 1902 a reform movement won the election; Magee died; but a new boss was discovered to have gained the power.

Philadelphia

Some of Philadelphia's electoral methods we have seen above. Says Mr. Steffens of Philadelphia's corruption: "There is nothing like it in the country except possibly in Cincinnati."

In 1885 the citizens revolted and adopted a good charter, with the Bullitt law which went into effect in 1887, giving the mayor vast powers and believing that electing an honest mayor would secure a good administration. Since then things have been as bad as before. According to Mr. Steffens, the machine is not merely municipal, but state and national. All the power of the Republican Party and Republican city, state, and national patronage is made use of to keep it in power, with Senator Quay and his successor, Senator Penrose, at the head of all. Mr. Quay at times used the reform law to keep in check certain local bosses, as when he put down Boss McManus and put Dave Martin in his place, but the people got no benefit. Martin took away much of the loot from the ordinary ward heelers and party office-holders and gave it to a firm which he stood in with, Filbert & Porter. They got almost any contract they desired, with the appearance of legality, as their bid was always considered "lowest and best." Martin had under pay in office at least 15,000 men and women, each capable of delivering many votes. In with Mr. Quay stood—according to Mr. Steffens—the Standard Oil Company, Cramps' Shipyard, the Steel companies, with the Pennsylvania Railroad at their head, and other public utility companies following after. They got franchises, privileges, exemptions, and Martin's bosses could get his workers jobs from these companies as in a city department. Martin, however, finally fought Quay, and Quay put Israel W. Durham in his place. Martin nearly got Quay in prison. John S. Hopkins, cashier

State Ring

of the People's Bank, had let Quay and others have bank funds without collateral, Quay and the state treasurer leaving heavy state deposits with the bank. Quay, his son, and the state treasurer were indicted for conspiracy, but Quay got every kind of stay and postponement, till Judge Biddell ruled out the essential evidence on the ground of the statute of limitation. Mr. Wanamaker then, defeated in getting the second U. S. senatorship, fought Mr. Quay, but was defeated at every point, Mr. Quay naming Penrose as his successor and Penrose and Durham electing Samuel H. Ashbridge—"Star and Stripes Sam"—as Mayor of Philadelphia. Durham widened his ring, taking in James P. McNichol as preferred contractor and John M. Mack as promoter and financier. The Municipal League said of Ashbridge's administration: "Never before, and let us hope never again, will there be such brazen defiance of public opinion, such flagrant disregard of public interest, such abuse of powers and responsibilities for private ends." Corruption spread through every department. Teachers and principals had to have a pull to get appointment and were assessed "2 per cent" on their salaries for political purposes. Widener and Elkins, "the national franchise buyers," were in the ring. They had combined all the street railways of the city before 1900. Having got all they wanted from the ring they wanted to retire. But while they were on the ocean bound for Europe, the ring went to the legislature with two bills granting a charter for practically all the streets and alleys in Philadelphia not already covered by tracks (so as to be able to threaten Widener and Elkins with competing street-car lines and so blackmail them). The bills were introduced without notice at 3 P.M., May 29th, and were reported from the committee in five minutes; at 8.50 P.M. they were printed and on the members' desks and by 9 P.M. were passed on first reading. The next day they passed second reading, and the following day they were passed through the Senate with more trickery, and in six legislative days were signed, June 7th, at midnight in the presence of Senators Quay and Penrose, James P. McNichol, John M. Mack, and other capitalists and politicians of the ring. The next morning 100 charters were applied for under the law—thirteen of them for Philadelphia. A special meeting of the Philadelphia Select Council was called; a brief hearing was heard, but the charters were sent to Mayor Ashbridge to sign June 13th. The mayor's secretary promised authoritatively that he would not sign them that day. But Mr. John Wanamaker sent the mayor an offer of $2,500,000 for the franchises about to be given for nothing, and deposited $250,000 as guarantee of good faith. Mr. Ashbridge therefore threw the letter aside unread and signed the franchises before midnight.

The ring put through two more bills and then compelled Widener and Elkins to lease their lines to the new company representing the ring. The leaders of the ring were cartooned and so Durham, Quay, and Governor Pennypacker passed a libel law meant to muzzle the press. Mr. Weaver, a former notorious ring leader, suddenly broke with the ring and was elected as a reform mayor. For more recent developments, see Philadelphia.

New York

Of corruption in New York Mr. Steffens writes:

"Tammany is the embodiment of corruption. All the world knows and all the world may know what it is, and what it is after. For hypocrisy is not a Tammany vice. Tammany is for Tammany and the Tammany men say so. . . . Richard Croker said under oath once that he worked for his own pockets all the time. . . . The items are so incredible that I hesitate to print them. Devery told a friend once that in one year the police graft was 'something over $3,000,000.' Afterward the syndicate which divided the graft under Devery took in for thirty-six months $400,000 a month from gambling- and pool-rooms alone. . . . Yet this was but one department and a department that was overlooked by Tammany for years. . . . Tammany when in control of New York takes out of the city unbelievable millions of dollars a year. . . . The Tammany clique of financiers have knocked

down and bought up at low prices Manhattan Railway stock by threats of the city's power over the road; they have been let in on Metropolitan deals and on the Third Avenue Railroad grab; the Ice Trust is a Tammany trust; they have banks and trust companies, and through the New York Realty Company are forcing alliances with such financial groups as that of the Standard Oil Company. Croker shared in these deals and businesses. He sold judgeships, taking his pay in the form of contributions to the Tammany campaign fund, of which he was treasurer, and he had the judges take from the regular real estate exchange all the enormous real estate business that passed through the courts and give it to an exchange connected with the real estate business of his firm, Peter F. Meyer & Co. This alone would maintain a ducal estate in England. But his real estate business was greater than that. . . . Some of the richest graft in the city is in the Department of Buildings; $100,000,000 a year goes into building operations in New York. . . . Architects and brokers had to stand in with the department. . . . The Dock Board has exclusive and private and secret control of the expenditure of $10,000,000 a year. . . . It is very large graft and the new Tammany leader, Charles Murphy, had it. . . . Tammany leaders are usually the natural leaders of the people. . . . Their charity is real at first. But they sell out their own people. They do give them coal and help them in their private troubles, but as they grow rich and powerful, the kindness goes out of the charity and they not only collect at their saloons or in rents—cash for their 'goodness'; they not only ruin fathers and sons and cause the troubles they relieve; they sacrifice the children in the schools; let the Health Department neglect the tenements, and, worst of all, plant vice in the neighborhood and in the homes of the poor. . . . The police grafters, for example, in Devery's day, were not content with the amounts collected from the big vices. They cultivated minor vices, like policy, to such an extent that the policy king was caught and sent to prison, and Devery's wardman, Glennon, was pushed into so tight a hole that there was danger that District-Attorney Jerome would get past Glennon to Devery and the syndicate. The murder of a witness the night he was in the Tenderloin police station served to save the day. But, worst of all, Tammany, the 'friend of the people,' permitted the organization of a band of so-called cadets, who made a business, under the protection of the police, of ruining the daughters of the tenements, and even of catching and imprisoning in disorderly houses the wives of poor men. This horrid traffic never was exposed. It could not and cannot be. Vicious women were 'planted' in tenement-houses (I know this personally), the children of decent parents counted the customers, witnessed their transactions with these creatures, and, as a father told with shame and tears, reported totals at the family table." (See New York; also Tammany.)

Tammany's Graft

San Francisco

For San Francisco, we quote from *The World's Work*, May, 1907:

"The people of San Francisco have suffered overmuch. But the earthquake and the fire are not the greatest of their calamities. . . . After the ruin of April, 1906, a venal city government, the tool of a corrupt and corrupting city boss, sold the public privileges of the city for ridiculous prices upon payment to the supervisors of graft fees ranging from $500 to $15,000 a vote. The street-railway company bought the privilege of running an overhead trolley line from "Abe" Ruef, the chief grafter, instead of buying it from the city for what it was worth. The telephone monopoly entrenched itself by similar means. Citizens otherwise reputable chased smaller private ends through the same paths of graft. In all, something more than $1,000,000 seems to have been collected into Ruef's corruption fund, and much of it stuck to his fingers. Enough passed on, however, to purchase the desired favors from the city powers.

San Francisco was used to the kind of graft disclosed in the earlier part of the investigation. The purchase of immunity by vice had been known for years, and was common to many cities. But the graft in high places, the spread of the taint to "good people," and the enormous bulk of the corrupting influences raise San Francisco to a solitary eminence of shame. . . .

The fact that the graft had been accepted by labor politicians is not especially significant. The significant fact is that the graft was offered by men of every political complexion, and especially by some of those highest in the city's business life.

To some extent the honor of the city has been redeemed by the conviction of Ruef and Mayor Schmitz, "the Labor Mayor." But the great corporations who made use of these men and to whom Ruef himself was largely only a tool are left in the main intact.

Chicago

Chicago's corruption has never been so well organized as in other cities. Says Mr. Steffens: "The city was once pretty solid black. Criminally it was wide open; commercially it was brazen; socially it was thoughtless and raw; it was a settlement of individuals and groups and interests with no common city sense and no political conscience. Everybody was for himself; none was for Chicago. There were political parties, but the organizations were controlled by rings, which in turn were parts of state rings, which in turn were backed and used by leading business interests, through which this corrupt and corrupting system reached with its ramifications far and high and low into the social organization. The grafting was miscellaneous and very general, but the most of the corruption was that which centered in the city council. It never was well organized and orderly. The aldermen had 'combines,' leaders, and prices, but, a lot of good-natured thieves, they . . . were so unbusinesslike that business now went into the city council to reduce the festival of blackmail to decent and systematic bribery. These men helped matters some, but the happy-go-lucky spirit persisted, until the advent of Charles T. Yerkes from Philadelphia, who, with his large experience of Pennsylvania methods, first made boodling a serious business." Then the city rose through a few shrewd men in the Municipal League and began to elect honest aldermen. (See Chicago.)

But in spite of many successes by the Municipal League, terrible corruption still remains. Mr. George K. Turner, in *McClure's Magazine*, April, 1907, shows that the revenue of the dealers in dissipation in Chicago totals at least $135,000,000 and directly employs more than 40,000 persons, and that every dollar of this sum, and every person it employs, is and must be in politics. The dealers recognized by law, brewers, wholesale and retail liquor dealers, have to be in politics to protect their interests from the anti-liquor legislation continually threatened by legislative blackmailers and by temperance reformers. The illegal dealers, in prostitution and gambling and criminal saloons, have still more need to be in politics to be able to break law with security. With this disrespectable element in politics work for other reasons, many "respectable" interests. He says:

It is the custom to call the tribute of illegal establishments to the police of great cities blackmail. This term is neither comprehensive nor accurate. The operation is merely one phase in the working out of the business of a great financial and political organization. Inroads have been made and will be made upon the influence of this organization by attacks on particular powers—as has been done in Chicago. Such attacks will probably not achieve final results.

The fact is that under present conditions the financial interests of dissipation have more direct representation in the administration of the city government than the will of the people. In Chicago the dealer in vice reaches directly through the ward and county organizations into the police department. The citizen at large must act through a mayor politically indebted to the ward organization, who hands over bodily the function of enforcing the law—concerning which he himself is and must be to a large extent ignorant—to a political appointee at the head of the police department.

Vice in Politics

Mr. Turner gives details. He says:

It would be difficult to estimate the cash payment which must be made every year by the interests of dissipation, for the privilege of breaking the law. So many people receive the money, so many give it out. There is such a variation from time to time. However, there cannot be less than $500,000 a year paid out now. There is probably much more. Prostitution pays at least $250,000; the remainder is largely paid by gambling.

In two down-town wards of Chicago—the First and the Eighteenth—are situated five sixths of the criminal saloons and of the dealers in prostitution, and at least two thirds of the gambling interests. It is not surprizing therefore that the bosses of Wards One and Eighteen in Chicago are remarkable figures and wealthy men.

Considering both worlds—the upper and the under—the bosses of the First Ward in Chicago are the most widely known men in political life, which that city has ever produced. "Hinky-Dink" (Michael Kenna), the older, ex-bootblack and newsboy, is the keeper of the greatest tramps' saloon on the continent. He is a wise, silent, dapper little man of about fifty; straight as a die in his personal relations; a virtuoso in the English language. When he speaks in anger, his words leave scars. "Bath-house John" (John J. Coughlin)—a large, pompous, poetic temperament—rose from the work of a rubber in a Turkish bath-house to his present occupation as insurance broker and active ward boss. He dresses like a bartender's dream of Beau Brummel, a bottle-green dress suit being his highest sartorial achievement; he also hires a man

to write poetry for him, to appear under his name. The rulers of the Eighteenth Ward have been less successful. John J. Brennan, the older—a gruff, husky, generous old saloon-keeper, adored by his ward—has, in fact, served a term in the House of Correction for the clumsy buying of votes. His health has failed since that experience. He has now the appearance of a broken-down prize-fighter. The junior boss, M. C. Conlon, was formerly a keeper of an unsavory saloon near the Union Station, and is now interested as a silent partner in various enterprises for the sale of dissipation.

These four men have the absolute power of political dictators in Wards One and Eighteen. As political agents of the business interests of dissipation, they have unlimited funds. They operate throughout the year a finely organized business for the handling of votes. The main aims of this business are two: first, the control of the ward; second, and vastly more important, the production of a Democratic majority so large that they can secure from the city administration the right for the business interests they represent to break the law in their wards.

Boston

Boston is believed by many to have had at times at least, corruption and ring rule equal to any city of her size. Mr. Thos. Lawson, whose articles in *Everybody's* (1904) have not been considered the sanest, yet whose statements have been more scoffed at than answered, says of one period of corruption: that the arch-corrupter was Henry M. Whitney, president of the Boston Chamber of Commerce and brother of the late William C. Whitney; and that, in comparison with the Whitney machine, "an average 'Tammany gang,' a 'Chicago combine,' or a 'St. Louis syndicate' would look like a broken-down snow-plow in August." Mr. Lawson goes to the extent of specifying the particular rooms in Young's hotel where the Whitney machine received the legislators, drove its bargains, and paid its bribes; and relates in detail Whitney's vain attempt in 1896 to buy a two thirds vote to override a veto —vain because he could not meet the legislators' demand for cash in advance. He says: "Of the year in which he writes (1904) the Massachusetts legislature is bought and sold as are sausages and fish at the markets and wharves; the largest, wealthiest, and most prominent corporations in New England, whose affairs are conducted by our most representative citizens, habitually corrupt the Massachusetts legislature, and the man of wealth among them who would enter protest against the iniquity would be looked on as a 'class anarchist.'"

Mr. Lawson asserts that any one who would investigate the legislature and municipal life of Boston would find more corruption than in any other civilized community in the world. How far these broad accusations can be proved is uncertain. What is certain is that thus far they have not been disproved.

Smaller Towns

In many of the smaller towns corruption is proportionally as marked an evil as in the larger. Nor is it new.

Says Mr. James Bryce ("American Commonwealth," vol. i., p. 608):

There is no denying that the government of cities is the one conspicuous failure of the U. S. The deficiencies of the national government tell but little for evil on the welfare of the people. The faults of the state governments are insignificant compared with the extravagance, corruption, and mismanagement which mark the administrations of most of the great cities. For these evils are not confined to one or two cities. The commonest mistake of Europeans who talk about America is to assume that the political vices of New York are found everywhere. The next most common is to suppose that they are found nowhere else. In New York they have revealed themselves on the largest scale. They are "gross as a mountain, open, palpable." But there is not a city with a population exceeding 200,000 where the poison germs have not sprung into a vigorous life; and in some of the smaller ones, down to 70,000 it needs no microscope to note the results of their growth.

Says Mr. Andrew D. White (*The Forum*, Dec., 1890):

Municipal Corruption

Without the slightest exaggeration we may assert that, with very few exceptions, the city governments of the U. S. are the worst in Christendom—the most expensive, the most inefficient, and the most corrupt. The city halls of these larger towns are the acknowledged centers of the vilest corruption. They are absolutely demoralizing, not merely to those who live under their sway, but to the country at large. Such cities, like the decaying spots on ripe fruit, tend to corrupt the whole body politic. As a rule, the men who sit in the councils of our larger cities dispensing comfort or discomfort, justice or injustice, beauty or deformity, health or disease, to this and to future generations, are men who in no other country would think of aspiring to such positions. Some of them, indeed, would think themselves lucky in keeping outside the prisons. . . . Few have gained their positions by fitness or by public service; many have gained them by scoundrelism; some by crime. . . . It has been my lot also to have much to do with two interior American cities of less size—one of about 100,000 inhabitants, the other of about 12,000. In the former of these, I saw a franchise for which $1,000,000 could easily have been obtained, given away by the common council. I saw a body of the most honored men in the state go before that council to plead for ordinary justice and decency. I saw the chief judge of the highest court of the state, one of his associate judges, a circuit judge of the U. S., an honored member of Congress, two bishops, the president and professors of a university, and a great body of respected citizens urge this common council not to allow a railway corporation to block up the entrance to the ward in which the petitioners lived, and to occupy the main streets of the city. They asked that, if it were allowed to do so, it might be required, in the interest of human life, either to raise its tracks above the streets or to protect the citizens by watchmen and gateways, and to pay a fair sum for the privilege of cutting through the heart of a populous city. All was utterly in vain. I saw that common council, by an almost unanimous vote, pass a bill giving away to this great corporation all this franchise for nothing, so far as the public knew, and without even a requirement to protect the crossings of the most important streets; and I soon afterward stood by the mutilated body of one of the noblest of women, beheaded at one of these unprotected street crossings while on an errand of mercy. So, too, in the smaller of these two interior cities, while the sewerage and the streets were in such bad condition as to demand the immediate attention of the common council, I saw the consideration of these interests neglected for months, and the main attention of the council given to a struggle over the appointment of a cemetery-keeper at a salary of $10 a week.

Legislative Corruption

Considering first state legislatures, the relation between the city and state political machines is, in most states, so intimate that there is probably little to choose in purity between the city council and the state legislature. The state legislature because of its greater prestige undoubtedly attracts a considerably stronger and to a less extent a better class of men, but on the other hand the greater value of the franchises and legislative bills at the disposal of the legislature compared with those at the disposal of most city councils undoubtedly works to draw to it much larger corruption funds, a more persistent lobby, and consequently the most daring and effective corrupt politicians, and especially the tools of the most corrupt rings. The corruption of the legislatures of Missouri, Minnesota, Illinois, Pennsylvania have been shown in connection with municipal corruption. The corruption of the legislatures of states largely under the dominance of one or more railroads, like New Hampshire and California, is notorious. The old joke about the legislature of Pennsylvania only adjourning when the Pennsylvania Railroad has no more business for it to transact has still point. New Jersey has been called "a traitor state" because of its legislature's notorious subservience to corporate influence. The facts, however, as to the corruption of state legislatures have been sufficiently shown in connection with municipal corruption.

Concerning Congress, Mr. Bryce, in his "American Commonwealth," comes to the conclusion that all legislation affecting corporations and manufactures is systematically managed or at least influenced by corruption, that about 5 per cent of both houses of Congress take direct money bribes, that from 17 to 20 per cent are pretty certainly open to corruption and a much larger number suspected to be dishonest. It is doubtful if the situation has very much changed since. Recent agitation and a growing public condemnation of the evil have undoubtedly increased the number of honest congressmen, but recent revelations of the complications of congressmen in

land-steals and various other forms of graft have shown that the evil is very widely spread. As to the form of the corruption Mr. Hudson ("Railways and the Republic," 1886) says:

The Huntington letters, published last year, throw new light on corporate lobbying in Congress. Here in the confidence of private correspondence, we learn from the railway kings how some statesmen serve the corporations under the pretense of opposing them; how editorial opinions in leading journals are a good investment for the corporation fund; how unsuspected lobby agents are set to work, apparently without concert, but under secret orders from one head; how, in short, the unlimited resources of great corporations employ all that is unscrupulous, wily, disreputable, and dangerous in politics to attack members in their weak points, to flatter, bribe, and control them so that they must support the corporations. . . .

A remarkable series of articles by David Graham Phillips, appearing in the *Cosmopolitan Magazine* in 1906, entitled "The Treason of the Senate," makes very general and daring assertions, but accompanied by very detailed and concrete evidence.

Senators

Of the two senators from New York, Platt's record he calls "an unbroken record of treachery to the people in legislation, of privilege and plunder promoted and indecent legislation permitted." Mr. Depew is "the sleek, self-satisfied American opportunist in politics and plunder." He estimates that Depew's joviality and popularity have cost the American people at least $1,000,000,000. The Republican right arm of the corporation control of the Senate, in defeating legislation in the interest of the people, and enacting legislation for "the interests," he considers to be Senator Aldrich of Rhode Island, the Democratic left arm, formerly Gorman of Maryland. He says: "Whoever may be for appearance sake in charge of the Republican machine, Aldrich is really in charge. Whoever may be nominally at the head of the Democratic machine, Gorman is really there. Aldrich and Gorman are as the thumb and the forefinger to a skilful hand." The tariff bill of 1894, which President Cleveland called "party perfidy and party dishonor," was a Gorman-Aldrich bill. The sugar scandal bill which presented $20,000,000 a year to the Sugar Trust, he lays largely at Gorman's door. Senator Spooner of Wisconsin Mr. Phillips considered to be the crafty spokesman of the interests, who openly spoke against them and quietly worked their will. Senator Bailey, he argues, works in the Democratic Party for the interests as Senator Spooner in the Republican Party. Senator Elkins of West Virginia is presented as perhaps the most open and powerful of the lieutenants for "the merged interests," and particularly the railroads, and therefore placed by Mr. Aldrich as chairman of the Interstate Commerce Committee, one of the most influential of positions. It was he who made a farce of the railway hearings in 1905, he who has made his $30,000,000 out of railways and coal lands in western Virginia. Senator Knox of Pennsylvania, attorney of the corporations outside of the Senate, Mr. Phillips argues is their attorney in the Senate, even tho he was appointed Attorney-General by Mr. Roosevelt, nominally to prosecute his former clients, but naturally accomplishing nothing. Senator Foraker of Ohio Mr. Phillips considers in the second rank of the Senate's leadership, but equally in his place to serve the corporations. Senator Lodge of Massachusetts, in his literary aristocracy, prefers foreign affairs to active service in pushing corporate interests, but can always be counted on to vote for them and against the people. Such, according to Mr. Phillips, are the Senate's leaders, and after them many followers, down to Senators Burton of Kansas and Mitchell of Oregon who have been caught with their hands in the pocket of the people and imprisoned.

Corrupt Senators

It is true that these and similar articles have been answered. Mr. C. Arthur Williams, writing what he considers "The Truth About the Senate" in *The World To-day* (May, 1906), says:

There are bad senators, of course. Some of them are merely weak or easily led. Possibly one or two are actually corrupt, and certainly several, who look at everything from only the "business" point of view, stand for special interests rather than for the interests of the people. But in every such instance it will be found that the bad senator is fairly representative of a majority of the people of his state. It is not the fault of the Senate that he falls below its standard. It is rather the fault of his constituency.

Kansas knew what Burton was, yet sent him to the Senate. Rhode Island knows what Aldrich is, yet complacently permits his reelection as frequently as he and the corporate interests he serves desire it. New York has long known what Platt and Depew are, yet they have represented that state in the Senate for many years.

Opposed to this is the attitude of the Senate itself toward such men. Since Burton has been under indictment he has been barred from the Senate chamber by the sentiment of a majority of his former colleagues. The same was true of Mitchell. In another way it is true of Platt and Depew, who, since the Senate has come to know them for what they really are, have been stript of the last vestige of legislative influence . . . Even Aldrich is not the puissant figure he once was.

On the other hand Mr. Williams mentions Senator Teller of Colorado, "an earnest advocate of right and justice"; Senator Culberson of Texas, "a conspicuous example of the highest type of senatorial integrity"; Senator Morgan of Alabama, "who had an unbroken record of faithful and upright public service"; La Follette of Wisconsin, "perhaps the most prominent representative of the interests of the people"; Tillman of South Carolina, "with all his explosive passion, as honest a man as ever sat in a legislative assembly." He says:

Uncorrupt Senators

Every official act of Bacon of Georgia will bear the closest scrutiny. Berry of Arkansas, Blackburn of Kentucky, Overman of North Carolina, and Clay of Georgia, tho perhaps less able, are certainly not less upright. Cullom of Illinois was somewhat tardy in responding to the demand for relief from existing transportation conditions, but has since done all his ill health would permit him to do in support of the rate bill. Dubois of Idaho, altho possibly more of a politician than a statesman, has no corporate connections or leanings. Fulton of Orgeon is also to be counted on the right side, as is Heyburn of Idaho. Kittredge of South Dakota and McCumber of North Dakota are considered both worthy and able.

Morgan and Pettus of Alabama, the oldest men in the Senate, have unbroken records of faithful and upright public service. Newlands of Nevada, however much he may be inclined to ride hobbies, and despite his considerable wealth, enjoys the reputation of a good and efficient official. Even Clark of Montana, the richest man in the Senate, is almost invariably to be found voting in opposition to measures in the interest of corporate wealth. The impulsive and emotional Patterson of Colorado votes and speaks in accordance with his convictions, which, tho sometimes mistaken, are always honest. Rayner of Maryland, one of the minority's most brilliant lawyers and debaters, is as upright as he is erudite. Taliaferro and Mallory of Florida, Carmack and Frazier of Tennessee, and McEnery and Foster of Louisiana are good men, and Teller of Colorado is as earnest an advocate of right and justice as the Senate contains. Beveridge of Indiana is in danger of being consumed by his overweening vanity, and sometimes politics leads him into grave errors. But he is an upright man. Allison of Iowa occasionally leans toward corporate interests by reason of his ultra-conservatism perhaps, but his probity is unquestioned. The courtly Daniel of Virginia is a sincere friend of the people.

Yet even Mr. Williams has to add (we condense his words):

Some of the senators who favor corporate interests are powerful in the workings of the Senate, because they are members of the dominant party, and because they are sent back for term after term by the "business" elements by which their respective states permit themselves to be controlled. Kean of New Jersey, enormously wealthy and unalterably opposed to any legislation tending to curb corporate domination, is one of them. Elkins of West Virginia, a capitalist whose obligations are mainly to the railroads, and Foraker of Ohio, who, altho he has indignantly denied connection with any special interests, is nevertheless invariably opposed to legislation objectionable to such interests, are others. Wetmore of Rhode Island is a nonentity who does what Aldrich tells him to do, just as Aldrich's butler does. Allee of Delaware is another follower of such "leaders." Carter of Montana and Hansbrough of North Dakota have been charged with wrongful practises in connection with Alaskan affairs and have remained silent. Crane of Massachusetts, the successor of Hoar, has aligned himself with the pro-railroad forces in the rate bill contest. Other New England senators—high-class men, too, like Lodge, Frye, and Proctor—are partial to special interests, but they are the special interests which New England votes to uphold.

Dryden of New Jersey is an excessively rich man, whose constant endeavor is so to shape legislation as to give added riches and power to himself and others like him. Flint of California, a former attorney for the Southern Pacific Railroad, has yet to show his hand. Hale of Maine is one of the most independent of all the Republican senators, but even he

seems to forget the public at times. Hemenway of Indiana left a fairly good record in the House, but has diminished the respect in which he was formerly held by standing sponsor for an amendment to the pure food bill which was palpably in behalf of the patent medicine trust.

Millard of Nebraska is a "railroad senator," but lacks the courage to wage his campaigns in the open. Clapp of Minnesota and Dolliver of Iowa exhibited leanings toward the railroads in the past, but realized that sentiment in their respective states was distinctly not pro-railroad, in the matter of the rate bill, and acted accordingly.

Dick of Ohio has a record which is by no means commendable. Hopkins of Illinois is of no importance beyond the circumstance that several transactions which are not particularly creditable, are marked against him. Penrose of Pennsylvania has all the late Quay's tendencies and none of his talents. Scott of West Virginia is not a conspicuous corporation man, but is not free from the taint. Stone of Missouri came to the Senate with a particularly bad record. The list is all too long, but, even if none of the men named is given the benefit of the doubt which is perhaps justifiable in some cases, they would still not be a majority of the Senate.

Causes of Corruption

To understand these, it is necessary to revert to a few first principles. When the U. S. began to fashion its life, a principle of government generally accepted by all parties was that that is the best government which governs least. In considering any activity, the presumption was against its conduct by government and for its conduct by individuals. Only those things necessary to be done which private initiative would not or could not do were left to government. With few exceptions this was universally, and still to-day is to a large extent, the view of all schools of political thought, Jeffersonian or Hamiltonian, strict or broad constructionist, Democratic or Republican. It is admittedly the theory upon which our commercial and governmental life has developed.

Freedom from Restraint

As a result, American government, local, state, or national, has done less in the *conduct* of industrial enterprises and even less in the *control* of such enterprises than any other strong civilized government. This needs no proof. It is but the converse of this to say that in America individuals apart from government have done more than in any other country. But this has meant enormous opportunity for the able individual. In an enterprising country, with boundless resources, a continental domain, and a rapidly growing population, energetic individuals, and especially combinations of energetic individuals, i. e., corporations, have had such opportunities and development as in no other age or place; and, above all, with a freedom from legal restraint and governmental supervision undreamed of in any country with manifold traditions of paternal or feudal governments. This, again, no thoughtful man will deny. The inevitable result has been to attract to enterprises promising such rewards the shrewdest and most daring commercial spirits, and also to enable these energetic captains of industry to summon to their employ the ablest lieutenants to conduct their business, and the keenest professional talents, of attorneys, inventors, accountants, architects, and the like. To all these American business has given opportunity never equaled in any other land.

Meantime government, by the theory, limited in the range of its activities, has given, broadly speaking, comparatively little opportunity *to the able and the upright.* Its higher offices, to a considerable degree in the nation and to a much less extent in the state, have indeed appealed to noble spirits. Especially in time of national need American statesmen have not been wanting. Politics in America in the open political arena compare not unfavorably in ability and in honor with politics in Europe. Diplomacy in America is, in the opinion of most, more honest than in the Old World. But the politics of office-holding and of office-seeking, except for the highest offices, has had very little to attract the honest able man. Government salaries are usually small, very small compared with commercial salaries to men of ability. A cabinet officer recently left a salary of $7,000 from the nation to take one of $70,000 from a private corporation. Still less have ordinary government positions called for large activities from able men. The theory has been that government should do little things and corporations big things. Our Constitution balances branches of government by other branches, to restrain each. The government official is hampered in a hundred ways. Again, to gain his office and to hold his office he often has to resort to humiliating and sometimes questionable petty political devices; and even with that he has no certainty of tenure in office. For an unattractive, petty, uncertain political position, he must also usually for a period of time renounce, or at least partly renounce, attention to his business, which—if he be a man of ability—would be incomparably more remunerative, certain, and usually more attractive. The wonder is that government has attracted the ability that it has.

Minimizing of Government

This with honest business and honest government officials. But the moment dishonesty enters in, the whole case is changed. Under the American theory of government the honest official has little opportunity, but the dishonest official has almost boundless opportunity. The very growth of corporate wealth and power gives him his chance. To the legislator, the alderman, the commissioner, the assessor, corporate wealth goes and must go to seek a franchise, a grant, a privilege, an exemption. A clause in a legislative enactment, or even the change in one word, may mean to interested petitioners millions of dollars. The question is decided often and the bill is worded usually, not in open legislature, but in closed committee. (See CONGRESS.) The honest legislator, alderman, commissioner, assessor, on American salaries and with American expenses of life in his position, can scarcely meet expenses. The dishonest legislator, alderman, commissioner, inspector, can get almost what he will. The theory thus does everything it can to handicap honesty—so much so that unless born wealthy an honest man can scarcely afford to sacrifice business and enter politics; it does almost all that can be done to give opportunity to corruption, and yet we ask what is the cause of corruption.

Dishonest Officials Favored

The corrupt official or legislature does not always need even to be *consciously* corrupt. Almost every American newspaper shows what great things corporate wealth has done and is doing for America. No millionaires are so generous as American millionaires. What other country is so financially prosperous or pays such high wages? Why should not the legislator, the alderman, the commissioner, the assessor, favor these corporations that are doing such great things? Where were we without

Unconscious Corruption

our railroads, mines, gas works, electric plants, systems of transit? Could we have these, developed as they are more than in any other country in the world, without these great corporations? If these laudable corporations, therefore, want a little change in a bill, or a certain concession in a franchise, why should they not be accommodated? The legislator and commissioner is taught to worship the corporation. Its attorneys and legislative agents are his personal friends and professional brethren. Why should they not be listened to? The legislator and commissioner in serving the interests of the corporations is carrying out often, perhaps usually, what he is taught to believe in. Why should he not have some return—not open money, perhaps, but a pass, retainer, position, political help or indorsement, from these corporations if he helps them get favors worth millions, and in which favors the legislator honestly believes? The line between honest and dishonest service of special interests is not marked in black and white.

And here another important element enters in. Given wealthy corporations seeking franchises or concessions from poorly paid officials with uncertain tenure, he who is dishonest can make money, but *he who will make a profession of graft and give it his time and organize politics for it, and put brains into it, can become enormously wealthy, enormously powerful, and almost absolutely secure.* This is the city or more often the state boss. Everybody knows what Mr. Platt is, yet he sits in the United States Senate representing New York. In St. Louis, Mr. Folk even got Colonel Butler convicted, but he laughed at the indictment, and is still in power in St. Louis. Senator Clark was unseated from the Senate for corruption, but he is now in the Senate. Everybody knows what Mr. Murphy stands for in New York and men like Michael Kenna, "Bathhouse John," John J. Brennan in Chicago, yet they rule their city or their ward. And this power once developed, the corporation must, if they are to go on under the present system, continue the purchase of legislations and immunity, otherwise these political bosses who have gained their power through corruption by corporations will turn against the corporations. A banker in California declared that he was no more to blame for giving his quota to purchase legislation from the legislature of California than the traveler who pays over his money to the highwayman who holds him up. An enthusiastic capitalist recently declared that he had given $5,000 to help purchase Indiana, and would willingly give $5,000 more. A Rhode Island protectionist said it was necessary to buy votes from the working men for their own good else Rhode Island would go free trade and manufactures and employment would be ruined. The vice-president of a great insurance company said the present so-called insurance reforms in New York would do no permanent good because corruption was necessary, not to insurance, but to the present methods of doing business on a large scale. Mr. Lincoln Steffens found this out in Chicago. He says:

Power of the Boss

I spent one whole forenoon calling on the presidents of banks, great business men, and financiers interested in public utility companies. With all the evidence I had had in other places that these men are the chief sources of corruption, I was unprepared for the sensation of that day. Those financial leaders of Chicago were "mad." All but one of them became so enraged as they talked that they could not behave decently. They rose up, purple in the face, and cursed reform. They said it had hurt business; it had hurt the town. "Anarchy," they called it; "Socialism." They named corporations that had left the city; they named others that had planned to come there and had gone elsewhere. They offered me facts and figures to prove that the city was damaged.

Said Charles Francis Adams in 1871:

The existing coalition between the Erie Railway and the Tammany ring is a natural one, for the former needs votes, the latter money.

It must be remembered that through the political boss corporations can get immunity from legislation which is to-day threatening their dividends, possibly even their existence. The boss has this power because he has the political reputation, good name, and future of most politicians in his hands. Even judges sometimes high on the bench, at some time—perhaps early in their career—have had politically to "stand in" with him. The boss can sway conventions and organize political districts to nominate and elect his men. He controls the funds. If he be cunning enough to work, either through both parties, or with one party plus enough of the other party to hold the balance of the power, he can rule almost any legislature. Without him no corporation can get a favor. With him it can get almost what it will. Such is the position in almost every state in the union. An article by Mr. John Jay Chapman in *The Atlantic Monthly* calls it the *capture of government by commercialism*, but it is based upon the fundamental American idea of enthroning commerce over government.

Government in Europe is much less corrupt precisely because there government is enthroned over commerce. Government there has power, position, traditions of respect. Law is magnified. Government controls and does important things. It attracts able men. There are scandals, indeed, Panama affairs, Dreyfus questions, scandals in war offices, colonial departments in England and Germany, corrupt administrations more or less everywhere, but they are not comparable to American corruption in extent or persistency.

A subsidiary proof of the truth of the above analysis is that the higher you go in American government, the more you exalt government, the less corruption you have. Municipal legislatures are the lowest and the worst. State legislatures come next in power and in dishonesty. Congress is highest and best. It is so generally speaking with officials and with judges. This is enforced by the apparent exception that *some* high offices are more open to corruption than lower ones; this is because they are especially valuable for corporate wealth to control.

Other causes of corruption come in subsidiary to and derivative from the prime cause—the degradation of governmental action as compared with private corporations. Such minor causes are the disgust of the better classes of citizens with "practical politics." It has been estimated that the stay-at-home vote in many elections is one fourth of the registered vote, and this is true usually of the more intelligent citizens.

There is not so much to fear from the Irish vote or the German vote as from this absentee vote. The foreign vote is susceptible of disintegration; it may negative itself. But the abstaining vote is almost solid against good government. At intervals, after some particularly atrocious conduct, this vote is invaded by indignation, and some fraction of it shakes off its languor and makes itself felt at the polls. But

it is only a spasm. It is the rush of raw volunteers against regulars. The regulars may be broken, but they can wait. Their turn will come. Of another potent subsidiary cause of corruption it has been said:

Another cause of municipal misgovernment is the uncertainty of responsibility, especially in its executive branches. Various departments, which should work in closest harmony, owe their appointment to as many different authorities, and often not only do not cooperate, but actually pursue cross purposes. At one time Philadelphia was found to be possest of four boards with power to tear up the streets at will, but none whose duty it was to see that they were properly relaid. Or here is an example of a composite officialdom which may happen any day: a "citizens' ticket" mayor, a Republican street commissioner, both elected by the people; other appointments filled by men acceptable to a Democratic board of aldermen; a police commissioner named by the governor, together with the state legislature interfering on occasion. With such a mixture it is not easy to fix responsibility for maladministration. Non-partizan commissions of four members, two from each party, is another favorite and specious arrangement by which the people are prevented from calling either party to account. This non-partizan contrivance is also an open door for the most unblushing division of spoils in the department between the "workers" of both parties. . . .

It is another proof of the correctness of the above analysis that generally speaking those departments of government are the least corrupt which have least to do with corporation influences and those branches of business are least corrupt which are least dependent upon government franchises and favors. The demoralizing effect upon legislatures, upon the adulteration of commodities, and upon the pricing of articles in the market affected by the tariff alone, it is hard to overestimate. (See FREE TRADE.)

It is largely from these sources, however, that springs the corruption in commerce even apart from government. Business upon a large scale, being largely carried on with corruption, is copied by business on a small scale. The seller who bribes his purchaser is copying his employer who bribes his assessor.

This view of the cause of corruption in the American minimizing of government and the magnifying of controlled commerce is supported finally by the conclusions to which Mr. Steffens came in his investigations apart from any theory. He says ("The Struggle for Self-Government," p. 1):

Every time I attempted to trace to its sources the political corruption of a city ring, the stream of pollution branched off in the most unexpected directions and spread out in a network of veins and arteries so complex that hardly any part of the body politic seemed clear of it. It flowed out of the majority party into the minority; out of politics into vice and crime; out of business into politics, and back into business; from the boss, down through the police to the prostitute, and up through the practise of law into the courts; and big throbbing arteries ran out through the country over the state to the nation—and back. No wonder cities can't get municipal reform! . . . The corruption of our American politics is our American corruption, political, but financial and industrial, too. Miss Tarbell has shown it in the trust, Mr. Baker in the labor-union, and my gropings into the misgovernment of cities have drawn me everywhere, but always, always out of politics into business, and out of the cities into the state. Business started the corruption of politics in Pittsburg; upheld it in Philadelphia; boomed with it in Chicago and withered with its reform; and in New York, business financed the return of Tammany Hall. Here, then, is our guide out of the labyrinth. Not the political ring, but big business—that is the crux of the situation. Our political corruption is a system, a regularly established custom of the country, by which our political leaders are hired by bribery, by the license to loot, and by quiet moral support, to conduct the government of the city, state, and nation, not for the common good, but for the special interests of private business. Not the politician, then, not the bribe-taker, but the bribe-giver, the man we are so proud of, our successful business man—he is the source and sustenance of our bad government. The captain of industry is the man to catch. His is the trail to follow.

The Chief Cause

Of the business man Mr. Steffens says:

The typical business man is a bad citizen; he is busy. If he is a "big business man" and very busy, he does not neglect, he is busy with politics—oh, very busy and very businesslike. I found him buying boodlers in St. Louis, defending grafters in Minneapolis, originating corruption in Pittsburg, sharing with bosses in Philadelphia, deploring reforms in Chicago, and beating good government with corruption funds in New York. He is a self-righteous fraud, this big business man. He is the chief source of corruption, and it were a boon if he would neglect politics. But he is not the business man that neglects politics; that worthy is the good citizen, the typical business man. He, too, is busy. He is the one that has no use and therefore no time for politics. When his neglect has permitted bad government to go so far that he can be stirred to action he is unhappy, and he looks around for a cure that shall be quick, so that he may hurry back to the shop. Naturally, too, when he talks politics, he talks shop. His patent remedy is quack; it is business.

"Give us a business man," he says ("like me," he means). "Let him introduce business methods into politics and government; then I shall be left alone to attend to my business."

There is hardly an office from U. S. senator down to alderman in any part of the country to which the business man has not been elected; yet politics remains corrupt. . . .

Two hopeful elements in the situation, however, must not be overlooked. These are (1) the extent to which the public is aroused on the subject of corruption, and (2) and even more, the nature of its interest and the way in which it is beginning to look at the problem. As to the extent of its interest it may be said that the revelations of corruption in St. Louis made by Mr. Folk, in Wisconsin by Senator Spooner, in New Jersey by Mr. Colby, in Pennsylvania by the reform element, have been almost the supreme recent political interest in the U. S. This has probably, however, been exceeded by the interest in the investigations into the corruption of the big insurance companies, the Pennsylvania and other railroads, the packing industry in Chicago, the Standard Oil Company, and other monopolies. Articles like those above quoted of Mr. Steffens, and of Mr. Th. Lawson have been most eagerly read. Mr. Upton Sinclair's novel, "The Jungle," exposing the conditions in the Chicago packing industry has had a most phenomenal sale. The exposure and consideration of corruption may be said to be even at present the supreme interest in the U. S., and this is a fact of the most hopeful import.

Hopeful Elements

But even more important is the direction this interest is taking. There have for many years been local and sporadic efforts at pure politics, but only recently has there been any effort to strike at causes. People hitherto have been content to oust the rascals and put in the saints without any attention to or understanding of the system which produced the rascals, and the result has been that not seldom in a year or two the saints elected to office have become almost as bad as the rascals, or, and more frequently, the reformers have relaxed their spasm of political efforts and the regular rascals have returned to power, sometimes with greater evil and daring than before. Still is this too true; nevertheless a change is certainly coming. A steadily increasing number of able and honest men are giving themselves permanently to politics, while Governor Folk in Missouri, Senator La Follette in Wisconsin, and to a less extent Governor Hughes in New York, show that able and persistent honesty can defy even an entrenched machine. A growing number of reform clubs in the important cities of the union (see MUNICIPAL REFORM), are making serious study of the question. In all the large cities independent political citizens'

parties are organizing, not for one campaign, but upon permanent lines. Popular articles and academic studies are pointing out more and more not only the corruption but the causes of the corruption, and therefore implicitly, and to some extent explicitly, pointing to the way out. A serious and persistent effort is being made, and notably by the present federal administration, to enforce the law against all lawbreakers and not the least against the great corporations which have been found most seriously at fault. People are less afraid of the word "socialism" as a scare word to prevent the extension of the control of commerce by government, and are seeing that the best way to prevent an undesirable socialism is to do away with its fertile soil, corporation dishonesty and corporation preying upon the public, and that, by an increased supervision of commerce by government, federal and national. Signs of this tendency are on every hand. Even municipal ownership is advocated by many and is entering into practical politics. Whether effective or not, it is certainly a sign of the effort to enthrone government over commerce, which, if the above analysis of the evil be correct, is certainly a sign of hope. (See CORRUPT PRACTISES ACTS; PRIMARIES; REFERENDUM; MUNICIPAL REFORM CLUBS; GALVESTON. MUNICIPALISM; PUBLIC OWNERSHIP.

Striking at Causes

Tarbell, *History of the Standard Oil Company* (1904); Hudson's *Railways and the Republic* (1886).

CORRUPT PRACTISES ACTS, or legislative acts passed to prevent the use of corrupt methods in elections: They are to-day mainly based on the English Corrupt Practise Act of 1883, which has had an almost unqualified success, as has also the Canadian law based on it.

English Acts

The Corrupt Practises Prevention Act of 1854 was aimed mainly at bribery in elections. A wider effect was aimed at by an act of 1868, but the Act of 1883, of which Sir Henry James was author, is by far the most important.

Previous to 1883 there were three corrupt practises known to the law in England: bribery, treating, and undue influence. The act of that year added a fourth, by declaring that "personation, and the aiding, abetting, counseling, and procuring the commission of the offense of personation" (fraudulent impersonating of another person), should be a corrupt practise.

The British law is very explicit in its definition of bribery. "Every person is pronounced guilty of it who directly or indirectly, by himself or by any other person, gives, lends, or agrees to give or lend, or offers, promises, or promises to procure or to endeavor to procure, any money or valuable consideration, or any office, place, or employment, to or for any voter, or to or for any person on behalf of any voter, or to or for any person in order to induce any voter to refrain from voting, or who in any similar manner seeks to induce any person to procure or endeavor to procure the return of any person to Parliament or the vote of any voter at any election. Every person is also pronounced guilty of bribery who, in consequence of any of the forbidden acts mentioned, procures or endeavors to procure the election of a candidate, or who advances or pays or causes to be paid any money to or to the use of any other person with the intent or knowledge that it shall be expended wholly or in part in bribery; and every voter who, directly, receives, either before or during election, any consideration of the kind forbidden in the anti-bribery provision above summarized, either for voting or refraining from voting, is also pronounced guilty of bribery; as also is any person who, after election, directly or indirectly, by himself or by any other person in his behalf, receives any money or valuable consideration on account of any person having voted, or refrained therefrom, or having induced any other person to vote or refrain from voting."

Provisions of the Law

Treating is also forbidden with explicitness: "Any person is pronounced guilty of it who corruptly or by himself, or by any other person either before, during, or after an election, directly or indirectly gives or provides, or pays wholly or in part the expenses of giving or providing any meat, drink, entertainment, or provision to or for any person for the purpose of corruptly influencing his vote, or inducing him to refrain from voting, or on account of himself or any other person having voted or refrained from voting, or being about to do one of these things; and every voter who accepts such forbidden attentions is equally guilty.

"In regard to undue influence, every person is guilty of that who directly or indirectly, by himself or by any other person in his behalf, makes use of or threatens to make use of any force, violence, or restraint, or inflicts or threatens to inflict by himself or by any other person any temporal or spiritual injury, damage, harm, or loss upon or against any person to induce or compel him to vote or to refrain from voting, or on account of his having done either of these things, or who by abduction, duress, or any fraudulent device or contrivance impedes or permits the free exercise of the franchise of any elector. Personation is also defined and forbidden."

The penalties attached to a conviction of these offenses are, for bribery, treating, and undue influence, each of which is a misdemeanor, imprisonment with or without hard labor for a term not exceeding one year, or a fine not exceeding £200; for personation, which is a felony, for a term not exceeding two years with hard labor. If it is found by the election court that the offenses of treating, or undue influence, have been committed by a candidate, or that the offenses of bribery and personation have been committed by or with his knowledge or consent, he is declared ineligible ever after to hold a seat in the House of Commons in the county or borough in which the offenses were committed.

To prevent objectionable expenditures, the law restricts the employment of agents, clerks, messengers, and others within a very narrow limit. "Voluntary efforts are made to take the place of paid labor. But it was anticipated that there would be a strong desire to evade such a restriction by making contracts to carry on the election work in place of the candidate employing persons for that purpose. And so the plan of controlling the amount of expenditure by a fixed schedule was accepted, and it has certainly proved most beneficial in practise. By the eighth section of the act it is enacted that no sum shall be paid and no expenses incurred by any candidate in excess of any maximum amount in that behalf specified in the first schedule to the act. Any breach of this prohibition by a candidate or his election agent is an illegal practise."

Penalties

From $1,000 to $3,500 is the maximum amount which may be expended in a parliamentary election.

The United States

Fifteen states have enacted laws more or less modeled after the English law, tho most of them have been very weak and none have proved very efficient. The first was the New York law of 1890, which merely requires the reporting of personal campaign expenditures by candidates without any report from committees. The Minnesota law of 1892, and especially its law of 1895, is much more thorough, and applies to committees and all campaign expenses. The Massachusetts law of 1892 is one of the best. It applies to all public elections, including elections by the Legislature or by city council, and nominations by caucus or convention. The only exception to it is the election of town officers in towns. It provides for a complete and public account of all political expenditures. This is its main feature; but it falls short of the English act by not restricting the amount to be spent and by not specifying legal objects of expenditure. With the exception of personal expenses, no candidate is allowed any expenditure to secure his own election otherwise than through a political committee. This political committee is held responsible for violations of the law.

It has resulted in publicity, yet not a prosecu-

tion has been made under it, and the use of money in politics in Massachusetts recently has been greater than ever. The Ohio Act of 1896 (Garfield Act), among the best, was repealed. The trouble with most of the laws has been one of procedure.

Among the requirements of the laws are:

First. The full publication of election expenses both by individuals and organizations. There is a general feeling that publicity will do much to mitigate present evils. But it is doubtful whether correct and complete statements will be made, unless some easy form of procedure is provided by which such statements can be readily inquired into and criticized, on the motion of responsible citizens or organizations.

Second. The prohibition of corporate contributions for election purposes. These contributions are shrouded in such secrecy that they can probably be detected only by beginning with the expenses in a given election district, and working back to the contributor.

Third. The fixing of proper objects of expenditure, such as meetings, publications, etc., and the fixing limits to the amounts so to be spent. No state law now covers this branch of the subject with any thoroughness.

Fourth. Providing punishments by forfeiture of office, fines and imprisonment. The New York statute now decrees forfeiture of office for corrupt practises by a candidate but has no proceeding to enforce the penalty.

The legislation proposed last winter provided that where a party organization was guilty of corrupt practises in an election district, it should forfeit its vote in that district.

Fifth. Procedure. To enable citizens to push a judicial inquiry into the correctness and completeness of statements and the existence of corrupt practises. The grant to the public of this important right is considered by many to be the thing now most needed.

The failure of these laws and the increase of the evil has led to a demand for stronger legislation and also for federal action, which has resulted in congressional bills for publicity, and also forbidding political contributions from corporations. In many states various societies are agitating the question. New York has an Association to Prevent Corrupt Practises at Elections in New York City, of which Mr. Wm. C. Osborn, 70 Broadway, is secretary. It is pressing for legislation, as are other bodies.

COST OF LIVING. See Expenditure.

COTTON (for statistics, see Agriculture, p. 26): For one of the best brief statements of the economic importance of the cotton industry, and especially as applied to the United States, we quote from Leroy-Beaulieu's "The United States in the Twentieth Century." He says:

Next to cereals, hay, and live stock, the chief agricultural resource of the U. S. is cotton. In 1899, the year to which the agricultural statistics of the census of 1900 apply, the area under cotton was 23,257,000 acres, or 8.4 per cent of the crop-bearing land. But the value of the cotton crop was no less than $370,000,000, or 12 per cent of the total crop value. For no other staple, agricultural, industrial, or mineral, is the primacy of the U. S. so clearly established. If it has more cattle, if it produces more wheat, oats, petroleum, coal, iron, and lead than any other country, if it furnishes more than half the world's supply of corn and copper, it also provides over three fourths of the cotton-supply. Throughout the nineteenth century cotton was the backbone of its agriculture. Cotton is still its chief reliance. In 1902 out of a volume of export trade of $1,400,000,000 fully $300,000,000 must be placed to the credit of cotton. Assuredly the leading modern textile is of vast importance in the economic life of the U. S. . . .

It was introduced into the country in 1721, and from that year was grown in Virginia and the two Carolinas, but long for local consumption only. It was not until 1784 that it was exported from Virginia for the first time—to the amount of eight sacks, weighing 1,200 pounds. The development of spinning machinery by Hargreaves, Cartwright, and Crompton at the end of the eighteenth century and the invention of Whitney's cotton-gin about the same time, paved the way for an enormous development of its industrial utility, and the U. S., whose exportations in 1790 still met only one sixth of the British demand, made ready to produce it in enormous quantities.

Importance

Production of Cotton, United States

Crop of	Number of bales	Average number of pounds per bale	Total weight (in millions of pounds)
1790	6,667	225	1½
1800	153,509	228	35
1810	286,195	297	85
1820	575,540	278	160
1830	1,026,393	341	350
1840	1,634,954	394	644
1850	2,454,442	416	1,021
1860	3,849,469	477	1,836
1870	4,352,317	442	1,923
1880	6,605,750	460	3,038
1890	8,652,597	473	4,092
1900	10,245,602	480	4,846
1906	13,305,265	489	6,354

It will be seen that gains were steadily made, except during the Civil War decade, 1859–69, when the cultivation of cotton became almost a thing of the past. During the preceding ten years, development had been most rapid as a result of the increased demand produced by an era of exceptional prosperity in Europe, and history tells us how great a crisis arose in consequence of the almost total cessation of American exports. To-day the cotton production of the U. S. is about double what it was on the eve of the Civil War.

To have thrived thus it is evident that cotton must be produced in the U. S. under very favorable conditions. Such conditions are not found throughout the country, however, . . . Increased improvements in methods of transportation have tended to concentrate cotton-growing, like all other kinds of production, in the most favorably situated localities. Not only has it receded toward the South, but it has also advanced in a westerly direction. In 1850 only 12 per cent of the annual crop was grown west of the Mississippi, Louisiana being the only state on that side of the river to have fields of any size. By 1860 the development of Arkansas and Texas had begun, and the share of the trans-Mississippi states in cotton production had reached nearly 30 per cent. By 1880 the percentage was a little higher; by 1890 higher still, and by 1900 it amounted to nearly half the entire output—to be exact, 44 per cent. An interesting and distinctive feature of cotton production is that it is largely in the hands of cash and share tenants.

Farms operated by direct ownership are in a minority. I have already had occasion to explain why the vast plantations of the South were partitioned into a number of small holdings leased to cash and share tenants. In the ten principal cotton states, farms operated directly by the owner constituted, in 1900, but 48.3 per cent of the total, 20.3 per cent being operated by cash tenants and 31.4 per cent by share tenants. In 1880, on the contrary, the proportions were respectively 60.6, 12.4, and 27 per cent. We see that the number of cash tenants has increased more rapidly than that of the share tenants, and, consequently, that many share tenants have become cash tenants. This indicates social progress on the part of the cultivators, for the share tenant—most frequently a former slave or the descendant of a slave—works to a large extent under the more or less effective supervision of the owner. The cash tenant is by far the more independent. On the other hand, so far at any rate as the colored producers are concerned, it must be said that the share tenants are the ones who obtain the best results, averaging exactly two fifths of a bale per acre—as a result, doubtless, of having put themselves under the guidance of the planters—while the cash tenants obtain an average of only .381 per acre and the owners but .368. Among the white cultivators these proportions are reversed: .40 for the owners and cash tenants, .381 for the share tenants.

Ownership of Cotton-Fields

Everything considered, the production of cotton is a profit-

able occupation, the crop bringing an average price of nine to ten cents per pound, a return much higher than for any other American product.

Concerning the cotton industry in Great Britain and in other countries, the following is abridged from Hazell's "Annual" for 1907:

Hitherto the cotton manufacturing industry has relied mainly upon the U. S. for its supplies. Out of an annual crop now amounting to about 16,500,000 bales, the U. S. furnishes on the average about 11,000,000 bales. India is responsible for a further 3,000,000 bales (of which, however, nearly half is consumed in that country itself), and the remainder is not of sufficiently high quality to be available for most manufacturers. Egypt produces another 1,250,000 bales, and a further 1,000,000 is derived from various parts of the world.

With the development of cotton manufacturing in the U. S., and on the Continent, the proportion of the American cotton crop available for the United Kingdom diminishes, tho the real requirements of its manufacturers increase.

The question of seeking supplies in other directions has therefore become very urgent. This task has been seriously taken up the British Cotton-Growing Association, a body formed by the Lancashire producers. The following is a brief summary of the results of the investigations which have hitherto been made.

India.—As already stated, India is a large cotton producer, but the quality has suffered a good deal from the methods of picking, while at the same time the standard of quality in manufactured articles has been steadily growing higher.

Egyptian cotton is good in quality, but unfortunately nearly the whole area suitable for cotton-growing has already been taken up.

Africa.—Investigations show that cotton-growing in British Central Africa offers very promising prospects. The Protectorate contains an area of 20,000,000 acres suitable for cotton-growing, and cotton has indeed been grown in a small way for centuries.

Supply

All the British colonies and protectorates in West Africa are capable of producing good cotton crops, but the possibilities in this connection are dependent upon improved transport facilities, which at present do not exist.

The cotton plant grows wild over nearly the whole of Rhodesia, and the results of experiments and investigations there have been so far encouraging as to lead to the sending out of an American expert to conduct experiments on a very large scale.

West Indies.—Here the cotton industry has been reestablished on an extended scale.

Commerce

While it is impossible to give exact figures relative to the cotton manufactures of various countries owing to the fact that in practically every case a large part of the output is consumed at home, and no figures are available as to any country's home trade, indications of the chief movements are to be found. A test of the progress of the chief nations concerned is to be found in the export figures.

Taking cotton-yarn first, the following are the particulars of the exports of Great Britain, Germany, and France during the past twelve years:

VALUE OF EXPORTS OF COTTON-YARN

	United Kingdom	Germany	France
	£1000	£1000	£1000
1894	9,286	785	....
1900	7,741	1,455	217
1904	8,956	1,492	262
1905	10,317	1,703	750

British trade is very much larger than that of the other two countries put together, but it will be seen that it has shown a fluctuating tendency for some time past, while that of both Germany and France has been improving on the whole. This however, reflects no discredit upon British producers. Owing to a number of favorable circumstances they practically had a monopoly for many years; and that monopoly has now disappeared.

British trade has been steadily growing in volume, and the increase has been much larger than in that of all the other three countries put together. The table affords an incidental illustration of the fallacy of percentage increases. The U. S., for instance, starting from a very low level, shows an increase of about 200 per cent, while the United Kingdom has only an increase of about 20 per cent. In point of fact, however, British trade has increased £12,000,000, and that of the U. S. only £3,000,000.

As regards cotton manufactures, figures can be given relative to four countries, tho it should be explained that with regard to the U. S. the statistics include cotton-yarn.

VALUE OF EXPORTS OF COTTON PIECE GOODS

	United Kingdom	Germany	United States	France
	£1000	£1000	£1000	£1000
1894	57,279	7,090	2,867	....
1900	62,009	12,235	4,801	6,977
1904	64,078	12,974	5,495	7,829
1905	70,817	13,208	6,000	10,562

COULANGES, NUMA DENIS, FUSTEL DE: French historian; born in Paris in 1830. A member of the Institute and director of the École Normale Supérieure, Fustel de Coulanges is best known in social science for his important studies in the history of early civilizations and primitive tenures of land and other property. It was "La Cité Antique" which gave De Coulanges his first name; his "Institutions" is his great life work. He died in 1889, before his work was completed, but he may be regarded as a creator in the realm of historical economic research. He has freely criticized M. de Laveleye's theories of the communistic primitive property in land, arguing that property in land was always held on the seigneurial rather than the communal tenure. De Coulanges was the author of the following works: "La Cité Antique, Étude sur le Culte, le Droit, les Institutions de la Grèce et de Rome" (1864); "La Gaule Romaine"; "Histoire des Institutions Politiques de l'Ancienne France" (7 vols.); and an essay translated into English, "The Origin of the Property of Land," edited by W. J. Ashley (1891).

COUNTY COUNCIL. See LOCAL GOVERNMENT and LONDON COUNTY COUNCIL.

COURCELLE-SENEUIL, JEAN GUSTAVE: French economist; was born at Dordogne, Chile, 1813. At first a merchant, he later occupied himself with economics. In 1848 he held a post under the minister of finance; from 1853–63 he was professor of political economy at the University of Santiago, in Chile. Since 1879 he has been state councilor; since 1882 Fellow of the Academy of Naval and Political Science. Author: "Études sur la science sociale" (1862); "Operation de banque" (1853); "Traité théorique et pratique d'économie politique" (1867), one of the best-known treatises in the French language.

COURTS. See JUDICIARY.

COXEY, JACOB SELCHER, AND "COXEYISM": The movement popularly called "Coxeyism," or the formation of "armies" or companies of unemployed men or of those sympathizing with them to peaceably march to Washington and give Congress and the country visible evidence of the distress of the unemployed, and thus induce legislation to meet the need, is a movement which has gained its name from Mr. J. S. Coxey, of Ohio, to an extent the originator of the movement, and the "general" of the leading "army."

Jacob Selcher Coxey was born in Pennsylvania in 1854, and after leaving school when he was thirteen worked for ten years in a rolling-mill. In 1879 he purchased a sandstone quarry at Massillon, Ohio, where he has since lived, and in 1889 he added to other ventures a stock-farm in Kentucky, making a specialty of blooded race-horses. He prospered, and is reputed by his neighbors to be worth some $200,000, an honest and successful business man. Originally an Epis-

copalian, he has become a theosophist, and is said to have believed that he and his lieutenant, Browne, are between them sharers of the reincarnation of Christ.

Long interested in public questions, in 1892 he drafted a bill, which was presented in Congress, calling upon the federal government to construct a general country road system in the United States, and to meet the expense of this by issuing $500,000,000 of treasury notes to be a legal tender for all debts. The bill, however, was pigeonholed by Congress, and this led Mr. Coxey to more radical agitation. There now appeared on the scene a Mr. Carl Browne.

Carl Browne was born near Springfield, Ill., in 1849. He became a painter, and painted a "Lord's Supper" and panoramas of the Yosemite, of the Franco-Prussian War, and other subjects which were exhibited all over the United States. In 1872 he married and settled in Berkeley, Cal. At the time of the great Pennsylvania strikes of 1877 (see STRIKES) he came out for the cause of labor, and later supported Dennis Kearney's agitation by cartoons and in a newspaper. He then threw himself into the Greenback and later the Populist movements. Christmas Day, 1892, his wife died of pneumonia, and it was during her last days that he was converted to theosophy, believing that he absorbed his wife's soul. He went to the World's Fair in Chicago in 1893 and met Mr. Coxey at a bimetallic convention. He later visited Mr. Coxey, and was sent by him to Chicago to induce the American Federation of Labor to indorse the Good Roads plan. He succeeded, and there devised the plan of marching the unemployed to Washington. Mr. Coxey approved the plan. They finally decided to start, and did start from Massillon, Easter morning, March 24, 1894. They planned to reach Washington on May 1st, to present a petition to Congress on the steps of the capital, and then to camp there until Congress acted upon two bills to be presented by Senator PEFFER—a Good Roads bill and a Non-interest-bearing Bond bill.

Coxey's Army

As Mr. Coxey was very busy, tho he accompanied the army with his wife, daughter, and a little infant son whom he named "Legal Tender," he left the whole management of the army to Mr. Browne. The plan was to get an army of 100,000; as a matter of fact, they never had over 500. It was a motley, altho perfectly orderly company. It took a religious coloring. They called the army "The Commonweal of Christ" and bore a banner with a portrait of Christ, and the legend "Death to interest-bearing bonds." As they left Massillon, a negro carrying the American flag marched ahead. Then on a gray horse rode Carl Browne, in the dress of a cowboy, with buckskin coat, fringed down the sleeves and plastered with decorations, a broad-brimmed sombrero on his head, around his neck an amber necklace given him by his wife. Next came the trumpeter, "Windy Oliver," the astrologer, "Cyclone" Kirkland, of Pittsburg, and seven musicians. "General" Coxey came next in a buggy drawn by two bay mares. Behind rode Mrs. Coxey with her infant child and her sister. Then came another negro carrying the banner of the Commonweal; next the army proper of 100 men, expected to swell on its way to Washington to 100,000, and accompanied on either side by forty-three newspaper men. Three wagons carried a circus tent and supplies. As a rule, however, the army was supplied with victuals by people on the way, but went often hungry. Crowds gathered to see them at every point. On Sundays Browne preached, with continual allusion to Scripture prophecies. They met many difficulties, such as a snow-storm in crossing the Blue Mountains. Some of their men were arrested as vagrants. Dissension arose, but they persevered. After reaching the Chesapeake and Ohio Canal they were transported for ninety miles. Everywhere they preserved good order. Mr. Coxey boasted that not a chicken had been stolen on their march.

The "Commonwealers" reached Washington the last of April. May 1st, in a solemn procession, the army marched to the Capitol to present its petition. Thousands flocked to see the sight. But when Mr. Coxey alighted he is said to have walked on the grass, and he, Carl Browne, and Mr. Jones were arrested "for trespassing on the grass." Mr. Coxey handed his address to the reporters, and was hurried away by the police. The army quietly returned to its camp. Coxey, Browne, and Jones were imprisoned twenty days. When they came out the movement was practically at an end. The army was maintained for a while, but gradually disbanded. Congress had been somewhat frightened, and considerable talk and discussion arose as to conditions that led to such armies; but no serious action was taken. "General" Coxey himself, however, has entered politics more earnestly than ever, and in 1895 was nominated for governor by the People's Party of Ohio, and polled 52,675 votes, the Populist vote for president in Ohio in 1892 being only 14,850.

The Result

Such were the main incidents. Gradually the movement came to an end. Returning opportunities for work absorbed most of the men, and the rest disbanded. With its bizarre side the movement had its serious side, at least as an evidence of the lack of employment among large bodies of law-abiding citizens. The men of these armies were not tramps or lawbreakers. They simply asked for work. Of 290 "industrials" selected at random from "General" Randall's Chicago army, Professor Hourwitch of the University of Chicago says: "One half were American born, two thirds were English-speaking men; they averaged from 30 to 32 years of age; 181 were skilled mechanics; of 115 questioned, only two were uneducated; twenty-six had attended high school or college; only five or six appeared of questionable character; seventy were trade-unionists." Carlyle said of a similar "insurrection" in Manchester, England: "An insurrection that can announce the disease and then retire with no balance account of grim vengeance opened anywhere has attained the highest success possible for it."

CRANE, WALTER: English artist and Socialist; born in Liverpool, 1845; son of Thomas Crane, a miniature and portrait painter. Apprenticed in 1859 to W. J. Linton, the eminent wood-engraver, poet, and chartist, Walter Crane learned from him reform ideas, as well as lessons in art. A prominent member of various art societies and committees, an examiner at the national competition of drawings at South Kensington since 1879, elected an associate of the Royal Society of

Painters in Water Colors in 1888, he was associated with the movement against the Royal Academy in 1886, and favored the establishment of a national exhibition in which *all* arts should be represented. In 1888 he founded with other decorative artists the Arts and Crafts Exhibition Society, and became its first president. Successful as a painter, he is even better known as a designer and decorator of books, etc. In 1891 an exhibition of his works was held, and the collection was also taken to the United States and Germany, Mr. Crane accompanying it. In 1884 he became associated with the Socialist movement, largely under the influence of William MORRIS, and has lectured and written for it, besides making numerous designs for Socialist books and papers. *Address*: 13 Holland Street, Kensington, W. London, England.

CREDIT: A term used in political economy in so many different ways and in so many shades of meaning that it is almost impossible to define it so as to cover all its uses. Certainly many of the definitions given to it by economists are faulty. Credit is defined by John Stuart Mill as "permission to use the capital of another person." Professor Roscher defines it as "the power to use the goods of another, voluntarily granted in consideration of the mere promise of value in return." Credit has also been defined as "confidence in the ability of another to make a future payment."

Professor Knies of Heidelberg has defined credit as merely "a commercial transaction between two parties, in which the services or the value rendered by the one falls in the present, and the counter-service or counter-value of the other in the future."

Says Professor Ely: "There are three elements in a business transaction to which we apply the term credit: first, the present transfer of goods; second, the use of the goods transferred; third, the future retransfer of the goods or an equivalent —that is, repayment."

But these definitions, while emphasizing important points, do not cover all the uses of the word, nor give even its central idea. Professor Jevons does better, in his "Primer of Political Economy," in reminding us that credit comes from the Latin *credo*, and means *belief*. Any one who sells on credit does so in the belief that the purchaser who does not pay at the time will do so in the future. Credit is trust. A man, a government, or a currency that has good credit is trustworthy. As such, credit enters into all life. It has been said that there is scarcely a human being in a civilized country who does not transact a piece of credit business almost every day of his life. The workman, hired by the week, and paid at its end, gives his employer credit from Monday morning to Saturday evening. The same workman, when getting a coat made for himself, even altho he engaged to pay ready money on delivery, gets credit from the tailor during the making.

Into monetary transactions of a more ambitious nature credit enters still more largely, and in many forms credit is the instrument for the greater number of exchanges. Money is used, but in the latest development of credit economy, only as "small change." Banks are the chief organs of society for credit economy. We live now in a period of credit, and in business circles the volume of money is small when compared with the amount of annual transactions in what are called instruments of credit, by which we mean principally checks, drafts, and bills of exchange. An American bank in a large city will in a day's business frequently handle over $40 in instruments of credit for every dollar in actual money. According to Rae, from 70 to 90 per cent of the monetary transactions of the world are done on a credit basis. Nevertheless, there is serious doubt if this is not an exaggeration. President Andrews, in "An Honest Dollar," gives elaborate reasons for questioning whether the proportion is so large as is generally supposed. He shows that clearings for many years have fallen in numbers in this country and in England; that never since 1882 has the New York Clearing House cleared in an autumn week a sum reaching the billion figures, which was a regular thing that year. Some credit substitutes for cash have been disappearing. The truck system is dying out. Barter in rural communities is disappearing. Book accounts between neighbors, once common, are now rare. "With nations, as with individuals," says President Andrews, "those who have the most credit need use it the least." Credit traffic has its fullest development in Holland; its strongest in Turkey and Yucatan. Cash payment getting the mastery, first in wages, in retail trade, and in raw products, spread gradually over other fields, shutting up credit to its most useful and least dangerous functions. Many authorities agree with President Andrews, others do not. (For the economic principles involved in and growing out of credit, see CONTRACTION AND EXPANSION OF CURRENCY; MONEY; PANICS, etc.)

CREMATION: Cremation, or, as it is sometimes called, incineration, is the rapid decomposition of human bodies by means of extreme heat. All decomposition or disintegration is, of course, effected through the agency of heat, and the length of time which is occupied in the process depends upon the degree of heat that is employed. When bodies are placed within the ground, so that no more heat than that which is naturally contained in the earth can act upon them, decomposition goes on perceptibly, but still very slowly. During its progress new compounds are formed, and some of these find their way into the air as fetid and noxious gases, while others, in a liquid form, contaminate the water which has its origin in the neighborhood.

To such an extent is this accomplished that high medical and chemical authorities have pronounced the opinion that organic substance can never undergo what may be called spontaneous decomposition without so contaminating the adjacent air and water as to impair the health of those living in the neighborhood, and to shorten the average duration of life.

The process of disintegration, or resolution into elements, is thus seen to be the same, whatever may be the method employed to encompass the result. It is believed by many that a large proportion of the diseases which afflict mankind are due to the slow decomposition of organic matter within or upon the earth. When thousands of bodies are interred yearly in a limited area, the earth becomes in time so saturated with the liquid resultants of decomposition that it is incapable of further absorption. Then, whatever be the character of the soil, the decomposition becomes still less rapid, and its gaseous products find their way directly into the air.

Among the advantages to be derived from

substituting cremation for burial besides those which are said to appertain to the sanitary aspect of the question, it is urged that the cost of the former is quite small when compared with that of placing a body in the ground. It is necessarily admitted that, so far as show and circumstance are concerned in the conduct of a funeral, there is no limit to the expense that may be incurred in the one case as in the other. But the necessary outlay for cremation is small when placed by the side of the indispensable expenditure involved in the purchase of ground and the decent and reverent deposition of a body therein. This will have weight with those by whom the scientific features of the question would be passed without notice. Altho it will no doubt be a long time before the burial of the dead is abolished in Christian countries, yet there seems but little doubt that cremation is yearly commending itself more and more to the thoughtful, and that it will gradually work its way into general acceptance.

It is not in modern times only that circumstances have compelled a consideration and discussion of the means by which the human body can be best disposed of after death. In Rome both inhumation and cremation were employed, and either was expressly permitted by the Roman law. It was found, however, that accumulations of decomposing bodies within the boundaries of the cities was not favorable to the health of the community, and cemeteries were removed to the rural districts. Cicero tells us that by one of the twelve tables it was decreed that *hominem mortuum in urbe ne sepelito neve urito*. From the foundation of the empire to about the fifth century of the Christian era burial in the earth was almost entirely abandoned, and cremation substituted.

When the burning of the dead was first adopted by the Greeks is not settled. Homer does not mention it as an innovation, but speaks of it as if it were a common custom.

Greeks, Romans, and Jews

Among the ancient Jews, also, both methods appear to have been in use. The burning of the body was ostensibly regarded as the more honorable manner and the ceremony was performed as a mark of respect to the memory of the deceased; while it was explicitly denied to those whose lives were regarded as having reflected discredit upon the nation.

Among these nations, and by the Hindus at the present time, as well as with the native Australian, the American Indian, and other savage tribes, the means by which cremation was affected was the open pyre, consisting generally of a platform of rough logs, upon the top of which were placed both the body and the bier upon which it had been brought. By the early Christians, however, the custom was abolished so thoroughly that, for a period of 1,500 years, we do not know of any cremation having taken place in Europe. From the end of the fourth century of the Christian era until the year 1658 we do not find the subject even mentioned in European literature. The essay of Sir Thomas Browne upon non-burial was then published, and caused a temporary interest in the subject.

In 1817 Dr. Jamieson published in the Proceedings of the Royal Society, Edinburgh, a paper on "The Origin of Cremation," and public attention was directed to the merits of the question. In July of that year the poet Shelley and his companion Williams were drowned by the upsetting of a boat in the Ligurian Sea. Their bodies were washed ashore near Leghorn. The quarantine laws of Tuscany required the burning of all material drifting in from the sea. Byron and Shelley had made an agreement that whichever died first should be cremated by the survivor. Thus, by a singular coincidence, was Byron compelled by legal enactment to perform a ceremony which had been prearranged, but in the conduct of which he had expected to meet with powerful opposition.

Modern Times

It attracted a great amount of notice and comment. For the first time in its history science bestowed its attention upon the subject. Altho the first step toward a practical realization of cremation was made in England, yet must Italy be regarded as the pioneer in Europe of the modern scientific system. The first Italian cremation society was formed in 1876, in the city of Milan. Two other societies, those of Cremona and Lodi, were formed, and Rome and Udine followed suit in 1879. In Germany the first crematory was established in Dresden, but was forbidden by law, and Gotha remained for several years the only place in Germany where cremation could be carried into effect.

In 1874 the first attempt to carry the change into England was made by the formation of the Cremation Society of England. For several years the Parliament of the country was asked to take such action as should legalize cremation. At length the body of a child was cremated, and the father was prosecuted upon the charge of having performed an illegal act. At the trial, however, the presiding judge laid down the rule that, provided it was done without creating a nuisance, there was, in the law, nothing which was infringed by this method of disposing of a body. At this the crematorium of the society was at once opened (1885) and has since continued in operation, mainly through the efforts of Sir Henry Thompson of London.

In that year three bodies were cremated, in the next ten, in 1901 over 300, in 1903 over 2,000.

In Switzerland, Zurich led the way in 1873. France cremates her dead in considerable numbers, and Sweden has manifested great activity in the matter. In the United States the first effort, at all serious, to form a cremation society was made in 1874, in the city of New York. In 1881 two societies were formed: the New York Cremation Society, to prepare public opinion for the theory, and the U. S. Cremation Company, to construct crematories. Dr. F. J. Le Moyne of Washington, however, cremated the first bodies in the U. S. in a private furnace in 1884. The same year a crematory was opened in Lancaster, Pa. The U. S. Cremation Company opened its first crematory in 1885. Buffalo followed the same year. Detroit, Baltimore, San Francisco, Davenport, Ia., Cincinnati, Pittsburg, Philadelphia, Boston, followed later. By 1897 there were 592 crematories in the U. S.

In Great Britain there are now several crematoria at Woking, near London, Manchester, Liverpool, Glasgow, Hull, Darlington, Birmingham, and smaller places. There are twenty-five crematoria in the U. S. of America, where 3,613 were cremated during the year 1901, San Francisco and New York being by far the largest, the first with 666, the second 654, during 1901.

In Paris there is a fine crematorium at Père-la-Chaise. Germany has seven crematoria: Gotha, Hamburg, Heidelberg, Offenbach, Jena, Manheim, and Eisenach, the total cremations being 693 during 1901.

Italy possesses twenty-two crematoria.

In Switzerland there are three crematoria: Zurich, Basle, and Geneva. There is a crematorium at Stockholm and at Gothenberg. There is also one at Copenhagen.

CREMER, WILLIAM RANDALL: British member of Parliament; born 1838 at Fareham, Hants, England. In 1859 he organized the Society of Amalgamated Carpenters; and during the American Civil War he protested, as a trade-union leader, against sympathy with the Southern states. On behalf of the proletariat he took a leading part in welcoming Garibaldi to England; and he was one of the founders of the Reform League, and for two years and a half general secretary of that terror of kings, the famous "International." He was elected to Parliament in 1885 for the Haggerston Division of Shoreditch, and has been four times reelected since. Of late years his attention and energy have been mostly devoted to international peace and arbitration. Cremer is the founder of the Inter-Parliamentary Conferences which since 1888 have met in the great cities of Europe and once in the United States. He has twice presented to the president and Congress of the U. S. memorials from members of the British House of Commons in favor of a treaty of arbitration between Great Britain and America. For thirty-five years secretary of the International Arbitration League, he also edits the League's organ, *The Arbitrator*. In 1903 he was awarded the Nobel Prize, £7,000 of which he gave as an endowment to the International Arbitration League. In addition the French Government bestowed upon him the Cross of the Legion of Honor. Mr. Cremer's views in matters of economic and social reform are those of a thorough democrat and practical Socialist. *Address*: 11 Lincoln's Inn Fields, W. C., London, England.

CRIME (see also PENOLOGY): In this article we consider the facts as to crime, and the question as to whether or no crime is on the increase. We shall notice:

I. Some general considerations. II. International statistics. III. The statistics of crime in the separate countries and the question for each country whether crime is on the increase or not. IV. Some general conclusions.

I. General Considerations

The first thing to be remembered in statistics of crime is what they do and do not indicate. Increase in numbers of persons accused, or of criminals tried, or convicted, do not, by any means, always indicate increase of criminality. Very often, perhaps even usually, they mean the reverse. When crime is common, public conscience low, morals lax, enforcement of law weak, few criminals are accused, tried, or convicted. When, however, public morals awake, new laws are put on the statute-books, offenses formerly condoned or not made amenable to law become contrary to law, people are tried, and convicted, and the number of criminals is apparently largely increased.

In England to-day hundreds of thousands of people annually are convicted of offenses against laws which did not even exist a generation or two ago. Education acts, vaccination acts, acts against the adulteration of food, regulations concerning the muzzling and treatment of dogs and other animals—all these enormously swell the number of convictions, and afford basis for thoughtless statements of the increase of crime, but certainly show if anything the reverse. In 1860 there were 158 offenses punishable as crimes in Massachusetts and 108 in Virginia, or fifty less. A large number of convictions in Massachusetts would therefore not prove more crime in Massachusetts than in Virginia, but here again very probably the reverse. In the German Empire, Mr. A. C. Hall ("Crime and Social Progress") states that between 1882 and 1895 new legislation increased the number of delicts punishable under the German code from 323 to 447, or 38 per cent. It is small wonder that apparently Germany has grown in crime. It is perfectly evident that one must know the state of the laws and of the enforcement of laws, before one says whether statistics of crimes do or do not mean high or low criminality.

Effect of New Legislation

Again, one must know what other conditions are. A large part of the modern apparent increase of crime is owing to accusations and convictions for comparatively petty offenses, but even in regard to the more serious crimes, like murder, which in all times and in all countries has been contrary to law, there are very different degrees of enforcement of the law. Law in Spain is probably much less enforced than in most civilized countries. In the United States legal methods and procedures are such that it is unquestionably much more difficult to convict even of murder in the U. S. than in England or most European countries. Notice must also be taken of the extent to which crimes are reported and recorded. Says a Boston paper, speaking of the asserted increase of crime in the U. S.:

"The ubiquitous reporter is responsible for the gloomy showing. His note-book and pencil are everywhere, and the telegraph is the ready agent for transmitting news to all parts of the world. . . ." Says another writer: "Years ago a crime had to be of unusual proportions to make its way into an adjoining state. Only the great crimes could cross the continent. But now we see and know everything. We skim the whole creation every morning, and put the results in our coffee."

All this and very much more must be remembered before one can rightly answer the question whether crime is on the increase or not, and also before one can compare the amount of crime in the different countries. Especially is it difficult, if not impossible, to compare the amount of crime in the U. S. with that in other countries. Conditions, methods, laws, vary greatly; the statistics of criminals in the U. S. for the census of 1900 have not yet appeared; the most recent general statistics we have are, therefore, those of 1890, and these the census tells us are not truly comparable with those of former censuses because these latter as to criminals were too incomplete.

II. International Statistics

It is scarcely too much to say, for the reasons given above, and, particularly, as to the U. S., that there are no general international statistics as to crime which are not more misleading than they are informing. The utmost that can be done, and that with the extremest caution, and even then with no little danger of being misleading, is to compare the statistics of crime in different countries for a very few main crimes. As to murders and homicides in the different countries Dr. A. C. Hall (idem, p. 32) gives the following suggestive table:

	England	Germany	France	Austria	Italy	Spain
Industrial rank (value of manufactures produced yearly in millions of pounds sterling, 1888)	820	583	485	253	121	85
Percentage of adults able to write (1889)	90%	90%	85%	55%	47%	28%
Convictions for murder and homicide, per 1,000,000 inhabitants (average for 10 years 1886–95)	5.13	5.45	11.55	15.42	76.11	44.70

Statistics comparable with this for the U. S. cannot be given. The *Chicago Tribune* reports each year the number of homicides and murders in the U. S., and also the number of executions, but neither of these are official or comparable with statistics as to *convictions* in other countries.

Mr. W. D. Morrison, of the prison at Wandsworth, England, in his "Crime and Its Causes" (1891), gives the following table:

Homicides of All Countries

Countries	Years	Tried	Convicted	
		Annual average	Annual average	Per 100,000 inhabitants over 10 years
Italy	1887	3,606	2,805	11.98
Austria	1883–6	689	499	2.90
France	1882–6	847	580	1.87
Belgium	1881–5	132	101	2.31
England	1882–6	318	151	0.76
Ireland	1882–6	129	54	1.40
Scotland	1882–6	60	21	0.74
Spain	1883–6	1,584	1,085	8.16
Hungary	1882–6	....	625	5.78
Holland	1882–6	35	28	0.88
Germany	1882–6	567	476	1.35

For statistics of illegitimacy and prostitution, see those articles.

For theft and robbery, Baron Garofalo, of Italy,

presented the following statistics at the International Conference of Charities and Corrections at Chicago in 1893 as to those *accused* of robbery and theft (annual average from 1881–87).

Country	Accused	Per 1,000,000 inhabitants
France	46,000	14.2
England	50,000	18.2
Belgium	11,000	18.3
Germany	146,000	29.8
Italy	125,000	42.2

A more minute study from facts given by Mr. Hall seems to show the following as to *accusations*:

Robbery and Extortion

Period	England	France	Austria	Germany	Italy
1881–85	215	143	164	1,116	725
Per 1,000,000	8.7	3.8	7.5	24.5	25.5
1891–95	226	[2]230	[2]134	1,024	859
Per 1,000,000	7.8	5.0	5.6	20.6	26.6

Serious Theft

1881–85	7,095	1,285	17,589	[1]12,898	.....
Per 1,000,000	288.4	31.5	803.1	283.4	.....
1891–95	6,92	[2]1,129	14,590	12,354	.....
Per 1,000,000	252.8	29.4	611.3	248.9	.....

Frauds and Fraudulent Bankruptcy

1881–85	1,829	14,800	17,783	37,081	.....
Per 1,000,000	74.3	393.0	812.0	812.8	.....
1891–95	1,837	18,577	23,847	43,775	10,791
Per 1,000,000	66.6	485.0	1,006.2	882.4	354.3

Allowance must be made in these figures for different ratings in different countries. When, as in the above, it appears that there is nine times as much serious theft in England as in France and that there is five or six times as much fraud in France as in England, it is evident that the difference is largely not in morals but in different ratings as to what is theft and what is fraud.

Nevertheless, it is significant that both as to murder and homicide, the countries stand in this order (those having the least murder and homicide in proportion to population being put first): England, Germany, France, Austria, Italy, Spain.

In offenses against the property there is more confusion, because of the different ratings of crime, but the countries stand in about this order: France, England, Belgium, Germany, Austria, Italy.

The United States

As already stated, the 1900 census returns as to statistics for crime are not yet available. The returns for 1890 are therefore the latest official figures.

Is Crime Increasing?

Based largely on these, the opinion is general that crime is largely on the increase in the United States. This is the statement of such authorities as David A. Wells, Henry M. Boies, Dr. F. H. Wines, General Brinkerhoff, Dr. Josiah Strong, and others. Dr. J. M. Buckley writes in the *Century* for Nov., 1903, on the present "epidemic of crime." S. S. McClure gives startling figures (*McClure's Magazine*, Dec., 1904). More recently epidemics of crime have been spoken of in New York, Chicago, and other cities.

Nevertheless, other authorities, like R. P. Falkner (*Forum*, July, 1900) and Eugene Smith ("Proceedings of National Prison Association," 1904), deny that this is proved. The statement of the census is:

	Prisoners	Per 100,000 of population
1850	6,737	29
1860	19,086	61
1870	32,901	85
1880	58,609	117
1890	82,329	132
1904	81,772	100.6

The figures published each year by the *Chicago Tribune* as to murders and homicides are not official, and are undoubtedly somewhat more complete for the later years than the former; nevertheless, they are significant and cannot be ignored:

Murders and Homicides in the U. S.

(From statistics compiled by the *Chicago Tribune*)

Year	Number of murders and homicides in the United States	Number of murders and homicides for each million of people	Number of suicides in the United States	Number of executions in the United States	Number of murders and homicides to each execution	Number of lynchings
1885	1,808	32.2	978	108	17	181
1886	1,499	26.1	914	83	18	133
1887	2,335	39.8	1,387	79	29	125
1888	2,184	36.4	1,487	87	25	144
1889	3,567	58.2	2,224	98	36	175
1890	4,290	68.5	2,640	102	42	123
1891	5,906	92.4	3,331	123	56	193
1892	6,791	104.2	3,860	107	63	230
1893	6,615	99.5	4,436	126	52	200
1894	9,800	144.7	4,912	132	73	189
1895	10,500	152.2	5,759	132	79	166
1896	10,652	151.3	6,530	122	87	131
1897	9,520	132.8	6,600	128	74	166
1898	7,840	107.2	5,920	109	72	127
1899	6,225	83.6	5,340	131	87	107
1900	8,275	108.4	6,755	117	71	115
1901	7,852	100.9	7,845	118	67	135
1902	8,834	111.7	8,132	144	61	96
1903	8,976	112.4	8,597	124	72	104
1904	8,482	104.4	9,240	116	73	87
1905	9,212	111.9	9,982	136	67	66
1906	9,350	108.9	10,125	123	76	69

Making every allowance for error, and tho things do not seem quite as black as in the hard times of 1895–96, an increase in murders and homicides in twenty-one years from 1,808 in 1885 to 9,350 in 1906 is startling in the extreme.

Yet possibly even more significant is the fact that in 1885 there were only seventeen murders and homicides for each execution, and in 1906, seventy-six for each execution, an increase of over 400 per cent. The columns, too, show that except for the years of depression from 1894 to 1899, the growth of murders and homicides has been almost steady, showing it the resultant not of accidental causes, but of some sinister evils in the nation steadily working increasing wrong.

Concerning the nature of crimes and criminals in the U. S., the Special Report on Prisoners and Juvenile Delinquents in Institutions (Department of Commerce and Labor, Bureau of the Cen-

sus, 1907) gives the following data, p. 20, for June 30, 1904:

Crimes	Number	Per cent
Against society	17,739	21.7
Against the person	26,017	31.8
Against property	37,166	45.5
Miscellaneous	850	1.0
Total	81,772	100.0

[1] Including 436 "unknown" parentage for U. S. not appearing in separate column.

[2] The percentage of white population over 10 years of age in 1900 was: native, 80.5; foreign, 19.5.

The compendium gives the following statements as to the birthplace of the parents of prisoners in the U. S.: Canada, 4,388; England, 5,997; Scotland, 1,996; Ireland, 29,184; France, 1,036; Germany, 9,987; Italy, 1,209; Mexico, 1,483; Norway, 487; Poland, 339; Russia, 382; Sweden, 775; Switzerland, 384. (Figures for 1890.)

For 1900 we have estimates only. Mr. Eugene Smith ("Proceedings of National Prison Association," 1900, House Document No. 491, 56th Congress, 2d Session) estimates 250,000 in the U. S. who make their living, at least in some degree, by the practise of crime. Their annual income he estimates at $1,600 each, or $400,000,000. Taxation caused by crime he puts at $200,000,000, besides the property destroyed; the time, life, and labor lost; the private expense entailed, expenses for steel safes, safe-deposit vaults, burglar alarms, detectives, locks, bars, bolts.

Rev. J. J. Munro, chaplain of the Prison Evangelistic Society of New York, writing in *Harper's Weekly*, estimates the annual direct and indirect cost of crime in the U. S. for 1906 at $1,075,000,000, which he figures as follows:

Cost of crime to Greater New York	$35,000,000
Cost of crime to New York State elsewhere	42,000,000
Cost of crime all other states	697,000,000
Cost of crime to federal government	80,000,000
Criminal losses by fires	100,000,000
Custom House frauds	60,000,000
Wages of 100,000 prisoners in state prisons	28,000,000
Wages of 150,000 in jail	33,000,000
	$1,075,000,000

After a careful study of the statistics of penitentiaries in 1890, Professor Falkner found that of 9,859 prisoners reported by the Wardens' Association, there were only 227 females, or 2.3 per cent, which, he says, may mean that females are not sent to penitentiaries or do not commit the more serious crimes. (The total aggregate in all penal institutes, however, in 1890 was 40,741 men to 32,304 women.) Nearly one fifth of the convicts in the penitentiaries studied were colored, a proportion far in advance of the colored in the population.

As to the extent to which the foreign born in the community contribute to our penal population, Professor Falkner found that, in 1890, considering penitentiaries alone (not including workhouses and other penal institutions) adult whites of foreign birth did not contribute more than their due proportion as compared with the native born.

But of the second generation of the foreign born —that is, of the native whites of foreign parentage —it does seem true that they produce more than their proportion of criminals, for native whites of native parentage had 753 prisoners for each million in 1890, and native whites of foreign parentage had 1,345. And taking into consideration penal institutions of all sorts, except juvenile reformatories, the 20,000,000 of our population in 1890 who were foreign by birth or parentage, furnished a half more prisoners than the 34,000,000 of our native white population. In other words, the tendency to crime in the U. S. was more than two and one half times as strong among those who are foreign by birth or parentage, as among the native white.

Difference of race, however, seems to count more than difference of nativity in the production of criminals. The following table, compiled from the census of 1890, gives the nationality of the parents of prisoners and paupers in the U. S., so far as these were known, and compares the per-

PERCENTAGE OF NATIVITY OF 105,885 KNOWN PARENTS OF PRISONERS IN U. S. AND 108,802 KNOWN PARENTS OF PAUPERS IN U. S. CENSUS OF 1890

	Canadian, English	Canadian, French	English	Scotch	Irish	French	German	Scandinavian	Russian	Hungarian	Bohemian	Italian	Total foreign	Native
Parents of total population	1.50	.82	3.07	.86	7.85	.41	10.94	2.11	.41	.12	.34	.40	33.02	66.94
Parents of prisoners	3.83	.30	5.66	1.88	27.56	.97	9.43	1.20	.36	.24	.08	1.14	56.81	43.18
Parents of paupers	1.85	.22	4.30	1.28	29.79	.89	14.36	1.98	.12	.09	.32	.29	48.46	41.59

centages of the extent to which each country has furnished the parents of criminals, with the percentage of the extent to which it has furnished parents in the community at large. It will be seen by making this comparison what differences there are in this respect between races.

As to age and conjugal condition, Professor Falkner found that in round numbers one third of the convicts were over 30 years of age, and that 68.75 per cent were unmarried. As to occupations, agriculture produced 15.27 per cent. of the prisoners and (in 1900) 44.3 of the community; personal and professional life, 72.09 of prisoners and 23.7 of the community; trade and transportation, 10.41 of prisoners and 16.3 of the community; manufacturing and mechanical pursuits, 22.01 of prisoners to 23.3 of the community.

[6] Including one corporate body indicted for nuisance.

Concerning the nature of crimes, and the question of increase or decrease in recent years, the 1907 Year Book of the *Daily Mail* makes the following summary:

OFFENSES	1904	Annual average 1900–4	Proportions per 100,000 population: 1904	Proportions per 100,000 population: Annual average 1900-4
I. Crimes (indictable offenses) known to the police	92,907	84,247	275	255
II. Persons for trial or tried for:				
(*a*) Indictable offenses	59,960	56,911	178	172
(*b*) Criminal non-indictable offenses	89,254	94,288	264	286
(*c*) Other non-indictable offenses	657,925	641,159	1,949	1,943
Total persons tried	807,139	792,358	2,391	2,401
III. Persons convicted of:				
(*a*) Indictable offenses	49,567	46,550	147	141
(*b*) Criminal non-indictable offenses	59,372	61,605	176	186
(*c*) Other non-indictable offenses	556,440	540,016	1,648	1,637
Total persons convicted	665,379	648,171	1,971	1,964
IV. Persons imprisoned:				
Convicted prisoners received	199,153	175,613	590	532
Convicted prisoners in prison on 31st March	20,099	18,130	60	55

These figures are not all of equal value as criteria of the state of crime, but they all indicate an increase of criminality in 1904. The statistics of persons tried for indictable offenses have been generally accepted as the best index to the fluctuations of crime, and accordingly these figures will be used in the remarks which follow in preference to the others.

The total number of persons for trial for indictable offenses was 59,960, or 177.59 per 100,000 population, being an increase of 1,516, or nearly 3 per cent, as compared with the previous year. There has been a continuous growth of crime since the year 1899; the figures for each year from 1899 to 1904 being as follows:

Year	Number of Persons	Proportion per 100,000 population
1899	50,494	158.97
1900	53,628	166.98
1901	55,453	170.00
1902	57,068	172.94
1903	58,444	175.10
1904	59,960	177.59

It is necessary, however, to remember that for many years prior to 1899 there was a steady decline, with occasional interruptions, in the number of persons tried for indictable offenses, and in that year the total was less than in any previous year since 1875. The actual figures for 1904, altho high, are by no means the highest, there having been eight occasions during the forty-eight years for which figures are available in which the total exceeded 60,000; and as in those years the population was less than in 1904, the proportion of crime to population was of course greater than in recent years. For example, during the quinquennial period, 1860–64, the annual average was 280 per 100,000 population, as compared with 172 in the last quinquennial period

An increase in the total of crime does not imply an increase in all descriptions of crime. The increase in 1904 was wholly in offenses against property. Offenses against the person fell from 2,768 to 2,525, or nearly 9 per cent. Except in the past year, and in 1900, the figures for offenses of this description have shown a remarkable steadiness during the 12 years covered by the revised criminal statistics, the figures being as follows:

1893	2,790	1899	2,785
1894	2,752	1900	2,566
1895	2,755	1901	2,727
1896	2,812	1902	2,757
1897	2,734	1903	2,768
1898	2,749	1904	2,525

The decrease in 1904 is spread over nearly all the headings, but is mainly in offenses of violence. The only offense against the person which (measured by the number of cases tried) shows a marked tendency to increase, is bigamy, for which the figure was 138, the quinquennial averages for 1895–99 and 1900–4 being 104 and 112 respectively.

The principal classes of offenses showing an increase in 1904 are:

Offenses	1904	1903	Annual average 1900–4
Simple larceny and minor larcenies	41,952	40,127	39,368
Obtaining by false pretenses	2,153	1,830	1,727
Frauds by agents, etc	76	54	37
Bankruptcy offenses	59	32	40
Other frauds	152	114	111
Arson	219	143	152
Coining	98	89	75

The increase of offenses of simple larceny and minor larcenies (1,825, or 4 per cent) is more than sufficient to account for the whole of the increase in the total number of persons tried. The increase under this heading is mainly in cases tried summarily, and it may therefore be inferred that the additional offenses were not of the gravest character.

It is satisfactory to observe that those classes of offenses usually committed by habitual criminals have ceased to increase at the same rapid rate as formerly. The figures for burglary and housebreaking were 2,942, as against 2,863 in 1903, an increase of only 79, as against increases of 313 and 435 in the two previous years; and the figures for receiving stolen goods were 1,187, as against 1,267 in 1903. The offense of larceny from the person has been on the decline for a long period, the figures for 1904 (2,164) being little more than half the figures for 1893 (3,993).

The number of persons prosecuted for non-indictable offenses was 747,179, an increase of only 1,927, or 0.25 per cent, as compared with the previous year, while the proportion to population fell from 2,233 to 2,213 per 100,000. During the forty-eight years for which figures are available, non-indictable offenses reached their highest point—761,322—in 1899, the year in which indictable offenses touched their lowest level during the past thirty years.

The principal conclusions as to the increase and decrease of crimes and offenses to be drawn from the statistics for 1904 may be thus shortly stated:

1. Crimes against the person have diminished.
2. Crimes of the classes chiefly committed by habitual criminals have ceased to increase at the same rapid rate as in previous years.
3. Minor offenses of dishonesty have increased.
4. Serious frauds and breaches of trust have increased.
5. Drunkenness is stationary.
6. Offenses of the vagrancy class are growing rapidly.

Concerning the question of the increase or decrease of crime in England compared with former times, Mr. A. C. Hall has compiled considerable information. We are largely indebted to him for the following:

Former Times

He finds that as England emerged from feudalism, the fourteenth and fifteenth centuries (the great period of constitutional progress) were times of weakness in the administration of justice, of increasing anarchy, and moral decay, tho on the whole there was little crime, the lawless being attracted to the service of the nobility and their feuds. Under the Tudors there was the enactment of a large number of new laws severely enforced. Hence, apparently and in fact, a flood of criminality. English blood was astir with restlessness. Under the Stuarts again there were great constitutional and religious contests. There was large and general corruption, but less of other forms of crime. The Reformation and Puritanism checked immorality with an unnatural condemnation of all joys, that reacted in a carnival of vice and crime. In 1723 Lady Mary Montagu wrote: "Honor, virtue, and reputation, which we used to hear of in the nursery, are as much laid aside as crumpled ribbons." Says Lecky ("England in the Eighteenth Century," vol. i., p. 482): "The impunity with which outrages were committed on the ill-lit and ill-guarded streets of London during the first half of the eighteenth century can now hardly be realized. In 1712 a club of young men of the higher classes, who assumed the name of Mohawks, were accustomed nightly to sally out drunk into the streets to hunt the passers-by. . . . One of their favorite amusements, called 'tipping the lion,' was to squeeze the nose of their victim flat upon his face, and to bore out his eyes with their fingers. . . . [Another] favorite amusement was to set women on their heads and commit various indecencies and barbarities on the limbs that were exposed. . . . Country gentlemen went to the theater as if in a time of war, accompanied by their armed retainers." Macaulay, in his well-known picture of England of the seventeenth century, confirms the same picture of London being utterly unsafe by night, while the country was unsafe by night or day. Banditti and highwaymen infested the roads near London, and ruled the remoter sections. Walpole (1721–42), established an "organized system" of parliamentary bribery. Coaches were plundered for weeks together in broad daylight. Piracy was common. Laws were ferocious. Men were hanged at Tyburn every Monday by the dozen. Even from 1824 to 1830, forty kinds of forgery were punishable by death.

Since the beginning, however, of the nineteenth century there has been a large doing away with the death penalty for most crimes, the passage, as stated above, of a very large number of new laws, a resultant steady increase of accusations and convictions, but beyond all question a diminution of serious crime, except perhaps in a few forms peculiar to modern commercialism. For serious crimes Mr. Hall gives the following table of arraignments before the high courts of England and Wales:

	Annual average	Per 100,000 of population
1857–61	17,825	90.53
1862–66	19,758	94.61
1867–71	18,445	83.00
1872–76	15,096	63.63
1877–81	15,567	61.36
1882–86	14,303	53.13
1887–91	12,481	43.87
1892–96	11,816	39.31
1896–	11,103	36.13

IRELAND

	Annual average	Per 100,000 of population
1852–56	12,155	185.52
1857–61	6,071	99.52
1876–80	4,255	80.86
1881–85	3,687	73.11
1886–90	2,430	50.55
1891–95	2,133	46.15

Says the Report of the Howard Association (1906):

It is interesting to note that while crime generally has increased, offenses against the person have decreased, falling from 2,785 in 1899 to 2,525 in 1904, a decrease of nearly 9 per cent. The obvious deduction is that passion and brutality are becoming less potent factors in the causation of crime.

The great increase has taken place in those kinds of offenses that require not only dishonest intention, but also some education and skill in their perpetration. Hence false pretenses, frauds, embezzlements, and larcenies make up the increase; the deduction being obvious, that dishonesty, cupidity, and lack of principle are becoming more powerful causes of crime.

SCOTLAND

The number imprisoned during 1904 was 59,962, or 1 prisoner in 75 of the population.

As in England, while the number of minor offenses resulting in imprisonment has been going down, the more serious crimes have been increasing. Drunkenness and breaches of the peace show large reductions below the average of the last five years; but thefts, frauds, housebreakings, and cruelty to children have increased greatly. The commissioners call particular attention to housebreaking and fraud. The average number of imprisonments for housebreaking for the previous five years was 563; in 1904 the number rose to 869, or 54 per cent above the average. Cases of fraud rose in the same period from 316 to 434, or by 37 per cent.

Concerning the increase of crime the following figures seem to show a steady increase, but are probably largely due to increasing legislation:

GERMAN EMPIRE

	Convictions in courts of first instance	Per 10,000 inhabitants
1883	330,128	102.3
1884	345,977	106.6
1885	343,087	104.6
1886	353,000	108.2
1887	356,357	108.4
1888	350,665	105.5
1889	369,644	110.1
1890	381,450	112.0
1891	391,064	112.4
1892	422,327	119.6
1893	430,403	121.2
1894	446,110	124.4
1895	454,211	124.9
1896	456,999	124.4
1897	463,585	124.8
1898	477,807	125.7
1899	473,139	123.6
1900	469,819	119.5
1901	497,310	125.6
1902	512,329	127.3
1903	505,353	123.4
1904	516,976	124.2

THE GERMAN EMPIRE, 1904

(Statistisches Jahrbuch für das Deutsche Reich, 1906)

CRIMES AND MISDEMEANORS AGAINST LAWS OF THE EMPIRE	Accused	Convicted	Punishable actions	PERSONS SENTENCED: Male	Female	From 12 to 18 years	Previously sentenced
Total crimes and misdemeanors	660,857	516,976	611,082	435,191	81,785	50,028	225,326
(a) Against the State, public order, and religion	106,760	92,677	101,649	81,170	11,507	2,230	38,003
(b) Against persons	285,904	220,164	245,180	189,118	31,046	12,939	89,890
(c) Against property	266,606	202,860	261,899	163,704	39,156	34,850	97,157
(d) Crimes and misdemeanors of officials	1,587	1,275	2,354	1,199	76	9	276

TABLE OF PERCENTAGES

		Percentage of crimes and misdemeanors specified			Percentage of persons sentenced			
Total crimes and misdemeanors		100.0	100.0	100.0	84.2	15.8	9.7	43.6
(a) Against the State, public order, and religion		16.2	17.9	16.6	87.6	12.4	2.4	41.0
(b) Against persons		43.3	42.6	40.1	85.9	14.1	5.9	40.8
(c) Against property		40.3	39.2	42.9	80.7	19.3	17.2	47.9
(d) Crimes and misdemeanors of officials		0.2	0.3	0.4	94.0	6.0	0.7	21.6
Details	Violence and threats against officials	2.8	3.4	3.1	94.5	5.5	2.0	65.1
	Breaking the peace	4.7	4.8	5.4	90.5	9.5	4.7	48.5

	Damage to property	4.0	3.8	3.6	94.4	5.6	16.4	43.9
	Incendiarism	0.1	0.1	0.09	85.5	14.5	35.8	33.5

As stated above, Germany from 1882 to 1895 increased the number of offenses punishable under the code 38 per cent. Naturally accusations have increased, as will be seen from the tables of international statistics. Germany's main offenses are against property, not against life. This is doubtless due to her new almost sudden development of commercialism. According to Mr. Hall, there were from 1891 to 1895 1,080 crimes for 100,000 in the country districts, 1,400 in cities of 20,000 or over. Fraud increased from 1882 to 1895 50 per cent; fraudulent bankruptcy and forgery 45 per cent. Theft in all forms decreased. Delicts of immorality and lust increased from little over 3,000 in 1882–85 to 4,000, 1891–95. Mr. Hall finds a rapid increase of crime among young men and women, which he connects with the increase of factories.

France

	Convictions in			Total	Per 100,000
	Assize courts	Correctional tribunals	Police courts.		
1885....	3,028	211,797	450,773	665,598	1,779
1890....	2,918	211,731	447,273	661,988	1,731
1895....	2,372	221,234	398,723	622,329	1,620
1900....	2,248	187,024	[1]411,087	600,359	1,547
1903....	1,996	190,421	435,354	627,771	1,565

[1] 1901.

This shows a somewhat marked diminution in convictions. Until recently, however, convictions have been on the increase in France, mainly, probably, as in other countries, due to the enactment of new laws and particularly of police regulations. Comparing various periods in the nineteenth century Mr. Hall gives us the following table:

	Total persons held for trial	Per 100,000 of pop.	Persons convicted
1826–50.....	403,748	1,199	350,775
1851–75.....	685,445	1,872	639,047
1876–95.....	679,944	1,799	650,318

Most of this increase, however, was due to new police regulations, such as laws for wagons and coaches.

Austria

	Crimes	Per 100,000 of pop.	Less serious offenses	Misdemeanors
1885.....	30,865	137	....	544,692
1890.....	29,090	127	....	581,813
1895.....	28,709	115	7,596	521,756
1901.....	36,317	144	9,052	607,081
1904.....	34,202	131	8,388	560,058

Austria in recent years shows a decrease of crime; up to 1885, however, there was an increase. As Austria has become liberal and less clerical, crime has grown less.

Italy

	Persons Condemned			
	Total convictions	Per 100,000 of pop.	Serious crimes,[1] annual average	Per 100,000
1881–85.....	367,510	1,291	[2] 6,464	23.3
1891–95.....	506,687	1,614	[3] 4,952	13.9
1900–4.....	403,743	1,246	2,788	9.6

[1] Before courts of assize. [2] 1880–84. [3] 1890–94.

Italy shows recently a decrease of convictions of all kinds and a very marked decrease in serious crimes. From 1880 to 1890, however, convictions multiplied, because for the first time under a strong centralized government law began to be enforced and brigandage and lawlessness put down. Under the Church, convictions were few, because law was not enforced and brigandage common.

Spain

	Convictions Under the Criminal Code	
	Annual average	Per 100,000 of pop.
1883–85.....	84,188	504.1
1886–90.....	91,846	532.5
1891–95.....	89,923	521.4
1896.....	81,118	.....

From the above table by Mr. Hall, he draws the conclusion that the political and economic misfortunes and popular ignorance and superstition which have made an almost unprogressive nation of a once great people, have produced an almost stationary condition of criminality.

Belgium

	Annual Convictions			
	Assize courts	Per 100,000 of pop.	Correctional tribunals	Per 100,000 of pop.
1870.....	105	1.9	22,254	419.8
1880.....	137	2.4	40,208	731.0
1890.....	97	1.6	40,275	671.9
1900.....	68	1.0	45,939	696.0
1903.....	68	1.0	47,748	712.1

Belgium in recent years has been among the most progressive countries in the enactments of laws. Convictions of lesser offenses have, therefore, grown since 1870, tho as in other countries serious offenses have fallen off.

Netherlands

	Annual Convictions			
	Cantonal courts	District tribunals	Together	Per 100,000 of pop.
1887.....	66,143	17,262	83,405	1.853
1891.....	69,622	17,428	87,050	1.934
1900.....	95,289	14,490	109,779	2.152
1904.....	147,955	16,138	164,043	2.983

In the Netherlands crime of all kinds seems to have increased. Even the cases before the High Court increased from 270 in 1895 to 437 in 1905.

DENMARK

	Convictions of crime	Per 100,000 of pop.
1885	3,525	176
1890	3,897	185
1897	3,689	161
1904	3,863	148

Showing a decrease of crime.

NORWAY

	Convicted of crimes	Per 100,000 of pop.
1891	2,548	134
1896	3,075	146
1902	3,362	151

An increase of crime.

SWEDEN

	Convicted of crimes	Per 100,000 of pop.
1899	2,224	45
1904	2,393	46

A slight increase.

SWITZERLAND

	Convictions	Per 100,000 of pop.
1893	4,426	147
1898	3,295	106
1903	4,044	118

A decrease of crime.

JAPAN

	Serious crimes	Lesser	Total	Per 100,000 of pop.
1893	3,129	172,489	175,618	425
1900	2,675	128,525	131,200	382
1904	3,866	84,597	88,463	187

A marked diminution of crime, tho serious crimes seem to have increased.

AUSTRALASIA

The following tables are compiled from Coghlan's "Statistical Account of Australia and New Zealand," 1904. The figures are for the year 1902:

STATE	Persons charged	Summarily convicted	Committed	Persons charged per 1,000 of pop.
New South Wales	60,373	50,776	1,271	42.89
Victoria	45,198	33,461	641	37.49
Queensland	21,115	17,625	489	41.01
South Australia	6,608	5,556	209	18.06
Western Australia	16,443	12,753	335	76.43
Tasmania	6,228	4,975	75	35.17
Commonwealth	155,965	125,146	3,020	40.13
New Zealand	28,076	22,125	765	34.75
Australasia	184,041	147,271	3,785	39.21

In New Zealand each charge is counted as a separate person—a proceeding which, of course, tells against the colony; a reduction of about 10 per cent should be made to get at the number of persons.

NATURE OF OFFENSES

STATE	PER 1,000 OF POPULATION				
	All offenders	Serious offenders			Minor offenders
		Against the person	Against property	Total	
Commonwealth	40.13	2.52	3.81	6.33	33.80
New Zealand	34.75	1.62	3.57	5.19	29.56
Australasia	39.21	2.36	3.77	6.13	33.08

YEAR	PER 1,000 OF POPULATION	
	Committals	Convictions in superior courts
1861	2.2	1.3
1871	1.4	0.8
1881	1.2	0.7
1891	1.1	0.6
1902	0.7	0.4

Showing a steady diminution of crime.

CANADA

	Summarily convicted	Per 100,000 of pop.	Convicted in higher courts	Per 100,000 of pop.
1888	33,902	737	3,747	81
1893	31,023	646	4,630	96
1898	32,419	635	5,787	113
1904	48,192	932	6,754	127

Showing an increase of crime.

III. General Conclusions

The general conclusion from these statistics is that (excepting, perhaps, in the U. S., Canada, Germany, the Netherlands, and to a less extent the Scandinavian countries) serious crime is on the decrease, and that if commitments for minor offenses are in many countries on the increase, it is in almost every case due to the enactment of new laws, police regulations, etc., with the stricter enforcement of social and hygienic regulations—an indication, therefore, of social progress rather than of the reverse.

Speaking broadly, statistics therefore unquestionably show that the world is growing better. Comparing for a moment the present with the remote past, this is clearly the case.

For social evils to-day, see PROSTITUTION; but compare these with classic days, when the noblest philosophers practised and openly defended not only prostitution, but unnatural vice; when in the baths of Rome thousands of men and women were abandoned *en masse* to the lowest crimes. Without referring to Rome under her degenerate Cæsars, under Augustus 10,000 gladiators fought, and their bloody games were applauded by Stoic philosophers and by vestal virgins. Naturally recklessness of life spread everywhere, and philosophy defended the right of the master to kill or to torture his slaves.

The immorality of Rome and Greece cannot be credited, scarcely described, in a modern encyclopedia. Take it in other lands. In England before the Norman Conquest it was the custom to buy men and women in all parts of England and carry them to Ireland for sale, the buyers usually making the women pregnant to insure a better price ("Life of Bishop Wolstan"). The one aim of life was to escape being slain if a man, and being violated if a woman. The violence and crime and bloodshed of the Middle Ages are well known. The Peace of God, when for a few days a week men agreed not to murder, was instituted to preserve society from absolute disintegration. Murders, treasons, brawls, poisonings were on every hand. A nobleman declared war against Frankfort because a lady had not danced with his cousin. Together with good men the vile were also in the Church, at times even in the chair of St. Peter's; priests went from their mistresses to the altar, and the nunneries were like brothels. The Reformation and Puritanism checked immorality with an unnatural condemnation of all joys, that reacted in a carnival of vice and crime.

Former Ages

Of modern times progress is less clear, only because one of the characteristic marks of modern progress has been the enactment of social and humanitarian legislation, technically vastly increasing the possibility of violating law.

Another conclusion that stands out is what Mr. Hall shows in his book, that crime, at least of the lesser sort, is an almost inevitable concomitant of social progress and of steps to a larger gain.

Again, the facts show that in times of war and political agitation, crime so far as it appears in statistics is reduced, partly because the restless find other outlet and partly because society is too much otherwise occupied to arrest or prosecute petty crimes which would be noticed in times of peace.

Once more, it seems shown, that as countries break away from former religious or governmental paternal forms, the first result in crime is an increase, but that liberalizing institutions and, above all, advance in education tend to the decrease at least of serious crimes.

For the sources of information used in this article, tho not for the tables as here published, we have largely used various editions of the Statesman's Year Book, except as stated.

CRIMINAL ANTHROPOLOGY: This can hardly be considered a science, but it is a term which represents systematic efforts made in recent years to apply physiological, and to some extent psychological tests to the study of the criminal. Lombroso has worked with great industry in the field, but his conclusions are not generally accepted. Mr. W. D. Morrison in his "Crime and its Causes," chapter vii., has brought out the variety of opinions represented by criminal anthropologists.

CRIMINOLOGY treats of the nature, causes, and prevention of crime and the treatment of the criminal. The word is often used synonymously with PENOLOGY, under which head it is treated in this volume.

CRISES (COMMERCIAL AND MONETARY): A time of general difficulty and pressure in commercial and monetary circles, if acute, is called a *crisis*; if prolonged it is usually called *a period of depression*. A crisis, too, must not be confused with a panic. A panic starts with a group of speculators, perhaps occasioned by some disastrous event or report of a disastrous effect. The market is upset. Weaker firms fail; yet there is no general crisis and the market soon recovers. A crisis lasts longer and is general, tho it is often connected with panics. Crises, whatever be their cause, usually follow a certain course, which it is asserted by some writers, Jevons prominently among them, follows a certain cycle.

In 1634 there was a crisis over speculation in tulips which became a furor in Holland, and lasted four years before it burst. But the first crisis of the modern type occurred in 1720 over the speculative plans of John Law in forming his Mississippi Company. His company possest in 1719 over twenty-one ships and nearly $1,000,000. Shares went up to many times their value. Speculation developed like a fever in France and England. About the same time, too, the South Sea Bubble was developed in England. In 1763 and 1799 there were crises in Hamburg. In England there were crises in 1783, 1793, 1795–97, in connection with the American and French wars. In 1815 there was a severe crisis at the close of the Napoleonic wars. After the peace England undertook to flood Europe with manufactures, but there was OVERPRODUCTION and a crisis. In 1825 there was another crisis, which affected America also. In 1837 there was a most severe crisis in the United States, renewed in 1839, when 959 banks stopt payment. There were 33,000 failures with an aggregate loss of $440,000,000. The crisis of 1847 affected England more, being occasioned by the failure of the potato crop of 1846. The crisis of 1857 began in America, but affected England and all Europe more severely.

Early Crises

The crisis of 1866 was mainly in England, once more causing a suspension of the Bank Act, and was marked by the memorable "Black Friday" and of the failure of the almost historic house of Overend, Gurney & Co. The 23d of September, 1869, saw a "Black Friday" in New York, but it was mainly local and connected with gold speculation.

During the first three quarters of 1873 the general prosperity of the U. S. seemed undiminished; but on Sept. 18, 1873, the most extraordinary panic began which this country has ever witnessed, and reached its height about the middle of October. It prostrated thousands of commercial houses, cut off the wages of hundreds of thousands of workmen, and overthrew the Stock Exchange. It swept down the entire banking system of the country. Even savings-banks closed their doors. It broke off the negotiation of American securities in Europe, and prostrated business in every way. The causes were involved.

Crisis of 1873

The closing of the War of the Rebellion had seen the commencement of great industrial activity in the U. S. From 1869–73 enormous amounts of money were invested in commercial enterprises. The cost of the railroad construction

of those five years is estimated at $1,700,000,000, while municipalities and private corporations borrowed money for vast undertakings. The land grant policy and cheap transportation developed a new West. In Europe the opening of the Suez Canal stimulated commerce. Interest was based on the high prices of war time. There was increased need of currency. Instead of this the policy of resumption and contraction (see CONTRACTION AND EXPANSION OF CURRENCY) limited the amount of currency below the demand. On Sept. 18th, the great house of Jay Cooke & Co. of New York failed, dragging other houses with it. Concerted action was taken, and the immediate crisis was stayed; but in industrial lines 1874 was worse than 1873, and there was depression till 1877. The great railroad strikes of that year made matters worse. In 1878 there was improvement, and this continued till 1883. In 1884 another crisis occurred, tho of less serious character, and depression prevailed through the strikes and industrial troubles which continued till 1886. Confidence was then in a degree restored, with some depression in 1888, till the crisis of 1890. That year prominent English houses which had invested in Argentine Republican and African securities were disturbed, and finally on Dec. 15th even the great house of Baring Brothers suspended. In France the great coffee syndicate failed. But the Bank of England stood firm, and a syndicate of strong houses liquidated the debt of Baring Brothers. It affected the U. S. almost as much, tho not so much in the form of a crisis as of adding to depression, continuing without much improvement to the great crisis of 1893.

Crisis of 1893

The crisis of 1893 was in many ways different from all other crises. It was only very slightly due to overspeculation, almost purely to monetary conditions, yet it affected not only financial circles, but industry all over the U. S. In Congress there was discussion over the repeal of the silver-purchasing act of 1890. (See CURRENCY.) On June 26th it was announced that India had stopped the free coinage of silver. This at once sent the price of silver bullion down to the lowest point ever recorded, and all stocks went down. The mines of Colorado and other silver states were at once stopt, and their workmen left unemployed. There was a panic. Western and Southern banks began to fail. Hoarding set in, even in the East. Currency became scarce. Many manufactories shut down. Wealthy men with unquestioned credit could not get checks cashed. All the banking centers except Chicago began to have recourse to clearing-house certificates. There was a money dearth. The president called an extra session of Congress which opened Aug. 7th. There was a heated struggle over the money question, and not until October 30th was a bill, introduced by Senator Voorhees, repealing the silver-purchase law, but declaring for the parity of gold and silver, passed by the Senate, accepted by the House, and signed by the president.

Meanwhile the crisis was already checked. Foreign investors began sending in money, taking advantage of the low price of stocks. Only one private banking firm in New York City had failed, and only one national bank. Of the 301 bank suspensions from May 1st to July 22d, 93 per cent were in the South and West. Yet the business failures from April 1st to October 1st were 8,105 against 4,171 for those months in 1892, with liabilities of $284,663,624 against $41,110,322 for 1892. Thus the number of failures had doubled, and the liabilities had increased nearly sevenfold. Three great railway systems were sent into the hands of receivers: the Northern Pacific, the Union Pacific, and the Erie. Since 1893, while there have been money stringencies, and while the elections of 1896 and 1900 caused some depression of business, there has been no real panic, tho there was a severe depression of stocks in 1907, when some trust companies and banks temporarily closed.

CRITTENTON, CHARLES NELSON: Founder of the Florence Crittenton Mission; born in Adams, Jefferson County, N. Y., Feb. 20, 1833. Beginning in the drug business he became head of the Charles N. Crittenton Company. But after the death of a daughter, Florence, he felt that God was calling him to a work in behalf of homeless, friendless, and unfortunate girls. From that time he has devoted his time and energy to establishing homes and schools where homeless, friendless, or unfortunate girls can be cared for.

In 1895 a corporation, known as the National Florence Crittenton Mission, was chartered to take charge of the work.

At the present time there are sixty-eight of these homes and schools in the U. S. and five in foreign lands.

The Charles N. Crittenton Company was one of the original profit-sharing companies in the U. S.

Mr. Crittenton is a pronounced prohibitionist and at one time was a candidate for the mayoralty of New York on the Prohibition ticket. *Address*: 213 Third Street, N. W., Washington, D. C.

CROOKS, WILLIAM: One of England's leading trade-unionists, and member of Parliament; born, in Poplar, 1852. Part of his early life was spent in the workhouse. Apprenticed to a cooper, he early found difficulty in securing work because of his trade-union principles. In 1882 he was elected trustee of the parish and library commissioner for Poplar; 1892, elected to the London County Council; chairman of the Poplar Board of Guardians since 1877. He has also been mayor of his borough. In 1903 he was elected to Parliament from Woolwich, his election bringing consternation to Conservatives and Liberals. In 1906 he was reelected, under the auspices of the Labor Representation Committee, by 9,026 votes against Adams, Conservative, 6,914 votes. *Address*: 81 Gough Street, Poplar, London E.

CROSBY, ERNEST HOWARD: American author and lecturer; born in New York City, 1856; was graduated from New York University, 1876, and from Columbia Law School, 1878; practised law in New York till 1889. He was a member of the New York Legislature in 1887 and in 1889, being in charge of high-license legislation, and chairman of the committee on cities. In 1889, being nominated by President Harrison, he was appointed judge of the mixt tribunal of Alex-

andria, Egypt, by the Khedive. He resigned this position in 1894, and returned to America. Mr. Crosby was long president of the New York Social Reform Club, of the People's Club, of the Civic Council, N. Y., of the Anti-Imperialist League, and of the New York Vegetarian Society. He was an ardent admirer and student of Tolstoi, a believer in the system of single taxation, an advocate of peace, and an opponent of all kinds of monopoly. He has written: "Plain Talk in Psalm and Parable"; "Captain Jinks, Hero"; "Broadcast"; "Tolstoi and His Message"; "Tolstoi as a Schoolmaster"; "Garrison, the Non-Resistant," etc. Mr. Crosby died in 1907.

CRÜGER, HANS: Member of the Prussian House of Deputies; born 1859 in Königsberg; studied law and political sciences at Königsberg and Göttingen; Dr.J., 1883. He followed the law till 1887, when he became secretary of the General German Cooperative Society till 1896. His literary activity has been quite extensive. Besides annotating and digesting the laws of Germany, as to cooperative societies, he has edited the year books of the society, and written numerous pamphlets about cooperative savings-banks and related subjects. He is a collaborator of the *Handwörterbuch der Staatswissenschaften*. *Address*: Nussbaum Allee 17, Westend, Berlin.

CUBA, REPUBLIC OF: Till 1898 in the possession of Spain, the incessant guerrilla wars maintained in the mountainous portions of the island against the Spanish, the injustice and inefficiency in many ways of the Spanish Government, the cruelties practised by General Weyler, the blowing up of the United States warship the *Maine* in the harbor of Havana, whether by the Spaniards or not, all combined to make most people in the U. S. favor the armed freeing of Cuba, and war of the U. S. against Spain was declared April 22, 1898. After a brief but brilliant campaign Spain was compelled to yield and relinquished sovereignty over the island in the treaty of Paris, Dec. 10, 1898. For three years the U. S., through its War Department, controlled the island, doing much for education, justice, hygiene, and the establishment of republican institutions. On May 20, 1902, however, the U. S. turned the complete control of the island over to the Cuban Republic, General Palma having been elected president. After apparent success, however, dissensions arose in the island (1906). The government being unable to restore order, the U. S. Government was appealed to and 6,000 troops were sent and order restored. The U. S. Government has appointed Secretary Taft as provisional governor, but as soon as orderly government is established the U. S. Government will retire.

Relations with United States

The area of the island is 43,000 sq. m., of which only 3 per cent till 1899 and now little more than 4 per cent is under cultivation; population, (1905), 1,786,207, of whom less than one third are mulattoes or negroes.

Capital, Havana, with a population of 275,000. Revenue, 1905, $29,609,000; expenditures, $18,997,000; exports, 1905, $112,000,000; imports, $103,000,000. In 1906 the debt was $47,693,000.

Statistics

The government of the republic is patterned upon the American Constitution, with a president, Senate and House of Representatives. There are six provinces, each having four senators. The representatives are elected one for every 25,000 inhabitants. Every male Cuban who has reached the age of twenty-one has the right to vote, except he be a criminal or of unsound mind. A residence of five years is required before a foreigner may become a citizen. Education is free and compulsory. The schools are organized after the American system; there is a university at Havana, and 3,550 schools through the island, with an attendance of about 150,000. About two thirds of the population is illiterate, but the schools are rapidly improving this condition. The prevailing religion is of the Roman Catholic Church, the whole island being the diocese of an archbishop. The Protestant Churches, notably the Episcopal Church, have active missions.

Morals are somewhat loose, but this is partly due to defective laws. The proportion of those over fifteen legally married is in the U. S.: in Cuba 30, in Havana 25, among the colored in Cuba, 6. Over 8 per cent of the people are living together without legal marriage.

The island is noted for its sugar and tobacco. The most famous tobacco lands are found in the far west. The climate is mild, with northeast trade winds. There is considerable rain during the summer. The dreaded yellow fever was largely due to carelessness and unnecessary exposure. The whole country is like a park, with vegetation mainly tropical. It is believed that sugar was first planted in the year 1523. In 1905 the sugar exported was worth $71,249,055 (to the U. S. $64,366,169). Tobacco seems to have been grown first in the year 1580. Corn, rice, wheat, oats, barley, all thrive well. The banana, or plantain, grows in great quantities, and forms very largely the food of the poorer classes. Manufacturing consists mainly in the making of cigars and cigarettes. Such skilled labor as there is, is largely in the building trades. Nominal wages have fallen since the Spanish rule, owing to trade uncertainties. But prices have also fallen. Labor generally is rather in bad shape, whether in the agricultural or the industrial lines, many feeling that the result of the freeing of the slaves has been to retard development of the country. The freedmen are not industrious, either in Cuba or in any of the West Indian islands, and there have been many Chinamen brought in. Great numbers of these people are cooks and house-servants. Many Gallegos and people of the Canary Islands have also been brought there lately. The tobacco trade is generally in the hands of the white people.

A trade-union movement began in Cuba in 1878 and since its relations with the U. S. the American Federation of Labor has made efforts to organize the workers. But results are not large, tho in Havana and in a few other places the nominal membership of some unions is considerable. The building of the Cuban Central Railroad has developed some work at fair wages. There has been considerable immigration from Spain. Currency troubles have caused uncertainties and depreciation. The two economic needs of Cuba are by some said to be immigration and capital.

CUNNINGHAM, WILLIAM: British clergyman and economist; born in Edinburgh, 1849; was graduated from Trinity College, Cambridge, in 1873, and ordained the same year; devoted his early years mainly to economic, theological, and philosophical studies. Deputy to the Knightsbridge professor in 1880, and since 1887 Vicar of St. Mary's the Great, Cambridge, he has given his later years largely to economic history. In 1882 appeared the first edition of his important work, "The Growth of English Industry and Commerce," which Professor ASHLEY calls the first attempt that has been made to trace the whole course of English economic development. He has since developed this book into a practically new work, the first volume of which appeared in 1890 and the second in 1892. In 1891 he was made Tooke professor of political economy at King's College, London, and also elected to a fellowship at Trinity, Cambridge. He is a D.Sc. of Edinburgh, and D.D. of Cambridge. Mr. Cunningham is considered by many the leading advocate of the historical or empirical study of social phenomena. He is the author of: "Christian Opinion on Usury"; "Politics and Economics, an Essay on the Nature of the Principles of Political Economy and a Survey of Recent Legislation"; "S. Austin and His Place in the History of Christian Thought"; "Western Civilization in its Economic Aspects"; "Use and Abuse of Money," etc. *Address*: Trinity College, Cambridge, England.

CURRAN, PETE: British labor organizer; born in Glasgow, Scotland, 1860. He has been in the labor movement since he was eighteen, and belongs to the Independent Labor Party. He was first brought prominently before the trade-union world in connection with the "Intimidation Case" at Plymouth in 1890, when he was sentenced to imprisonment for six weeks. On appeal, however, Lord Coleridge reversed the decision. Curran is the principal organizer for the Gas-workers and General Laborers' Union, and chairman of the General Federation of Trade-Unions. He represents trade-unions on the executive committee of labor representation, and has been labor delegate to America, France, Germany, Belgium, and Holland. Judging from the present outlook Mr. Curran's prospects of an early election to Parliament are very bright. He has many friends, and a large and influential committee is working to secure for him the seat for Jarrow in the county of Durham. *Address*: 1 Pretoria Avenue, Walthamstow, Essex, England.

CURRENCY (UNITED STATES) (see also MONEY; BANKS AND BANKING; GOLD AND SILVER; BIMETALISM; MONOMETALISM; PAPER MONEY; CONTRACTION AND EXPANSION OF CURRENCY; CRISES; GREENBACKISM, etc.): The word currency may be defined as money in *circulation*, or the commodity or commodities in use in any country as the medium of exchange. Money (*q. v.*) is the general and philosophic term; currency is money, with emphasis upon its passing from hand to hand. A large percentage (estimated at over ninety) of the actual business transactions of the U. S. is performed, however, not with *money* at all, but with monetary substitutes; representatives of credit, as notes, drafts, bills of exchange, and the like. If not strictly *currency*, these should, nevertheless, be remembered as doing the work of currency, and as constituting a vastly important factor of our medium of exchange. For a statement of the economic principles and different theories of money, see MONEY. We present here an historical review of the U. S. currency, our main authorities being, for the earlier periods, Professor Sumner's "History of American Currency" and Bolles's "Financial History of the United States"; for the later periods, the reports of the Secretary of the Treasury, the Controller of the Currency, the Director of the Mint, the *Congressional Globe*, and the Record of Political Events in the *Political Science Quarterly*.

I. COLONIAL PERIOD

From Professor Sumner we learn that the first colonies to this country brought little English or European currency with them, and soon found need for more.

Winthrop wrote to his son in 1630 especially to bring £150 or £200 with him. A married clergyman in those days was allowed £30 per annum. Carpenters and skilled workmen who were greatly in demand were forbidden to take over one shilling and later two shillings per day. When explorers reached Long Island Sound they found the Indians using a medium of exchange consisting of beads of two kinds, one white and the other black. They were rubbed down and polished, and when artistically arranged in strings or belts formed objects of real beauty. These beads, one black bead being reckoned as worth two white ones, were known as *wampum*, or *wampumpeag*, or *peag*. The colonists came to use them first in their trade with the Indians, and then among themselves. In Massachusetts they became the currency of the colony, and were made a legal tender in small sums. "The white man," says Professor Sumner, "also proved his superiority by counterfeiting it." A fathom or belt of wampum consisted of 360 beads, and one fathom of white would buy furs valued at five shillings sterling. Barter was also at this time continually used, and various commodities did duty for money. In 1635 musket bullets were used for change at a farthing apiece. And the more barter was used because money was scarce, the scarcer money became. Interest in 1664 was 8 per cent. Merchants drained the people of their cash. In 1652 Massachusetts set up a mint to coin silver—the famous "pine-tree" coinage. She coined shillings, sixpences, and threepences. The coins were to be of sterling alloy 11 fine, and the shilling worth tenpence sterling. It was taken in England at 25 per cent discount, and declared to be not of even weight or fineness. Barter, however, continued. Silver was smuggled out of the country or clipt. The silver which came to the colonies consisted mainly of Spanish pillar coins. They were not allowed to be circulated. In 1686 a bank was proposed, and seems to have made issues, but soon disappeared. Andrews stopt the mint about 1688. The first enduring issue of paper money made in the colonies was in 1690, six years before the founding of the Bank of England. It was declared to be "in value equal to money," and kept at par twenty years.

Pine-Tree Coinage

There were continually at every new crisis new issues of money. An expedition against Canada in 1709 meant a new, large issue. Connecticut and most of the colonies also issued a small amount. South Carolina probably issued more money than any other colony. In 1709 the time for redemption in Massachusetts was set at four years and then later, and the paper began to depreciate. In Connecticut there were four prices for "pay," "pay as money," "money," and "trusting." "Pay" was barter at government prices. "Money" was Spanish or New England coin. "Pay as money" was barter currency at prices one third less than the government rate; "Trusting" was an enhanced price according to time. The merchant asked his customer how he would pay before fixing his price.

In 1715 John Colman proposed a land bank, which in those days meant simply an issue of paper based on land. Such an issue was made. Banking was arresting attention the world over. At the same time the commissioners of the New England colonies became alarmed at the tendency to further increase the paper notes. The English Parliament forbade banking except under its charter, and forbade the colonial governments from emitting bills. Later the restriction was modified to permit an issue for government expenses only. In 1739 a "land bank" was set in operation, which loaned its notes for 3 per cent per annum interest, and 5 per cent in principal, *both payable in merchandise*.

Land Banks

Rhode Island had the severest experience, as it issued bills the most recklessly. Parties were no longer Whig or Tory, but Creditor and Debtor. In 1749 the paper issue of Massa-

chusetts was £2,466,712. Parliament at this time, however, ransomed Louisbourg from the colonies, and paid Massachusetts in silver and copper £138,649 sterling which, at eleven to one, the ruling exchange, nearly canceled the paper, and Massachusetts found herself with a specie currency. Other colonies, and Rhode Island in particular, clung longer to paper money.

II. To the War of the Rebellion

With the beginning of the Revolution the Continental Congress at once faced the need for revenues. These it sought through appeals to the states, calls for commodities, loans, domestic and foreign, the lottery, confiscation by states of Tory property, forced sales, and voluntary subscriptions. The receipts from all these sources were trifling. Congress next resorted to bills of credit, i. e., irredeemable paper money. These were its only remaining resource; and, without them, it is inconceivable how the colonies could have won in the Revolutionary struggle.

Had Congress possest an effective power of taxation, enabling it, on paying out its paper money, to call it back at par in taxes, thus establishing a circuit of outgo and income, and had it strictly limited the volume of its issues to the amount of its taxes—these, in war, being necessarily high—it is entirely probable that, like the demand notes of the Civil War, the continental currency would have maintained almost or quite its face value through the war. Congress, however, was destitute of the power of taxation. The only course open to it, therefore, was to print paper and pay it out for goods and services; and, on the consumption of these, to repeat the process. Thus, throughout the war, Congress poured forth a non-returning stream of paper money. This, of course, meant inflation. It also meant that Congress was unable to maintain the value of the paper by receiving it at par. The situation was aggravated by the systematic counterfeiting of continental currency by, or through the connivance of, the British Government. Furthermore, the states failed to cooperate with Congress in maintaining the value of paper money. Congress, on issuing the paper, assigned each state a quota to call in by taxation and cancel. This the states did to a very limited extent. Again, army officers were paid commissions proportioned to the amount of their expenditures. They were thus stimulated to pay high rather than low prices. These various causes combined to force down the value of the continental currency. Numerous attempts, including maximum and legal-tender laws, were made to maintain it, but without effect. The value of the money fluctuated and fell until, by the close of the war, it had practically disappeared.

Unfair critics have argued from the history of our continental currency that government paper is necessarily unscientific and vicious; a position as logical as that of one who should declare that railroads, because of occasional tie-ups and wrecks, are unscientific and vicious.

The effect of the continental currency on the laboring class is thus described by Bolles, whose conservatism is unquestioned:

> The candor of history requires the fact to be stated that paper was "at all times the poor man's friend. While it was current, all kinds of labor very readily found reward. In the first years of the war none were idle from want of employment, and none were employed without having it in their power to obtain ready payment for their services. To this class of people, whose daily labor was their support, the depreciation was no disadvantage. Expending their money as fast as they received it, they always got its full value." ("Financial History of the United States," vol. i., p. 177, quoting Ramsay.)

The new federal Constitution, framed in 1787, had decreed that no state "shall coin money, emit bills of credit, or make anything but gold and silver coin a tender in payment of debts."

The proposal in the constitutional convention to give to Congress the right to emit bills of credit was defeated by a vote of nine states to two.

In 1786 Congress passed a coinage law upon a plan presented by Thomas Jefferson.

> The Constitution (Article 1, section 8, clause 5) had vested in Congress the right to coin money and to regulate the value thereof, and the Act of Congress of April 2, 1792, was the first act respecting coinage, entitled "An act establishing a mint and regulating the coins of the U. S." The ninth section of this act provided:
>
> "That there shall be, from time to time, struck and coined at the said mint, coins of gold, silver, and copper of the following denominations, values, and descriptions, viz.: Eagles —each to be of the value of $10 or units, and to contain 247 grains and four eighths of a grain of pure, or 270 grains of standard gold."
>
> After providing for half-eagles, each to be of half the value of the eagle, and quarter-eagles, each to be of one fourth of the value of the eagle, the section continues, as follows:
>
> "Dollars or units—each to be of the value of a Spanish milled dollar as the same is now current, and to contain 371 grains and four sixteenth parts of a grain of pure, or 416 grains of standard silver."
>
> The act also provided for half-dollars, quarter-dollars, dimes, and half-dimes, each to contain respectively one half, one fourth, one tenth, and one twentieth of the pure silver contained in the dollar. The coinage of cents and half-cents of copper was also provided for.

It thus declared the dollar to be the unit of value, and it measured this value in silver.

Adoption of a Currency

The money unit of the U. S. had been already established in 1785 by the Continental Congress as the dollar. This was a well-known coin, and had been in constant use for many years. Indeed, it competed with the pound as a measure of value; in some transactions the pound measure was used; in others, the dollar measure. Persons expressed their transactions in their books of account either in pounds or dollars; but for a long period the quantity coined was so small that it was necessary to use foreign coins for monetary purposes. Congress first authorized their use in 1793, declaring at what rates they should pass current, and that they should be a legal tender for the period of three years from the time the mint began operations. When that time expired their use was renewed by additional legislation for short periods until 1809.

> By the Act of 1792 the proportion of pure gold to the alloy in gold coins was made eleven parts gold and one part alloy, the alloy being composed of silver and copper. The proportion of pure silver to the alloy in silver coins was made 1,485 parts fine silver to 179 parts alloy. The reason for this proportion of silver to alloy was that the alloy was found in that proportion in the Spanish dollars then current.
>
> A dollar of gold contained 24.75 grains of pure metal, and a dollar of silver 371.25 grains, being exactly fifteen to one.
>
> This ratio of fifteen to one was not exactly in accordance with the ratio which then prevailed in European countries. Silver was slightly overvalued and gold a little undervalued.

15 to 1

> The result was that the metallic money of the U. S. during this period consisted mostly of silver coins and largely of foreign coins. But $11,908,890 of gold altogether were coined from 1793 to 1834, and this was generally soon exported. The production of gold for the same period in the U. S. is given at $14,000,000.
>
> The Act of May 8, 1792, provided for the purchase of copper "not exceeding 150 tons," "to be coined into cents and half-cents," which, by the Act of April 2, 1792, were to contain respectively eleven and five and one half pennyweights. The Act of Jan. 14, 1793, provided that the cent piece should contain 208 grains of copper and the half-cent 104 grains.

The Act of June 28, 1834, changed weight and fineness of the gold eagle, making the 258 grains of .899225 fineness, or 232 grains of pure gold.

Currency Changes

No change was made in our silver coins by the Act of 1834. Why the ratio should have been changed at this time from fifteen to one, as established in 1792, to sixteen (16.002) to one thirty-one years after the French Act of 1803, which had practically fixt the ratio for all Europe at fifteen and one half to one, is difficult to understand. The reason usually given is that under the ratio of fifteen to one little or no gold came or stayed here, and new mines of gold having been discovered in North Carolina and Georgia about this time, the higher ratio was adopted in order to give the gold a higher rating relatively to silver, and thereby keep it here.

But it worked evil, and the Act of Jan. 18, 1837, established .900 as the standard fineness of both gold and silver. It left the weight of the gold dollar unaltered (thus slightly increasing its value) and reduced the weight of the silver dollar to 412½ grains.

The ratio was thus altered from 16.002·1 to 15.988:1.

(See BANKS AND BANKING.)

Revolutionary experience on the one hand, coupled with private interest on the other, had created a very strong prejudice against government paper money, whatever its backing; the bank paper money both with and without adequate support was constantly and often abundantly issued during the period under consideration. In time of stress, however, the national treasury was authorized to issue its notes. These were issued during the War of 1812, at the time of the panic of 1837, the Mexican War, and the Buchanan administration, when the government finances were running constantly lower and lower.

Treasury Notes

These issues were made not as money but as notes given in exchange for loans. Special pains were taken to prevent their circulating as money. The denominations were usually large, ranging from $100 upward. They usually bore interest; often 5⅔ per cent, and at times more; this provision led to hoarding. The notes quite commonly were not negotiable without indorsement by the payee; finally, the notes were not made a legal tender. When in 1814 such a provision was hinted at, Secretary Dallas said, "The extremity of that day cannot be anticipated, when any honest and enlightened statesman will again venture upon the desperate expedient of a tender law."[1] On Nov. 12, 1814, Mr. Hall, of Georgia, proposed in the House that legal-tender U. S. notes should be issued, but his proposal received no support.[2] In 1837 a hybrid semilegal-tender "loan certificate" was proposed in the House. This certificate was to be a "legal tender to public creditors but not receivable for dues to the government." That is, the government might force the paper into circulation and then refuse to receive it. "The question of legal tender," very properly, "was not discust."

Yet a slight tendency can be detected, in the treasury note legislation, toward government paper money. The denominational barrier was in cases broken down and notes were issued for $50, $20, $10, $5, and even $3.[3] The interest rate was, in cases, made merely nominal, falling as low as one mill per $100 per annum.[4] Tho not generally if ever redeemable in specie, these notes were generally if not invariably receivable for all public dues. Finally, despite the handicaps above mentioned, these notes quite usually retained their face value, rising in cases to a premium because of their interest-bearing qualities. In cases where depreciation occurred, this depreciation could be traced directly to bank failures and suspensions; tho even in such cases the notes were saved from a serious fall in value by means of funding acts.[5]

Later history shows how these notes developed into the full legal-tender greenbacks whose legality and constitutionality were sustained in 1884 by the Supreme Court of the U. S.

III. The Period of the War of the Rebellion

At the breaking out of the rebellion the government found itself destitute of the means necessary to carry on a gigantic war, and unable to procure such means from ordinary sources. Salmon P. Chase, of Ohio, had been nominated Secretary of the Treasury by Mr. Lincoln, and after much hesitation had accepted. He was without experience, but trusted by the people. He had a difficult problem to meet. Howell Cobb had worked under the preceding administration to ruin the credit of the government, and tho General J. A. Dix, after Mr. Cobb's retirement, had done his best, he had had to borrow at 12 per cent interest, and raised only $5,000,000 of treasury notes at that.

Mr. Chase first negotiated some small loans under the authority already existing, and on July 4, 1861, Congress convened to enact measures for suppressing the war. A loan of $250,000,000 was authorized, duties were increased, an internal-revenue system was adopted, and a direct tax of $20,000,000 was laid. The states were offered 15 per cent reduction if they paid the tax, and this course was taken by all the states except those in rebellion, Delaware, and two of the territories, altho much of the money was paid by fitting out troops, and brought in no revenue to the general government. Tax commissioners were appointed to enforce the law in the insurrectionary states, and they made levies and sold land, and after a long effort collected a portion of the tax assessed on them.

War Loans

As soon as Congress adjourned, Mr. Chase went to New York to effect the loan, and was met, Aug. 9th (Bolles, vol. iii., p. 20), by "bankers and other prominent men of New York." Bank-president Coe proposed a general organization of the banks for the purpose of advancing money to the government in exchange for bonds. The next day a committee was appointed to formulate a plan; Aug. 15th it reported its plan. The banks of New York, Boston, and Philadelphia were represented at the meeting. "The report was cordially accepted and adopted by the banks of New York," while those in Boston and Philadelphia, through their representatives, "as zealously and cordially united in the organization" (Bolles, vol. iii., p. 21). The cooperation of the Western banks could not be secured. The aggregate capital of the united banks was $120,000,000. "They had $63,165,039 in coin to meet $142,381,956 in liabilities, or 45 per cent of the whole amount" (Bolles, vol. iii., p. 25). With this and the paper they might issue, supplemented by "clearing-house certificates and other well-known expedients," they proposed to furnish the funds desired.

Borrowing Money

The bankers' plan soon began to take shape as follows: 1. The public funds, instead of being held and safeguarded by the government, were to be deposited "in such solvent, specie-paying banks as he [the Secretary] may select." (Act of July 5, 1861, p. 9.) To this end the clause of the Sub-Treasury Act of 1846 forbidding such deposits was to be "suspended." Thus the government would keep its account in certain private banks. No interest, of course, was to be paid on such deposits.

When the secretary wanted money he was to obtain it by "draw[ing] checks upon some bank in each city representing the association, in small sums, as required in disbursing the money thus advanced. By this means his check would serve the purpose of a circulating medium, continually redeemed, and the exchanges of capital and industry would be best pro-

[5] Knox, p. 39.

moted." Bonds, of course, would accompany these checks, sooner or later, tho we do not find this fact stated. That this plan might be adopted, another provision of the Sub-Treasury Act of 1846—requiring the government to receive "gold and silver coin only," "or treasury notes issued under the authority of the U. S.," instead of "wildcat" bank-notes, etc.—was to be suspended. In other words, the banks were to enjoy the gratuitous use of the government's money; and, in addition, were to exchange their notes par for par for government checks as good as money, and receive an interest to boot. "To the astonishment of the committee who represented the associated banks, Mr. Chase refused" (Bolles, vol. iii, p. 26). And yet "this law [of Aug. 5, 1861] was passed for the purpose of enabling the secretary of the treasury to adopt the policy recommended by the banks" (Ibid., p. 26). Mr. Chase, instead, insisted on the banks furnishing him gold and silver if he was to borrow from them; he "was emphatically a 'hard-money man'; he well knew the evils caused by using any other medium of payment, and he believed the government could continue to do business on a purely specie basis. He did not in the least comprehend that the vastly greater payments required an entirely different mode of making them. The banks were far wiser than the secretary" (Ibid., p. 28). In other words, the banks were perfectly well aware that the war would have to be carried on with paper money of one kind or another; but if "by putting their coin into a common fund" and placing it where it might be in greatest demand, "and otherwise aiding each other" (Ibid., p. 23) in protecting their coin reserves—they could but maintain the farce of specie payments, they might enjoy the exclusive privilege of furnishing the paper money and lending it countless times over to the secretary; thereby easily buying bonds that, at a future day, would represent a gold-mine.

But the insistence of the secretary necessitated as it seemed loans in coin. The banks, therefore, reluctantly acquiesced, and, for a time, succeeded remarkably well. "As long as the secretary kept the treasury notes out of the channels of circulation, the disbursements of the government were so rapid, and the movements of trade so intense, that the coin paid on each instalment of the loan came back to the banks through the people in about a week" (Ibid., p. 31). That is, the banks were able to lend the secretary the same specie dollars over and over again at weekly intervals; which plan, so long as it could be maintained, was about as satisfactory and remunerative to them as lending the same paper dollars over and over.

Trouble, however, arose between the secretary and the banks over the demand notes. These were authorized by the Acts of July 17, 1861, Feb. 12, 1862, and March 17, 1862. They were payable on demand and were "receivable in payment of all public dues." This latter provision, combined with their limitation in quantity, constituted them an almost ideal form of money; throughout the war, both before and after suspension, they stood practically at a parity with gold (Knox, "U. S. Notes," p. 97; *Wall Street News*, quoted in *Public Opinion* for Sept. 2, 1893, p. 515; Bolles, "Financial History of U. S.," vol. iii, p. 78). Naturally a public money so perfect competed dangerously with private money, i. e., bank-notes; and, as an object lesson, menaced the latter in exactly the same way that a successful, publicly owned water, lighting, trolley, or steam-railway system menaces the privately owned. The secretary, adhering to his hard-money principles, insisted that these notes should be redeemed "in coin." The scarcity of coin rendered this impracticable either for him or the banks. This fact afforded a pretext for an attack upon the demand notes by the banks. They demanded of the secretary that he discontinue issuing them. He at first acquiesced; in Nov., 1861, however, he began issuing demand notes freely. The banks, thereupon, on Dec. 28, 1861, voted to suspend specie payments; the government followed their example. From that date until Jan. 1, 1879, a period of seventeen years, the business of the country was done with paper money and its representatives, and the subsequent war loans made by the banks to the government were made in paper.

Demand Notes

But more money was needed. Public sentiment favored the issue of treasury notes. Mr. Chase, in his report (see BANKS AND BANKING), had already proposed the creation of a national banking system, but it was seen that this could not be developed in time. Money was needed then. Mr. E. G. Spaulding, of New York, therefore, two days after the suspension of the banks, introduced a bill into the House authorizing the issue of $50,000,000 of treasury notes to be legal tender in payment of all debts in the U. S. and receivable by government for all dues to the U. S. It was referred to the Committee on Ways and Means, which increased the amount to $100,000,000, and reported it favorably. It immediately created great discussion and interest. Delegates from the banks came to Washington and protested. James Gallatin, president of the Gallatin Bank of New York, proposed a counter plan of taxation, and to make a loan with the banks as depositories, the government to issue $100,000,000 treasury notes for two years, to be receivable for public dues except duties on imports. Meanwhile the $100,000,000 Legal-Tender Note Bill came before the House for debate Jan. 28. An amendment was passed increasing the amount to $150,000,000; but the $50,000,000 authorized by the July act of the previous year were to be retired. The act finally passed by a vote of 93 to 59.

Greenbacks

On Feb. 10th the bill was reported by the Finance Committee of the Senate, with various amendments—among others, that the notes should not be receivable for "interest on bonds and notes, which shall be paid in coin," and an amendment relating to the issuing of certificates, which, said Mr. Fessenden, the chairman of the committee, "was very much desired by the banks in all the cities." This was opposed by Senator Sherman, and answered by Mr. Fessenden, who, however, opposed the bill as "a confession of bankruptcy," "bad faith," and "a stain on the national honor," altho he admitted that if it were necessary to issue legal-tender notes to sustain the government, he should have no hesitation in doing so. The bill passed the Senate by a vote of 30 to 7. Returning to the House, after a strong contention with the Senate, its principal amendments were finally concurred in.

The bill finally passed as amended by a vote of 97 to 22.

On Feb. 25th the bill was signed by the president. The limitation or "Exception Clause" read as follows:

> Such notes herein authorized shall be receivable in payment of all taxes, internal duties, excises, debts, and demands of every kind due to the U. S., except duties on imports, and of all claims and demands against the U. S. of every kind whatsoever, except for interest upon bonds and notes, which shall be paid in coin, and shall also be lawful money and a legal tender in payment of all debts, public and private, within the U. S., except duties on imports and interest as aforesaid.

The limitation on the greenback called forth vigorous opposition in the House. Mr. Spaulding, on Feb. 19, 1862, expressed himself in strong terms against it.

On Feb. 20th Thaddeus Stevens, closing the debate upon this bill, said:

> "I approach the subject with more depression of spirits than I ever before approached any question. No personal feeling influences me. I hope not, at least. I have a melancholy foreboding that we are about to consummate a cunningly devised scheme which will carry great injury and great loss to all classes of the people throughout this union, except one.
>
> "With my colleague I believe that no act of legislation of this government was ever hailed with as much delight throughout the whole length and breadth of this union by every class of people, without any exception, as the bill we passed and sent to the Senate. . . . It is true there was a doleful sound came up from the caverns of bullion brokers and from the saloons of the associated banks. . . . They fell upon the bill in hot haste, and so disfigured and deformed it that its very father would not know it. . . . It is now positively mischievous. . . . It makes two classes of money—one for the banks and brokers and another for the people."

In speaking of the mutilated bill, he said later:

> "We did not yield until we found that the country must be lost or the banks be gratified, and we have sought to save the country in spite of the cupidity of the wealthy citizens."

To the legal-tender act Judge Kelley, on Jan. 15, 1876, in Philadelphia, refers in these words:

"But the patriots to whom I have referred had studied the Constitution of the U. S. They knew that it had imposed upon them the duty of saving the nation. They knew that money is the sinew of war. . . . A marvelous child was that 'rag baby.' It lighted the fires in every forge and furnace in the country; it hired ships and bought others. . . . It rallied an army of 75,000 men, and we soon after heard ringing through the streets shouts of well-paid and well-clad soldiers—'We're coming, Father Abraham, 300,000 more.' It met all demands, and the free states, with the great war on its hands, were prosperous as they had never been before."

Of the Senate's limitations he said:

"That crime perpetrated by the Senate of the U. S., or that blunder worse than a crime, has cost the American people more than all the war would have cost had the House bill been adopted as originally passed."

Even Senator Sherman said, in 1862:

"If we can compel one citizen to take this paper money, why not another and another? Is it any less the violation of contracts in one case than another? Do not all citizens hold their property subject to unlimited power of taxation? Do not all share in the blessings of government, and should not all share in its burdens? Shall we inflict a loss only on those who furnish the labor for the government, and relieve the selfish, avaricious, idle, unpatriotic citizen who will neither fight for, lend to, nor aid the government?

"Sir, to make all these share in the burden of the war, and to relieve those who risk life and property in its defense, I would waive a constitutional doubt."

This exception clause was afterward justified by Mr. Sherman on the grounds that paying interest on bonds in coin increased the value of and thus made a market for the bonds; while collecting duties in specie caused specie to be imported, and thus increased our scarce stock. The effect of the provision was obviously the demonetization of government paper for the payment of duties on imports and interest on the public debt. This created a demand for coin with which to meet these two species of obligations. The coin would now travel first from the banks to the custom-house in payment of duties, thence to the treasury, and thence largely to the banks; a portion in payment of coin interest on the bonds held by the banks and the remainder on deposit, in accordance with the act suspending the provision of the sub-treasury law that required the secretary of the treasury to take charge of public funds, and permitting him instead to deposit the funds in such solvent pet banks as he might select.[1] In accordance with the law of supply and demand this exception clause by increasing the demand for coin would raise its price; and by curtailing the demand for greenbacks would cause this species of money to depreciate. With the now depreciated greenbacks, bonds could be bought cheap; while the depreciation of the greenback could be used as a weapon with which to destroy government paper issues, on the ground that only "intrinsic value" money or bank money is good. Further, if the bonds could afterward be made to appreciate, an unearned increment could be created that might in time handsomely reward the "enterprise" and "thrift" of the promoters of the policy.

Second Issue

Many who voted for the first bill strongly opposed the second; but it passed and became a law. The banks, tho prudently confining their issues for a time after suspending specie payments, turned a fresh issue into the swollen stream. Having suspended specie payment they could issue as much as they chose. As soon as the legal-tender notes appeared, the banks could legally use these for redeeming their own issues, and thus the way had been made easy for an enormous inflation. Some of the banks did, in truth, collect the legal-tender notes and substitute their own to a much larger amount. The increase in one year, after suspension of specie payment, was $56,000,000 (Treasurer's Report, 1866, p. 67). This was one of the causes of enmity on the part of Congress against the banks, and helped onward the creation of a rival system and the imposition of the tax of 10 per cent on the state bank issues, which finally drove them out of existence.

[1] Act of Aug. 5, 1861, § 6, p. 9.

At this time this was one of the strongest arguments made for issuing more treasury notes. Mr. Hooper, of Massachusetts, said in the debate:

"I confess that I can see no limit to a depreciation of the currency that may be produced by the banks; and were it not that I have great faith in the prudence and wisdom and patriotism of those who manage the banks, I should have great apprehension in regard to it, as no obligation is now recognized by them to redeem their circulation, many of the states having legalized the suspension of specie payments."

Another member said of the banks:

"They have authority to buy up our bonds in the market, to take up our circulation, and put their circulation in place of it, and that is what they are doing all the time, and the question is whether we shall pay these people 6 per cent upon our bonds for furnishing no better currency than we can furnish ourselves. . . . In other words, it is a struggle on the part of the banking institutions of the country to bleed the Government of the U. S. to the tune of 6 per cent on every dollar, which is necessary for the government to use in carrying on this struggle for our independence and our life." Senator Sherman said the same in milder form: "The legal-tender notes are actually kept out of circulation by the depreciated bank paper of the country; and every issue you make increases that tendency. Every new issue of treasury notes is only a bid for new inflation by the banks, and thus the better money of the U. S. is hoarded and laid away, and the paper money, which is issued on the credit of it, is thrown on the country, producing inflation and derangement of our monetary system, and I believe in the end will produce disaster." (A. S. Bolles's "Financial History of the U. S.," vol. iii., pp. 79, 80.)

Senator Chandler, of Michigan, spoke strongly against the issue, but it passed. Depreciation set in and gold rose. By August, Professor Sumner says that specie had disappeared. July 17th postage-stamps were made legal payment to the government in quantities not exceeding $10. Cities and towns issued small notes payable in taxes or lawful money. This was forbidden by Congress for amounts less than $1. In March, 1863, Congress authorized the secretary to issue fractional currency to an amount not exceeding $50,000,000. But already by Feb. 1863, Congress had issued $400,000,000 of treasury notes (the last $100,000,000 of these being in Jan., 1863, to pay the soldiers), and had indorsed $60,000,000 more of other notes with the legal-tender quality, besides the postage-stamps, etc.

The next step we give in the words of Mr. A. S. Bolles ("Encyclopedia Americana," article FINANCE):

The same law which authorized the first issue of legal-tender notes also authorized the issue of $500,000,000 of bonds bearing 6 per cent interest and payable after five and within twenty years. The interest was payable in gold collected from import duties, and at this early date Congress also provided that 1 per cent of the public debt should be discharged annually. At first the bonds sold very slowly, but, in the mean time, the government procured considerable funds by two kinds of temporary loans. The first consisted of certificates of indebtedness, which were nothing more than certificates given to such creditors of the government as would take them, payable in a year, or sooner if it desired, and bearing 6 per cent interest. The other kind of temporary loan consisted at first of $25,000,000, and finally increased to $100,000,000, of deposits of treasury notes by the banks to the government, which bore not exceeding 5 per cent interest, and which they could demand after thirty days' notice.

To some members of Congress this operation of the treasury seemed to be wholly for the benefit of banks, as the government could make no use of money which it was liable to pay at such a short notice. In truth, however, the government did use all of the money thus loaned, so that it was a highly favorable operation of the government. To provide more adequately for the payment of these deposits, if they should be demanded when the government was not able to respond, an issue of $50,000,000

legal-tender notes was authorized for this purpose.

Meanwhile the bill establishing the national banking system had been at last enacted. (See BANKS AND BANKING.)

It received the president's signature Feb. 25th. The bill (see BANKS AND BANKING) provided for an issue of $300,000,000. Yet no issues appeared till Dec. 21st, and conversions of the state banks did not take effect until after the amendments of the bill the next year, the Act of March 3, 1865, which forced their conversion by a tax of 10 per cent on all issues of state banks, and the decision that the act was constitutional. Then the process went on rapidly. Many claimed that the delay was because the banks wanted to send the treasury notes to a lower point before they bought them all and exchanged them for bonds, which meanwhile Mr. Chase was gradually placing. Into all the details of the placing of these bonds we need not enter. When Mr. Chase found that he could not place the bonds at 5 per cent he had recourse to the issue of more legal-tender notes which he induced Congress to authorize till the currency was depreciated to a point where he could place these bonds. Thus, wittingly or unwittingly, he played into the hands of the bond-buyers, who bought these bonds with a depreciated currency, and then held them for the contraction which later they forced. On the last day of the fiscal year 1864 Mr. Chase retired from the office of the treasury and Mr. William P. Fessenden, of Maine, took his place. Mr. Chase, not a banker by profession and without much experience in financiering, had yet proved himself obstinate and unwilling to learn. Whatever were his intentions—and it must be allowed that they were probably good and his difficulties great—he had, without consenting to what the bankers desired on many points, actually played into their hands. Mr. Fessenden was a man of different type. He determined, if possible, to issue no more treasury notes. He advertised for a loan, the lenders to receive treasury notes payable in three years, with semiannual interest at 7.3 per cent in lawful money. The response was not great—the soldiers themselves, however, taking over $20,000,000. Once more then he endeavored to sell bonds, and was successful. Bids reached nearly $70,000,000, and the premium offered was 4 per cent and higher. He continued this general policy till, being reelected to the Senate, he retired from the treasury on March 5, 1865, and Hugh McCulloch took his place. In April Richmond was captured, and soon after the Confederate armies surrendered. Mr. McCulloch knew that he would now need a large sum for transportation, pay, and bounties. To use his own words, "As it was important that these requisitions should be promptly met, and especially important that not a soldier should remain in the service a single day for want of means to pay him," the secretary perceived the necessity of realizing as rapidly as possible the amount —$53,000,000—still authorized to be borrowed under the Act of March 5, 1865. The 7.3 per cent notes had proved to be a popular loan, and altho a security on longer time and lower interest would have been advantageous to the government, the secretary considered it advisable, under the circumstances, to continue to offer these notes to the public, and to avail himself, as his immediate predecessors had done, of the services of Jay Cooke in the sale of them. The result was in the highest degree satisfactory. . . . No loan ever offered in the U. S., notwithstanding the large amount of government securities previously taken by the people, was so promptly subscribed for as this. Before Aug. 1st the entire amount had been taken. This was the last war loan. The other great war loans had been:

Inflation

$500,000,000, authorized Feb. 25, 1862; $900,000,000, March 3, 1863; $200,000,000, March 3, 1864; $400,000,000, June 30, 1864; $600,000,000, March 3, 1865.

The significance of the certificates referred to should be noted.

Certificates of Deposit

Section 4 of the act authorized the secretary to receive on deposit U. S. notes in sums not less than $100—thereby preventing the scheme from degenerating into a mere savings-bank arrangement for the common people—and to issue in return "certificates of deposit" bearing 5 per cent interest. Bolles explains the workings of this feature ("Financial History of U. S.," vol. iii., pp. 88–92). New York City banks belonging to the clearing-house deposited $20,000,000 of government notes with the assistant treasurer (the law authorized the deposit of only $25,000,000) "very soon after the law was passed, and used the certificates received from him in settling clearing-house balances. By such action the banks loaned permanently $20,000,000 to the government, because they were not likely to present these certificates for redemption. Funds of some kind must be kept for paying clearing-house balances, and the above arrangement was very beneficial to the banks as well as to the government. Having thus deposited four fifths of the amount authorized by law, the question was raised in the Senate whether the limit of deposits should not be extended to $50,000,000" (Ibid., pp. 88–89). Tho some senators strongly opposed the measure, it nevertheless passed. Its exceeding great popularity with the banks, and their influence in Congress is shown by the fact that the limit of deposits was raised as follows: Beginning Feb. 25, 1862,[1] with $25,000,000, it was raised to $50,000,000 March 17, 1862,[2] to $100,000,000 by the Act of July 11, 1862,[3] and to $150,000,000 by the Act of June 30, 1864.[4]

From Bolles's statement, its popularity was obviously due to the fact that it enabled the banks to trade to the secretary or his authorized agent $1 and receive in exchange what for them was as good as another dollar, and, in addition, a "boot" of 5 per cent interest. This privilege was confined to banks connected with the clearing-house. On this sum of $150,000,000 the government paid the banks a gratuity of 5 per cent. The Act of June 30, 1864, authorized the Secretary of the Treasury to "increase the interest on deposits at less than 6 per centum to that rate."

The acts for legal-tender notes may be thus summarized:

$150,000,000, Feb. 25, 1862; $150,000,000, July 11, 1862; $150,000,000, Jan. 17 and March 17, 1863; $400,000,000, March 3, 1863; 6 per cent interest-bearing notes, running not longer than two years; $400,000,000, June 30, 1864, and Jan. 28, 1865, 7.3 per cent interest-bearing notes, running for three years or longer.

The cost of the war was estimated at $6,844,571,431.03 (Sen. Doc., No. 206, Forty-sixth Congress, Second Session). The expenditure by states and municipalities was $467,954,364 (Bolles's "Financial History," vol. iii., p. 245).

The leading provisions of the five great war loans are shown in the table on page 350.

The term "five-twenty" signifies that the bond so designated was payable by the government in not less than five nor more than twenty years; that is, the government could not require the bondholder to accept payment for his bond until five years had elapsed from the date of contract. From that date until after the twenty years had expired, the government enjoyed the option of paying whenever it pleased. At the expiration of the twenty years, however, the bondholder acquired the right to demand immediate payment, should he so desire. The terms "ten-forty," "five-thirty," and "five-forty" are to be similarly interpreted. The term "seven-thirty," however, as applied to the notes authorized in the fifth of these loans, signifies that such notes bore interest at the rate of 7.30 per cent, provided such interest were not payable in coin.

As elsewhere stated, the Civil War, like the War of the Revolution, was carried through by the federal government on paper money. Specie, always scarce, early disappeared. The

[1] See Bolles, pp. 316 *et seq.*

banks suspended specie payments at the close of the first year of the war; the uncertainties of the war impeded the use of credit; and paper money, as the banks foresaw from the start, became indispensable.

It will be seen that the issue of non-interest-bearing legal-tender notes was comparatively not large. Their ill effect has been greatly exaggerated by hostile interests. Prices rose not only because of inflation, but because of the enormous demand for arms and other commodities by the government. The price of gold was comparatively but slightly affected by the issue. It went up and down according as war reports were unfavorable or otherwise. Gold speculation was also rife. Hugh McCulloch, controller of the currency, said in his second report:

Speculation

> Hostility to the government has been as decidedly manifested in the effort that has been made in the commercial metropolis of the nation to depreciate the currency as it has been by the enemy in the field, and unfortunately the effort of sympathizers with the rebellion and of the agents of the rebellious states to prostrate the national credit has been strengthened and sustained by thousands in the loyal states whose political fidelity it might be ungenerous to question. Immense interests have been at work all over and concentrated in New York to raise the price of coin, and splendid fortunes have been apparently made by their success. . . . Gold has been a favorite article to gamble in. . . . The effect of all this has been not to break down the credit of the government, but to increase enormously the cost of the war and the expense of living; for, however small may have been the connection between the price of coin and our domestic products, every rise of gold, no matter by what means effected, has been used as a pretext by holders and speculators for an advance of prices, to the great injury of the government and the sorrow of a large portion of the people.

CONTRACTION AND CREDIT-STRENGTHENING

Scarcely was the war at an end when the demand arose from the financial classes that the public money should be destroyed. Protests, it is true, were not wanting. Senator Sherman, for one, expresst his condemnation of the contraction policy in the strongest terms. Speaking of England's passage from a paper currency to a gold standard after the War of 1815, he said:

Senator Sherman on Contraction

> When the war was over measures were slowly adopted for its appreciation to the gold standard. These measures resulted in a reduction of the paper currency from $231,000,000 in 1815 to $152,000,000 in 1821. Commercial paper, discounted at the Bank of England, fell from $75,000,000 in 1815 to $13,000,000 in 1821. It is only necessary to appeal to histories of the time to show the disastrous effect. The purchasing value of capital was increased 50 per cent. A thousand dollars in 1821 would buy more than $1,800 in 1815. Small traders, debtors, and laborers were reduced to the sorest distress. The loss to them was far greater than the actual depreciation of the currency, for all confidence and trust were lost. . . .
>
> If senators wish other examples of the severe process of passing from a depreciated currency to a gold currency, or to a paper currency convertible into gold, let them read the story of the times after the Revolution and the War of 1812, and after the revulsion of 1837, all of which were periods of transition from a depreciated paper currency to a convertible paper currency. Sir, it is not possible to take this voyage without sore distress. To every person except a capitalist out of debt, or to the salaried officer or annuitant, it is a period of loss, danger, prostration of trade, fall of wages, suspension of enterprises, bankruptcy, and disaster. To every railroad it is an addition of at least one third to the burden of its debt; and, more than that, deduction from the value of its stock. To every bank it means the necessity of paying $150 for one hundred of its notes and deposits, except so far as the bank may transfer this to its debtors. It means the ruin of all dealers whose debts are twice their capital, tho one third less than their property. It means the fall of the agricultural productions without any very great reduction of taxes. To attempt this task suddenly, by a very surprise upon our people, by at once paralyzing their industry, by arresting them in the midst of lawful business and applying a new standard of value to their property, without any reduction of their debt,

or giving them an opportunity to compound with their creditors or distribute their loss, would be an act of folly without example in modern times.[1]

President Lincoln is also credited with the following declaration:

If a government contracts a debt with a certain amount of money in circulation, and then contracts the money volume before the debt is paid, it is the most heinous crime a government could commit against the people.[2]

It is, of course, true that the circulating mediums of the U. S. at the close of the Civil War was much greater than at the beginning. President Lincoln, in his annual message, said: "Five years ago the bank-note circulation of the country amounted to $200,000,000; now the circulation, bank and national, exceeds $700,000,000." And it is also true that a portion of this circulation should have been retired. The real question, however, was, Which kind of circulation should go: the U. S. treasury notes or the national bank-notes? Each represented a public utility, essential to economic, commercial, and industrial life. The first, however, represented public ownership and control; the second, private ownership and control of that utility. The fact which should be firmly grasped is that it was the public money upon which sentence of death was passed, while the private, corporation currency was preserved, and in every way safeguarded and cherished.

The effect of currency contraction upon the present value of debts is a large question, and played a vastly important part in the currency controversy. On this subject, E. Benjamin Andrews ("An Honest Dollar," p. 13) said:

Falling of Prices

Our national debt on Sept. 1, 1865, was about $2,750,000,000. It could then have been paid off with 18,000,000 bales of cotton or 25,000,000 tons of bar iron. When it had been reduced to $1,250,000,000, 30,000,000 bales of cotton, or 32,000,000 tons of iron, would have been required to pay it. In other words, while a nominal shrinkage of about 55 per cent had taken place in the debt, it had, as measured on either of these two world staples, actually been enlarged by some 50 per cent.

One chief pretext for the demand that our national currency should be destroyed was and still is the extraordinary theory that a national currency not made of metal (more recently one not made of a single metal, i. e., gold[3]) is a portion of the national debt, to be paid like any other debt; and the evidence of debt, i. e., the paper money itself, thereupon destroyed.

Why Contract?

The destruction of the greenback and consequent contraction of the currency was authorized by the Act of April 12, 1866, in the following provision:

The Contraction Act

Within the next six months after the passage of the act $10,000,000 worth of U. S. notes might be destroyed;[4] from that time on indefinitely a stream of $4,000,000 worth each month might pour into the publicfurnace. Not content with this the promoters of the contraction policy deliberately left open an avenue for further contraction, which again called forth an indignant protest even from Senator Sherman. While permitting the Secretary of the Treasury to destroy greenbacks it at the same time left it within his power to dispose of still more by simply locking them up in the vaults of the treasury. Of this provision Mr. Sherman said: "He [the secretary] might retire $200,000,000 of legal-tender notes by retaining them in his possession without consultation, or sell bonds for legal tenders and hold them in his vault, thus retiring them from the business of the country. He might, therefore, without violating the terms of the bill, contract the currency according to his own good-will and pleasure. My own impression is that the Secretary of the Treasury, in carrying out his known policy, will do so."[1]

Two years' steady pursuit of this policy of money destruction was all the country could or would endure, at least for one time. "When Congress convened in Dec., 1868, a considerable stringency existed in the money market. The price of commodities had declined and opposition to further contraction was loud and general. From all parts of the country complaints were heard of depression and paralysis in business, and many of those who suffered were certain that contraction of the currency was the cause."[2]

Contraction Checked

The greenback circulation had now fallen from $449,338,902[2] to $356,000,000;[4] and "so loud and general," in truth, "was the opposition to further contraction" that Congress on its assemblage made haste, and by vote of an overwhelming majority, to pass the Act of Feb. 4, 1868,[5] depriving the secretary of the power which he had used so freely and with such serious results.

The amount of U. S. notes actually destroyed is stated by the Treasury Department to have been "about $44,000,000."[6] This excludes $50,000,000 authorized as a "temporary issue for the redemption of a debt known as the temporary loan." It also takes no account of the contraction caused by the locking up of notes in the vaults of the treasury and of the banks.

Following the panic of 1873 came another imperious popular demand for an increase in the actual monetary machinery required to perform the exchanges of the country. The result was a reissue of $26,000,000 of the canceled notes not yet destroyed.[7] But the contraction policy had not yet reached its end. On Jan. 14, 1875,[8] was passed the "Act to provide for the resumption of specie payments." This act provided that the remaining sum of greenbacks should be cut down to $300,000,000, and more bonds issued. Thus the furnace was rekindled, to burn until Congress, on May 31, 1878, in obedience again to an imperative popular demand, extinguished its flames with the currency standing at $346,681,016.

At this point, despite vehement assertions that "the greenback must go," and that "the government must go out of the banking business," and despite determined attempts to supplant our national currency with the issues of banking corporations, the volume of U. S. notes still stands.

The next important act in the history of our financial legislation is that approved March 18, 1869, entitled "An act to strengthen the public credit."[9] Following is that portion of the act especially worthy of attention:

The Credit-Strengthening Act

Be it enacted by the Senate and House of Representatives of the U. S. of America in Congress assembled, That, in order to remove any doubt as to the purpose of the government to discharge all just obligations to the public creditors, and to settle conflicting questions and interpretations of the laws by virtue of which such obligations have been contracted, it is hereby provided and

declared that the faith of the U. S. is solemnly pledged to the payment in coin or its equivalent of all the obligations of the U. S. not bearing interest, known as U. S. notes, and of all the interest-bearing obligations of the U. S., except in cases where the law authorizing the issue of any such obligation has expressly provided that the same may be paid in lawful money or other currency than gold and silver.

What ground was there for "doubt," or "conflicting questions and interpretations of the laws"? Reference to the chart will show that, contrary to the supposition of some, the bonds and treasury notes were sold not for specie simply, but, generally speaking, for coin or for any kind of government security the bond buyer chose to offer; moreover, that the bonds were sold not at par but at market price. Indeed, the original plan of the bankers was that the secretary should sell his bonds for the notes of private and state banks, "wildcat" and all.[1] From this plan, however, the secretary dissented. The original plan of Congress, it is true, provided that the bonds should not be sold at a discount.[2] This scheme, however, soon proved impracticable, and the secretary threw his wares on the market and took in return whatever price they would command.

Further, the bonds that were on a future day to command such a premium as to destroy the profit on national bank circulation were sold on a par with the depreciated paper currency. Senator Sherman declared:

> The notes were still received, *par for par*, for bonds during the war and after the war was over. The right to convert them into a particular form of bonds, that is, the five-twenties, was denied; still they were converted at par into seven-and-three-tenths treasury notes, into ten-forty gold bonds, and into every form of security except only the five-twenties.[3]

Next, in what were these bonds and treasury notes payable? A glance at the chart shows that, regarding loans 1 and 4, nothing whatever was said. Loan 5 specifies "coin or other lawful money," plainly leaving the option to the government. Loans 2 and 3, however, say "coin"; but the coin specification in even these two cases Bolles[4] says was "accidental."

Considering his general attitude on financial questions, Senator Sherman's opinion on this question may be quoted:

> I do not believe, and I never could reason myself into the belief, that the laws which authorized the issue of these bonds made a discrimination against the lawful-tender money of the U. S. I do believe that by a fair and reasonable construction of those laws the bonds of the U. S. might be paid in lawful money issued within the limits and according to the terms of those laws.[5]

The following letter, found in the *Congressional Globe*, for Dec. 14, 1877, p. 204, is, if possible, even stronger:

> UNITED STATES SENATE CHAMBER,
> WASHINGTON, DISTRICT OF COLUMBIA, March 20, 1868.
> *Hon. A. Mann, Jr., Brooklyn Heights.*
>
> DEAR SIR: I was pleased to receive your letter. My personal interests are the same as yours, but, like you, I do not intend *to be influenced by them.* My construction of the law is the result of careful examination, and I feel quite sure an impartial court would confirm it, if the case could be tried before a court. I send you my views as fully stated in a speech. *Your idea is that we propose to repudiate or violate a promise when we offer to redeem the "principal" in legal tenders.*
>
> *I think the bondholder violates his promise when he refuses to take the same kind of money he paid for the bonds.* If the case is to be tested by the law, I am right; if it is to be tested by Jay Cooke's advertisements, I am wrong. I hate repudiation or anything like it, but *we ought not to be deterred from doing what is right by fear of undeserved epithets.* If under the law as it stands the holders of the five-twenties can only be paid in gold, then we are repudiators if we propose to pay otherwise. *If the bondholder can legally demand only the kind of money he paid, then he is a repudiator and extortioner to demand money more valuable than he gave.*
>
> Truly yours, JOHN SHERMAN.

Assurance Made Doubly Sure

This act next provides that where the government's right to pay in lawful money is unquestioned, that right may not be exercised until the debt has matured; unless, in the mean time, the lawful money has become as dear as coin. The provision reads: "But none of said interest-bearing obligations [i. e., those payable in lawful money] not already due shall be redeemed or paid before maturity unless at such time U. S. notes shall be convertible into coin at the option of the holder, or unless at such time bonds of the U. S. bearing a lower rate of interest than the bonds to be redeemed can be sold at par in coin."

That is, the bondholder must, in any case, be guaranteed his unearned increment.

REFUNDING THE PUBLIC DEBT

The Public Debt

The next series of acts is that providing for the refunding of the national debt. Previous to the Civil War the people of the U. S. had been unaccustomed to the thought of a public debt. The debt, ever since its establishment by Alexander Hamilton, had continued to exist, but it was never large, and at one time it fell so low as to be practically insignificant. Yet at the very beginning of the war it leaped to a considerable height, and by the end of the war it had attained a magnitude beyond the mind of man to conceive. The following figures will show its growth:

Jan. 1,	1791	$75,463,476.52
	1800	82,976,294.35
	1810	53,173,217.52
	1820	91,015,566.15
	1830	48,565,406.50
	1840	3,573,343.82
July 1,	1850	63,452,773.55
	1860	64,842,287.88
	1861	90,580,873.72
	1862	524,176,412.13
	1663	1,119,772,138.63
	1864	1,815,784,370.57
	1865	2,680,647,869.74
	1866	2,773,236,173.69

—"Report of Secretary of Treasury," 1894, p. xcvi.

The debt was indeed great, but all of the loans (see chart of "Five Great War Loans," p. 9) were contracted for comparatively short periods. The 5–20 bonds might at any time between five years and twenty years from the date of sale be paid by the government at its own option. Similarly, the 10–40's might be discharged in ten years, or at any time within the following thirty years, at the government's option. In the same way the 5–40's were payable at any time after five years and before forty years, and the 5–30's at any time after five years and before thirty years from the date of sale as the government might choose.

Further, the day of possible payment soon rolled around; 5–20's, sold in 1862, were payable in 1867, tho payment was not obligatory till 1882; 5–30's and 5–40's, sold in 1864, might be paid in 1869; 5–40's, marketed in 1865, might

be cleared away in 1870; and, slowest of all, the 10–40's of 1863 might, if sold in 1863, be paid off in 1873. Provided, then, its revenues were only sufficient, the U. S. might, according to the terms of the contract into which it had entered with the bondholder, rid itself of the burden of a national debt in 1873, or soon thereafter.

Had it felt unable to do so at so early a day it might, as Secretary Windom did, have exchanged its maturing bonds for new bonds payable at the government's option.

Instead, Congress pursued a wholly different course. The following table of refunding acts will show what was actually done:

Refunding Acts

No.	Date.	Bonds authorized—amounts	Rate	Redeemable	Payable	Conditions and application
I.	July 14, 1870.	[*a*] Not more than $200,000,000.	5 per cent payable semiannually in coin of present standard value.	In coin of present standard value.	After ten years at pleasure of U. S.	To be sold at not less than par for coin; proceeds to be applied to redemption of 5–20's at par; or exchanged for 5–20's par for par. To be used for no other purpose.
		[*b*] Not more than $300,000,000.	4½ per cent do.....	"	After fifteen years do.	" " "
		[*c*] Not more than $1,000,000,000.	4 per cent do.....	"	After thirty years do.	" " "
II.	Jan. 20, 1871.	Class [*a*], above, to be increased to $500,000,000; the $1,500,000,000 limit [200 plus 300 plus 1,000] is not to be passed.	.....	.....	.....	Secretary of Treasury may make interest on any of above bonds payable quarter-yearly.
III.	Jan. 25, 1879.	Secretary of Treasury may employ billion-dollar, 4 per cent bonds [above] in clearing away remaining 5–20's. When all such have been redeemed, "provisions of this section and all existing provisions of law authorizing refunding of national debt shall apply to any bonds of U. S. bearing interest at 5 per cent per annum or a higher rate which may be redeemable." Double interest for three months is provided for.				
IV.	Feb. 26, 1879.	The act authorized exchanges as follows: 1. Bondholder may present to Secretary of Treasury a 5 per cent bond of Act of July 14, 1870,[1] or a 5-20 bond and receive a legal tender. 2. Holder of legal tender may present same to Secretary of Treasury and receive a 4 per cent certificate of deposit. 3. Holder of $50 worth of 4 per cent certificates of deposit may present same to Secretary of Treasury and receive a thirty-year, 4 per cent bond.				

[1] These bonds, having but ten years to run, were in 1879 almost due.

Analysis of this legislation shows that its effect was to defer for many years the possibility of paying the public debt, and to provide an opportunity for investment to those able to avail themselves of it.

The effect of such legislation was well illustrated in President Cleveland's first term when the country was suffering from "a congested treasury and a depleted circulation."

The logical and rational solution would have been to apply the surplus to the payment of the national debt. Refunding acts, however, had made this impracticable. No bonds were due; and to go into the market and buy them at the existing premiums would have cost the government as much as to wait and pay interest on them. The refunding acts had practically closed the door in the face of the government to all opportunities advantageously to reduce its debt, however great might be its stock of cash. That such a situation was designed in order to furnish a permanent basis for a system of currency-issuing banks might be inferred from the following utterance of Secretary Chase in 1862 relative to the national banking system:

> The central idea of the measure is the establishment of a sound, uniform currency throughout the country *upon the foundation of national credit* (in other words, upon a national debt), *making this the settled policy of the country.*

Demonetization of Silver

Regarding the much-mooted question of the demonetization of silver in the U. S., the facts in brief are as follows:

By an order of Secretary Madison in 1806 the coinage of the silver dollar was discontinued, but the coinage of fractional silver was still permitted. Such silver was, from 1792 to 1853, a full legal tender.

In 1834 Congress changed the ratio between silver and gold from 15 to 1 to 16.002 to 1. In 1837 Congress again changed the ratio, this time to 15.988 + to 1. Neither the act of 1834 nor that of 1837 affected the amount of pure silver in the silver coins, nor the full legal-tender character of any coin.

In 1853 Congress demonetized fractional silver coins for payments of more than $5; this act, however, left intact the weight, fineness, and full legal-tender quality of the silver dollar. Except in 1858, silver dollars were coined constantly between 1853 and 1873.

In 1873 Congress dropped the standard, 412.5-grain silver dollar from the list of coins, and substituted, instead, the 420-grain silver trade dollar, good only for payments of $5 and under.

The movement leading to the general demonetization of silver originated in Europe after the great gold discoveries. The plan at first was to demonetize gold (see Report of U. S. Silver Commission of 1876, p. 15). In 1857 Germany and Austria demonetized their gold.

In 1865 the nations of France, Belgium, Switzerland, and Italy, later reenforced by Greece and the papal states, all together constituting the "Latin Union," agreed to establish a system of international bimetalism, fixing the ratio between the precious metals at 15.5 to 1. In 1867 it was proposed to extend the principles of this bimetallic system to other countries. An internationa committee met at the Paris Exposition in 1867 On this committee the U. S. was represented by

Samuel B. Ruggles, a believer in an international gold standard. Correspondence between Mr. Ruggles and Hon. John Sherman, Chairman of the U. S. Senate Committee on Finance, himself at Paris, showed that Mr. Sherman also favored the international gold standard. (See Senate Executive Document No. 14, Fortieth Congress, second session, pp. 107–110.) Mr. Sherman exprest the belief that the U. S. Congress would share his view. His letter had much weight with the international committee.

The session of the international committee was immediately followed by that of the Paris Monetary Conference. Mr. Ruggles was the American delegate to this body also. Mr. Sherman's former letter was read, and exerted much influence on the conference. (See Senate Executive Document No. 14, Fortieth Congress, second session, pp. 9, 13, 55, 99, 100.) This conference recommended the establishment of "a single standard exclusively of gold." Of it Mr. Sherman said: "The single standard of gold is an American idea, yielded reluctantly by France and other countries." (Ibid., pp. 4–6.)

Returning home, Mr. Sherman, on Jan. 6, 1868, introduced into the U. S. Senate a bill (S., No. 217) dropping the silver dollar from the list of coins, and reducing the weight of the gold dollar to facilitate international coinage and the establishment of the international gold standard. Mr. Sherman accompanied this bill with a powerful report strongly advocating its passage. Senator E. D. Morgan, of New York, however, also of the Finance Committee, presented a minority report arguing strongly against the silver demonetization feature of Mr. Sherman's bill. Mr. Sherman thereupon moved that further consideration of the matter be postponed till the next session. It was, in fact, postponed until Mr. Morgan's retirement from the Senate.

This first and unsuccessful attempt to demonetize the U. S. standard silver dollar was followed by two others. The second attempt apparently emanated neither from Mr. Ruggles nor Mr. Sherman, but from the U. S. Treasury Department, in a bill prepared by Mr. John Jay Knox, and looking toward the revision of the laws relative to the mints, assay offices, and coinage of the U. S. It substituted for the standard silver dollar of 412.5 grains a silver dollar of 384 grains, whose use was limited to payments of $5 and under. This bill also made the gold dollar of 25.8 grains the unit of value in place of the standard silver dollar which Mr. Knox declared had, hitherto, been by law the dollar unit. This bill, in "rough draft," was submitted to some thirty "experts" in monetary matters. The correspondence may be found in "Documentary History of the Coinage Act of Feb. 12, 1873," issued by the U. S. Treasury Department without date. A few of the experts, e. g., E. B. Eliott, recognized and called attention to the fact that the bill demonetized the standard silver dollar. Chief attention, however, was given to other and minor matters.

Mr. Knox revised his bill and dropped the 384-grain dollar, omitting also the standard silver dollar. In this form the bill was submitted by Secretary of the Treasury Boutwell to Senator Sherman, chairman of the Senate Finance Committee, who, on April 28, 1870, introduced it into the Senate. It was known as the "Mint Bill." Table, "The Evolution of the Mint Bill" (p. 358), shows the various changes which, from time to time, were made in this bill. A table, "Tabular View of History of Act of Feb. 12, 1873, known as the 'Mint Bill'" (published in *The Industrialist*, Kansas State Agricultural College, Nov., 1898), epitomizes the legislative history of the measure. This bill passed the Senate of the Forty-first Congress, and appeared twice in the House. In no instance was demonetization mentioned. The bill died with the adjournment of this Congress.

The third and successful attempt was made in the Forty-second Congress, which immediately met. The Mint Bill was again introduced, this time by Representative Kelley, of Pennsylvania, chairman of the House Committee on Coinage, Weights, and Measures, as H. R. No. 5. Later Mr. Kelley retired from the management of the bill; on Feb. 9, 1872, it reappeared, this time as H. R. No. 1,427, in charge of Mr. Samuel Hooper of Massachusetts, characterized by Mr. Blaine as the most competent financier in the House. Mr. Hooper's bill provided for a 384-grain or "five-franc" dollar, good only for payments of $5 and under.

Reference to the "Tabular View" will show that, throughout the entire history of the bill, the demonetization feature was never mentioned in the Senate, and on but a single day, viz., April 9, 1872, in the House; it was referred to by Messrs. Hooper, Stoughton, Potter, and Kelley. This feature attracted but little attention. Alleged "jobs" in the bill brought upon it bitter attacks. Although entitled to daily consideration until disposed of, the bill did not again appear in the House for nearly seven weeks, and then within forty-eight hours of adjournment. On this last appearance it was brought in by Mr. Hooper, "for the purpose," as he said, "of offering an amendment to the bill in the nature of a substitute, one which has been very carefully prepared, and which I have submitted to the different gentlemen in this House who have taken a special interest in the bill. I find that it meets with universal approbation in the form in which I offer it. I move that the rules be suspended and that the substitute be put on its passage." In the midst of a stormy discussion, in which the demonetization feature was not mentioned, a former opponent of the bill, Mr. McNeely, declared his thorough familiarity with it, and his belief that it ought to pass. It therefore did so, 110 to 13. The demonetization clauses of the Hooper "substitute" were the same as those of the bill for which it was a substitute.

Throughout the Senate history of this bill, as of its predecessor in the Forty-first Congress, the demonetization feature was, as stated, not once mentioned. Senator Sherman had constant control of the bill, and allayed all suspicions as to its character. He substituted for the Hooper 384-grain silver dollar the 420-grain silver trade dollar, good also only for payments of $5 and under. The differences in the House and Senate bills were referred to a conference committee dominated by Senator Sherman and Representative Hooper. The bill as recommended by this committee passed both houses and, on Feb. 12, 1873, was signed by President Grant.

That congressmen actually did not know that the bill they were passing demonetized the standard silver dollar is shown by the following statements: Senator Conkling, *Congressional Record*, March 30, 1876, p. 2062, column 2; Senators Thurman and Allison, ditto, p. 1064, column 1, and p. 1058, column 1; Senators Voorhees and

Blaine, ditto, p. 1063, column 2; Senator Beck, ditto, p. 260, column 2, and *Congressional Record* for Jan. 10, 1878, p. 261, column 2; Senator Hereford, *Congressional Record*, for Feb. 13, 1878, p. 989; Senator Howe and Representative Garfield, *Cong. Rec.*, Feb. 5, 1878, p. 764; Representative Bright, *Cong. Rec.*, Jan. 26, 1878, p. 584, column 2; Representative Holman, *Cong. Rec.*, p. 4561, and Appendix, p. 193, column 1; Representative Cannon, *Cong. Rec.*, Forty-fourth Congress, first session, Appendix, p. 197, column 1; Representative Burchard, *Cong. Rec.*, July 13, 1876, p. 4560, column 1; Representative Kelley, *Cong. Rec.*, vol. vii., part 2, Forty-fifth Congress, second session, p. 1605, column 1, and *Cong. Rec.*, p. 1231, column 2.

It is clear, however, that Senator Sherman and Representative Hooper were well aware of the fact that the bill demonetized the standard silver dollar. That the general public did not, for some time after the passage of the bill, so understand is shown by testimonials on both sides of the subsequent controversy, including those of Murat Halstead, the Chicago *Tribune*, Hon. Thomas B. Reed, President F. A. Walker, Hon. W. S. Groesbeck, and J. K. Upton. That President Grant, when signing the bill, was ignorant of its effect upon our silver coinage, is shown by his celebrated "Cowdrey letter." Senator Sherman, in his speech delivered Aug. 30, 1893, virtually admitted as much, saying: "It is sometimes said that General Grant did not know of the demonetization of silver. Well, what of it? General Grant was not a financier, nor a metalist, nor a monetary expert."

The act of 1873 closed the mints of the U. S. against the coinage of additional full legal-tender silver dollars. Such, however, as had before been coined were unaffected by this act. Their demonetization came one year later in the revision of the statutes of the U. S. The revisers were authorized simply to revise, not to legislate. When their work in completed form came before Congress for acceptance, the question at once arose whether the revisers had made changes in the laws. Senators Butler, of Massachusetts and Poland of Vermont declared positively that they had not. In fact, by section 3,586, which reads, "The silver dollar coins in the U. S. shall be a legal tender at their nominal value for any amount not exceeding $5 in any one payment," they had demonetized the outstanding standard silver dollars save for payments of $5 and under.

On Jan. 14, 1875, the free-coinage system was applied to gold by the discontinuance of the coinage charge of one fifth of one per cent.

On July 22, 1876, by a joint resolution, the trade dollar was deprived of all legal-tender qualities, Senator Sherman declaring that it was never intended to make it a legal tender for any sum whatever. In Feb., 1887, the trade dollars were retired.

That the above was but a part of a world-wide movement to demonetize silver is shown by U. S. Treasury Circular No. 123, pp. 35–36.

Resumption of Specie Payments

On Jan. 14, 1875, the act for the resumption of specie payments was passed. This act provided for the redemption of paper money with coin, for unlimited issues of national bank-notes, for the reduction in volume of "greenbacks" to $300,000,000, and for the selling of bonds by the Secretary of the Treasury that funds might be obtained with which to effect resumption. The same act provided for the discontinuance of the charge made for coining gold bullion.

The discovery that silver had been demonetized occasioned a tremendous agitation, and demand for remonetization. In consequence Congress, on Feb. 28, 1878, passed the Bland-Allison Compromise Silver Act. This act authorized the Secretary of the Treasury to purchase from $2,000,000 worth to $4,000,000 worth of silver bullion per month, and coin the same into standard silver dollars of 412.5 grains. Coinage of silver on private account was prohibited. Standard silver dollars, old or new, were made full legal tender save where otherwise provided by contract, i. e., demonetization by private contract was permitted. Silver certificates, redeemable in silver, were provided for. The president was directed to call an international conference to fix the ratio between gold and silver, and establish international bimetalism. President Hayes vetoed the bill, but it was passed over his veto.

The Bland-Allison Act

By Act of May 31, 1878, at which time the amount of U. S. treasury notes had been reduced to $346,681,016, the further cancelation of this form of money was forbidden, notes redeemed being required to be reissued. Thus was established the so-called "endless chain," to remedy which it was later proposed by some that the greenbacks be abolished; by others, that the redemption feature be abolished; and, by still others, that the secretary redeem in silver as freely as in gold.

The year 1881 saw a renewed monetary agitation, when France and the U. S. jointly issued a call to a monetary conference. It met in Paris on April 19th, fourteen governments being represented at the opening, and delegates from Great Britain, India, and Canada being present a part of the time. This conference, which continued its sessions with some breaks for nearly two months, indicated a strong approval of the theory of bimetalism, but came to no agreement or line of action, England and Germany being unwilling to act. The U. S., therefore, were still left to act alone. No change, however, was made in our currency, these years being marked by large decreases in the public debt and a discussion of what to do with the "surplus" in the treasury.

The year 1883, however, was marked by financial depression and many failures, caused partly by poor crops and overspeculation, and fell particularly on the iron trade. Yet there was no panic till May, 1884, when it fell in force, altho in speculative rather than in commercial circles. In 1885 there was a general improvement, yet the Secretary of the Treasury and the president alike in their annual messages recommended the repeal of the Silver Bill of 1878; but Congress declined to act, and the next year likewise, altho it also declined to pass a free-silver bill. In 1887, a year of prosperity, there was still more discussion of the "surplus" in the treasury, and again an effort to repeal the Silver Bill of 1878, but still Congress refused. In 1888 the revenue of the U. S. was over $1,000,000 a day. The circulation of the national banks was, however, contracting, and Congress could still not be prevailed upon to repeal the silver law. In 1890 the failure of several London houses, and notably Baring Brothers, owing mainly to a crisis in the Argentine Republic, was

to some extent followed by a stringency in the market here.

On July 14, 1890, the so-called Sherman Silver Purchase Act was passed. This law required the Secretary of the Treasury to purchase each month 4,500,000 ounces of silver, paying for the same with treasury notes ("Sherman notes") not more than $1 for 371.25 grains of pure silver. These notes were made redeemable on demand, *in coin*, at the discretion of the secretary. The act declared it to be "the established policy of the U. S. to maintain the two metals on a parity with each other upon the present legal ratio, or such ratio as may be provided by law." When redeemed, these notes, like the notes comprehended in the Act of May 31, 1878, might be reissued. Unless otherwise provided for by contract, these notes were legal tender. They might be used as national bank reserves. Until July 1, 1891, the secretary was required to coin 2,000,000 ounces monthly; thereafter he was required to coin enough to redeem the treasury notes presented. The price of silver being such that the amount of silver requisite for the coinage of a dollar could be purchased with less than a dollar, a difference called the "seigniorage" was foreseen; this seigniorage was to be preserved. The silver-purchase clause of the Bland-Allison Act of 1878 was repealed.

The Sherman Law

A stormy period followed the enactment of this law. "Raids" were made on the treasury gold reserve, "Sherman notes" being presented in large quantities for redemption. The Secretary of the Treasury uniformly redeemed these notes in gold, leaving the silver idle in the treasury; he gave as his reason that only by paying out the coin demanded could he "preserve the parity" between the two metals. The so-called "endless chain" thus depleted the treasury of its gold. In the spring of 1893 there burst the most fearful panic in American history, the financial classes accounting for it on the ground that "confidence was destroyed" by the exhaustion of the treasury gold-supply; while others attributed it to a conspiracy among certain New York national bank presidents and officers of the national government. (See J. W. Schuckers's "The Black Crime of 1893.")

President Cleveland called Congress together Aug. 7, 1893, in special session to repeal the silver-purchase clause of the "Sherman Act." After a long and bitter session the clause was repealed. Congress, however, passed a bill requiring the coinage of the seigniorage, at that time lying idle in the treasury. On March 29, 1894, this bill was vetoed by the president.

The theory that repealing the purchasing clause of the Sherman Act would stop the raids on the treasury proved groundless. Drains on the treasury gold stock continued. The gold thus drafted away was recouped by four bond sales. The first occurred Jan. 14, 1894. Authority, dubious at best, for all these sales was found in the Act of Jan. 14, 1875. The secretary borrowed $50,000,000 in gold, redeemable in coin after ten years. By November the gold-supply had again fallen so low as to cause a crisis. At a time when the "balance of trade" should have brought it to the U. S., gold was again going abroad. The secretary now sold to a syndicate $50,000,000 worth of bonds, payable in coin after ten years. Late in the same winter heavy withdrawals of gold again occurred; less than one half of this gold was exported, the balance being hoarded at home. On Feb. 8, 1895, the secretary, at the direction of the president, sold to August Belmont & Co. on behalf of the Rothschilds and themselves, and to J. P. Morgan & Co. on behalf of J. S. Morgan & Co., of London, and themselves, bonds amounting to $62,315,435. The bonds were payable in coin after thirty years, and bore interest at the rate of 4 per cent, payable quarterly. The syndicate agreed to "protect the treasury." The syndicate bought at 104½; on Feb. 20th they offered one half of the entire amount purchased ($62,315,435) in New York at 112½, and the remaining one half in London at about the same rate. Subscriptions in New York amounted to $200,000,000; in London, to $590,000,000. In consequence the price in New York went to 120.

By the holiday season of 1895–96 the gold stock had again dropt to the danger line, and the secretary arranged again to sell bonds, amounting this time to $100,000,000, to the Morgan syndicate. A loud protest was now raised against bond sales to private syndicates, and a popular loan was demanded. Over $568,000,000 were, accordingly, bidden for. In consequence the syndicate, which would have paid 104¾, was obliged to pay 110.6877 for its bonds, the government saving, in consequence, over $8,000,000.

Bond Sales

The total of bonds issued in these four sales amounted to $262,315,435.

Currency "Reform"

The financial legislation of 1893–94 was accompanied and followed by a series of demands from financial circles for currency "reform." Numerous "plans," the Baltimore, Rhodes's *Journal of Banking*, Eckels, Carlisle, and, later, the McCleary, Fowler, and Gage bills, all variations of the same general measure, were proposed. These measures contemplated the ultimate elimination of government paper money, the substitution therefor of national bank-notes, and the reduction in the cost to bankers of securing these notes, notably by the substitution of the banks' "assets" for government bonds, whose advancing premium reduced the profits on national bank circulation. These proposals, in a word, all looked to the private ownership and monopolization of a prime public utility. In view of the popular hostility to greenback destruction, the process of "impounding," i. e., locking up this form of money in the national treasury and thus protecting the bank-note against the competition of the greenback, met with much favor. Silver dollars, which also competed with bank-notes, were characterized as "fiat" money and their redemption in gold was advocated. None of these plans, however, found expression in legislation.

The money question constituted the paramount and almost the exclusive issue in the national political campaign of 1896. The Republican National platform declared: "We are . . . opposed to the free coinage of silver except by international agreement with the leading commercial nations of the world, which we pledge ourselves to promote, and until such agreement can be obtained the existing gold standard must be preserved." The Democrats declared for the "free and unlimited coinage of both silver and

1896

gold at the present legal ratio of 16 to 1, without waiting for the aid or consent of any other nation," i. e., the restoration of silver to the position it occupied in the currency system of the U. S. prior to 1873. The "National" or "Gold" Democrats declared for the gold standard.

In intensity and earnestness the campaign of 1896 surpassed all others since that of 1860. Under the leadership of Mark Hanna, the Republicans employed money to a degree unparalleled in political history. The avowedly gold standard party, the "National" Democrats, carried one county—in western Kansas. The Republicans won, and announced the result as a victory for the gold standard.

In accordance with his party's platform pledge to promote international bimetalism, President McKinley appointed a commission, consisting of Messrs. Walcott, Stevenson, and Payne, to visit Europe and, if practicable, negotiate an international bimetalic agreement. In France the commission found the prospect very favorable; in England they received much encouragement from Lord Salisbury, Prime Minister, and others. The British financial classes, however, abetted, it was widely believed, by the government at Washington, vetoed the proposal, and the commission returned home empty-handed. The agitation was thereupon dropt, and the "single standard exclusively of gold," for which Messrs. Ruggles and Sherman began working in 1867, but for which the American people had never voted, was accepted as final.

President McKinley

In his message of Dec., 1897, President McKinley proposed legislation providing for the redemption of greenbacks in gold, the greenbacks thereupon to be retained in the treasury unless called for in exchange for gold. Inasmuch as redemption would be demanded mainly by bankers and speculators, constitutionally opposed to the existence of the greenbacks, such a law, as pointed out by Congressman Walker, of Massachusetts, would have enabled a single individual with $1,000,000, or less, in greenbacks to impound the entire $346,000,000 of greenbacks. To do this it would have been necessary only, first, to present the greenbacks at the sub-treasury in Wall Street for gold; then, crossing the street to a bank, to exchange the gold for greenbacks; then, recrossing the street to the sub-treasury, to redeem these greenbacks in gold, and so continue until all the greenbacks in the country, as they gravitated to the financial center, were safely locked in the vaults of the sub-treasury. The proposal was not carried out.

The Gold Standard Law of 1900

On March 14, 1900, the "single standard exclusively of gold" was enacted into law. This law designated the gold dollar of 25.8 grains, nine tenths fine, as "the standard unit of value," and directed the treasurer of the U. S. to maintain all of the forms of money issued by the U. S. at a parity with this standard. The gold reserve of the national treasury, traditionally assumed to have been fixt by the law of July 12, 1882, at $100,000,000, was definitely put at $150,000,000, and the Secretary of the Treasury was directed to maintain it, if necessary, by selling bonds. The legal-tender quality of the silver dollar and greenback was retained. Divisions of issue and redemption were established in the national treasury. Silver certificates were made to replace treasury notes. The Secretary of the Treasury was authorized to coin silver purchased under the Act of July 14, 1890, into subsidiary coins, canceling an equal value of treasury notes of 1890; national banks with capitals of $25,000 were authorized for towns of 6,000 population or under; bonds maturing in 1904, 1907, and 1908 were permitted to be refunded, at a lower interest rate, into gold bonds payable in thirty years and exempt from duties and all species of taxation, national, state, municipal, or local; and national banks were permitted to issue circulation up to the par value of their bonds, the tax upon such circulation, if based upon the new bonds, being at the same time reduced one half.

National Bank Money

In the second session of the Fifty-ninth Congress a bill (H. R. 23,017), drawn in accordance with the carefully prepared recommendations of a convention of bankers, and indorsed by the president, was introduced by Representative Charles N. Fowler. It provided that any national bank which had been doing business for a year, and had a surplus equal to 20 per cent of its capital, might issue credit notes equal to 40 per cent of its outstanding bond-secured currency, but not exceeding 25 per cent of its capital; upon these credit notes an annual tax of 3 per cent was to be laid. In addition, the bank might, in time of emergency, issue credit notes equal to 12½ per cent of its capital, upon which a tax of 5 per cent was to be laid. The government would hold, as trustee, a 5 per cent security fund out of which to pay the notes of insolvent banks.

This bill was correctly characterized as a "revival of the old Baltimore plan of non-secured asset currency," "contrived in formidable banking circles twelve years ago, and, periodically, when stock jobbers and speculators on the 'street' had been pinched and squeezed by a high call rate of interest, put forward with constantly increasing vehemence." By its friends this measure was described as "merely another patch on a patchwork system"; by its opponents as providing for currency inflation, certainly of $213,000,000, and possibly of $320,000,000, at a tax to the banks of 3 per cent on the smaller sum, and 5 per cent on the $106,000,000 additional, and by the banks upon the borrowers of two or three times that amount; as calculated to stimulate the spirit of speculation and gambling at the money centers; as failing absolutely to provide, like the Scotch and Canadian systems after which it was nominally modeled, for prompt redemption; as unnecessary to meet an alleged lack of money, inasmuch as national banks were already issuing but 62½ per cent of the amount of circulation to which they were entitled by law; as merely enabling banks, unwilling to issue expensive bond-secured currency, to issue a cheaper form of money at a greater profit to themselves; and as utterly uncalled for by the business community in general. Critics might also have added that the scheme provided for fiat money, pure and simple; the 5 per cent security fund serving as but the shadow of that metallic basis which bankers, when criticizing government-issued and -secured money, have been accustomed to maintain is essential to the "soundness" and "honesty" of a medium of exchange. Further, in the light of our financial history, they might also have pointed out that this bill was but another long step toward the realization of the national bankers' dream, name-

THE EVOLUTION OF THE MINT BILL

Chart showing forms assumed by important sections of the Mint Bill at various stages of its progress

NUMBERS AND FORMS	1. GOLD SECTION			2. SILVER SECTION				3. PROHIBITORY SECTION

ly, a currency system created and indorsed by government and turned over to national banks at a nominal cost, to be contracted and expanded by them at pleasure, and employed in exploiting the public to their own enrichment.

This scheme, providing for what is usually styled "credit currency," "elastic currency," and, derisively, "rubber money," again ignominiously failed. An act, however, approved March 4, 1907, and bearing the name of Senator Aldrich, was passed. Aside from some features of minor interest, it conceded, in part, two of the bankers' demands. The first of these, omitted, however, from the above bill, was that the Secretary of the Treasury should be required to turn over to the national banks all the funds in the national treasury save such as were needed for the safe conduct of the daily business of the treasury. The Aldrich bill met this demand in part through the following clause:

"All national banking associations, designated for that purpose by the Secretary of the Treasury, shall be depositories of public money, under such regulations as may be prescribed by the secretary"; i. e., banks specified by the secretary may have free use of the public funds. What percentage of such funds might thus be placed at their disposal the act does not indicate.

The second demand of the bankers, namely, that they should be provided with a less expensive money than a currency based on government bonds, was conceded in part by a provision that a national bank may, upon deposit of lawful money, withdraw its circulating notes, the maximum of such withdrawals for all national banks in a given month being fixed at $9,000,000. This provision saves the bank, now entrusted with public funds, the cost of the premium paid for government bonds with which to secure its circulation, and enables it to secure a higher interest rate upon its own money than that borne by government bonds. The measure is a step toward asset or "elastic currency"; it permits contraction of the currency by national banks to the extent of $9,000,000 per month. "Elasticity" requires that the banks shall be permitted both to contract and to expand. Naturally, their next demand should be, again, for "asset" or "credit" currency that they may thus expand.

"Elastic Currency"

The Aldrich law also contains the following provision:

> The Secretary of the Treasury shall require the associations thus designated (as depositories of public money), to give satisfactory security, by the deposit of U. S. bonds *and otherwise*; for the safe-keeping and prompt payment of the public money deposited with them.

What do the words "and otherwise" mean? In answer, the *Wall Street Journal* said:

> By the passage of the Aldrich bill Congress has made lawful, if there was any doubt about the legality before, the acceptance by the Secretary of the Treasury of other bonds than those of the U. S. as security for U. S. deposits in national banks.

This statement has been interpreted to mean that hereafter "when it is not convenient for the bankers to deposit U. S. bonds they may give state bonds, municipal bonds, or railway bonds, and when it suits their purpose not to give any bonds whatever, then the personal notes of the officers of the banks will be accepted."

Commenting upon this situation, *The Commoner* (April 12, 1907, p. 3) said: "Why did it (the *Wall Street Journal*) not tell its readers that the very men who had laughed to scorn the Populists' subtreasury proposition, which, as described by one Republican, meant 'the loan of the public money on haystacks, hogs, and hominy,' had provided for loaning the public money without interest upon the personal notes of national bankers?"

CURTIS, GEORGE WILLIAM: American editor and civil service reformer; born in Providence, R. I., 1824. He began a commercial career in New York City, and later, together with his elder brother, joined the community at Brook Farm, being the youngest member of that company. Mr. Curtis remained four years at Brook Farm, going thence to Concord, Mass., keeping up the friendship formed with Emerson, Hawthorne, and others.

In 1846 Mr. Curtis went to Europe, and during his travels contributed letters to the New York *Tribune*. On his return, in 1851, he became connected editorially with that paper. In 1852 he became one of the editors of *Putnam's Monthly*, and in 1853 began a career as a lyceum lecturer, soon becoming one of the most popular speakers of the day. In 1857 he became permanently associated with the Harpers, as editor of the "Easy Chair," the remarkable series of papers which he had commenced in 1853. The previous year he had become chief editorial writer for *Harper's Weekly*, a position he held till his death.

In 1860 Mr. Curtis was a delegate to the convention that nominated Mr. Lincoln, and in *Harper's Weekly* and on the platform he enthusiastically advocated the cause of the union and emancipation. In 1871 General Grant appointed him one of the commissioners to draw up rules to regulate the civil service. A civil service league had been formed in New York State in 1876, and in 1880 it was revived, and Mr. Curtis became its president. This was superseded a year later by the National Civil Service Reform League, which was essentially of his organization. In 1890 Curtis became chancellor of the University of the State of New York, of which he had been a regent since 1864. He died at his home on Staten Island, Aug. 31, 1892. Among his works may be mentioned: "Lotus Eating" (1852); "Trumps" (1862); "Eulogy on Wendell Phillips" (1865); "Motley's Correspondence" (1890); and "From the Easy Chair" (1892).

D

DANGEROUS TRADES, THE (see also ACCIDENTS): American legislature seems almost to have ignored a branch of factory legislation considered elsewhere of the utmost importance. While most of the countries of Europe, especially England, have considered the special regulations of dangerous trades as a necessity of modern industry, in only one case have the American states enacted special laws on the subject. This is the law with reference to emery wheels that has been adopted by several of our states.

The expression "dangerous trades" is used in a somewhat technical sense. It does not include all trades that are dangerous, but has been especially applied to those trades in which some form of poison or disease is incidental to the trade itself as at present carried on. It is not generally used with reference to those trades in which sudden injury and death are caused by dangerous machinery or unguarded perils (see ACCIDENTS), but rather refers to those slower acting causes which, while not so sensational in their horrors, are even more frightful in their results. On the other hand, the term is not applied to those dangers of poor sanitation and poor ventilation that are incidental to all trades.

In our present era of sharp international competition the smallest difference in the technic of an industry may give a nation a great commercial advantage, such as the United States enjoys in many cases to-day; but with the spread of technical education all the nations are turning out men able to bring each industry up to the highest level of efficiency, so that in the great majority of processes the same methods prevail in all countries. In England the U. S. has her greatest competitor, and in England this question of the dangerous trades has for the last ten years claimed a very large share of public attention. It has been foremost in the unions, has filled columns of the press day after day for years, has been the subject of parliamentary acts and exhaustive parliamentary reports.

Looking to her as leader in this matter, the following is a classified list of those trades which have been considered dangerous either in the acts of Parliament, in the recent reports above mentioned, or in the annual reports of the factory inspector:

1. Trades in which lead is a poisonous element: The manufacture of earthenware and china. File cutting. The manufacture of white lead; Lead smelting. The use of lead in print or dye works. The manufacture of red, orange or yellow lead. Glass polishing. Enameling of iron plates. Enameling and tinning of hollow metal ware and cooking utensils. Processes in which yellow chromate of lead is made, or in which goods dyed with it undergo the process of building, winding, weaving, etc.

2. Trades which produce other chemical poisons: Manufacture of paint and color. Extraction of arsenic. Dry cleaning. Paper staining, coloring and enameling. Hatters' and furriers' work. The manufacture of matches. Chemical works. Bronzing and metallochrome powder in lithographic works. India-rubber work. Dyeing with certain dyes. Mixing and casting of brass, gun metal, bell metal, white metal, phosphor-bronze, and manila mixture.

3. Trades in which anthrax or lockjaw is an incident: Wool sorting. The handling of hides and skins. Hair factories. Brushmaking. Bone factories. Fellmongers' works. Furriers' works. Tanneries; Wool combing. Blanket stoving and tentering. Warp dressing. Carbonizing and grinding of rags. Flock-making. Feather cleaning.

4. Trades in which the danger arises from injurious particles in the air or from dust: Basic slag works. Manufacture of silicate of cotton. File cutting. Flour mills. Trades which use grindstones or emery wheels. China scouring. Silk combing. Flax scutching.

5. Trades in which sudden accidents are so frequent as to demand special legislation: Metal works which use converters. Electrical generating works. Bottling and bottle testing. Quarries. Manufacture of salt.

6. Processes which require a sudden change from great heat to cold and vice versa, such as lacquering and japanning, galvanizing of iron, and the work carried on in furnaces and foundries.

7. Processes that require artificial humidity: Cotton spinning, weaving, etc. Flax spinning, weaving, etc. Wool spinning. Silk spinning.

Remedies

Legislation has been provided by Parliament to cover all these trades, and is in many cases very effective. The method followed is to give the Home Secretary power to declare a certain trade dangerous and to require whatever preventives he may consider necessary. If the manufacturer objects he may appeal to arbitrators, whose decisions are then binding. These provisions are very generally enforced. Out of fifty-six cases before the courts in 1898 the inspectors won forty-nine.

The first essential point in the regulations is that sickness from these cases is required to be reported. This is essential both for the enforcement of the rules and as a guide for future action.

These rules may be said to have the following objects:

1. To prevent fumes of dust from arising in the first instance.
2. To carry off the fumes and dust before they reach the worker.
3. To prevent the fumes or dust from reaching the worker or those parts of the body they might injure.
4. To keep clean the person and clothes of the worker where he is exposed to injurious dust.
5. To furnish an antidote before any poison taken into the system has had its effect.
6. To bring immediate relief after an injury, whether the worker is aware that he has been injured or not.
7. To prevent poisoning from reaching a more serious stage.
8. To eliminate persons unfitted for dangerous occupations, whether this unfitness results from youth, sex, personal idiosyncrasies, or even from the accumulated effects of labor at the trade.

In the U. S. the success of the emery-wheel laws should give encouragement and show the practicability of special legislative enactments in this field. Two or three states have a general law which may be stretched to cover some of the evils, but, as experience in Great Britain has shown, this is not sufficient.

The INTERNATIONAL LABOR ASSOCIATION is agitating for international legislation upon the making of phosphorus matches, etc.

DANTE AND SOCIAL REFORM (1265–1321): The influence exerted by the great Italian poet on the social movement of his day was not small. As is well known, he took an eager part in public affairs. Altho of a family traditionally Guelph, he was a Ghibelline, favoring the empire against the Church, and therefore, for what he believed to be the deepest good of Florence and Italy, opposing the popular party. It was as a result of the strife and intrigues arising out of this controversy that he was expelled from Florence, and given the bitter, sad, noble life out of which has come his great, mystic, unfathomable song. His one great work on social themes is his "De Monarchia," written in Latin in rigid dialectical method, perhaps about 1302, tho more probably later. In any case, it represents his mature Ghibelline views. He asks three questions concern-

ing the Roman Empire ("De Monarchia," i., ii.): 1. Whether it was necessary for the welfare of the world. 2. Whether the Roman people took to itself by right the office of monarchy or empire. 3. Whether the authority of monarchy comes from God directly or only from some other minister or vicar of God. He believes that the authority of the empire came from God direct; he advocates the theory which became the ruling thought of the Middle Ages, and which has affected all European history—that the empire and the Church are two parallel coordinate powers, both divine, both owing respect, but neither owing obedience, to the other. It is this ideal that is revived in the German ideal advocated by Bismarck—e. g., of the Christian State. (See GERMANY.)

DANTON, GEORGE JACQUES: French revolutionist; born at Arcis-sur-Aube, 1759; received a good education and entered the practise of law in Paris. Of radical views, he was one of the leaders of the club of the Cordeliers, which was from the first the center of the extreme popular party in the French Revolution, and became prominent in 1792. He is credited with instigating the rising of the bloody insurrection of Aug. 10th of that year, which began the Reign of Terror. The next day he was raised to the post of minister of justice. On Sept. 2d, when Paris was in a panic, Danton made a bold, powerful speech in the assembly, closing with the words: "Dare, dare again, and forever dare." That evening several hundred prisoners were massacred in the prisons. His admirers claim that Danton adopted this attitude because he believed that a little audacity on the part of the people then would really in the end most preserve life as well as liberty. As a member of the convention he joined the Mountain, as the extremists were called, and voted for the death of the king. He was prominent in the establishment of the revolutionary tribunal; was a member of the committee on public safety; aided in overthrowing the Girondists; but was not a member of the new committee on public safety, being unable to approve its excesses. He could not, however, prevent them, and fell into a sort of apathy till at last Robespierre moved against Danton. He was brought before the Tribunal, sentenced, and guillotined April 5, 1794.

DARROW, CLARENCE S.: American lawyer and worker for reform; born at Kinsman, Ohio, 1857; educated in the public schools; admitted to the bar in 1875; acted for some time as attorney for the Northwestern Railroad. In politics he is a radical or independent democrat, practically a Socialist. He was counsel on the side of labor for Eugene DEBS, as well as in a large number of labor injunctions and conspiracy cases. He represented the United Mine Workers of America before the Anthracite Coal Commission which was appointed by President Roosevelt in 1903, and at present (1907) is defending the officials of the Western Federation of Miners who were indicted for conspiracy to murder former Governor Steunenburg of Idaho. He was special traction counsel for the city of Chicago in the recent litigation against the gas and traction companies. He is the author of: "The Persian Pearl"; "Resist not Evil"; "Farmington"; and "An Eye for an Eye." *Address:* 1202 Ashland Block, Chicago.

DAUM, ADOLFUS: Austrian reformer; born in Vienna, 1850; studied at the university of his native city, and was admitted to the bar in 1880. In 1887 he became a member of the Gemeinderat (common council). He is very active in charity organization and temperance work, and together with Baron Oppenheimer he founded an association for improving working men's dwellings. He is joint founder with Dr. Proskowetz of the first Austrian temperance society (Oesterreichischer Verein gegen Trunksucht), has been its secretary since its foundation, and edits its monthly paper. Daum is author of articles and pamphlets on temperance, housing, and charity organization. *Address*: 19 Spiegelgasse, I. Vienna, Austria.

DAVIDSON, THOMAS: Philosophist and reformer; born near Tetterangus, Scotland, 1840; graduated at Aberdeen University, 1860; in 1866 removed to Canada; in 1867 to the United States, and in 1870 settled at Cambridge, Mass. He however, studied, wrote, and lectured on both sides of the Atlantic, mainly on philosophical themes. He also established a summer camp in the Adirondacks for the study of philosophy and ethics. Deeply interested in social reforms, he conducted a class of Russian Jews in New York, tho his main reform influence, however, was his inspiring personality. Out of his classes and lectures have come various reform efforts, some of them, however, not at all on the lines he approved, notably among these the Fabian Society of London. He himself was a strong individualist and a religious and violent freethinker, but large enough to encourage all workers for humanity and seekers for truth. His published writings are all philosophical. Died 1900.

DAVITT, MICHAEL: Founder of the Irish Land League; born in the village of Straide, Mayo County, 1846. When five years old he saw his parents evicted from their home. The family emigrating to Lancashire, he was employed in a cotton-mill, and at the age of eleven lost his right arm through a machinery accident. He attended school at Harlingden until fifteen, when he obtained work in a printing-office, remaining seven years. In 1865 he joined the Fenian Brotherhood, and in 1870 was arrested on charge of treason and sentenced to fifteen years' penal servitude. After seven and a half years he was released on ticket of leave. After a visit to America he returned to his native country. In 1879 he started the land agitation, and in conjunction with Parnell and others founded the Land League. In 1880 he went to the United States to organize land leagues; and on his return (1881) he was again arrested, but after fifteen months was released anew on ticket of leave, and was accorded a reception by Mr. Parnell and the Irish leaders. In February, 1883, he was once more arrested for a speech against rent and landlordism, and was incarcerated four months. While in prison in Portland in 1882 he was elected M.P. for Meath, but was disqualified by vote of the House of Commons. In 1890 Mr. Davitt, siding with Mr. Gladstone, demanded the retirement of Mr. Parnell because of his proved immorality, Mr. Davitt believing this to be the only way of saving the Home Rule cause. The conflict in the Irish Party

and in Ireland became bitter, but Mr. Davitt found a large following, and in 1892 was returned to the House of Commons. In 1895 he was again returned, serving until 1899, when he resigned. Afterward he traveled extensively. He died in 1906. He is the author of: "Leaves from a Prison Diary" (1889); "Defense of the Land League" (1891); "The Boer Fight for Freedom" (1902); "The Fall of Feudalism in Ireland" (1904); besides works on Australia, etc.

DAWSON, HON. ANDERSON: Senator for Queensland in the Australian Federal Legislature; born at Rockhampton, Queensland, 1863. He educated himself, and afterward engaged in the grocery business, later becoming a mining prospector. In 1901 he was elected to the first Commonwealth Parliament. Dawson is leader of the Queensland Labor Party, and in 1899 he was premier for a brief period. *Address*: George Street, Fitzroy, Victoria.

DEAF AND DUMB AND BLIND SCHOOLS AND ASYLUMS: The first public institution for the deaf and dumb was opened at Leipzig in 1788 and the first in England, in London, in 1792, tho in 1760 Abbé de l'Épée, in Paris, and Thomas Braidwood, in Edinburgh, had gotten together classes of the deaf and dumb. The first institution of the kind in America was opened at Hartford, Conn., in 1817, owing to the efforts of Dr. Gallaudet.

The first blind school or asylum was founded at Paris in 1785. England followed in 1791, in a school at Liverpool. A London school was established in 1799.

The first American school for the blind was opened in Boston in 1831 through the efforts of Dr. J. D. Fischer. (See also Howe.)

The first embossed book for the blind was invented by Victor Haüy, in Paris, 1785.

The total number of deaf-mutes in the United States, 1890, was 40,592—whites, 37,447; negroes, 3,115; others, 30; males, 22,429; females, 18,163; native-born whites, 33,278; foreign-born whites, 4,169.

The number of persons so deaf as to be unable to hear loud conversation June 1, 1890, was 121,178, of whom 80,611 were able to speak. The latter were 49,278 males, 31,338 females, 77,308 whites, 3,308 negroes.

Deaf-mutism is an affection of childhood. The steady decrease after the age of twenty shows the greater mortality among these unfortunates.

The total number of the blind in the U. S., 1890, was 50,568—whites, 43,351; negroes, 7,060; others, 157; males, 28,080; females, 22,488; native-born whites, 34,205; foreign-born whites, 9,146. The number blind in one eye only was 93,988.

The U. S. Census of 1900 reports deaf and blind asylums together. There were, in 1904, 66 public, 34 private, and 15 ecclesiastical schools or asylums for the deaf and blind. These had Dec. 31, 1904, 7,923 male and 6,808 female inmates. The cost of maintenance was (1903) $3,523,683. Annual subsidies to private and ecclesiastical institutions, $884,772. Pay from inmates, $100,693.

Statistics

In Great Britain, under Blind and Deaf Children Act, 1893, there are 39 schools and institutions for blind and 54 for deaf children, with 1,683 and 3,248 inmates. London, Bristol, Birmingham, and Nottingham, voluntary after-care committees, take the blind, deaf, and defective children as they leave school, find them work, and generally supervise their welfare.

Professor Mayo-Smith ("Statistics and Sociology," p. 213) gives the following table, but reminds us that it is of doubtful comparative value, owing to the different degrees to which the deficient are registered in different countries:

Deficient for 1,000,000 of Population: 1890

Countries	Blind	Deaf-Mutes
Austria	806	1,292
England and Wales	809	489
Hungary	1,051	1,089
Ireland	1,135	715
Norway	1,289	1,080
Scotland	695	528
Sweden	825	1,019
United States	805	659
North Atlantic Division	777	670
South Atlantic Division	888	634
North Central Division	783	731
South Central Division	895	581
Western Division	561	430

DEAKIN, ALFRED: Prime minister of the Australian commonwealth; born at Melbourne, 1856; educated in the Church of England Grammar School and at Melbourne University; called to the Victorian bar in 1877; elected to the legislature in 1879, but resigned; reelected in 1880, serving till 1889. He was solicitor-general and minister of public works and water supply in the service ministry, 1883–86; and leader of the Liberal Party, 1886, holding various offices. Deakin is the author of the first factory act, and of the first act for public irrigation on an extensive plan; and he is president of the royal commission on irrigation. He was a member of the Federal Council in 1889, 1895, and 1897, took a prominent part in the movement for federal union, was a member of the convention which framed the commonwealth constitution (1897–98), was a delegate to London to urge the passing of the Commonwealth Bill (1900), attorney-general for the first federal ministry (1901–3), acting prime minister and minister for external affairs in 1902, prime minister from 1903 till April, 1904, and leader of the Protectionists. In July, 1905, he was again made prime minister. He is also president of the Imperial Federation League in Victoria since 1905. In 1887 he declined knighthood. *Address*: Llanarth, South Yarra, Melbourne.

DEARMER, PERCY: English clergyman and author; born in London, 1867; educated at Westminster School, abroad, and at Christ Church, Oxford. He has been successively curate of St. Anne's, South Lambeth; St. John's, Great Marlborough Street; and Berkeley Chapel, Mayfair. Since 1901 he has been vicar of St. Mary the Virgin's Church, Primrose Hill. Mr. Dearmer is greatly interested in the social conditions and problems of the time, and has written many tracts on social questions, besides editing and contributing to several volumes on the same subject, notably "The Church and the New Century Problems." Since 1891 he has been the secretary of the London branch of the Christian Social Union. He is the author of: "Oxford Cathedral" (1897); "Religious Pamphlets" and

"Wells Cathedral" (1898); "The Parson's Handbook" (1899); "The Little Lives of the Saints" and "Highways and Byways of Normandy" (1900); "The English Liturgy" (1903); "The Server's Handbook" (1904); "The Sanctuary" (1905), etc. *Address*: St. Mary's Vicarage, Elsantly Rd., London, England.

DEATH PENALTY: The infliction of the death penalty has existed among all peoples and in all times. Only recently has there been any serious agitation for its abandonment. In the earliest times and through the Middle Ages it was often accompanied with the most terrible tortures. Death on the wheel, by quartering, by flaying alive, by burning, by crucifixion, by immersion in boiling oil, by disemboweling—these were but a few of the simpler methods.

The death penalty was in former times inflicted for all manner of crimes. It was once the ordinary punishment for all felonies; in England it was the certain doom of all who could not avail themselves of benefit of clergy—i. e., it was inflicted on all who could not write. Moreover, numerous acts of Parliament created felonies without benefit of clergy. Things grew worse rather than better. Llorente estimates the number that were buried alive under the Inquisition alone at 31,912. Rowe divides this by 10. Protestant England has her shame. Blackstone mentions 160 offenses as punishable by death. Four fifths of these had been added during the reign of the first three Georges. Among these offenses were stealing in dwelling-houses to the amount of 40s.; stealing in a shop to the value of 5s.; counterfeiting stamps used in the sale of hair powder and perfumery. In the latter part of the reign of George III., due to the efforts of Sir Samuel Romilly, much of this was abolished. In Pennsylvania, under Penn's code of laws, murder and treason were the only crimes punishable by death. In Massachusetts there were twelve causes. Capital punishment has been defended in all times and by the greatest philosophers. The Mosaic and the Germanic law allowed retaliation—a life for a life. Plato argued for its limitation to incorrigible culprits, whose death would serve the public good. Grotius treats the question from a religious point, basing his argument on the laws of Moses. Montesquieu defends it as a sort of retaliation by society, based on the nature of things. Rousseau, following Hobbes, defends it on the ground that the criminal is a rebel to the social contract. Kant says that in the social contract man consents to the penal law, and so can be put to death. Beccaria, in his "Essay on Crimes and Punishments" (1775), was the first to argue for its total disuse. He did so on the ground that society had no right to take away life, since it did not give life, and that it was not the punishment most deterrent to crime. Bentham argued that it was the most deterrent. Romilly argued that if it is not the supreme penalty, and society has the right to inflict worse penalty, it surely has that right.

The main arguments for capital punishment have been based on the absolute justice of demanding life for life, on Scripture warrants, and, above all, on the asserted teaching of experience that the death penalty is actually the most deterrent punishment, and therefore the most effective. Men have striven to show that where the death penalty has been abolished murder has decreased. This, on the other hand, is strenuously denied; and the argument against the death penalty is based on the denial of the right of the State to take life, on Christian charity, and, above all, on the claim that it works evil, brutalizes the community, making it think life cheap, even adding a horrible fascination to murder, and delivering juries from convicting murderers, etc.

In the United States the death penalty may be given in most states for treason, murder, arson, rape, piracy, robbery of the mails with jeopardy to life, rescue of a convict going to execution, burning a vessel of war, and corruptly destroying a private vessel. It has been abolished in Michigan (1846), Wisconsin (1852), Rhode Island (1852), Iowa (1877), Maine (1887), and New York; but has been restored in Iowa and New York. In 1888 the latter state substituted death by electricity for hanging.

In Europe it seems going out of use. In Holland there have been no executions since 1860, and the penalty was abolished in 1870. In Rumania it was abolished in 1864, and in France and Portugal in 1907. Switzerland abolished it in 1874, but murders increasing, in 1879 the cantons reestablished it where the canton so votes. It remains abolished in fifteen cantons. From 1870–79, of 805 persons sentenced to death in Austria, only 16 were executed; in Sweden, only 3 out of 32; in Norway, 3 out of 14; in Denmark, 1 out of 94; in Bavaria, out of 249 committed for murder, only 7 were executed. In North Germany, from 1869–78, 1,301 were convicted of homicide, 484 sentenced, but only 1 executed—Hödel, who attempted the assassination of the emperor. The death penalty for political crimes is all but universally abolished. The French Revolution of 1830 declared for this, and it was abolished in France by the Constitution of Nov. 4, 1848, and the law of June 8, 1850. In Great Britain, Austria, Russia, and most of the states of the U. S., the method of execution is by hanging; in New York and Massachusetts by electrocution; in Germany by beheading; in Spain by garroting. See Penology.

Romilly*, 1840; *Rationale of Punishment*, by Jeremy Bentham, 1830; *Report of Select Committee on Capital Punishment*, New York State Assembly, 1851; *Essays on Crimes and Punishments*, by Beccaria, 1775; Articles: *Westminster*, April, 1901, May, 1906; *Annals Am. Acad.*, March, 1901.

DEATH-RATES: Two facts stand out in the study of death-rates from the standpoint of social reform. First, the marked falling of the death-rate in almost all civilized countries and cities, clearly indicating advance in national and civic cleanliness and hygiene, together with increasing successful provision for the sick and for old age. Second, the varying death-rates between city and country, the poor and the rich, the overcrowded and the well-circumstanced, showing to what extent the death-rate is a matter of economics and of environment. These questions, however, are better considered after the statistics:

General Statistics

Death-Rate per 1,000 Population

(From U. S. Census Bulletin 15, 1904)

	1890	Twenty-five years 1876–1900	1900
Austria	29.4	28.6	25.4
Belgium	20.6	20.1	19.3
Denmark	19.0	18.3	16.9
England and Wales	19.5	19.1	18.2
France	22.8	21.9	21.9
German Empire	24.4	24.2	22.1
Prussia	24.0	23.7	21.8
Hungary	32.4	32.3	26.9
Ireland	18.2	18.2	19.6
Italy	26.4	26.5	23.8
Netherlands	20.5	20.3	17.8
Norway	17.9	16.6	15.9
Scotland	19.7	19.2	18.5
Spain	32.5	30.3	28.7
Sweden	17.1	17.0	16.8
Switzerland	20.8	20.6	19.3
United States (registration area)	19.6	....	17.8

In the United States the "registration" area means areas where there are adequate official returns. "Non-registration"

areas are those where the census enumerators made the reports, or where the official reports were too defective to be adequate. The registration area embraces ten registration states—namely, Connecticut, District of Columbia, Maine, Massachusetts, Michigan, New Hampshire, New Jersey, New York, Rhode Island, and Vermont—and outside these states 153 registration cities. These are all states and all cities having at least 8,000 inhabitants, for which the registration of deaths under local laws and ordinances was found to be sufficiently accurate for use by the Census Office. The population of the registration area in 1900 was 28,807,269, or about 38 per cent of the entire population of continental U. S. In the registration area it is estimated that the death-rate of 1900 was 17.8, but the census states that as the non-registration area was largely rural the real death-rate was between 17.8 and 15.4 (the rural registration rate).

The United States

Death-Rates per 1,000 Population by Race and Nativity: 1900

(Twelfth Census, vol. iii., pp. lvii., lxx., lxxiv., and 286)

Registration Area	Total	White	Negro, Indian and Mongolian	White	
				Native	Foreign born
Summaries:					
Registration area	17.8	17.3	29.6	16.6	19.4
Registration cities	18.6	17.9	30.5	17.3	19.7
Registration states	17.3	17.1	25.3	16.7	18.3
Cities	18.6	18.4	27.6	18.3	18.5
Rural	15.4	15.3	19.0	14.9	17.8
Registration states:					
Connecticut	17.0	16.9	23.4	16.8	16.9
District of Columbia	22.8	19.1	31.0	17.6	32.0
Maine	17.5	17.5	16.1	17.7	16.2
Massachusetts	17.7	17.7	19.5	18.3	16.4
Michigan	13.9	13.8	16.4	13.1	16.4
New Hampshire	18.0	18.0	15.1	19.3	13.1
New Jersey	17.4	17.1	23.3	16.7	18.6
New York	17.9	17.8	26.2	17.0	20.1
Rhode Island	19.1	18.9	24.9	19.7	17.3
Vermont	17.0	16.9	28.7	16.6	19.1

Death-Rates

Certain Causes, for the Registration Area, 1900 and 1890

(From the Twelfth Census)

Cause	Death-Rate per 100,000		Increase or Decrease in Death-Rate, 1890 to 1900	
	1900	1890	Increase	Decrease
Pneumonia	191.9	186.9	5.0	
Consumption[1]	190.5	245.4		54.9
Heart disease[2]	134.0	121.8	12.2	
Diarrheal diseases[3]	85.1	104.1		19.0
Diseases of the kidneys[4]	83.7	59.7	24.0	
Apoplexy	66.6	49.0	17.6	
Cancer	60.0	47.9	12.1	
Old age	54.0	44.9	9.1	
Bronchitis	48.3	74.4		26.1
Cholera infantum	47.8	79.7		31.9
Debility and atrophy	45.5	88.6		43.1
Inflammation of the brain and meningitis	41.8	49.1		7.3
Diphtheria	35.4	70.1		34.7
Typhoid fever	33.8	46.3		12.5
Influenza	23.9	6.2	17.7	
Diseases of the brain	18.6	30.9		12.3
Croup	9.8	27.6		17.8
Malarial fever	8.8	19.2		10.4

[1] Including general tuberculosis.
[2] Including pericarditis.
[3] Including cholera morbus, colitis diarrhea, dysentery, and enteritis.
[4] Including Bright's disease.

Death-Rates by Age Periods per 1,000 Population of Corresponding Age: 1900

(Twelfth Census, vol. iii., p. lxxx.)

Registration Area	Age Period							
	Under 1	Under 5	5 to 14	15 to 24	25 to 34	35 to 44	45 to 64	65 and over
Summaries:								
Registration area	165.4	52.1	4.3	6.4	9.0	11.5	22.1	86.6
Registration cities	179.9	57.6	4.7	6.7	9.6	12.6	24.8	93.3

Concerning the interpretation of these and other vital statistics caution must be exercised. Says Professor Mayo-Smith ("Statistics and Sociology," p. 149):

The ordinary basis for comparison of mortality is to take the number of deaths per 1,000 of the population. As the death-rate, however, is greater among males than among females, and at certain age periods than at others, it is obvious that comparison would only be fair between two populations where the sex and age distribution was exactly the same. This never happens, and even in the same population, in course of time, the sex and age distribution may vary. The use of the crude death-rate has given rise, therefore, to many criticisms. In 1881 the general rate in England and Wales was 18.9 per 1,000 of all ages, while in France it was 22.0—i. e., 3.1 higher. But had the age distribution of the French population been identical with that of England, the general death-rate would have been 20.9 and not 22.0. Thus, of the 3.1 difference between the two rates, 2.0 was due to difference of health condition and 1.1 to difference of age distribution.

Various plans, therefore, have been proposed for correcting the death-rate by reducing the population to a common standard.

Professor Edgeworth, of Oxford, has summed up in Palgrave's "Dictionary of Political Economy" the generally received conclusions as to death-rates, which we condense as follows:

One class of causes in variations in death-rates, since they can be little changed, are mainly important because they must be allowed for in estimating the causes which can be changed. Among these, in the main, unvariable causes of differences in death-rates is sex.

At the early ages the difference between the mortality of the two sexes is marked. At the zero point of age it appears that the proportion of male to female still-born children is 139 to 100. For the period 0–5 the proportion of mortality is 72 to 62 (according to Dr. Farr's life-table for England and Wales). At the age of adolescence female mortality gains upon male, but again lags behind at later ages. The disturbing effect which this cause exercises on inferences drawn from the general death-rate is not so considerable as the effect of age. Mr. Humphreys, in his paper "On the Value of Death-Rates" (*Journal of Stat. Soc.*, xxxvii., p. 444), contrasting the English towns which have the greatest and the least proportion of male to female inhabitants, argues that the extreme perturbation of the general death-rates which may be expected from this cause is not more than two per mille.

Here may be mentioned the effect on mortality of the variations of the seasons. Of the four quarters of the year, the first is the most fatal; next comes the fourth; the mortality of the second quarter is for this country on an average in excess, but occasionally below, that of the third quarter ("Reports of the Registrar-General," tables showing death-rates in each quarter of the years since 1838).

Other causes, not admitting of such exact measurement, are race and climate (including properties of soil, water, etc.).

Also it may be expected that the mortality of unmarried persons will, *cæteris paribus*, be particularly large. The married have the advantage at almost all ages, as is shown by Dr. Farr ("Vital Statistics," p. 441, and references there given). But it is a nice question whether celibacy can be regarded as a cause of high death-rate. The high death-rate attending celibacy may be a case of *post hoc* not *propter hoc*; the finest individuals being selected for marriage; while "men with a weak constitution, ill health, or any great infirmity of body or mind will not often wish to marry, or will be rejected" (Darwin, "Descent of Man," part i., ch. v.).

Among the causes which can be remedied are (1) vice, (2) unhealthy occupations, (3) indigence, and (4) insanitary residences—agencies which are apt to be entangled with each other as well as with the first set of causes.

Vice

(1) There is much truth as well as exaggeration in Süssmilch's dictum ascribing the chief differences in mortality to "the manner of life, the moral circumstances, virtue and vice, indolence and industry." One example is the great mortality of illegitimate children. Dr. Farr cites instances in which the death-rate of illegitimate infants is double that of the legitimate. The vice of drunkenness is also conspicuously fatal. The mortality of hotel keepers and their servants is appalling. It is difficult to say, however, in many instances how far alcoholism is to blame and how far occupation and economic causes.

The other three causes of death which Professor Edgeworth mentions—unhealthy occupations, indigence, and insanitary residences—may be summed up in one word—poverty. How far death is due to poverty few realize. From England we have the most abundant testimony. Some years ago Dr. Drysdale, in England, wrote:

At present the average age at death among the nobility, gentry, and professional classes in England and Wales was fifty-five years; but among the artizan classes of Lambeth it only amounted to twenty-nine years; and while the infantile death-rate among the well-to-do classes was such that only eight children died in the first year of life out of 100 born, as many as 30 per cent succumbed at that age among the children of the poor in some districts of our large cities. The only real causes of this enormous difference in the position of the rich and poor with respect to their chances of existence lay in the fact that at the bottom of society wages were so low that food and other requisites of health were obtained with too great difficulty" (Dr. C. R. Drysdale, "Report of Industrial Remuneration Conference," p. 130).

One great cause of the short and miserable lives of the poor is the insanitary condition of the slums in which many of them are compelled to dwell. The strongest testimony to the evil effects of such surroundings comes from the insurance companies. The industrial friendly societies have in each large town their "proscribed streets." The Liverpool Victoria Legal Friendly Society proscribes, for Liverpool alone, on account of their insanitary character, 167 "streets wherein no members of the society may be entered" (Circular of Oct. 13, 1886). Yet these unhealthy streets are not too bad to be the only homes of thousands of the poorer citizens of that commercial center.

The relation between overcrowding and death-rate is only too plainly seen in the following tables for London:

Proportion of total population living more than two in a room (in tenements of less than five rooms)	Death-rate, "all causes," 1885–92
Districts with under 15 per cent.....	17.51
Districts with under 15 to 20 per cent.....	19.51
Districts with under 20 to 25 per cent.....	20.27
Districts with under 25 to 30 per cent.....	21.76
Districts with under 30 to 35 per cent.....	23.92
Districts with over 35 per cent.....	25.07

"London Government," p. 68.

In the United States similar facts exist. In 1904, in Boston's wealthy wards the death-rate was 13.45; in the thirteenth ward, a working-class district, it was 18.45. Speaking broadly, the rural death-rate in the U. S. registration area 1900–4 averaged 14.3, and for the cities 17.5. In Paris, the rich quarters of the Elysée and the Opéra had, according to Levasseur ("Pop. Française, Vol. II., p. 403), a death-rate of 13.4 and 16.2 when Ménilmontant had a death-rate of 13.3.

For the terrible effect of occupations upon death-rates, see ACCIDENTS, RAILWAYS, and DANGEROUS TRADES.

It is, however, among the children that is seen the most fatal effects of poverty. For this, however, see INFANT MORTALITY.

DEBS, EUGENE VICTOR: American Socialist and labor leader; born at Terre Haute, Ind., 1855. He was educated in the common schools, and worked first as a railway fireman (1871–74) and later in the wholesale grocery trade (1875–79). In 1879 he was elected city clerk of Terre Haute, which position he held until 1883, being elected to the state legislature two years later. He was grand secretary of the Brotherhood of Locomotive Firemen from 1880 to 1893, in which latter year he formed the American Railway Union, an effort to organize all railway men in one aggressive union rather than on the more conservative lines of the American Federation of Labor. He was president of this union from 1893–97. In 1894 he led the great PULLMAN STRIKE, having first done his best to procure a peaceable settlement. He was charged with conspiracy, but acquitted, was then charged with violation of an injunction, imprisoned without trial, and held in prison for six months for contempt of court. Joining the Socialists he has traveled and delivered brilliant addresses in all parts of the United States. In 1900 and again in 1904 he was the presidential candidate of the Social Democratic Party. His views are those of international and "class conscious" socialism. *Address*: Terre Haute, Ind.

DEGENERATION: To whatever school of social reform one belong, whatever be his view of the cause of present ills and the methods to be followed to remove those ills and to advance to any ideal condition, whatever that ideal may be, one cannot escape the question of the ability of the individuals who compose society to conduct the methods of reform believed in, and to realize the ideal conditions that may be desired. The Socialist, who dwells most upon the power and function of society in developing progress, must meet the question whether the individual be capable of socialism no less than the individualist must consider individual ability. We therefore consider in this article the causes which tend to lower individual ability and to produce that personal degeneration which makes the individual lower than the norm (*de*, from, and *genus*, class or norm), unfitted to play his proper part in life. This is all that we mean here by the degenerate. All forms of unfittedness for life are more or less connected, and pass by degrees from the slightest unfittedness to the extremes of vice, intemperance, and disease.

The conception of degeneration which prevails to-day in the study of mental disease, and which lies at the basis of Max Nordau's well-known book, "Degeneration," was first clearly defined by Dr. Morel in his "Traité des Dégénérescences Physiques Intellectuelles et Morales de l'Espèce Humaine et des Causes qui Produisant ces Variétés Maladives," published in Paris in 1857. He says (p. 5): "The clearest notion we can form of degeneracy is to regard it as a morbid deviation from an original type. This deviation, even if at the outset it was ever so slight, contained transmissible elements of such a nature that any one bearing in him the germs becomes more and more incapable of fulfilling his functions in the world; and mental progress, already checked in his own person, finds itself menaced also in his descendants." Such degeneracy shows itself, according to many writers, and particularly LOMBROSO, in his "L'Uomo Delinquente," in certain physical characteristics termed *stigmata*, such as deformities, stinted growth, asymmetry, etc. Max Nordau, however, argues that there are also certain mental stigmata which appear in degeneracy when coupled with affinity for art or literature. Such higher degenerates he considers to dwell in the borderland between reason and pronounced madness. These mental stigmata he considers to be the lack of moral sense or of moral proportion, egoism, impulsiveness, emotionalism, despondency, fear; a predilection for idle reverie, doubts, and curious surmisings as to the causes of the universe, mysticism, etc. His book, which has been by many received as an able contribution to modern thought, and by others as a weak and sometimes ignorant criticism upon new forms of art and literature, is a minute analysis of many of the foremost works of art and literature of the day, with the result of convicting most of the artists and litterateurs of the day of being, according to Nordau, degenerate.

We have referred to this book to show how wide is the range that has been covered by the word degenerate. The causes that produce such an undefined and such an undefinable phenomenon must be themselves undefined and undefinable. Only some of them can be here noted, and one must beware of too exact statements, especially as to the degree to which different causes contribute to producing character and ability below the norm. The main causes we can here only name, for a discussion of them referring the reader to their respective heads. In the first place, we are met by the old question, how far environment and heredity contribute to the formation of character, and how far men form their own characters. Without entering into questions of philosophy, it is not difficult to show the results of modern careful investigation upon this point. Mr. A. G. Warner, in his "American Charities" (p. 34), has tabulated the results of careful investigations as to the prime causes of poverty, conducted by trained charity organization visitors in Baltimore, Boston, Buffalo, Cincinnati, and New York, by Mr. Charles Booth in London, and results tabulated by Böhmert for seventy-six German cities. This tabulates practically all the scientific investigations that have been made. The details are given in the article POVERTY, in the section on its causes. We here simply point out some of its results. According to this table, in all the different investigations taken by men and women, humanitarians, tho not socialistically inclined, only from 2.7 to 42.2 per cent of the cases were found to be primarily due to causes indicating misconduct, while the causes indicating misfortune are put at from 46.4 to 92.5 per cent. According to this showing, then, poverty—and since poverty and degeneration usually are as-

sociated, degeneration—is very much more due to misfortune than misconduct. And even in cases of poverty due to misconduct, one can by no means be sure how much of the misconduct is due to bad environment or bad heredity. Misconduct causes much poverty—of that there is no question; but that poverty also causes much misconduct, such as drinking, prostitution, crime, theft, can no more be questioned. How much tendency, too, to drinking, prostitution, and crime is inherited, who can say? Cases like the Jukes show the terrible power of heredity. The extent to which people thus form their own characters, as taught by modern science, is reduced to the lowest proportions. That people can, however, rise out of the lowest environment to the highest character, numerous instances indicate; but how far this is due to heredity remains still to be ascertained.

Misconduct or Misfortune

Coming to the question as to whether heredity or environment is the more effective cause, we are again on a contested field in biological controversy.

Mr. Spencer's philosophy is mainly based on the belief that heredity accounts for much, and that acquired characteristics can be transmitted to posterity. Professor Weismann denies this. Science to-day is undecided upon the point, tending perhaps, however, to the position that while Weismann may not be wholly right, and acquired characteristics may sometimes be transmitted, yet for the future race selection has more to do with character than environment, and acquired character cannot largely be transmitted. This, however, does not prevent environment from being for the individual more important than heredity, which seems to-day largely proved. For further details upon this point, however, see HEREDITY.

Heredity or Environment

Coming to the question of what are the principal factors in environment that produce degeneration in the individual, perhaps the first that should be named is lack of employment. This has the highest percentages of *any single cause* of poverty in Professor Warner's table, its percentages running from 2.2 per cent to 32.5 per cent, while insufficient employment and poorly paid employment carry the percentage much higher. Not, perhaps, so much as a cause of poverty, since it is rather a result of poverty, but certainly among the very foremost causes of degeneration is the lack of a good home. This is probably the supreme cause of degeneration as far as environment goes, mainly because it is that which most affects the early years, when, by all experience, character is the most impressionable. The point is too well known, however, to need dwelling upon here. For confirmation of it, see POVERTY.

It should, perhaps, however, be suggested, too, that in noticing the terrible effects upon character of lack of homes and poor homes, one should not forget the terrible results upon character of unhappy homes, of unhappy marriages, and family quarrels. (See FAMILY.)

Professor Warner puts as a most palpable social cause of degeneration accidents, and shows how in one year, ending June 30, 1892, 28,268 men in railway employ were injured on the railways of the United States, or one man for every twenty-nine. (See RAILWAYS.) It must not be forgotten that the worst results of accidents are often not the direct results, but the indirect, when homes are broken up through the inabilty of the breadwinner to maintain the family. Akin to this is the effect of unhealthy trades. The effect of this, however, on the individual and the family can be seen only in studying the relative death-rates, and perhaps even more the relative sick-rates that prevail in different occupations. According to statistics prepared by Josef Körösi, as quoted by Professor Warner (idem., p. 104), if we start at the age of twenty-five with 1,000 persons of each class, there will be alive at the end of thirty-five years, of merchants, 587; of tailors, 421; of shoemakers, 376; of servants, 290; of day laborers, only 253. The total number of years of life for the merchants will be 28,501, and of the laborers only 22,317, while, worse yet, of the years falling to the laborer, 1,493 will be years of sickness, while of the merchants' years only 824 will be years of sickness. Such are some of the social causes of degeneration.

Among the causes which may be considered under misconduct, the most recent thought gives a larger place to sensuality than to intemperance. It is often not easy to tabulate this as a cause; but, says Professor Warner: "Careful observers believe it to be a more constant and fundamental cause of degeneration than intemperance. It certainly effects degeneration of a more or less pronounced type in a much larger number of persons. It persists almost to the end in the most degenerate stock, while at the same time it is operative among the healthier classes." It has, however, been comparatively little studied. The effects of venereal disease have been treated at length, but the amount of vitality burned out through lust has never been and, perhaps, never can be adequately measured. Above all, it brings multitudes of unhealthy children into the world, often to be neglected after birth. (See ILLEGITIMACY.)

Sensuality

Intemperance is much more readily recognized as a cause of degeneration. Says Professor Warner: "Probably nothing in the tables of the causes of poverty, as ascertained by cold counting, will more surprize the average reader than the fact that intemperance is held to be the chief cause in only from one fifteenth to one fifth of the cases, and that where an attempt is made to learn in how many cases it had a contributory influence, its presence cannot be traced at all in more than 28.1 per cent of the cases. (See POVERTY.) Professor Warner sums up the case by saying: "The general conclusion regarding drink as a cause of poverty is sufficiently well formulated by Mr. Booth. 'Of drink in all its combinations, adding to every trouble, undermining every effort after good, destroying the home and cursing the young lives of the children, the stories tell enough. It does not stand as apparent chief cause in as many cases as sickness and old age, but if it were not for drink, sickness and old age could be better met.'" Such are the chief social causes of degeneration, but by no means all. Speculation in the market, hopelessness and discouragement in business—all are causes. Perhaps the most powerful causes of personal degeneration have not yet been mentioned—the psychic causes. These may be often connected with religion. When in early years moral teachings have been combined with certain religious dogma, it often happens that when in later years the religious dogmas are given up, there results, for a time at least, a moral chaos,

Intemperance

Probably far more demoralizing both in extent and degree, and especially to the young, is the skepticism as to honor and virtue which results from seeing those whom they have been taught to respect at the church commit acts contrary to their profession. The degeneration of character that arises from this source can never be measured, but it must be among the most operative causes. Such considerations, however, lead us into fields too wide to be covered here, and apart from the limitations of this cyclopedia. Yet this and a hundred other similar psychological forces must never be forgotten in their effect upon character.

How far such an analysis of the causes of degeneration affect the question of the wisest methods in social reform different minds will differently estimate. Socialists argue that all modern science tends to show that character is almost wholly the result of environment, and hence that by giving right environment vice and crime will disappear, and gradually a race be developed capable of what is to-day impossible. Individualists, while not denying the power of environment upon character, fear that socialism will result in weakened character and impaired individuality, by tending to make men rely too much upon society. (See EVOLUTION; INDIVIDUALISM; PHYSICAL DEGENERATION; POVERTY; PROSTITUTION; SOCIALISM.)

DE LEON, DANIEL: Socialist; editor of *The People*; born in Curaçao, Dutch West Indies, off the coast of Venezuela, 1852. Came to the United States from Europe, 1872; graduate Columbia Law School. Lectured on diplomacy at Columbia School of Political Economy; supported Henry George 1886; joined Knights of Labor 1888; became interested in Nationalism 1889; joined Socialist Labor Party 1890. Growing more revolutionary in his methods, and opposing working with the trade-unions as the Social Democratic Party does a split resulted, and Mr. De Leon led in founding the Socialist Trade and Labor Alliance 1895. He has since been the leader of the Socialist Labor Party as opposed to the Social Democratic Party. (See SOCIALISM.) In 1892 he founded *The People* (a weekly paper) and in 1900 *The Daily People*. A lessening number of irreconcilable Socialists stand with him as opposed to the main Socialist Party, altho his party perhaps correctly claims to represent the original Socialist Party. *Address*: 2–6 New Reade Street, New York.

DEMAND AND SUPPLY: In political economy demand and supply may best be considered together as correlatives. *Demand* is the desire to purchase and possess coupled with the power of purchasing; sometimes called, by way of distinction, effectual demand—a phrase originated by Adam Smith. Cairns ("Political Economy," I. ii., sec. 2) defines demand as "the desire for commodities or services seeking its end by an offer of general purchasing power." *Supply* is the amount or quantity of any commodity that is on the market and is available for purchase. Cairns defines it (ibid.) as "the desire for general purchasing power, seeking its end by an offer of specific commodities or services." As, then, the things are correlate, the laws of supply and demand are correlated. Marshall states them thus; first of *Demand* ("Economics of Industry," pp. 69–71):

It is a matter of common experience that the larger the stock which sellers determine to sell, the lower will be the price at which it can be got rid of. Vice versa, the lower the price at which anything is offered for sale, the greater is the amount of it which can be sold off. Examples occur to us every day. In a good apple year, the price of apples is low; in a bad year it is high. At the end of the season a fashionable shop sells off at a great reduction, and so gets many customers. . . .

The lower the price that a man has to pay for a thing, the more of it is he likely to buy. A fall in price will not, indeed, make every purchaser increase his purchases. It might in the case of sugar; it would not in the case of carpets. But a fall in the price of carpets would induce some of the householders in a large market to buy new carpets; just as an unhealthy autumn increases the mortality of a large town, tho many persons are uninjured by it. For in a large market there must be some who are doubting whether to replace an old carpet by a new one; and their decision will be affected by a fall in the price of carpets. There will not be any exact relation between the fall in price and the increase of demand. A fall of one tenth in the price may increase the sales by a twentieth or by a quarter, or it may double them. But in a large market every fall in price will cause an increase of demand. The law of demand then is:

The amount of a commodity which finds purchasers in a market in a given time depends on the price at which it is offered for sale, and varies so that the amount demanded is increased by a fall in price and diminished by a rise in price. Its price measures its final utility to each purchaser—that is, the value in use to him of that portion of it which it is only just worth his while to buy.

Of *Supply* Marshall says (p. 76):

The interest of every producer of a commodity is always to calculate the amount of it that is being produced for market. If this amount seems likely to be small, so that its price will rise above its expenses of production, he will produce as much as he can, so as to derive as much benefit as possible from the high price which he anticipates. If, on the other hand, the amount brought to market seems likely to be so great that its price will fall below its expenses of production, then he will check his own production so far as he conveniently can. So that if the price of a commodity is likely to be higher than its expenses of production, it is the interest of each producer to do what he can to increase the supply; and the effect of this is to lower the price toward its expenses of production. And if its price is likely to be lower than its expenses of production, it is the interest of each producer to do what he can to check the supply; and the effect of this is to raise the price toward the expenses of production. That is to say:

Every producer of a commodity calculates the price at which he will be able to sell it, and the expenses of producing it. He thus determines whether to increase or diminish his production. If there is free competition—that is, if he is not acting in combination with other producers—he increases or diminishes his supply according as the price of the commodity seems likely to be greater or less than its expenses of production. Thus he is led by his own interests to act in the same way as he would if his only object were to regulate the amount produced so that it could just be sold off at a price equal to its expenses of production.

This law of supply may be called the law of normal supply, because it refers to the results that are in the long run brought about by free competition. Of course, all the expenses of production of a thing are themselves liable to variation. Wages may rise and fall, the rate of interest may rise and fall; and so on.

Putting these two laws together, Marshall goes on to say:

The laws of demand and supply tell us that a rise in price lessens the amount demanded and increases that supplied, and that a fall in price increases the amount demanded and lessens that supplied. This competition tends to make the exchange value such as just to "equate supply and demand," i. e., such that the amount that people are willing to sell at that value is equal to the amount which can find purchasers at that value. This tendency of competition to equate supply and demand is the central fact of the theory of exchange, whether applied to normal values or to market fluctuations of value.

Mill says on this point ("Political Economy," Book III., chap. ii., sec. 4):

Demand and supply, the quantity demanded and the quantity supplied, will be made equal. If unequal at any

moment, competition equalizes them, and the manner in which this is done is by an adjustment of the value. If the demand increases, the value rises; if the demand diminishes, the value falls; again, if the supply falls off, the value rises; and falls, if the supply is increased. The rise or the fall continues until the demand and supply are again equal to one another; and the value which a commodity will bring in any market is no other than the value which, in that market, gives a demand just sufficient to carry off the existing or expected supply.

The above are, perhaps, the best statements of the law of supply and demand, which has played such a large part in economic thought from the days of Adam Smith to the present time. It refers, however, as already stated, only to articles which are not monopolized, and also which cannot be multiplied indefinitely at pleasure. For a discussion of the first case, see MONOPOLY. Other articles have no *exchange value* and these need not be studied in the science of exchange, to which the subject of demand and supply belongs. Nevertheless, these exceptions should always be borne in mind, especially at the present, when there is so little of free competition in many industries and so much of combination. The importance of the so-called law of supply and demand, which has hitherto played a part in economic thought, is thus being very rapidly diminished. Certainly, at least, generalizations that have been so rashly made on the subject must be carefully scrutinized, if not avoided. To say, as is not infrequently done, that demand is the cause of supply, is as rash as to say that supply creates demand. Many inventions have come into the market before there was an (effectual) demand for them; and for many demands, as for flying machines, there is no supply. No amount of demand will supply a Shakespeare, and no amount of supply can compel a demand for professors of Sanskrit. These are but a few illustrations of the many limits there are to the working of this boasted law. One school of economic thought, the eight-hour philosophy, denies that demand has anything to do, for example, in determining either price or wages; but for this, see VALUE; WAGES.

DEMOCRACY: A system of government, or the state where a government exists, according to which the sovereign power is vested in the people as a whole, and is exercised directly by them or by representatives chosen by them. In Greece, whence we derive the name (δῆμος, people, and κρατεῖν, to rule), most of the republics or cities, and notably Athens, were, at their best periods, democracies, if by the word *people* in the definition of democracy is meant *citizens*. Yet they were by no means true democracies, because large classes of the people—some say a large majority—were slaves and not considered citizens, and had no voice in the government. Some even question whether the United States is a democracy, since even here a large half of the people—the women—do not vote. (See WOMAN SUFFRAGE.) Many writers, like Aristotle, claim that it is not necessary, however, that all classes of the people vote to constitute a democracy. He believes that suffrage should be limited to the citizen class. Where all vote, he says, it is an ochlocracy, or mob government. A modern author, Professor Burgess, of Columbia ("Political Science and Constitutional Law," vol. i., p. 72), defines democracy as applied to the State as the rule of the majority. On the other hand, John Stuart Mill, in his "Representative Government," makes the rule of all, not of a majority, and certainly not of a class, the essence of democracy. He says:

> The pure idea of democracy, according to its definition, is the government of the whole people by the whole people equally represented. Democracy, as commonly conceived and hitherto practised, is the government of the whole people by a mere majority of the people, exclusively represented. The former is synonymous with the equality of all citizens; the latter, strangely confounded with it, is a government of privilege, in favor of the numerical majority, who alone possess practically any voice in the State. This is the inevitable consequence of the manner in which the votes are now taken, to the complete disfranchisement of minorities.
>
> The confusion of ideas here is great, but it is so easily cleared up, that one would suppose the slightest indication would be sufficient to place the matter in its true light before any mind of average intelligence. It would be so, but for the power of habit; owing to which the simplest idea, if unfamiliar, has as great difficulty in making its way to the mind as a far more complicated one. That the minority must yield to the majority, the smaller number to the greater, is a familiar idea; and accordingly men think there is no necessity for using their minds any further, and it does not occur to them that there is any medium between allowing the smaller number to be equally powerful with the greater, and blotting out the smaller number altogether.

He then goes on to make a strong plea for PROPORTIONAL REPRESENTATION, and says:

> Nothing is more certain than that the virtual blotting out of the minority is no necessary or natural consequence of freedom; that, far from having any connection with democracy, it is diametrically opposed to the first principle of democracy, representation in proportion to numbers. It is an essential part of democracy that minorities should be adequately represented. No real democracy, nothing but a false show of democracy, is possible without it.

Of the advantages of democracy, he says:

> There is no difficulty in showing that the ideally best form of government is that in which the sovereignty, or supreme controlling power in the last resort, is vested in the entire aggregate of the community; every citizen not only having a voice in the exercise of that ultimate sovereignty, but being, at least occasionally, called on to take an actual part in the government, by the personal discharge of some public function, local or general. . . .
>
> It is a great discouragement to an individual, and a still greater one to a class, to be left out of the constitution; to be reduced to plead from outside the door to the arbiters of their destiny, not taken into consultation within.
>
> **Advantages** The maximum of the invigorating effect of freedom upon the character is only obtained when the person acted on either is, or is looking forward to becoming a citizen as fully privileged as any other. What is still more important than even this matter of feeling is the practical discipline which the character obtains from the occasional demand made upon the citizens to exercise, for a time and in their turn, some social function. It is not sufficiently considered how little there is in most men's ordinary life to give any largeness either to their conceptions or to their sentiments. Their work is a routine; not a labor of love, but of self-interest in the most elementary form, the satisfaction of daily wants; neither the thing done nor the process of doing it introduces the mind to thoughts or feelings extending beyond individuals; if instructive books are within their reach, there is no stimulus to read them; and in most cases the individual has no access to any person of cultivation much superior to his own. Giving him something to do for the public supplies, in a measure, all these deficiencies. If circumstances allow the amount of public duty assigned him to be considerable, it makes him an educated man. Notwithstanding the defects of the social system and moral ideas of antiquity, the practise of the dicastery and the ecclesia raised the intellectual standard of an average Athenian citizen far beyond anything of which there is yet an example in any other mass of men, ancient or modern. The proofs of this are apparent in every page of our great historian of Greece.
>
> Still more salutary is the moral part of the instruction afforded by the participation of the private citizen, if even rarely, in public functions. He is called upon, while so engaged, to weigh interests not his own; to be guided, in case of conflicting claims, by another rule than his private partialities; to apply, at every turn, principles and maxims which have for their reason of existence the common good; and he usually finds associated with him in the same work minds more familiarized than his own with these ideas and operations, whose study it will be to supply reasons to his understanding, and stimulation to his feeling for the general interest. He is made to feel himself one of the public, and whatever is for their benefit to be for his benefit. Where this school of public spirit does not exist, scarcely any sense is

entertained that private persons, in no eminent social situation, owe any duties to society, except to obey the laws and submit to the government. There is no unselfish sentiment of identification with the public. Every thought or feeling, either of interest or of duty, is absorbed in the individual and in the family. The man never thinks of any collective interest, of any objects to be purchased jointly with others, but only in competition with them, and in some measure at their expense. A neighbor not being an ally or an associate since he is never engaged in any common undertaking for joint benefit, is therefore only a rival. Thus even private morality suffers, while public is actually extinct.

Morality

So conceiving of democracy, we notice here, tho briefly, its growth and steady development in the world. The first democracies of the world were undoubtedly the city-states of ancient Greece. In Sparta the constitution of Lycurgus (about 850 B.C.), tho maintaining the ancient double monarchy, introduced institutions largely democratic. The kings became little more than presidents of a senate elected by the general assembly of citizens over sixty years of age. This assembly (ἀπέλλα) could accept or reject all laws and decide on war and peace, etc. Ephors were created to watch over the constitution. The immediate result was to raise Sparta into preeminence in Greece—a position she never wholly lost till she finally fell, last of the Greek states, before the power of Macedon. Yet her democracy was little more than a military oligarchy based upon birth and age. Athens was more really democratic in her best period. After Codrus, the last of her kings (1050 B.C.), the Eupatrids (nobles) ruled with a council (βουλή) on Mars Hill (*Areopagus*), tho all citizens could meet in the agora and express assent or dissent. The Eupatrids elected archons, first for life and later for ten years. In 594 B.C., the legislation of Solon created constitutional government, admitting all citizens to a share in power, but giving the higher orders a preponderating influence. This gave way to the dictatorship of the Pisistratidæ till the constitution of Clisthenes (about 509 B.C.) introduced a complete democracy, so far as free citizens went. All such could vote. Ten strategi, elected annually, were the officers. Then came Athens' classic period of the wars with Persia and of art and letters. By a law of 478 B.C. the last property qualification for office was swept away. Yet the continual reelecting of a favorite statesman gave the republic the continuity of brilliant leadership like that of Aristides, Cimon, and Pericles. Yet within a century dissatisfaction with a Sicilian expedition induced the citizens to change their constitution in the direction of aristocracy, resulting finally in defeat by the Macedonian kingdom. (For the ideals and spirit of Greek democracy, see ARISTOTLE; ATHENS; PLATO; POLITICAL SCIENCE.)

Greek Democracy

Democracy in Rome begins 508 B.C., when the patricians expelled Tarquin, the last of the kings. Rome was now ruled by two prætors or consuls elected by the centuries, in which all freemen were enrolled. Then came the long struggle between the patricians and plebeians; the oppressions of the former; the secessions of the latter from the city; the creation of tribunes to defend the rights of the people; the election of the decemvirs; the return to the consulate; the creation of censors and military tribunes; the growing militarism; the division between the rich and the poor; the agrarian laws of the Gracchi; the triumph of the aristocracy; the creation of the triumvirs; the development of the empire. Yet through all these changes ran the ideal of the people as sovereign. (See POLITICAL SCIENCE.) Lecky says ("History of European Morals," vol. i., chap. ii.) that even under the empire "the theory of the Roman Empire was that of a representative despotism. The various offices of the republic were not annihilated, but they were gradually concentrated in a single man."

Rome

Democracy among Germanic nations begins with the mark or clan where the eorls or earls (leading men) elected their chief or voted war and peace, while the free ceorls or churls declared assent by the clash of arms. This early democracy, however, gradually disappeared in the development of feudalism, save in the rights maintained in communities like the Russian *mir*, and, above all, in the *Landsgemeinde*, the Swiss cantons. (See COMMUNISM; REFERENDUM.)

The real democracy of the Middle Ages is to be found in the rise of the free cities and centers of art, trade, and commerce, like Florence, Pisa, Venice, and Genoa in the south, and Hamburg, Nuremberg, and Frankfort in the north. (See CITY.) The southern cities aimed at avowed republicanism, perhaps, more than the northern, but save for fitful periods, as in Florence, were really under dukes and aristocracies more than the northern cities. In the northern free cities one finds the real parent of modern democracy.

Modern democracy begins as an idea with the Christian teaching of the brotherhood of man, the Protestant teaching of the right of private judgment, and of the responsibility of the individual to God alone. It is developed in theory in the social compact by Locke, Rousseau, and the various French writers of the eighteenth century. (For the ideas of this period, see NATURAL RIGHTS.)

Modern Times

But all history enters into modern democracy. Says De Tocqueville in the introduction to his "Democracy in America":

> We shall scarcely meet with a single great event in the lapse of 700 years which has not turned to the advantage of equality. . . . The gradual development of the equality of conditions is therefore a providential fact, and it possesses all the characteristics of a divine decree; it is universal; it is durable; it constantly eludes all human interference, and all events as well as all men contribute to it.
>
> Democracy began, according to De Tocqueville, with the Church, when the clergy opened her ranks to all classes, and "the being who as a serf must have vegetated in perpetual bondage took his place as a priest in the midst of nobles, and not infrequently above the head of kings." Next, he says, the need of civil laws gave the legal functionary a place by the mailed baron. Thirdly, the nobility being exhausted by wars and the lower classes enriched by commerce, the man of money gained position by the side of the man of birth. Next, education, science, and literature opened to any one of ability avenues to power. "In the eleventh century nobility was beyond all price; in the thirteenth it might be purchased; it was conferred for the first time in 1270. . . . It sometimes happened that in order to resist the authority of the crown or to diminish the power of their rivals, the nobles granted a certain share of political rights to the people, or, more frequently, the kings permitted the lower orders to enjoy a degree of power, with the intention of repressing the aristocracy. . . . Some assisted democracy by their talents; others by their vices. Louis XI. and Louis XIV. reduced every rank beneath the throne to the same subjection; Louis XV. descended himself and all his court unto the dust.

But modern democracy finds its first chief actual development in the United States, tho descended from English ancestry. Parliament was in a sense the continuation or revival of the ancient Witenagemote, or meeting of the wise men (eorls) of all England. If it did not rule England in form, it did rule through the purse. The con-

nection between taxation and representation, the idea that no man could be taxed save by his own consent—that and the kindred idea embodied in the Great Charter won from King John, that no man could be condemned without a trial by his peers—"by the country" (see JURY), lie at the basis of English and American ideas of freedom. The overthrow of feudalism, the struggle with Charles, the Revolution of 1688, the development of constitutional government, had made England to an extent democratic by confiding its government to a Parliament elected by a limited suffrage to represent the people. The American colonies held the same ideal of democracy, no more and no less. The doctrines of natural rights and the social compact to some extent found acceptance in America; but this was balanced by the constructive common sense of an English race and in the true spirit of Burke, the consciousness of national development. "No men were less revolutionary in spirit," says Bryce, "than the fathers of the American Revolution." The spirit of George Washington and John Adams was opposed to the ideas of Paine, of Rousseau, and even of Jefferson. Hamilton openly preferred monarchy to democracy, which he feared would overthrow morals and property and end in despotism. American democracy was thus a healthy natural development almost forced by circumstances on the people, and developed by a race jealous for rights. (For the constitutional development of American democracy, see CENTRALIZATION; CONSTITUTION.)

De Tocqueville's View

De Tocqueville, who studied America in 1831, found one of its fundamental characteristics and safeguards to be its connection between liberty and religion. "The safeguard of morality," he says, "is religion, and morality is the best security of law and the surest pledge of freedom." Another great tendency which he finds in the United States at this period is one to decentralization. The town meeting is the ideal. This results in weak, irregular administration, but its political results are admirable in interesting all portions of the land in government. "The town meeting is to liberty what primary schools are to science." De Tocqueville believed very much more in the future of the states than of the union; he believed that would go to pieces when the states desired it or differed in policy. How completely his view has been disproved is well known, but he touched here on the burning question of American politics for more than half a century. The constitution of the federal government, however, he highly praises. Its balanced division of powers he considers necessary and admirable. The election of the president by electors he terms a most happy device. He deplores, however, the custom of electing representatives as mere delegates bound by instructions as tending to destroy representative government. The practise of electing judges he criticizes, and praises the independence of the supreme court; tho, speaking of the power of that court to judge as to the constitutionality and therefore legality of any bill, he says, "A more imposing judicial power was never constituted by any people." He fears the power of majorities, and says that the main evil of democratic institutions in the U. S. arises "not from their weakness, but from their overpowering strength"; he is "not so much alarmed at the excessive liberty which reigns in that country as at the very inadequate securities which exist against tyranny. . . . If ever the free institutions of America are destroyed, that event may be attributed to the unlimited authority of the majority, which may at some future time urge the minority to desperation and oblige them to have recourse to physical force." This danger, however, is mitigated by the absence of centralized power, the wise laws, and especially by the morality, religion, and intelligence of the people. "Despotism may govern without faith, but liberty cannot."

With these institutions, De Tocqueville says, "the union is as happy and free as a small people and as glorious and strong as a great nation."

The effects of democracy upon the people of the U. S., he considers to be to produce mediocracy. They worship equality more than liberty. Great political parties, he says, have disappeared. The country contains few germs of revolution; America has factions but not conspiracies, the race of statesmen has dwindled. Universal suffrage does not guarantee wise choice of officers. Democracies are better in times of peace than of war. They develop the activities of the individual. De Tocqueville says: "This ceaseless agitation which democratic government has introduced into the political world influences all social intercourse. I am not sure that upon the whole this is not the greatest advantage of democracy. And I am much less inclined to applaud it for what it does than for what it causes to be done."

Such was the view of the most careful critic of American institutions at the close of the first third of the present century. How accurately he judged upon some points, how utterly events have proved him wrong upon others, is apparent. The union is stronger to-day than the states; democratic government in the U. S. has not been proved weak in war or fickle in time of peace. Majorities have rarely been tyrannical. Of the faults which have appeared, Mr. Bryce, writing in 1888, says ("American Commonwealth," 1st ed., chap. xcv.):

We have seen that the defects commonly attributed to democratic government are not specially characteristic of the United States. It remains to inquire what are the peculiar blemishes which the country does show. . . .

First, a certain commonness of mind and tone, a want of dignity and elevation in and about the conduct of public affairs, an insensibility to the nobler aspects and finer responsibilities of national life.

Secondly, a certain apathy among the luxurious classes and fastidious minds, who find themselves of no more account than the ordinary voter, and are disgusted by the superficial vulgarities of public life.

Thirdly, a want of knowledge, tact, and judgment in the details of legislation, as well as in administration, with an inadequate recognition of the difficulty of these kinds of work, and of the worth of special experience and skill in dealing with them. Because it is incompetent, the multitude will not feel its incompetence, and will not seek or defer to the counsels of those who possess the requisite capacity.

Fourthly, laxity in the management of public business.

Mr. Lecky, however, in his still more recent "Democracy and Liberty" (1896), is much more severe on the U. S. Its success he considers largely due to its wise constitution and the very favorable circumstances of its trial. Yet he points out no little corruption (see CORRUPTION), and then adds:

Lecky's View

There is, however, one thing which is worse than corruption. It is acquiescence in corruption. No feature of American life strikes a stranger so powerfully as the extraordinary indifference, partly cynicism and partly good nature, with which notorious frauds and notorious corruption in the sphere of politics are viewed by American public opinion. Of one other point Mr. Lecky says: "It must, I think, be added, that modern democracy is not favorable to the higher forms of intellectual life. Democracy levels down quite as much as it levels up. The belief in the equality of man, the total abstinence of the spirit of reverence, the apotheosis of the average judgment, the fever and the haste, the advertising and sensational spirit which American life so abundantly generates, and which the American press so vividly reflects, are little favorable to the production of great works of beauty or of thought, of long meditation, of sober taste, of serious, uninterrupted study. Such works have been produced in America, but in small numbers and under adverse conditions."

So far Mr. Lecky. He seems to consider most of these faults the direct natural and all but inevitable result of democratic institutions, tho he considers them "aggravated" by the unnecessary rule that congressmen must belong to the states they represent, and that senators should receive large salaries.

Mr. Lecky, however, does not seem to see how far political corruption in America is the result, not of democracy, but of commercialism and that moneyed aristocracy which De Tocqueville bade democrats fear sixty years ago. Lecky does, indeed, say that the industrialism of American life is one of its most characteristic features, and that its influence on politics has been by no means

wholly good; he does also notice the fact that in wealthy America, in 1893 alone, 30,000 miles of our railways passed into the hands of receivers, and says, "What an amount of gigantic and deliberate dishonesty as well as unscrupulous gambling does such a state of things represent!" But he does not seem to have a suspicion how far corporations corrupt democracy, and not democracy corporations. Of this, however, we shall speak later. We pass on to notice briefly the result of democracy in other lands.

French democracy was born of ideals of natural rights falling on a nation perhaps more despotically ruled than any in Europe. These ideals, with those of altruism, as Mr. Kidd has pointed out in his "Social Evolution," made even the aristocracy aware that their position was unjust, and prevented their effectually opposing the uprising of the oppprest. The result was an explosion. Says De Tocqueville of French democracy (Introduction to "Democracy in America"):

Europe

> The existence of democracy was seemingly unknown when on a sudden it took possession of the supreme power. . . . The theory was then submitted to its caprices; it was worshiped as the idol of strength, until, when it was enfeebled by its own excesses, the legislator conceived the rash project of annihilating its power, instead of instructing and correcting its vices. The consequence of this has been that the democratic revolution has been effected only in the material parts of society, without that concomitant change in laws, ideas, customs, and manners which was necessary to render such a revolution beneficial.

This view of a French opponent of democracy, written sixty years ago, is to a less extent true to-day. The French Revolution was one of the middle classes rather than of the lowest. The mass of the people were not ready for it. France, therefore, during the century has vibrated between emperor and commune. Plebiscites have served tyrants. Between 1800 and 1881 France had eleven revolutions and nineteen successive constitutions, and between 1870 and 1894, thirty-two ministries.

Still democracy has steadily grown, and is now probably more firmly established in France than ever. Her suffrage is all but universal, the main restrictions on her democracy being in the Senate, and, for Paris, in its lack of self-government. (See PARIS.) No one is enthusiastic over the French Government. Panama scandals, coquetting with Russia, the steady growth of her national debt and of taxation, in spite of her widely diffused land property and her popular loans, have made socialism and, to a less extent anarchism, the popular idols in France.

Switzerland is undoubtedly the most democratic and one of the most prosperous countries in Europe. Her well-known referendum and initiative we consider under that head. In Switzerland far more than in America the people rule. This is undoubtedly in part because of the smallness of her territory and of the fact that her commercial and industrial interests have not called into existence the great corporations which dominate and corrupt American politics; but believers in democracy argue that Switzerland shows that the cure for the ills of democracy is more democracy. France and America, they say, are plutocracies. With the referendum and the initiative, so that the legislative power is with the people, with a president (see SWITZERLAND) who is little more than a figurehead, with a government largely decentralized between cantons and municipalities, with a judiciary not allowed to enslave a people by interpreting a constitution framed in other days for other needs, Switzerland is really democratic, and tho not a land of extreme wealth, she holds high rank in popular learning, industry, and prosperity for her people.

Other countries in Europe, tho nominally monarchies, are, as in England, Germany, and Belgium, almost as democratic in many respects as America or France. In the extent of national as opposed to municipal suffrage, they rank almost with America. (See ELECTIONS.) They groan under standing armies, but so does republican France. Their legislatures represent the classes more than the masses; but England has some sixty labor men in Parliament, Germany forty-three Socialists in her Reichstag, France seventy-five, Austria eighty-two in their various Parliaments, while in the Congress of the United States there are no working men. Where do the people most truly rule?

Coming now to the arguments for and against democracy, Mr. Lecky, its latest critic, says of its evil results:

Unfavorable View

> "Sometimes the voter will be directly bribed or intimidated. He will vote for money or for drink or in order to win the favor or avert the displeasure of some one who is more powerful than himself. . . . A still larger number of votes will be won by persistent appeals to class cupidities. . . . If the poorest, most numerous, and most ignorant class can be persuaded to hate the smaller class, and to vote solely for the purpose of injuring them, the party manager will have achieved his end. . . . As education advances newspapers arise which are intended solely for this purpose, and they are often almost the only reading of great numbers of voters. As far as the most ignorant class have opinions of their own, they will be of the vaguest and most childlike nature. . . . A man will vote blue or yellow as his father did before him. . . . A few strong biases of class or creed will often display a great vitality. Large numbers, also, will naturally vote on what is called 'the turnabout system.' . . . A bad harvest or some other disaster over which the government can have no more influence than over the march of the planets will produce a discontent that will govern dubious votes. . . . The evil of evils in our present politics is that the constituencies can no longer be fully trusted, and that their power is so nearly absolute. . . . One of the great divisions of politics in our day is coming to be whether, at the last resort, the world should be governed by its ignorance or by its intelligence." Some results of democracy Lecky considers to be a lowered character of parliamentary government over all Europe and America. All countries give a sigh of relief when legislatures are prorogued. Wealth still rules, but wealth of the worst kind. Taxes and debts are increased, one class "has the power of voting taxes, which another class must almost exclusively pay." Group system and log-rolling are developed, machines govern parties.

There is, however, another side to this. Even Lecky has to admit that democratic institutions have enormously advanced both the quantity and the quality of popular education, have made enormous strides in caring for the public health, have aided factory legislation, have been favorable to religious liberty.

Favorable View

> It is true that he carefully shows that popular education does not accomplish all the good sometimes claimed, but yet he cannot bring himself to actually oppose, and he has to admit that opposition to much education for the toiling classes was a Tory doctrine, and that under democracy "hardly any change in our generation has been more marked than that which has made education of the poor one of the main functions of the government. . . ." "At the same time," he says, "the standard of popular and free, or, in other words, state paid education, seems steadily rising." Sanitary reform he calls "perhaps the noblest legislative achievement of our age." Of religious liberty he says, "On the whole, democracies, at least in the Anglo-Saxon race, seem to me favorable to religious liberty." No forms of liberty are more loved by English democracies than the liberty of expression, discussion, and association. Incidentally he speaks of "the higher wages, the better payment of functionaries and workmen of every order which has followed in the track of a higher standard of life and

aspect." He refers to the "intense and many-sided intellectual and moral energy that pervades the country." He thinks there never was a period when more time, thought, money, and labor were bestowed on the alleviation of suffering. He says, "No feature of our century is more remarkable than the skill with which by reformatories and industrial and other schools, by factory laws, by the diminution of insanitary dwellings, and by the better regulation of the drink traffic, modern philanthropy has succeeded in restricting or purifying the chief sources of national crime." . . . "Not less conspicuous is the improvement that has taken place in the decorum, civilization, and humanity of the bulk of the poor. . . . [while] the skilled artizans in our great towns within the memory of living men have become not only the most energetic, but also one of the most intelligent and orderly elements in English life." The closing chapter in Mr. Lecky's book in which he shows the almost revolutionary improvements that democracy has introduced in respect to women is one long argument for democracy. Surely if a critic of democracy has to admit all this, we need not regret that, as Mr. Lecky says, democracy is for a considerable time at least "an inevitable fact."

The main charge Mr. Lecky brings against democracy is that it makes the poor tax the rich, but most will think that that is an advance on the Toryism under which the rich tax the poor. Probably, too, it is true that democratic legislatures will be for some time in some ways inferior to aristocratic legislatures, because they admit representatives of classes whom aristocrats have long kept ignorant. But if democracy educates the people and raises their life, it will soon raise the standard of the representatives of the people. Democracy, as De Tocqueville discovered, is best because of its indirect results.

There are, indeed, those in America—and the number is at present growing—who ask if democracy is not a failure; they see the voters of our cities bought and sold; they see offices put up at auction, legislation obtained by corrupt means. They think this due to the ignorance and corruption of the people, and therefore they desire from good motives to restrict the ballot. They look with envy to the institutions of Great Britain and of Germany, where they find less political corruption and more efficient government. This class forgets that political corruption may be due, not to the ignorance of those who are bought, but to the corrupt power of the educated, who buy. They forget that England and Germany have recently made rapid advances in democracy, and that as they have advanced in trust of the people they have advanced and not retrograded in political and municipal purity. The reason for their comparative municipal purity and our municipal corruption may be, not that they are less democratic than we, but because with them the government rules the corporations; with us corporations rule the government. (See CITY.) This, at least, is a view that needs to be remembered. Whatever be the truth, the fact cannot be denied that a growing class in America desires to restrict the suffrage, to have less frequent elections, to take power from the common people. One of the "reforms" prest before the recent Constitutional Convention in New York was the restriction of the suffrage. In Massachusetts the effort for less frequent elections has been very strong. In many states "educational and sometimes property qualifications" are being mooted. In Ohio, the counsel of a great trust recently said, in a United States court, that "too many people vote." It is equally clear that this does not represent the view of the masses of the country, nor of some of the most experienced thinkers. Professor Ely (*Christian Union*, Oct. 9, 1890) quotes Mr. Seth Low, when Mayor of Brooklyn, as saying that universal suffrage is not the cause of bad city government. Professor Commons, in "Outlines of Lectures on City Government," quotes him as saying: "In a country where wealth has no hereditary sense of obligation to its neighbors, it is hard to conceive what would be the condition of society if universal suffrage did not compel every one having property to consider, to some extent at least, the well-being of the whole community." Mr. Albert Shaw, who perhaps has studied municipal administration more widely than any other writer, in an interview published by the *Pall Mall Gazette*, Nov. 27, 1888, makes it the second most important principle of municipal administration to "trust the people."

Cause of Plutocracy

The masses of this country want not less democracy, but more. They want not a limited suffrage, but industrial democracy added to political democracy. Their problem is not how to limit the suffrage, but how to save the political liberties of the people. Mr. Henry D. Lloyd, in an address before the Annual Convention of the American Federation of Labor, in Chicago, December, 1893, speaking of present evils in America, said:

> The pioneers who saw a generation ago the thread that would lead us through this labyrinth and into the free air have now become a multitude. That thread is the thread of democracy, whose principles must and will rule whreveer men coexist, in industry not less surely than in politics. It is by the people who do the work that the hours of labor, the conditions of employment, the division of the produce is to be determined. It is by them the captains of industry are to be chosen, and chosen to be servants, not masters. It is for the welfare of all that the coordinated labor of all must be directed. Industry, like government, exists only by the cooperation of all, and, like government, it must guarantee equal protection to all. This is democracy, and democracy is not true only where men carry letters or build forts, but wherever they meet in common efforts.
>
> The declaration of independence yesterday meant self-government, to-day it means self-employment, which is but another kind of self-government. Every dollar, every edifice, every product of human toil is the creation of the cooperation of all the people. But in this cooperation it is the share of the majority to have no voice, to do the hardest work and feed on the crumbs of life. Not as an exception, but universally, labor is doing what it does not want to do, and not getting what it wants or what it needs. Laborers want to work eight hours a day; they must work ten, fourteen, eighteen. Crying to their employers, to Congress, to legislatures to be rescued, they go down under the murderous couplers and wheels of the railroads faster than if they were in active service in war, marching out of one battle into another. They want to send their children to school; they must send them to the factory. They want their wives to keep house for them; but they, too, must throw some shuttle or guide some wheel. They must work when they are sick; they must stop work at another's will. . . . This is an impossible situation. No human society ever held together on such terms. This is contrary to the most sacred principles of American society. This is government without consent and it is the cornerstone and rooftree of American life that we will have none of it. The men who think it can continue are our idlest dreamers and most impracticable theorists. . . .
>
> Democracy must be progressive or die. It was by a divine instinct of right, whether they knew it or not, that the hundreds of men who found themselves these winter nights in Chicago without a roof went to the city hall. That is the house of democracy. It stands on the foundation principle that the people live and work for the people. The city hall means nothing if it does not mean that the general welfare, not the advantages or privileges of a few, is the object of society. It means more—the general welfare can be properly planned only if all have a voice, and the plans can be properly carried out only when all join their efforts. The city hall represents an institution ready made for any purpose of the common good for which the common people choose to use it—an institution in which they are equal partners, and no thanks to any one but themselves. The old democracy is the father of this new democracy. The old trade-union is to herald this greater union. The people who vote are bound on their own recognizance to get the independence and knowledge to vote right and free. The public schools are a pledge of the public honor that every citizen shall be able to buy books and shall have time to read and digest.
>
> The progressive genius of democracy is at one with its progressive necessities. "A house divided against itself

Need of Industrial Democracy

cannot stand," said Lincoln. "This union cannot permanently endure half slave and half free." It is equally true that all cannot remain politically free if all are not economically free. Political freedom is but the first instalment of economic freedom.

Nor is this the view of those alone who are socialistically inclined. Mr. George Gunton, who opposes socialism, says ("Wealth and Progress," p. 205):

> Freedom does not consist in the mere absence of legal barriers, but in the actual power to go and to do. The poor can never be *free* in any true sense of the term. Whoever controls a man's living can determine his liberty. Freedom means independence, which nothing but wealth can impart. Even intelligence cannot give independence, except as it can give wealth. Poverty and freedom are incompatible with each other.
>
> Whatever may be, theoretically, the form of government, the political *freedom*—real power and influence—of the masses is always proportionate to their industrial prosperity and progress. Thus, the political influence of the masses is far greater under the present European monarchies than it was under the ancient republics. And the political influence of the masses is greatest to-day in those countries where the industrial conditions—real wages—are the highest. The laboring classes possess more political influence and freedom in England under a monarchy with higher wages, than they do in France under a republic with lower wages; and there is still more real democracy with higher wages under a republic in America than with lower wages under a monarchy in England. . . .
>
> It is not and never was true that liberty enlightens the world. On the contrary, our democratic institutions are the natural consequence of our industrial prosperity and superior civilization; and liberty, like morality, instead of enlightening the world, is the golden result of the world's being enlightened by the material and social progress of society. Were this otherwise, the industrial depressions which afflict the Old World would be unknown here. The notorious fact is that the frequency and severity of industrial depressions are as great under the democracies of France and America as under the monarchies of England, Germany, and Belgium.

Such is a view of democracy that is growing to-day. Be this, however, as it may, democracy unquestionably, for weal or for wo, has the future. Mr. Kidd, in his "Social Evolution," shows that it is the underlying principle of all modern progress. Of this progress, he says (p. 164):

> It has consisted essentially in the gradual breaking down of that military organization of society which had previously prevailed in the emancipation and enfranchisement of the great body of the people, hitherto universally excluded under that constitution of society from all participation on equal terms in the rivalry of existence. From a remote time down unto the period in which we are living, we have witnessed a continuous movement in this direction. The progress may not have been always visible to the current generation among whom the rising waves surge backward and forward, but looking back over our history, we mark unmistakably the unceasing onward progress of the slowly advancing tide. . . . And it tends to culminate in a condition of society in which there shall be no privileged classes.

Growth of Democracy

Accepting democracy, the only question then is how to save it from defeat, from corruption, from misdirection. For this see various views: Direct Representation, through which it is claimed all the people can legislate, and thus take away from corrupt representatives the power to sell legislation; Proportional Representation, by which it is urged that all parties and all views and all interests can be represented in legislation, the rights of minorities being specially protected; Industrial Reform, by which all being put on the same plane economically and being able to earn a living by a moderate amount of honest toil, will not be easily tempted to either sell their vote or buy legislation. (See also ANARCHISM; CHRISTIAN SOCIALISM; CIVIL SERVICE REFORM; INDIVIDUALISM; MUNICIPAL REFORM; SINGLE TAX; SOCIALISM.

DEMOCRATIC PARTY AND SOCIAL REFORM, THE: A signed statement abridged from Mr. William J. Bryan's addresses on the subject.

"The aim of the Democratic Party in relation to social reform is the abolition of privilege. The Democratic Party is not the enemy of property or of property rights; it is, on the contrary, the best defender of both, because it defends human rights and human rights are the only foundation upon which property and property rights can rest securely. If we can but repeal the laws which enable men to reap where they have not sown—laws which enable them to garner into their overflowing barns the harvests that belong to others—no one will be able to accumulate enough to make his fortune dangerous to the country. Special privilege and the use of the taxing power for private gain—these are the twin pillars upon which plutocracy rests. To take away these supports and to elevate the beneficiaries of special legislation to the plane of honest effort ought to be the purpose of our party.

"The paramount issue to-day is the trust question, and for the purposes of this discussion it is sufficient to draw the line at the point where competition ceases to be effective and to designate as a trust any corporation which controls so much of the product of any article that it can fix the terms and conditions of sale.

Trusts

"Legislation which prevents monopoly not only does not injure legitimate business, but actually protects legitimate business from injury. We are indebted to the younger Rockefeller for an illustration which makes this distinction clear. In defending the trust system he is quoted as saying that as the American beauty rose cannot be brought to perfection without pinching off ninety-nine buds, so that the one hundredth bud can receive the full strength of the bush, so great industrial organizations are impossible without the elimination of the smaller ones. It is a cruel illustration but it presents a perfectly accurate picture of trust methods. The Democratic Party champions the cause of the ninety-nine enterprises which are menaced; they must not be sacrificed that one great combination may flourish.

"There must be no mistaking of the issue and no confusing of the line of battle. The trust, as an institution, will have few open defenders. The policy of the trust defenders will be to insist upon 'reasonable regulation' and then they will rely upon their power to corrupt legislatures and to intimidate executives to prevent the application of any remedies which will interfere with the trusts. Our motto must be: 'A private monopoly is indefensible and intolerable,' and our plan of attack must contemplate the total and complete overthrow of the monopoly principle in industry. We need not quarrel over remedies. We must show ourselves willing to support any remedy and every remedy which promises substantial advantage to the people in their warfare against monopoly. Something is to be ex-

pected from the enforcement of the criminal clause of the Sherman antitrust law, but this law must be enforced not against a few trusts as at present, but against all trusts, and the aim must be to imprison the guilty, not merely to recover a fine. What is a fine of $1,000 or even $10,000 to a trust which makes $100,000 while the trial is in progress?

"If the criminal clause is not going to be enforced it ought to be repealed. If imprisonment is too severe a punishment for the eminently respectable gentlemen who rob 80,000,000 of people of hundreds of millions of dollars annually, the language of the statute ought to be changed, for nothing is more calculated to breed anarchy than the failure to enforce the law against rich criminals while it is rigidly enforced against petty offenders. But it is not sufficient to enforce existing laws. If ten corporations conspiring together in restraint of trade are threatened with punishment, all they have to do now is to dissolve their separate corporations and turn their property over to a new corporation. We need, therefore, new legislation.

"Recent investigations have brought to light the fact that nearly all the crookedness revealed in the management of our large corporations have been due largely to the duplication of directorates. A group of men organize, or obtain control of, several corporations doing business with each other and then proceed to swindle the stockholders of the various corporations for which they act. Many of the trusts control prices by the same methods. The same group of men secure control of several competing corporations and the management is thus consolidated. It is worth while to consider whether a blow may not be struck at the trusts by a law making it illegal for the same person to act as director or officer of two corporations which deal with each other or are engaged in the same general business.

"A still more far-reaching remedy was proposed by the Democratic platform of 1900, namely, the requiring of corporations to take out a federal license before engaging in interstate commerce. This remedy is simple, easily applied, and comprehensive. The requiring of a license would not embarrass legitimate corporations—it would scarcely inconvenience them—while it would confine the predatory corporations to the state of their origin.

"If corporations were required to take out a federal license the federal government could then issue the license upon the terms and conditions which would protect the public. A corporation differs from a human being in that it has no natural rights and as all of its rights are derived from the statutes it can be limited or restrained according as the public welfare may require. The control which Congress has over interstate commerce is complete and if Congress can prevent the transportation of a lottery ticket through the mails, by the express companies or by freight, it can certainly forbid the use of the mails, the railways, and the telegraph lines to any corporation which is endeavoring to monopolize an article of commerce, and no party can long be credited with sincerity if it condemns the trusts with words only and then permits the trusts to employ all the instrumentalities of interstate commerce in the carrying out of their nefarious plans.

"The tariff question is very closely allied to the trust question and the reduction of the tariff furnishes an easy means of limiting the extortion which the trusts can practise.

Tariff

While absolute free trade would not necessarily make a trust impossible, still it is probable that very few manufacturing establishments would dare to enter into a trust if the president were empowered to put upon the free list articles competing with those controlled by a trust. The protective tariff has been the fruitful source of a great deal of political corruption as well as the mother of many of our most iniquitous trusts.

"But one of the worst features of the tariff, levied not for revenue, but for the avowed purpose of protection, is that it fosters the idea that men should use their votes to advance their own financial interests. The manufacturer has been assured that it is legitimate for him to vote for congressmen who, whatever their opinions on other subjects may be, will legislate larger dividends into his pockets; sheep-growers have been encouraged to believe that they should have no higher aim in voting than to raise the price of wool; and laboring men have been urged to make their wages their only concern.

"There never was a time when tariff reform could be more easily entered upon, for the manufacturers by selling abroad cheaper than at home, as many of them do, have not only shown their ingratitude toward those who built the tariff wall for them, but they have demonstrated their ability to sell in competition with the world. The high tariff has long been a burden to the consumers in the U. S. and it is growing more and more a menace to our foreign commerce because it arouses resentment and provokes retaliation.

"The railroad question is also interwoven with the trust question. Nearly all the private monopolies have received rebates or secured other advantages over competitors. Absolute equality of treatment at the hands of the railroads would go far toward crippling the trusts, and I rejoice that the president has had the courage to press the question upon Congress. While the law, as it was finally distorted by the Senate, is not all that could be wished, it deserves a fair trial.

"Rate regulation was absolutely necessary and it furnishes some relief from the unbearable condition which previously existed, but we must not forget that the vesting of this enormous power in the hands of a commission appointed by the president introduces a new danger. If an appointive board has the power to fix rates and can, by the exercise of that power, increase or decrease by hundreds of millions of dollars the annual revenues of the railroads, will not the railroads feel that they have a large pecuniary interest in the election of a President friendly to the railroads? Experience has demonstrated that municipal corruption is largely traceable to the fact that franchised corporations desire to control the city council and thus increase dividends of the franchised corporations. If the railroad managers adopt the same policy, the sentiment in favor of the ownership of the railroads by the government is likely to increase as rapidly throughout the country as the sentiment in favor of municipal ownership has increased in the cities.

Railroad Question

"Railroads partake so much of the nature of a monopoly that they must ultimately become pub-

lic property and be managed by public officials in the interest of the whole community in accordance with the well-defined theory that public ownership is necessary where competition is impossible. I do not know that the country is ready for this change; I do not know that a majority of my own party favor it, but I believe that an increasing number of the members of all parties see in public ownership the only sure remedy for discrimination between persons and places and for extortionate rates for the carrying of freight and passengers.

"Believing, however, that the operation of all the railroads by the federal government would so centralize the government as to almost obliterate state lines, I prefer to see only the trunk lines operated by the federal government and the local lines by the several state governments. Some have opposed this dual ownership as impracticable, but investigation in Europe has convinced me that it is entirely practicable. Nearly all the railroads of Germany are owned by the several states, the empire not even owning trunk lines, and yet the interstate traffic is in no wise obstructed. The ownership and operation of the local lines by the several state governments is not only feasible but it suits itself to the conditions existing in the various states. In those states where the people are ripe for a change the local lines can be purchased or new lines be built at once, while private ownership can continue in those states in which the people still prefer private ownership. Some States have been more careful than others to prevent the watering of stock and in the acquiring of roads each state can act according to the situation which it has to meet.

"As to the right of the governments, federal and state, to own and operate railroads there can be no doubt. If we can deepen the water in the lakes and build connecting canals in order to cheapen railroad transportation during half of the year, we can build a railroad and cheapen rates the whole year; if we can spend several hundred millions on the Panama Canal to lower transcontinental rates, we can build a railroad from New York to San Francisco to lower both transcontinental and local rates. The U. S. mail is increasing so rapidly that we shall soon be able to pay the interest on the cost of trunk lines out of the money which we now pay to railroads for carrying through mails. If any of you question the propriety of my mentioning this subject I beg to remind you that the president could not have secured the passage of the rate bill had he not appealed to the fear of the more radical remedy of government ownership, and nothing will so restrain the railroad magnates from attempting to capture the Interstate Commerce Commission as the same fear. The high-handed manner in which they have violated law and ignored authority, together with the corruption discovered in high places, has done more to create sentiment in favor of public ownership than all the speeches and arguments of the opponents of private ownership.

"I have referred to the railroad question as a part of the trust question because they are so interwoven that it is difficult to consider one without the other.

"Political liberty could not long endure under an industrial system which permitted a few powerful magnates to control the means of livelihood of the rest of the people.

"Landlordism, the curse of Europe, is an innocent institution in comparison with the trust carried to its logical conclusion. The man who argues that there is an economic advantage in private monopoly is aiding socialism. The Socialist, asserting the economic superiority of the monopoly, insists that its benefits shall accrue to the whole people, and his conclusion cannot be denied if his assumption is admitted.

Socialism

The Democratic Party, if I understand its position, denies the economic as well as the political advantage of private monopoly and promises to oppose it wherever it manifests itself. It offers as an alternative competition where competition is possible and public monopoly wherever circumstances are such as to prevent competition.

"Socialism presents a consistent theory, but a theory which, in my judgment, does not take human nature into account. Its strength is in its attack upon evils the existence of which is confest; its weakness is that it would substitute a new disease—if not a worse one—for the disease from which we suffer. The Socialist is honest in the belief that he has found a remedy for human ills, and he must be answered with argument, not with abuse. The best way to oppose socialism is to remedy the abuses which have grown up under individualism but which are not a necessary part of individualism, and the sooner the remedy is applied the better.

"There is noticeable everywhere a distinct movement toward democracy in its broadest sense. In the U. S. this trend toward democracy has taken the form of a growing demand for the election of U. S. senators by a direct vote of the people. It would be difficult to overestimate the strategic advantages of this reform, for since every bill must receive the sanction of the Senate as well as the House of Representatives before it can become a law, no important remedial legislation of a national character is possible until the Senate is brought into harmony with the people.

"I am within the limits of the truth when I say that the Senate has been for years the bulwark of predatory wealth, and that it even now contains so many members who owe their election to favor-seeking corporations and are so subservient to their masters as to prevent needed legislation. The popular branch of Congress has four times declared in favor of this reform by a two-thirds vote and more than two thirds of the states have demanded it, and yet the Senate arrogantly and impudently blocks the way.

"The income tax, which some in our country have denounced as a socialistic attack upon wealth, has, I am pleased to report, the indorsement of the most conservative countries in the Old World. It is a permanent part of the fiscal system of most of the countries of Europe and in many places it is a graded tax, the rate being highest upon the largest incomes. England has long depended upon the income tax for a considerable part of her revenues and the English commission is now investigating the proposition to change from a uniform to a graded tax.

"It is little short of a disgrace to our country that while it is able to command the lives of its citizens in time of war, it cannot, even in the most extreme emergency, compel wealth to bear its share of the expenses of the government which protects it.

Labor and Capital

"Concerning disputes between labor and capital, arbitration, I believe, defends the highest interests of the three real parties to these disputes, viz., the employers, the employees, and the public.

"The question sometimes asked, 'Can I not conduct my business to suit myself?' is a plausible one, but when a man in conducting his business attempts to arbitrarily fix the conditions under which hundreds of employees are to live and to determine the future of thousands of human beings, I answer without hesitation that he has no right to conduct his own business in such a way as to deprive his employees of the right to life, liberty, and the pursuit of happiness. To support this position, I need only refer to the laws regulating the safety of mines, the factory laws fixing the age at which children can be employed, and usury laws establishing the rate of interest.

"But if it is unwise to make the employer the sole custodian of the rights and interests of the employees, it is equally unwise to give the employees uncontrolled authority over the rights and interests of the employer. The employees are no more to be trusted to act unselfishly and disinterestedly than the employers.

"The strike, the only weapon of the employee at present, is a two-edged sword and may injure the workman as much as the employer, and even when wholly successful, is apt to leave a rankling in the bosom of the wage-earner that ought not to be. Society has, moreover, something at stake as well as the employer and employee, for there can be no considerable strike without considerable loss to the public. Society, therefore, is justified in demanding that the differences between capital and labor should be settled by peaceful means. If a permanent, impartial board is created to which either party of an industrial dispute may appeal, or which of its own motion can institute an inquiry, public opinion can be relied upon to enforce the finding. If there is compulsory submission to investigation it is not necessary that there shall be a compulsory acceptance of the decision, for a full and fair investigation will in every case bring about a settlement.

"No reference to the labor question is complete that does not include some mention of what is known as government by injunction. As the main purpose of the writ is to evade trial by jury, it is really an attack upon the jury system and ought to arouse a unanimous protest. However, as the writ is usually invoked in case of a strike the importance of the subject would be very much reduced by the adoption of a system of arbitration, because arbitration would very much reduce, even if it did not entirely remove, the probability of a strike.

"Another word in regard to the laboring man. The struggle to secure an eight-hour day is an international struggle and it is sure to be settled in favor of the workingman's contention. The benefits of the labor-saving machine have not been distributed with equity. The producer has enormously multiplied his capacity, but so far the owner of the machine has received too much of the increase and the laborer too little. Those who oppose the eight-hour day do it, I am convinced, more because of ignorance of conditions than because of lack of sympathy with those who toil. The removal of work from the house to the factory has separated the husband from his wife and the father from his children, while the growth of our cities has put an increasing distance between the home and the workshop. Then, too, more is demanded of the laboring man now than formerly. He is a citizen as well as a laborer, and must have time for the study of public questions if he is to be an intelligent sovereign. To drive him from his bed to his task and from his task to his bed is to deprive the family of his companionship, society of his service, and politics of his influence.

Bimetalism

"Thus far I have dwelt upon subjects which may not be regarded as strictly partizan, but I am sure that you will pardon me if in this presence I betray my interest in those policies for which the Democratic Party stands. I have not had an opportunity to make a Democratic speech for almost a year, and no one—not even a political enemy—could be so cruel as to forbid me to speak of those policies on this occasion. Our opponents have derived not only partizan pleasure but partizan advantage as well from the division caused in our party by the money question. They ought not, therefore, begrudge us the satisfaction that we find in the fact that unexpected conditions have removed the cause of our differences and permitted us to present a united front on present issues. The unlooked-for and unprecedented increase in the production of gold has brought a victory to both the advocates of gold and the advocates of bimetalism—the former keeping the gold standard which they wanted and the latter securing the larger volume of money for which they contended. We who favor bimetalism are satisfied with our victory if the friends of monometalism are satisfied with theirs. And we can invite them to a contest of zeal and endurance in the effort to restore to the people the rights which have been gradually taken from them by the trusts.

"The investigations which have been in progress during the past year have disclosed the business methods of those who a few years ago resented any inspection of their schemes and hid their rascality under high-sounding phrases. These investigations have also disclosed the source of enormous campaign funds which have been used to debauch elections and corrupt the ballot. The people see now what they should have seen before, namely, that no party can exterminate the trusts so long as it owes its political success to campaign contributions secured from the trusts. The great corporations do not contribute their money to any party except for immunity expressly promised or clearly implied. No party can afford to receive contributions even from individuals when the acceptance of those contributions secretly pledges the party to a course which it cannot openly avow. In other words, politics should be honest, and contributions public and not from corporations.

International Arbitration

"In regard to international relations and imperialism the U. S. should lead in the movement for international arbitration. The cause of arbitration is making real progress. At the last session of the Interparliamentary Union which convened in London last July, twenty-six nations were represented. I believe that if our nation would propose to make with every other nation a treaty providing that all questions in dispute between the parties should be submitted to The Hague Court for in-

vestigation and report before any declaration of war or commencement of hostilities, it would find many nations willing to enter into such a compact.

"Another subject connected with our foreign relations: I venture to suggest that we may not only promote peace but also advance our commercial interests by announcing as a national policy that our navy will not be used for the collection of private debts. While protecting the lives of our citizens everywhere and guaranteeing personal safety to all who owe allegiance to our flag, we should, in my judgment, announce that persons engaging in business and holding property in other lands for business purposes must be subject to the laws of the countries in which they engage in business enterprises.

"The growth of the principle of self-government, planted on American soil, has been the overshadowing political fact of the nineteenth century. It has made this nation conspicuous among the nations and given it a place in history such as no other nation has ever enjoyed. Nothing has been able to check the onward march of this idea. I am not willing that this nation shall cast aside the omnipotent weapon of truth to seize again the weapons of physical warfare. I would not exchange the glory of this republic for the glory of all the empires that have risen and fallen since time began.

"When Lord Howe asserted that the acts of Parliament which brought on the Revolution were necessary to prevent American trade from passing into foreign channels, Franklin replied:

"'To me it seems that neither the obtaining nor retaining of any trade, howsoever valuable, is an object for which men may justly spill each other's blood.'

"Lincoln said that the safety of this nation was not in its fleets, its armies, its forts, but in the spirit which prizes liberty as the heritage of all men, in all lands, everywhere, and he warned his countrymen that they could not destroy this spirit without planting the seeds of despotism at their own doors.

"Even now we are beginning to see the paralyzing influence of imperialism.

"A colonial policy means that we shall send to the Philippine Islands a few traders, a few task-masters, and a few office-holders, and an army large enough to support the authority of a small fraction of the people while they rule the natives.

"That a large permanent increase in our regular army is intended by Republican leaders is not a matter of conjecture, but a matter of fact. In his message of Dec. 5, 1898, the president asked for authority to increase the standing army to 100,000. In 1896 the army contained about 25,000. Within two years the president asked for four times that many, and a Republican House of Representatives complied with the request after the Spanish treaty had been signed, and when no country was at war with the U. S.

"It is argued by some that the Filipinos are incapable of self-government and that, therefore, we owe it to the world to take control of them. Admiral Dewey, in an official report to the Navy Department, declared the Filipinos more capable of self-government than the Cubans, and said that he based his opinion upon a knowledge of both races. But I will not rest the case upon the relative advancement of the Filipinos.

Imperialism

Henry Clay, in defending the right of the people of South America to self-government, said:

"'It is the doctrine of thrones that man is too ignorant to govern himself. Their partizans assert his incapacity in reference to all nations; if they cannot command universal assent to the proposition, it is then demanded to particular nations; and our pride and our presumption too often make converts of us. I contend that it is to arraign the disposition of Providence Himself to suppose that He has created beings incapable of governing themselves, and to be trampled on by kings. Self-government is the natural government of man.'

"The Republicans say that this nation is in the hands of destiny; Washington believed that not only the destiny of our own nation but the destiny of the republican form of government throughout the world was entrusted to American hands. Immeasurable responsibility! The destiny of this republic is in the hands of its own people, and upon the success of the experiment here rests the hope of humanity. No exterior force can disturb this republic, and no foreign influence should be permitted to change its course.

"Behold a republic, resting securely upon the foundation stones quarried by revolutionary patriots from the mountain of eternal truth—a republic applying in practise and proclaiming to the world the self-evident proposition that all men are created equal; that they are endowed with inalienable rights; that governments are instituted among men to secure these rights, and that governments derive their just rights from the consent of the governed. Behold a government standing erect while empires around are bowed beneath the weight of their own armaments—a republic whose flag is loved while other flags are only feared. Behold a republic increasing in population, in wealth, in strength, and in influence, solving the problems of civilization, and hastening the coming of a universal brotherhood—a republic which shakes thrones and dissolves aristocracies by its silent example and gives light and inspiration to those who sit in darkness. Behold a republic gradually but surely becoming a supreme moral factor in the world's progress and the accepted arbiter of the world's disputes—a republic whose history, like the path of the just, 'is as the shining light that shineth more and more unto the perfect day.'

WILLIAM J. BRYAN.

DEMOREST, W. JENNINGS: American publisher and prohibitionist; born in New York City, 1822; educated in the public schools. At the age of twenty he commenced business in the dry goods trade, and in 1860 began the publication of the New York *Illustrated News* in English and German, and also *Young America*. In 1864 these were merged into *Demorest's Family Magazine*. Mr. Demorest traveled extensively and wrote largely on ethics, especially against the evils of the liquor traffic. He distributed nearly 50,000,000 pages of tracts on this question.

Mr. Demorest was active in the great Washington movement, and was one of the originators of the Sons of Temperance. To test the question of the constitutionality of slavery he had a suit instituted and well on its way toward the supreme court when President Lincoln's emancipation proclamation was issued.

Actively identified with the Prohibition Party, Mr. Demorest, since 1884, was a tireless worker for its success. He established the National Prohibition Bureau for speakers and the distribution of literature, and, true to his early convictions, organized the National Constitutional

League, through which he was pressing a test suit up to the supreme court to establish the unconstitutionality of license to the liquor traffic, when his death occurred, April 9, 1895. He published a monthly periodical called *The Constitution*. He served the party as a candidate for mayor of New York City and for lieutenant-governor of the state. An interesting feature of Mr. Demorest's services for the cause of prohibition is the medal contest work for the education of the youth, and the creation of public sentiment in favor of the universal prohibition of the liquor traffic, which he originated and maintained.

DENIS, HECTOR: Belgian sociologist; born at Braine-le-Comte, 1842; doctor of law and natural science; advocate (1860); professor of philosophy at the University of Brussels, and instructor at the polytechnical school. He was rector of the University of Brussels, 1892–94, and resigned because of the suspension of Elisée Reclus. Denis is a member of the Royal Academy, and of the Superior Council of Labor. He was elected representative from Liège in 1894, 1898, and 1900, and is a leader in socialism. He is the author of "L'Alimentation et la Force du Travail." "De la Constitution de la Morale Positive."

DENISON, EDWARD: English founder of social settlements; born at Salisbury, 1840; son of Edward Denison, Bishop of Salisbury; graduated at Eton and Christ Church, Oxford. From 1862 to 1866 he read law, in the spring of 1864 traveling through Southern Europe and Northern Africa. He became deeply interested in the condition of the poor, and in 1867 took a lodging among the tenements in Philpot Street, Mile End Road, East London. He resided there eight months, studying the conditions of life, building, endowing, and teaching in a school. He was one of the original members of the Society for Organizing Charitable Relief and Repressing Mendicity in 1869, out of which has grown the Charity Organization Movement. He disbelieved in giving doles, and in 1868 went to Paris and Edinburgh to study the working of the poor-law. In November of that year he was returned to Parliament for Newark, but his failing health prevented his continued attendance, and after vainly seeking health in the Channel Islands, he went on a voyage to Australia, but died in Melbourne, Jan. 26, 1870, two weeks after his arrival. His letters and writings have been published, London, 1870.

DENMARK: A kingdom of northern Europe, on account of its former political associations with Sweden and Norway, customarily regarded as a unit of the Scandinavian peninsula. Its history has been closely united with that of Norway, and its language and literature are almost identical with Norway's, but on social reforms, Denmark has been the leader of her sister kingdoms.

I.—Statistics

Area and Population

Divisions	Area sq. m.	Population (1901)	Population per sq. m.
Copenhagen	21	378,235	17,909
Baltic Islands	5,062	1,007,513	199
Jutland	9,765	1,063,792	109
Faroe Islands	540	15,230	28
Total	15,388	2,464,770	160

General Statistics

At the latest official census (1901) the population of Denmark proper consisted of 1,193,448 males and 1,256,092 females, a total of 2,464,770; showing an increase of about 12 per cent since the census of 1890. While the town population has increased more than 29 per cent, the rural population has remained practically stationary, the increase being only slightly more than 4 per cent. The population is intermingled with a very small percentage of foreign blood; and the greater part of the foreign-born people come from Sweden and northern Germany (Sleswick-Holstein). According to the census of 1901, 948,997 persons were engaged in agriculture; 674,613 in industrial pursuits; 220,234 in commerce; 139,959 as domestic servants and other lower occupations; 114,100 in immaterial production; 72,072 in fishing and navigation; and 22,351 in inland transportation. There were 103,629 pensioners and capitalists, 48,678 public paupers, 5,623 persons in asylums for the abnormal, and 1,748 prisoners.

The principal cities of Denmark are: Copenhagen (the capital), with a population of 378,235; Aarhuus (Jutland), 51,814; Odense (Funen), 40,138; Aalborg (Jutland), 31,457. The birth-rate in 1904 was 29.89, the death-rate 14.57; 9.6 per cent of the births were illegitimate. There were in 1904 18,235 marriages and 473 divorces. Emigration, chiefly to the United States, was 9,034 in 1904.

Religion and Education

With regard to religion, Denmark maintains the Lutheran creed as her State religion, but no civil disabilities exist. In 1901 there were no 2,436,084 Protestants, 5,373 Roman Catholics, 3,476 Jews, and 4,501 of other denominations. In an educational aspect Denmark ranks high. Compulsory education was introduced in 1814, all children being obliged to attend school between the ages of seven and fourteen. There are 28 elementary schools in Copenhagen, 132 in other towns, and 2,780 in rural districts, making a total of 2,940. The pupils numbered 326,268 in 1903. Copenhagen has a university, founded in 1479, which has five faculties, 85 professors and teachers, and an annual roll of about 400 students. There are, further, a veterinary college, 12 agricultural schools, 72 high schools, 130 real-schools which prepare pupils for academic courses, a college of pharmacy, a polytechnic institution, and several commercial, technical, and horticultural schools. The State makes annual grants to many of the technical and agricultural schools, as well as to some of the real-schools, which, in reality, are preparatory to the university.

In 1903 there were 3,851 persons convicted of crimes, and 42,083 of minor offenses. There were 796 persons in the penitentiaries on March 31, 1903.

Industry

Denmark is primarily an agricultural country. On account of a law which prohibits the merging of small holdings into large estates the soil is greatly subdivided into small farms. The main crops are beetroots, potatoes, oats, wheat, barley, and rye. In 1903 Denmark had 486,935 horses, 1,840,466 head of cattle; 876,830 sheep; 38,984 goats; and 1,456,699 swine. In 1904, 26,137 horses, 92,058 head of cattle, and 936 sheep and goats were exported. Denmark produced (1904) 22,366,516 gallons of excisable beer, and 33,395,-

344 gallons of non-excisable beer; also 7,427,570 gallons of corn-brandy (*brændevin*) reduced to an alcoholicity of 8°. The production of beet sugar amounted to 44,125 tons, and that of oleomargarin to 21,885 tons. The Danish fisheries yielded a catch valued at 9,950,287 kronen in 1903.

Commerce

Year by year the commerce of Denmark shows a healthy increase, the high standard of her agricultural and dairy products assuring her a steady market abroad. The total exports in 1904 amounted to 497,836,000 kronen, and the total imports to 599,244,000 kr. Of the exports 358,629,000 kr. were home produce. The chief exports (1904) were as follows: Colonial goods, 12,754,000 kronen (krone=twenty-seven cents); beverages, 3,374,000 kr.; textiles, 21,514,000 kr.; metals and hardware, 18,264,000 kr.; wood and manufactures, 1,687,000 kr.; coal, 3,995,000 kr.; animals, 37,469,000 kr.; provisions, eggs, etc., 321,234,000 kr.; cereals, etc., 13,986,000 kr. The principal imports were: From Germany, 214,236,000 kr.; from Great Britain, 90,172,000 kr.; from Sweden and Norway, 63,119,000 kr.; from the United States, 74,464,000 kr.; from Russia, 76,390,000 kr.; from Holland, 12,411,000 kr.; from Belgium, 10,770,000 kr.; from France, 16,235,000 kr.; and from the Danish colonies, 3,519,000 kr. The chief exports of home produce go to Great Britain, and consisted, in 1904, of butter to the value of £9,003,089; eggs, £1,461,459; bacon, £4,532,420; beef, £17,696; pork, £158,639; and fish, £70,307. Otherwise the value of exports was distributed as follows: To Germany, 105,401,000 kr.; to Great Britain, 282,816,000 kr.; to Sweden and Norway, 52,335,000 kr.; to the U. S., 16,326,000 kr.; to Russia, 26,592,000 kr.; to Holland, 519,000 kr.; to Belgium, 1,334,000 kr.; to France, 899,000 kr.; to Danish colonies, 4,624,000 kr.

II.—Constitution and Government

According to the Constitution of 1849, the crown of Denmark is hereditary; but the powers of government are divided between the king and the two houses of parliament: the Folkething and the Landsthing. The king holds the executive power, while the legislative rights are vested in the Rigsdag, which comprizes the two houses mentioned in the foregoing. The Landsthing, or Upper House, consists of sixty-six members, twelve of whom are elected by the crown, and the remaining fifty-four by electoral bodies composed of the largest taxpayers. The Folkething, or Lower House, counts 114 members, elected by universal suffrage for a term of three years. Every resident citizen above the age of twenty-five, and of good reputation, is eligible for election to either house.

The civil subdivisions of Denmark are called "amts" and are eighteen in number, each being governed by an "amtmand," or governor. The amts are again divided into "herreder" (hundreds), and these in turn into parishes. The city of Copenhagen constitutes an amt by itself. Iceland has a specific charter of its own, by virtue of which the legislative power of this colony is vested in a body (the Althing) which is partly elective by universal suffrage and partly appointive by the king.

The estimated revenue for 1905–6 was 79,441,467 kronen and the expenditures 81,334,265 kr. The main part of the revenues (56,499,245 kr. estimated for 1906–7) is derived from customs, excise, and other indirect taxation. The Danish debt (1905) amounted to 172,927,250 kr.

The Danish army numbers 824 officers and 8,945 men on a peace footing; 1,448 officers and 66,000 men on a war footing. Of this total war-strength, 115 officers and 4,400 men are members of a National Guard of Volunteers. The navy is maintained mainly for purposes of coast defense. It comprizes about twenty vessels in various stages of efficiency.

The mercantile fleet of Denmark numbers (1904) 4,048 vessels of about 473,409 tons gross capacity. Of these 592 are steamships. Of the railways, which aggregate 1,993 miles, about 1,138 miles belong to the State, and the rest, mainly little by-lines, to private companies. The total cost of construction, March 31, 1903, was 198,230,918 kr. There are 960 post-offices in the country; 2,367 miles of telegraph wires, and 107,952 miles of telephonic wires.

III.—Social Reform

Modern social reform may be said to have begun in Denmark in 1857 when a law was enacted abolishing the old trade-gilds. It was still some four or five years, however, before joint-stock companies began to assume supremacy in the financial world; but during the thirty years from 1870–1900 these increased in number from 52 to 600, and their combined capital from $20,000,000 to $125,000,000. Educational reforms inaugurated by Bishop N. F. Grundboig (1783–1872) led to the establishment of industrial and agricultural high schools, which at first were supported by private contributions, but since 1864 by the State. These schools are largely frequented by young men and women of the peasant class, and the education afforded them in these institutions has had a remarkable effect in producing a Danish peasantry of which any land might be justly proud.

Socialism

Socialism is now somewhat strong. The strength of the Socialist Party in Denmark is shown by the fact that at the latest popular election of members to the Folkething, twenty-four Socialists were returned. The Landsthing has but one Socialist member. The controller of Copenhagen and two out of the four city councilors are Socialists, and more than 500 members of that party hold minor public offices. In 1887 8,406 Socialist votes were cast; in 1898 31,872; in 1906, 76,566.

Socialism first became a factor in the reform movement in Denmark when Louis Pio, in 1871, published a pamphlet entitled "Essays on Socialism." This pamphlet produced a marked effect, especially on the skilled workers, and during the next year several socialistic societies were formed under the auspices of the International, led by Karl Marx. The leaders of the Danish movement were Pio, Brix, and Geleff. In 1871 the Socialists started their first organ, *Socialisten*, and in 1872 (May 5th) a public meeting was planned in order to promote the formation of local trade-unions. This meeting was prohibited by the authorities, and on account of alleged incendiary articles in the *Socialisten*, the three leaders were arrested and sentenced to various terms of imprisonment. In 1873 the Danish authorities prevented the International from making further propaganda in that country, and local activities

thence became centered on the organization of the various branches of labor.

United Trade-Unions

In the course of the next four or five years many local trade-unions were organized, notably those of carpenters, bricklayers, shoe-workers, cigar-makers, etc. In 1871 there were three trade-unions with a total membership of 359; in 1877 there were thirty-one unions with a total of 3,189 members. In 1899 the membership had been swelled to 16,146. It soon became clear to the leaders of the movement that the interests of the different trade-unions would be greatly promoted if there were some central body in each town to exercise supervision in cases of disputes between employers and employees, an l especially to see to it that no amount of effort was misdirected by unnecessary strikes, etc. Accordingly, in 1886, De Samvirkende Fagforeninger i Kobenhavn ("The United Trade-Unions in Copenhagen") was organized; and in the course of the next few years similar centrals were established in other large towns. In 1898 more than 400 delegates, who represented 70,000 organized workers, met in Copenhagen and organized "De Samvirkende Fagforbund i Danmark," a union which exercises powers analogous with those exercised by the American Federation of Labor in the United States. In 1904 local trade-unions in Denmark numbered 1,156, with 90,111 members. Railroad employees number 18,000, and general laborers in the unions 29,044.

Results

The material results of the organized labor movement in Denmark have been to procure shorter hours and better pay in many branches, principally among typographers, bricklayers, carpenters, plumbers, etc. The average working-day is nine hours. Great strides have also been made toward securing industrial betterments. The government inspects factories and workshops to make them conform to sanitary requirements, and also to see to it that the law regulating the hours of work for young persons under eighteen is not violated. Children under twelve are not allowed to work in factories or workshops. There is a pension law (enacted 1891) by which all working people are entitled to a pension after the age of sixty; and in 1903 the number of such pensioners was 60,484, the pensions aggregating $2,700,000. The trade-unions maintain sick-funds and friendly societies which receive subsidies from the state and from county councils, such subsidies amounting to $320,000 in 1903. Other charitable institutions are maintained by the state at an annual cost of about $12,000,000.

Woman Suffrage

There is no law in Denmark which provides for woman's participation in state or municipal politics, but measures to that effect are continually being introduced to the legislature, and there is an energetic movement on foot among Danish women to promote their claims for a franchise. The only organized women's society is "Dansk Kvindesamfund," which is affiliated with the International Council of Women.

In 1906 a government committee was appointed for the purpose of making plans looking to the introduction of a system of state aid for the unemployed.

The poor-law of Denmark is especially famous.

Rev. Wilson Carlisle, founder of The Church Army in England, writes (in "The Nineteenth Century and After") about the Danish system of treating its poor, as follows:

The Poor and Unemployed

> The aged poor of spotless character . . . do not, strictly speaking, come within the poor-law at all in Denmark. They are state pensioners, and their position is no more dishonorable and involves no more loss of civil rights, than in the case of one who receives a service pension in this country (England). Some of the pensioners live in their homes, others in special public institutions. The Alderdomshjem, the place where the aged pensioners of Copenhagen are housed, is a delightful haven for these old people after the storms of life. Some 500 dwell there, the married couples in separate quarters of their own, and the single in common, the men having separate smoking-rooms and the women sitting-rooms. The inmates are entirely their own masters, and go in and out at pleasure. The food is plentiful and appetizing, and it is even prepared in a separate establishment, in order to save the old folks from the annoyance of odors of cooking.
>
> For the old age of those that miss entering the circle (described above)—those who have once been convicted of crime, or whose poverty is due to drunkenness, vice, idleness, or improvidence—provision is made in Denmark by another class of institution . . . represented in Copenhagen by the Almindelig. This place is neither workhouse, almshouse, prison, nor reformatory, but rather a "hospital" in the old sense of the word, where the aged who have not passed through life without stain may spend their last days in comparative comfort. Among them are certain of the better class of able-bodied failures, who come here hoping to get a fresh start by industry. All the inmates are expected to work according to their powers, and they receive moderate pay, partly (threepence a week) in cash and the remainder being placed toward the cost of maintenance, which works out at seven shillings per head per week, including the sick and infirm. To those who are unable to work the threepence a week is paid as a gift. Most of the inmates remain in the institution for the rest of their lives. They lose the franchise and are subject to certain restraints on their liberty, such as going out at certain times only. Married couples are permitted to live together.

The temperance movement is making great strides in Denmark, and local temperance societies as well as the Danish branch of the Good Templars count more than 100,000 members. The government grants monetary aid to the carrying on of temperance propaganda; and private enterprise provides coffee-houses, etc., to promote the cause.

Cooperation in Denmark in many lines is largely developed and mainly on the Rochdale plan. On the authority of M. P. Blem, the chairman of the Danish Cooperative Committee, it can be said that there are 1,000 societies with about 150,000 members, which do a total business of about £2,000,000 sterling. The Cooperative Wholesale Society of Copenhagen sells to 915 distributive stores. Cooperative creameries number 1,057, and the butter produced from milk delivered therefrom, during the last fiscal year, was valued at £8,400,000. The bulk of the agricultural exports from Denmark are of cooperative origin, the total production of the butter, bacon, and egg societies for export in 1903 being £11,414,000, while the total exports from the whole of the country were under £20,000,000.

There were, in 1902, twenty-seven cooperative bacon-curing factories. This cooperative movement in Denmark, however, is almost exclusively agricultural; the workers in cities and towns having taken comparatively little interest in this phase of social reform. In Copenhagen there are a few cooperative bakeries, notably "Arbejdernes Brödfabrikker" (the workmen's cooperative bakeries). There are also a brewery, a life-insurance company, and a clothing emporium which are partly operated under the auspices of the United Trade-Unions.

The foremost Danish social reform societies are:

Socialdemokratisk Forbund, 22 Römersgade, Copenhagen.

De Samvirkende Fagforbund i Danmark, 49 Nörre Farimagsgade, Copenhagen.

Dansk Forening for Arbejderbeskyttelse, 5 Höjbroplads, Copenhagen.

DENVER: The "Queen City of the Plains," with its phenomenal growth, restless enterprise, varied and, to some extent, chaotic social conditions, has been in many ways the typical Western city. But in some ways it has not been typical. On the one hand, the natural advantages of the city, with water, drainage, transit, unusually easily developed, have freed the city from any vast expensive municipal expenditures with their opportunities for large graft or corruption (except indeed for the $2,000,000 state capitol); but, on the other hand, political conditions have created party machines which have stuffed ballot-boxes and violated laws at least more openly and probably at times more flagrantly than in any other American city. But these political conditions, in almost all instances, have been due to state conditions rather than to municipal affairs. They have been due principally to the heated struggles in Colorado, first, between the Populists of the state and the Republican machine, and more recently between the Western Federation of Miners and the owners of the Telluride and Cripple Creek mines, and other corporate interests, largely using the political machines of all parties. To these struggles Denver has been but an incident, tho the unfortunate seat of many of the bitterest political battles.

This is true of the Bucklin amendment campaign of 1902, of the political reign of terror in 1893, of the heated struggle between the Populists and Republicans in the Waite campaign of 1894, and in the more recent sensational conflict to seat their respective candidates between the Democratic machine, which claimed the governorship for Alva Adams, and the Republican machine, which claimed it for James H. Peabody. In this campaign, at the polling-booths, in the law courts, and before the legislature, probably every kind of trickery was used by both parties. The ballot-stuffing was so open that finally forty ballot-box stuffers in Denver were sent to jail. But it was nevertheless a Colorado battle and not a Denver battle, and essentially a battle between the working miners and their political partizans and the corporations and their political partizans. Nevertheless Denver reaps the harvest of evil. Some one third of the voting population of the state is in Denver, and the city sees at election times a carnival of wholesale bribery and corruption.

Electoral Corruption

Back of this corruption, too, are undoubtedly, as in most cities (see CORRUPTION), the corporations which support the corrupt machines, because they can buy from them the franchises and legal immunities they desire. Among such corporations are said to be the Denver water, gas, and telephone companies, and not least the Denver Tramway Company, with such industrial corporations as the Smelter Trust, Sugar Trust, and the various mining companies. The economic struggle in Colorado will probably not be ended till these companies can be prevented from violating law in the courts and houses of legislature and the miners' unions be prevented from violating law on the streets.

Political reform in Denver began in 1889, when Mr. Pence succeeded in ousting from his seat a mayor fraudulently counted in. The Chamber of Commerce in 1892 appointed a committee to draft a new charter, which, after many defects, was finally adopted, substantially on the lines proposed by the Chamber of Commerce. In 1894 a Municipal Reform League was organized and did good work, tho to-day this movement is represented by the League for Honest Elections, organized in 1903. According to the present charter, the mayor has much power, appointing the health and park commissions, the superintendents of street-cleaning supplies, and the important boards of public works, fire, and police, but the treasurer, auditor, city clerk, besides the mayor himself, are elected by the people.

Political Reform

Denver with its wealth and energy has, in spite of its electoral corruption, good schools and institutions of higher learning, a library of 90,000 volumes, art museum, twelve public parks, fine clubs, and considerable admirable civic life. A large transient population and uncertain mining prospects often afford sudden need for help—but, generally speaking, there is not a great permanent need for relief, and little but the usual forms of charity are developed. The People's Tabernacle, under Rev. T. A. Uzzell, is prominent in institutional activities, but many churches and societies afford much relief.

Charities

The following are some of the more prominent reform and philanthropic societies:

League for Honest Elections, 709 Ernest Cranmer Building.
American Federation of Labor, Max Morris, vice-president, Sixteenth and Lawrence Streets.
Colorado State Federation of Labor, 532 Charles Building.
Western Federation of Miners, Pioneer Building.
Socialist Headquarters, 1842 Chamfa Street.
Charity Organization Society, 1420 Chamfa Street.
Young Men's Christian Association, 16 Lincoln Avenue.
Young Women's Christian Association, 125 East Eighteenth Avenue.
People's Tabernacle, Twentieth and Lawrence Streets.
Salvation Army Headquarters, 918 Lawrence Street.
Volunteers of America, 1759 Chamfa Street.
Woman's Christian Temperance Union, 918 Lorimer Street.
Women's Club, 1437 Glenward.

DENSITY OF POPULATION. See POPULATION; OVERCROWDING.

DEPARTMENTS OF U. S. GOVERNMENT. See CONSTITUTION.

DEPENDENTS. See CHILD-HELPING; PAUPERISM and POOR RELIEF.

DEVINE, EDWARD THOMAS: General Secretary of the Charity Organization Society of New York; born in Iowa, 1867; graduated at Albion Seminary and Cornell College, Iowa (1887); taught school in Iowa; studied at Halle, Germany, 1890–91; held fellowship in Walton School of Finance and Economy, University of Pennsyl-

vania, 1891–95; staff lecturer in University Extension, 1891–96; lectured at Oxford, England, summer of 1892 and 1894, and in Edinburgh (1897). Since 1896 General Secretary of the Charity Organization Society of New York City, taking an active part in housing reform legislation for the restriction of child labor, the movement for the prevention of tuberculosis, and emergency relief in disasters. Founded in 1898, *Charities*, a weekly periodical, and has since been its editor. Four periodicals, *Lend-a-Hand*, *The Charities Review*, the Chicago *Commons*, and *Jewish Charity* have been consolidated with it. Director of the School of Philanthropy established by the Charity Organization Society in 1904. In 1905, appointed Professor of Social Economy, Columbia University. In 1906 was appointed by Secretary Taft, to take charge of the emergency relief work for the San Francisco earthquake and fire, and was president of the Relief Commission. He is author of "Economics" (1889), "The Practice of Charity" (1901); "The Principles of Relief" (1904); "Efficiency and Relief" (1906); and of numerous reports and articles. *Address*: 501 West 113th Street, New York City.

DEWEY, DAVIS R.: American statistician; born at Burlington, Vt., 1858; educated at the University of Vermont and at Johns Hopkins University. In 1885 he became instructor in economics and statistics at the Massachusetts Institute of Technology, and later professor of the same subjects. In 1886 he was appointed secretary of the American Statistical Association; and he was special expert agent on wages for the twelfth census. Dewey was chairman of the Massachusetts Commission to Investigate the Subject of the Unemployed (1894), and is one of the joint authors of the report. He has written "Syllabus on Political History since 1815" (1887); "Financial History of the United States" (1902), etc. *Address*: Massachusetts Institute of Technology, Boston, Mass.

DICKENS, CHARLES: English novelist; born at Landport, Hampshire, 1812. Entering life as a parliamentary reporter and journalist, he early won that insight into life which enabled him to portray alike the sufferings and wrongs of the poor and the follies and shams of society. His "Pickwick Papers," published in 1837, exhibited almost for the first time the life and manners of the lower, middle, and working classes of London in the nineteenth century. "Nicholas Nickleby" attacked the wrongs and cruelties inflicted upon the wretched pupils of the cheap schools in Yorkshire; "Hard Times" mocked the commercialism of the day; all his novels, such as "Old Curiosity Shop," "Martin Chuzzlewit," "Dombey and Son," "Bleak House," "Little Dorrit," "Great Expectations," "Oliver Twist," and "David Copperfield" have served the cause of social reform by picturing, tho ever with good nature, and always with an eye for the ludicrous, the sufferings and wrongs of the poor, the foibles and delusions of society. Dickens, who visited America twice, died in June, 1870.

DIKE, SAMUEL WARREN: American Congregational minister and secretary of the National League for the Protection of the Family; born at Thompson, Conn., 1839; was graduated from Williams College, 1863; studied also at Hartford and Andover; ordained 1866; held ministries at West Randolph and Royalston, Vt. Mr. Dike had long given much thought to the family and its problems, and in 1881, when asked to deliver one of the Monday lectures in Boston, he took the ground that the divorce question is but a part of the larger problem of the family, and that this, in turn, is intimately related to the problems of property. That year a New England Divorce Reform League was organized, later changing its name to the National League for the Protection of the Family, and Mr. Dike became its corresponding secretary. He has been largely instrumental in securing reports of the Commission of Labor on marriage and divorce, and in the establishment of state commissions on uniform legislation. He also led in what has been known as the Religious Problem of the County Town, having proposed and assisted in the widely known statistical investigation of Rev. Henry Fairbanks, in Vermont; invented the Home Department of the Sunday-school, now extending over the country in many churches; and helped introduce the study of scientific sociology in higher educational institutions, where he is a frequent lecturer. *Address*: 113 Hancock Street, Auburndale, Mass.

DIRECT LEGISLATION (or THE INITIATIVE AND REFERENDUM): Direct legislation in small communities is the New England town-meeting, the present Swiss and ancient Teutonic *Landesgemeinden*, the Anglo-Saxon folkmoot, the Russian *Mir*, the old Greek and Latin *agora* or market-place meeting, or any other meeting in which the people actually propose and vote on their own laws, in an orderly and deliberate manner.

In communities too large for the voters to assemble in one body and consider and pass on the laws by which they are to be governed, direct legislation is attained by an adaptation of the old, highly valued, and nearly useless right of petition in what is called the Initiative and Referendum. Petitions in the past to kings, governors, legislatures, etc., may have been influential, but have had no real power in determining laws; and when, as actually happened in the New Jersey legislature, a petition signed by several hundred thousand citizens is rumpled up by the legislators and tossed from one to the other in disdain, the people have absolutely no redress. The Initiative and Referendum infuses new life into the worn-out right of petition.

By the Referendum no law goes into effect until a reasonable time has elapsed. In a city this may be one month, in a state two or three, in the nation four to six months. From this are excepted a limited class of urgent measures usually defined as measures necessary for the immediate preservation of the public peace, health, or safety. Generally these must be passed by a two thirds or three fourths majority of the legislature. If, during this reasonable time, a minority of the people, usually five per cent, sign and file a petition for the reference of any law, it is held from operation, till the next election when the people vote on it, a majority enacting or rejecting. This is the Optional Referendum, and is implied where the word "Referendum" is used alone. But there are several other varieties. The Obligatory Referendum, by which every law has to be referred to the people, is used on constitutional amendments in every state ex-

Definitions

cept Delaware. It is in use in some parts of Switzerland, but in the United States it is rarely advocated for all forms of legislation. The Executive Referendum is one by which the executive has the right to hold up a law and refer it to the people; while the Legislative Referendum is one by which a minority of the legislature has the same power. The Judicial Referendum gives a supreme court the right to declare a law unconstitutional, so that it is held from operation until the next election, when the people vote on it, a majority vote in its favor rendering it a law notwithstanding any constitutional infringements. This makes the people supreme over the supreme court.

The Referendum is negative or preventive; it gives the people the veto power over bad laws. The Initiative is positive and constructive. It makes it possible for the people to get what they want, and enables an active minority to educate the masses. By it, whenever a reasonable minority of the voters (sometimes five per cent, sometimes eight per cent) sign and file a petition for a law or ordinance, the measure goes to the legislature where it takes precedence over all other matters. The legislature can do anything it wishes with this measure: pass, amend, or reject. But if it does not pass it as petitioned for, the people vote on it at the next election, a majority vote deciding its rejection or enactment independently of legislature and governor.

The Initiative and Referendum together constitute Direct Legislation, or a simple method by which the people can control their own lawmaking all the time. It does not abolish legislatures; it does not mean that all laws will be submitted to the people, or even that many laws will be submitted. The fact that the people can use it at any time makes its frequent use unnecessary. It does not detract from the honor or dignity of the legislature; but instead, by taking away the final power of law-enacting, it removes the danger of bribery, lifts the legislators above suspicion, and makes them true to their old name, "Councilors to the People."

De Tocqueville says that the only way to interest people in their government is to make them partake in it. Direct legislation makes every voter a potential legislator, and hence interests him. It allows one section of the people most interested in some law to propose that law, force a public discussion and consideration by every voter, not on the character and promises of some candidate for office, but on a definite and real measure. Thus it is a great educational scheme. Further, each law has either an actual or a silent majority behind it, and it can be enforced. The disgrace of non-enforced or unevenly enforced laws does not exist when Direct Legislation has long been used. As the people have to understand the laws, they are made short, simple, direct. Our laws, made hurriedly in unhomogeneous legislatures pulled this way and that by varied business interests, are complex, ambiguous, and multitudinous.

Advantages

Direct Legislation is only a simple method of gaining popular government, or government by the people. As such its history goes back into the mists of antiquity. But the novel and ingenious adaptation of petitions to this end was begun in Switzerland about a century ago and has developed furthest there. Nearly three centuries ago the colonies of Plymouth and Rhode Island actually put into force for a while the use of petition almost exactly in the manner we now call the Initiative and Referendum, but there was no general necessity for it then, as legislators were seldom bribed; and so to Switzerland belongs the honor of developing the system of petitioning into that of the Initiative and Referendum.

In the United States the first organization to promote Direct Legislation was formed in New Jersey in 1891, and was known as The People's Power League. It was changed the next year into The Direct Legislation League of New Jersey. Since then state leagues have sprung up in twenty or thirty states, and are to-day active in fifteen to twenty. There are no exact statistics available, and from the nature of the case none are likely to become available. Each state must care for itself. If it does the rest are encouraged; if it does not it is its own fault or misfortune. In 1896 the National Direct Legislation League was founded, and later one or two other national organizations were formed with similar objects. The National League, however, is little more than a bureau of information, and a clearing-house for Direct Legislation news, carried by its president under his hat. In 1892 Sullivan's book on Direct Legislation was published, and in 1894 he began *The Direct Legislation Record*, which was carried on by Mr. Eltweed Pomeroy from 1895 to 1904. The book, this little paper, and some pamphlets were the slender means of propaganda used by this movement. But the very fact that there are no offices or jobs in Direct Legislation, and no strong organizations with hierarchy of officers to draw in large funds and spend them more or less ineffectively, making great noise before the public, has really been a source of strength among the quiet workers all over the country. Without much noise or newspaper notice, Direct Legislation has grown.

In the United States

The South Dakota legislature passed a Direct Legislation constitutional amendment in 1897, which the people adopted by an overwhelming majority; and the laws to carry it into effect were passed later. Next Utah followed the example of South Dakota; but tho the people carried the Direct Legislation amendment by a large majority, they also changed the political complexion of the legislature, and the succeeding legislatures have not passed the necessary laws to carry the people's will into effect. Direct Legislation will therefore remain an unused and unusable part of the Utah Constitution till the legislature permits. This is a fine illustration of the need for Direct Legislation, when legislatures can thus thwart even the exprest will of the people. Oregon followed next with the best drawn amendment yet adopted, and so thoroughly were the people roused to its value that two measures were voted on and carried at the Congressional elections in June, 1904, and nine at the election in June, 1906. One of these extended Direct Legislation to all the cities of Oregon. It has worked a great change and improvement in the legislature, and the people could not now be persuaded to drop it.

Nevada got a constitutional amendment in 1904; while the people of Missouri rejected a very faulty one in the same year. The people of Montana will have, at their next election, the opportunity to pass on a fairly good one. One house of the legislatures of Massachusetts, New York, Pennsylvania, Ohio, Kentucky, Michigan, Wisconsin, Iowa, Kansas, Nebraska, Colorado, North

Dakota, Arkansas, Washington, and California, have passed constitutional amendments introducing Direct Legislation.

In city government Direct Legislation has made great progress. Almost every city of the Pacific Coast states has it. Denver has a badly drawn form. Minneapolis, Detroit, Nashville, and other cities have it on the granting of franchises. It is applied very widely to the liquor question, usually under the title of "Local Option"; and great states such as Georgia, Tennessee, and Arkansas are under a thoroughly enforced prohibition by local option or local Direct Legislation on the licensing of the sale of liquor. Every year the cities of Massachusetts, Vermont, and New Hampshire vote on the license question. Many other subjects are continually being referred to the people. No other reform has made the quiet, yet sturdy, rapid, and satisfactory progress that Direct Legislation has in the last ten or fifteen years, and the outlook is very encouraging.

Foreign Countries

Canada has shared in the movement, and progress has been made in cities so far apart as Victoria and Toronto. Abroad there is a faint movement in England. A much stronger one exists in France, particularly for municipal Direct Legislation, and substantial progress has already been made in embodying it into an institution. The same is true of Norway. In Switzerland, its home, it is more fully developed and applied than anywhere else on the globe, and only an act of extreme violence could tear it from the Swiss statute-books.

Australia has a genuine movement which as yet has not enacted any laws on the statute-books; but in New Zealand it is used on the liquor and taxing questions, and the signs point to the adopting of a general Direct Legislation law within the near future.

The arguments usually advanced against Direct Legislation are that the people will not vote on a dry measure; that they require a principle to be embodied in a personality to rouse them to vote. It is true that dry, unimportant measures do not call out a large vote. It is also true that important measures do interest the people. Thus, in many of the cities of Massachusetts there is often a larger vote on the annually submitted question of licensing saloons than is cast for governor of the state or president of the United States. It is an important question regularly submitted. But even supposing it to be true that fewer votes would be cast for measures than for men, as long as every voter was free to cast his vote, this would only be an automatic, self-disfranchisement of the ignorant and uninterested.

Objections

Some people speak of the great expense of Direct Legislation. It does not mean frequent votings. Switzerland has held less than one election a year on measures. Oregon has held two in five years; San Francisco only two or three in six years. South Dakota, as a state, has not yet used it a single time. The very fact that it can be used at any time prevents the frequent necessity for its use. But suppose it did cost double, treble, tenfold what our present system does, it would pay for itself if it saved one legislative job. Probably, if it was extensively used in every state, the total cost for its use for a score of years would not equal the expense to the state of one such lobbyist as Andy Hamilton, or Col. Bill Phelps, or many another.

Others say the people cannot understand these abstruse and complex legislative questions. True, and rarely do the lawyers, judges, and whatnots that we have to interpret them to us, understand them. A judge of the U. S. Supreme Court has been known within two weeks to change his opinion on the meaning of some phrase. But the people will see that the laws are simple and understandable; else they will vote them down. They have done this in Switzerland, where the laws are such that the ordinary man can comprehend them. Compare the more than 25,000 measures introduced in the last Congress, of which between 4,000 and 5,000 were passed, with the less than 100 introduced in the Swiss legislature, of which a little more than a score were passed! It were better to have no laws than to have laws the people cannot understand.

A few persons boldly say that the people cannot govern themselves; and with the man who believes that there is no use arguing. But inasmuch as our revolutionary fathers fought for the right to govern themselves, inasmuch as our Civil War was on this same great issue, it would be advisable for such a man either to keep quiet or to move out of this country to some more appropriate land. But the very man who wants to govern others is rarely willing that others shall govern him.

There are three classes of people who oppose Direct Legislation: (1) The few who really believe the people are not fit to govern themselves. These are comparatively unimportant save as they become honest tools for (2) the second class which is our predatory rich, who want franchises, special privileges, jobs, grafts, etc., etc., and who have fattened on these in the past. These people know that it is much easier to get such franchises, jobs, grafts, etc., from the representatives than from the people. They are a powerful class at present, but their power is decreasing. They have defeated Direct Legislation in many a legislature, and they will continue to do so for a time. But like the well-known little animal, drive them into the open and they can be beaten. (3) The third class is the lawyers, hangers-on, and dependents of the second class, and those who expect to get favors from them. This is a large class, larger than most people imagine. But with publicity this class will shrink like snow in summer.

The only other obstacle to the progress of Direct Legislation is the inertia of the people. Many have not felt that we needed it. But the insurance inquiry, and many other legislative investigations, are continually making converts; and we may expect an increasing strength to the Direct Legislation movement, and its rapid spread. Only one thing can hinder its advance, and that is that the people do not use it when it is adopted. Vigilance is the price of liberty, and no system can take the place of vigilance. We must use Direct Legislation when we have it, and use it wisely, or we will not be fit to extend its scope and strength.

With the continual spread and use of Direct Legislation there will come an education of the people on public questions little dreamed of now; there will come a sense of social solidarity and unity, a feeling that we are equals and brothers, a real birth of the social consciousness. And after we have become conscious that we each and all belong to a social organism that is far greater than all of us, and that can and will and must

create much of the environment on which we all depend for real living, then will come the social conscience which will use Direct Legislation as the powerful hand by which the now almost dormant and infantile, but then vivified and regnant, social organism can reach out and execute its will. Then will come a change in our civilization little dreamed of. A Referendum, as a Swiss statesman once said, is a real and vital communion or common action for the common benefit. And Direct Legislation is to be the communion stirring the social organism to a consciousness of its own existence, and again stirring it more and more by the value of these communions, till the social conscience is aroused, and then it will be the tool by which this social conscience can carry out its will, ever attempting and ever coming nearer to success in making a heaven on this earth. Such in the dream of democracy, for which those who believe in Direct Legislation work and wait.

ELTWEED POMEROY.

DIRECT NOMINATION: A system of nomination to public office which does away with the nominating convention. On the day fixt for registration of voters before an election, any voter may cast a ballot for the candidate of any political party he chooses, regardless of his previous party affiliation. The ballots are secret, as in elections, and are provided by the state. Any one who is eligible may be a candidate for any office if he file an affidavit declaring it to be his bona fide intention to run for the nomination to the office. The candidate receiving the highest number of party votes thus becomes the candidate of that party.

This system was adopted in 1899 for nominations to certain offices in Hennepin County, Minnesota, the county containing Minneapolis. It resulted in the election of a mayor whose administration was not considered a success. In 1902, however, it was tried for the whole state of Minnesota, excepting for such state officers as governor, secretary of state, etc. The result was eminently successful. Efforts to repeal the law have failed, and the idea is spreading to other states.

REFERENCES: *Nominating Systems*, by Meyer; *Detroit Conference for Good City Government*, 1903.

DISPENSARY SYSTEM, IN THE LIQUOR TRAFFIC (South Carolina): This system, inaugurated in South Carolina in 1893, in 1906 was, through political efforts, given up as a system conducted by the state, but is still in use, only now being conducted by counties.

It is a compromise between two conflicting remedies. What was intended to be a decisive battle between these two remedies was fought in this state in 1892. In that year the license system was in vogue in most of the counties of this state. In some few the liquor traffic was prohibited. It was sought to extend this prohibition to the entire state. The Democracy carries all elections in this state and its nominations are made primary elections. In 1892 the Prohibitionists were strong enough in South Carolina to force the State Democratic Executive Committee to provide special boxes in the primary held that year in which the Democratic voters could express a preference between license and prohibition. There were more votes for prohibition than for license, but the number of those who voted for prohibition was exceeded by the number of those who did not vote at all, thereby showing that neither solution was satisfactory to them.

B. R. Tillman, now United States senator, was at that time Governor of South Carolina. When the legislature met in the winter of 1892 a prohibition bill was introduced and its passage was urged on the ground that a majority had voted in the primary in favor of prohibition. All test votes showed that it had a majority in the legislature and would pass. While Mr. Tillman is by habit practically a teetotaler, he was opposed to the enactment of a prohibition statute for South Carolina, as he believed that it would aggravate rather than relieve the evils it was aimed at. His judgment was that no law can be enforced which is not believed in and supported by a majority of the people who must live under it. While a majority of those who voted had voted for prohibition, those who had so voted were not much more than a third of the white voters of the state. In this dilemma it was brought to his attention that the city of Athens, Ga., conducted a municipal dispensary for the sale of intoxicating liquors. He studied the Athens idea with the result that he broadened it out to fit a whole state.

The prohibition bill before the legislature was amended at his instance so that it became the dispensary law. Six months were given those in the liquor business in this state in which to dispose of their stocks, and the dispensary law went into effect on July 1, 1893.

It was an innovation, and met the usual fate of innovations, no matter how pregnant with promised benefit. It was fought with relentless fury. The ablest lawyers in the state were retained to fight it in the courts. Legal attack after legal attack was aimed at the dispensary law, to have the courts set it aside as unconstitutional. These fights were carried through all the courts, even the Supreme Court of the United States. The dispensary withstood all these fights, and now it is *res adjudicata* that the state has the right to sell liquor as an exercise of its police power. This principle has been affirmed by the highest legal tribunal of the land.

But it was not only in the courts that the dispensary law was fought. It had to meet political attacks no less fierce. The fire came from the two extremes which the dispensary sought to compromise. The liquor dealers did not relish being driven out of their profitable business. They and their friends sought to put out of office those who favored the dispensary law. They were too shrewd to make a direct fight. Until the dispensary law had a chance to prove its benefits by its operation, it was bitterly attacked by the prohibitionists. The element in favor of liquor selling by individuals backed the political fights of the prohibitionists, believing that if a prohibition law were enacted, its operation would be so unsatisfactory that the state would return to the license system of regulating the sale of liquor. The experience of some other states gave ground for this hope.

But the dispensary was as successful in meeting this fight as it had been in withstanding the legal attacks. It has been in operation thirteen years and has more than fulfilled the hopes of those who devised the experiment. It is no longer an experiment. Among its stoutest champions to-day are many prohibitionists who were once its deadliest enemies.

I have prepared a comparison which is instructive. Maine and Kansas have prohibition laws.

Massachusetts tried prohibition and then gave it up in favor of what is generally regarded as the best law for license regulation of the liquor traffic. It is a local-option law, with a license fee of not less than $1,000. The number of licenses that can be issued is limited to one to 1,000 inhabitants, except in Boston, where the limit is one to 500.

In the comparison I make, the figures of population are from the U. S. Census of 1900, while the revenue figures are from the report of the U. S. Commissioner of Internal Revenue, for the fiscal year ending June 30, 1903.

In Maine, with a population of 694,466, there were 958 retail liquor dealers, 14 wholesale liquor dealers, 408 retail dealers in malt liquors, and 37 wholesale dealers in malt liquors.

In Kansas, with a population of 1,470,495, there were 2,822 retail liquor dealers, 22 wholesale liquor dealers, 303 retail dealers in malt liquors, and 107 wholesale dealers in malt liquors.

In Massachusetts, with a population of 2,805,346, there were 4,898 retail liquor dealers, 215 wholesale liquor dealers, 194 retail dealers in malt liquors, and 402 wholesale dealers in malt liquors.

Compared with Prohibition

In South Carolina, with a population of 1,340,316, there were 490 retail liquor dealers, 3 wholesale liquor dealers, 44 retail dealers in malt liquors, and 10 wholesale dealers in malt liquors. In South Carolina, 113 of the retail liquor dealers, 2 of the wholesale liquor dealers, 33 of the retail malt liquor dealers, and all of the wholesale dealers in malt liquors were state officials, selling according to law. The others were illicit dealers.

To make the comparison more instructive, it must be remembered that the percentage of negroes who drink is greater than that of whites. The percentage of illiteracy among the negroes is also greater. The records of the criminal courts of South Carolina show that the negroes have much less regard for the laws of the land than the whites.

South Carolina has 782,321 negroes, while the total of the other three states cited is but 85,296, as follows: Kansas, 52,003; Maine, 1,319; Massachusetts, 31,974.

Prohibition Kansas, with 130,000 more population than South Carolina and less than one fifteenth as many negroes, had nearly six times as many retail liquor dealers, more than seven times as many wholesale liquor dealers, about seven times as many retail dealers in malt liquors, and nearly eleven times as many wholesale dealers in malt liquors.

Prohibition Maine, with about half the population of South Carolina and practically no negroes, had about twice as many retail liquor dealers, five times as many wholesale liquor dealers, nearly ten times as many retail dealers in malt liquors, and nearly four times as many wholesale dealers in malt liquors.

In the face of these official figures, how can it longer be contended that prohibition prohibits? The test of practical results is all in favor of the dispensary.

In South Carolina the state admits that men will drink and therefore it is best for the state to control the sale of liquor by its own officers. This control eliminates the selfish interest, for the liquor is sold by salaried officers, who have no incentive to increase the sale of liquor, such as saloon-keepers have. The liquor they sell is sold under the state's guaranty of proof and chemical purity. Whether a citizen buys fine or common liquors, he knows he is buying pure liquors. This minimizes the effect of liquor-drinking on his system. The case is otherwise in prohibition states. The risks of the business there are such that the liquor dealers handle largely the very cheapest, commonest liquors and the drinkers are willing to pay as high or higher prices therefor as drinkers in other states pay for pure liquors.

In South Carolina liquor can only be sold between sunrise and sunset. This eliminates night drinking. It can only be sold in sealed packages of not less than a half pint nor more than four and seven eighth gallons and cannot be drunk on the premises where sold. This goes a long way toward abolishing the treating system, which is generally regarded as one of the very worst features of the liquor business in license states and is principally responsible for over-indulgence in alcoholic beverages. There is no credit. Cash must be paid for the liquor. Consequently the workingman's wages are not dissipated by credit drinking at a saloon before pay day comes. Liquor cannot be sold to drunkards or minors. License laws ordinarily have such a restriction, but it is usually inoperative because it clashes with the selfish interest of the licensed liquor seller. In South Carolina it operates because increase of sales does not mean more profits to the salaried officer who conducts the sale of liquor. There is no inducement to drink liquor, no gilded bars and comfortable loafing-places where intoxicating beverages are sold. All the tinsel is torn away and a man buys liquor as he goes into a grocery store to buy bottled pickles or catchup to carry home for use. The consequence is that even those who had formed the habit of drinking before the dispensary law was passed drink much less than they did when the bars were in operation and the rising generation have no temptation to acquire the liquor-drinking habit. Sobriety steadily increases with the length of operation of the dispensary law.

Methods

Aside from its other good features, the dispensary law has especially commended itself to the women of the cities of South Carolina because it has done away with the saloons and their attendant crowd of loafers, who stood around the front doors and ogled women as they passed by. This is probably the first feature of the good work of the dispensary law to attract the attention of visitors from other states, especially women visitors. They never fail to comment upon it and praise the dispensary system.

All supplies for the dispensaries are under the supervision of county boards of three members, who elect the officers in charge of the retail sales thereat. The supplies are invoiced to the retail dispensaries at a price which nets about 6 per cent profit. Under the law it is not allowed to exceed 10 per cent. The revenue from this source is about $125,000 annually, which is covered into the state treasury for use for school purposes. The retail dispensaries sell at prices which net about 16 per cent profit. This revenue amounts for the entire state to about $500,000 annually. The profits of each county dispensary are divided equally between the county and the municipal corporation in which it is located. They are covered into the general funds in their treasuries. The governor of the state has charge

of the enforcement of the law against illicit liquor sellers. For this purpose a force of special constables is provided. Any county which does not want a retail dispensary within its limits can so declare by vote. In that case it does not share in the profits of the dispensary and must pay a small special tax for the expense of the enforcement of the dispensary law within its limits.

According to the U. S. Census of 1900, the amount of whisky drunk in the U. S. per capita is $17.33. In South Carolina, according to the same census it was only $4.47, under the dispensary law, giving the blind tigers credit for selling one third of the whisky drunk in South Carolina. By blind tigers is meant illicit sales.

W. O. TATUM,
Superintendent Dispensary Commission.

ED.—This system is still opposed by most prohibitionists and others on principle. But many prohibitionists are inclined to accept the law as a stepping-stone to more rigid legislation.

In 1899 the directors of the Massachusetts Total Abstinence Society sent out a list of questions to responsible parties in South Carolina and some of the North Carolina and Georgia counties which have also tried the dispensary system, with the following results: *Question.*—What is your estimate of the value of the system? *Answer.*—18 in favor, 7 opposed. *Ques.*—Are the results growing better as the years advance? *Ans.*—17 favorable, 5 opposed. *Ques.*—Is there an apparent increase in the illicit traffic? *Ans.*—11 favorable, 6 otherwise. To these and some other questions there were in all eighty-five answers, 60 or 70 per cent favorable to the system, while some of the unfavorable ones had important qualifications. According to the investigation of Messrs. Rowntree and Sherwell, as recorded in "The Temperance Problem and Social Reform," not only has the ordinary saloon been abolished, but the places for the sale of drink have been greatly reduced in number, the hours of sale have been shortened, sales to minors are not allowed, sales on credit have been done away with, and gambling and the immoral accessories of the public house no longer exist" (p. 425). In 1892 there were 613 bars in South Carolina; in 1899 there were 92 dispensaries. In 1892 there were 285 bars in Charleston; in 1899 there were 10 dispensaries. The arrests for drunkenness have diminished rapidly. In 1890 there were 14.57 for every 1,000 inhabitants in Charleston; in 1898 there were 5.11. Messrs. Rowntree and Sherwell say: "Alike in South Carolina and in Scandinavia, the appropriation of the profits of the trade is open to objection." The prohibitionists point to the fact that there has been increase of sales of liquor in the dispensary system (which may simply be that the system is more widely adopted) and they claim that comparing the six years under license (1887–92) with six under the dispensary system (1895–1901) there has been an increase in assaults and homicides in the state. But this is also true in some other states and may be due to other reasons. See TEMPERANCE.

DISTRIBUTION: In political economy distribution refers to that large and important part of the subject which studies the division of products among the independent individuals, or classes of individuals, who compose the society. As the elements that contribute to production are usually classed as labor, capital, and natural objects or agencies, the fundamental formula of distribution is usually exprest thus:

Produce = Rent + Interest + Wages, where,
Produce = the increase made in material wealth, the net produce that remains after any auxiliary capital that may have been consumed is replaced;
Rent = the total amount received annually for the use of natural objects and agencies;
Interest = the total amount received annually for the use of capital;
Wages = the total amount received annually in remuneration for labor of whatever kind.

In the above equation we include under "wages" the remuneration of employers for the work of organizing, and supervising the labor of others; we include under "interest" what is usually called rent, so far as it is paid for anything that has been produced by labor; and we limit the word "rent" altogether to payments made for the use of land and other gifts of nature.

It is greatly to be regretted that in this, and other instances, we are compelled to use words in other than their ordinary meaning; but where ordinary parlance confuses things fundamentally different, such as the "rent" of a house, and the "rent" of land, things which depend on altogether different laws, our only alternative would be to invent new terms, the signification of which it would be still more difficult to understand.

The difficulty is perhaps most serious in the case of the word "wages." If the word "profits" could be taken to express the earnings of employers for the labor which they undergo, our equation might be put into the form Produce = Rent + Interest + Profits + Wages. For some purposes this would be the most convenient form of the equation. But the word "profits" is almost invariably used to include interest on capital, as well as remuneration for employer's labor, and if so used, the second form of the equation would count twice over one portion of interest. The balance of advantage seems therefore in favor of the earlier form of the equation.

In reference to distribution in general two questions may be, and in economic science have been, more or less carefully asked: What is the share, and what in equity should be the share of these various elements? As each question, however, in regard to each element demands in itself a long discussion, each is entitled to a separate article, and will be considered under the respective subjects of Rent, Interest, Profit, Wages. Thus far in political economy the question mainly asked as to distribution has been: What share, as a matter of fact, can rent, interest, and wages get, where each element is competing to get all it can? This was to Adam Smith and his followers the main question, because, experiencing the evils of the unwise state interference of the day, they believed that the best state of affairs for the public was where there was no interference, but where every one was left free to secure whatever share in the distribution he could. Believing also that every one was best able to look out for his own interests, they held that it was for the general good for each one to do this. They asked what share under this condition each one could get, believing that in the long run this was also the right share for him to get. More recently, and mainly beginning with Mill, men have asked more and more the ethical question, what share each should get. It has been seen that under the free play of private interests, persons monopolizing the ownership of natural agencies and opportunities, or abundant capital, were able to get a vastly larger share than those who had only their labor to dispose of. Men must live, and when they have only their labor to dispose of they must sell it day by day, as a rule, in order to earn a living. Those who have large capital or ownership of large natural opportunities to fall back upon, are, on the other hand, not compelled to sell until they can get good prices. Natural opportunities, again, cannot be indefinitely supplied, and can be and have become largely monopolized;

whereas, under the process of life, the supply of labor is much more abundant, and therefore the limited supply of natural opportunities enables rent to rise, while the large supply of labor tends to make wages fall; or, if other causes raise wages, to prevent wages from rising in proportion to rent. For these and other causes it is claimed by Socialists and others that the free play of private interest between rich capitalists and landlords and poor laborers is not fair play, and not truly free play, since the capitalist and landlord are comparatively free, but the laborer is often the slave of his circumstances. Hence the question is rising more and more as to what should be the basis of division, and many proposals have been made. It is proposed that laborers combine to get a larger share. Hence we have Trade-Unions, Knights of Labor, etc. It is proposed that capitalists and landlords give a larger proportion of the produce to the laborers than they are able to secure by mere private struggle. Hence we have proposals for profit-sharing and various charities. It is proposed that laborers combine to be their own capitalists and landlords; hence we have all sorts of cooperative and communistic experiments. It is asserted that the wealthy classes have so much power in their hands that private cooperation cannot succeed in competing against them, and hence it is proposed that all the people, through government (municipal, state, and national), secure all the means of production (capital and land, so far at least as land is used for production), and operate them collectively for the equitable good of all; the people thus being their own employers, capitalists, and landlords. Hence we have Municipalism, Nationalism, Socialism. It is claimed that capitalists and landlords have been able to secure, and are to-day able to maintain their large share in distribution, only through the favoritism of the government. Hence we have proposals for free trade, the single tax, or the freeing of competition after land has been removed from private appropriation, the extreme proposals of the very great minimizing of the state in individualism, or the abolition of government in anarchism. It will be thus seen how the large proportion of the social reforms proposed to-day are reforms either in distribution or proposed with the view of affecting distribution. Hence a large proportion of this volume may be said to be concerned with distribution, and for the various proposals the reader must look under the names given above.

It should be added that a few men, and some of them of great ability and even brilliancy, like Edward Atkinson, steadily refuse to recognize distribution as being a more important question to-day than formerly. They assert and undertake to prove that if labor to-day does not receive as large a share in distribution as it should, it is receiving at least a continually increasing share, and that the present so-called Labor Question is but the laborer striving for a still larger share because he has been lifted up to a plane of education and of conscious wants which he has never occupied till now. Hence they argue that all we have to do is to keep on in the operation of allowing the freest play to private interests, only aiming continually more and more at education in the broadest and deepest sense, and at increase and saving in production; so that there will be more to distribute. This position will be discust under the articles WAGES and SOCIALISM. Whether this position be right or not, however, the large majority of economists and workers for social reform believe that the problem of just distribution does press to-day as never before; their books, therefore, are filled with discussions of the various proposals to secure a juster distribution. It has been said that, comparatively speaking, economic thought has solved the problem of the production of wealth, and the question now is mainly how to distribute it. It should be added, however, that a growing number of Socialists argue that our present distribution is unjust because growing out of methods of production radically unjust, and that, therefore, the need is for a thorough change in industrial methods, both as to production and distribution, and beginning with the former. (See SOCIALISM; WEALTH; WAGES; etc.)

DIVISION OF LABOR: When a number of workmen are engaged in any work, we find that each man usually takes one part of the work and leaves other parts of the work to his mates. People by degrees arrange themselves into different trades, so that the whole work done in any place is divided into many employments or crafts. This is termed division of labor, and is found in all civilized countries, and more or less in all states of society which are not merely barbarous.

Such a condition of affairs naturally has both great advantages and disadvantages. Adam Smith's classic statement of the advantages of division of labor has been added to, but hardly surpassed. He found them mainly three:

(1) Increase of dexterity in every particular workman.

(2) Saving of the time which is commonly lost in passing from one kind of work to another.

(3) The invention of a great number of machines, which facilitate and abridge labor, and enable one man to do the work of many.

There can be no doubt as to the increase or dexterity which arises from practise. Any one who has tried to imitate a juggler, or to play the piano, without having learned to do it, knows how absurdly he fails. Adam Smith states that if a blacksmith had to make nails without having been accustomed to the work, he would not make above 200 or 300 bad nails in a day. With practise he might learn to make 800 or 1,000 nails in a day; but boys who are brought up to the nailer's trade can turn out 2,300 nails of the same kind in the same time.

Advantages

Secondly, division of labor saves time. Before one can make anything he must get the right tools and materials; when he has finished one box he is ready to make another with less trouble than the first; but if he must go off and do something quite different, such as to mend a pair of shoes or write a letter, a different set of implements has to be got ready. A man, as Adam Smith says, saunters a little in turning his hand from one kind of employment to another.

In the third place, Smith asserted that the division of labor leads to the invention of machines which abridge labor, because men, he thought, were much more likely to discover easy methods of attaining an object when their whole attention is directed to that object. Workmen invent modes of lessening their labor, and important inventions have been made in this way. Division of labor also leads to invention, because

it enables ingenious men to make invention their profession. The greatest inventors, such as James Watt, Fulton, Roberts, Nasmythe, Howe, Fairbairn, the Stephensons, Wheatstone, Bessemer, cultivated an original genius by careful study and long practise in mechanical construction. The division of labor also greatly assists invention, because it enables each factory to adopt particular kinds of machinery. The division of labor is continually becoming more and more minute, and it is not uncommon to find that the whole supply of some commodity is furnished from a single manufactory, which can then afford to have a set of machines invented on purpose to produce this one commodity.

The economy of inventions is best attained when it is the business of a certain set of people to study every new invention which bears on their particular trade; for each new leading idea with regard both to processes and machinery has many practical applications. Knowledge is acquired in working out one invention that is likely to be of use in seeking for others. If, however, the work of thinking is confined to a few, division of labor is carried too far.

There are other advantages. A deal of labor is often saved by arranging work so that a laborer may serve many persons as easily as one. If a messenger is going to carry a letter to the post-office, he can as readily carry a score. Instead of twenty people each carrying their own letters, one messenger can do the whole work without more trouble. This explains why the post-office is able to forward a letter from any part of the country to the other for two cents. Multiplying of copies is another great gain made possible by division of labor.

When the proper tools and models for making a thing are once provided, it is sometimes possible to go on multiplying copies with little further trouble. To cut the dies for striking a medal or coin is a very slow and costly work; but when once good dies are finished, it is easy to strike a great many coins with them, and the cost of the striking is very small. The printing-press, however, is the best case of multiplication of copies.

Almost all the common things we use now, such as ordinary chairs and tables, cups and saucers, teapots, spoons and forks, etc., are made by machinery, and are copies of an original pattern.

A further advantage of the division of labor is that, when there are many different trades, every person can choose that trade for which he is best suited. Each man will generally work at the trade in which he can get the best wages, and it is an evident loss of skill if the artizan should break stones or sweep the streets. Now, the greater the division of labor and the more extensive factories become, the better chance there is for finding an employment just suited to each person's powers; clever workmen do the work which no one else can do; they have unskilled laborers to help them in things which require no skill; foremen plan out the work and allot it to the artizans; clerks, who are quick at accounts, keep the books, and pay and receive money; the manager of the factory is an experienced man who can give his whole attention to directing the work, to making good bargains, or to inventing improvements in the business. Every one is thus occupied in the way in which his labor will be most productive and useful to other people, and at the same time most profitable to himself.

Lastly, the division of labor allows of local adaptation—that is, it allows every kind of work to be done in the place most suitable for it. Each kind of labor should be carried on where it is most productive; but this cannot be done unless there be division of labor; so that while the French grow wine, weave silk, or make *articles de Paris*, they buy the cottons of Manchester or the coals of Newcastle. When trade is free and the division of labor is perfect, each town or district learns to make some commodity better than other places. In England watches are made in Clerkenwell; steel pens in Birmingham; needles at Redditch; cutlery at Sheffield; pottery at Stoke; ribbons at Coventry; glass at St. Helen's; straw bonnets at Luton, etc.

The localization of industry promotes the education of skill and taste and the diffusion of technical knowledge.

Where large masses of people are working at the same kind of trade, they educate one another. The skill and the taste required for their work are in the air, and children breathe them as they grow up. This is seen particularly in such manufactures as those of glass and pottery.

Division of Industries

Again each man profits by the ideas of his neighbors; he is stimulated by contact with those who are interested in his own pursuit to make new experiments; and each successful invention, whether it be a new machine, a new process, or a new way of organizing the business, is likely when once started to spread and to be improved upon.

In a district in which an industry is localized a skilled workman is sure of finding work to suit him; a master can easily fill a vacancy among his foremen; and generally the economy of skill can be carried further than in an isolated factory, however large. Thus both large and small factories are benefited by the localization of industry and by the assistance of subsidiary trades. But these benefits are most important to the small factories, and free them from many of the disadvantages under which they would otherwise labor in competition with large factories.

Still a large factory has many special advantages.

First, greater economies can be attained by a large than by a small factory in such matters as the arrangement of buildings, steam-engines, and other machinery; and again in such work as that of clerks, doorkeepers, stokers, repairers of machines, etc. One high chimney can make a draft for a large furnace as well as for a small one; one doorkeeper can admit 500 men as easily as fifty.

Again, a large factory can often afford to buy a machine to do work that is done by hand in a small factory. It is true that a small factory devoted to one short stage of the process of manufacture may have the best and most highly specialized machinery. But such a factory would not come into existence until the advantage of having special machinery for this stage had become well established.

Perhaps the greatest economic advantage of large factories is that they can buy in large quantities, and thus both get better prices and save in transportation.

Whatever may be the result of the contest between large and small factories, it appears certain that the division of labor will continually increase. This increase is one of vital importance,

It adds to men's power over nature, and furthers social progress.

There are said to be about thirty-six distinct kinds of employment in making and putting together the parts of a piano; there are about forty trades engaged in watchmaking; in the cotton business there are more than 100 occupations. But new trades are frequently created, especially when any new discovery takes place; thus, there are at least sixteen different trades occupied in photography, or in making the things required by photographers; and railways have produced whole series of employments which did not exist fifty years ago. In the shoe trade, D. A. Wells states, in his "Recent Economic Changes," that there are really sixty-two distinct mechanical employments.

But we must now notice the disadvantages of division of labor. These may not be so numerous, but they are of the utmost seriousness.

Disadvantages

In the first place, division of labor tends to make a man's power narrow and restricted; he does one kind of work so constantly that he has no time to learn and practise other kinds of work. A man becomes, as it has been said, worth only the tenth part of a pin—that is, there are men who know only how to make, for instance, the head of a pin. "Think," says Dr. Josiah Strong, "of making pin-heads ten hours a day, every working day in the week for a year—twenty, forty, fifty years! A nailer . . . does his day's work by pressing into the jaws of an ever-ravenous machine a small bar of iron. . . . Think of making that movement for a lifetime. . . . It admits of little interest and no enthusiasm in one's work; and, worst of all, it cramps the mind and belittles the man. Once the man who made the nail could make the iron fence also; now he cannot even make the nail, but only feed a machine that makes it."

A second disadvantage of the division of labor is that trade becomes very complicated, and when deranged the results are ruinous to many. Each person learns to supply only a particular kind of goods, and if change of fashion or any other cause leads to a falling off in the demand for that kind of goods, the producer is left in poverty until he can learn another trade. At one time the making of crinoline skirts for ladies was a large and profitable trade; now it has ceased almost entirely, and those who learned the business have had to seek other employments. But each trade is generally well supplied with hands perfectly trained to the work, and it is very difficult for fresh workmen, especially when old, to learn the new work, and compete with those who have long practised it. Even if he be fortunate enough to get work, it is humiliating and exasperating to a workman who, at the cost of years of toil and application, has acquired skill, which has become a source of independence and honest pride, to find himself suddenly superseded by a machine and compelled at reduced wages to stand and guide its movements—a service which can as well be, and soon is, performed by a girl. But the laborer not only suffers pecuniarily; he is socially and morally degraded. Division of labor contracts the sphere of the laborer, renders him more and more dependent upon others, dwarfs him mentally, and thus degrades him.

Is it any wonder that labor protests? To adopt a system of compulsory education, which enlarges working men's ideas of liberty, equality, and manhood, and at the same time reduces them to industrial machines, will inevitably result in social disturbances. It is certain that the subdivision of labor cheapens production, and is therefore an economic principle which will prevail more and more in the development of industry.

It is equally and lamentably certain that little or nothing has been done to counteract its baleful effect upon the character of laborers. They cannot afford to become mere automatons at the expense of their manhood. Because machinery can go on forever, it is forgotten that flesh and blood cannot do the same.

There are disadvantages to the community generally apart from those that affect the laborer. When, under the division of labor, a whole town becomes dependent upon one industry, or one branch of one industry, the whole town becomes too dependent upon the condition of that industry. When it is flourishing the town is unhealthily "boomed"; when its industry declines it is "swamped." The discovery of a new method or the invention of a new machine may ruin a whole town or circle of towns. Men become not the masters, but the slaves of machines. They do not possess their tools, but are possest by them.

Once again, division of industry, by developing machine work and transforming the artizan into a tool, displaces handwork and much of the freedom and individuality and beauty and variety and originality that make medieval art work so attractive. It lowers esthetic as well as moral ideas. Machine work becomes the rule.

However, these disadvantages of the division of labor are not arguments for its disuse, but for its modification. Undoubtedly the lowering of a man into a tool is too high a price to pay for advantages in quantity and ease of production of material things; but the question is, whether we may not have the advantages without the disadvantages. To this end various methods are proposed. The most important is perhaps the reduction of the hours of labor. (See Eight-Hour Movement.) This, by reducing the hours when men should do their routine work, would give them increased opportunity to develop and broaden in other ways. Again, nationalists and Socialists would so order society that every man should have the opportunity to labor, so that if demand for one kind of labor ceased he could be sure of being given work in another kind of labor. (See Unemployment.) To these should be added a reform in which all agree—the development of technical and industrial schools, where, if men choose specialties, they can also be broadened by study and development to some extent at least, in other lines. All progressive thought is agreed that stern protest by word and deed must be made against the tendency to reduce the man to a tool.

Difficulties Met

Reference: *The Evolution of Capitalism*, by J. A. Hobson.

DIVORCE: The dissolution of marriage is essentially a social problem; and it has been solved in many ways by the different peoples of the earth. The experience of backward races is especially enlightening. Recent research has disclosed an immense mass of custom relating to the subject.

Early History: Often among barbarous or even savage tribes are revealed a careful attention to detail, a stability,

and sometimes a respect for equity, in the rules relating to divorce, which Western prejudice is scarcely prepared to find; while other peoples commonly looked upon as civilized, but relatively non-progressive, such as the Chinese, are quite capable of teaching us useful lessons. In the disposal of the children or the division of the property after dissolution of marriage, for instance, principles of natural justice are frequently observed which constitute a rebuke to the laws sanctioned by some modern Christian societies. Thus among a great many people, in case of separation, the children follow the father or the mother according as mother-right or father-right prevails; and where a mixt or cognatic system exists they are divided between the parents or their kindred. The division is determined by a variety of rules among diverse peoples. Sometimes, as in Bulgaria, Burma, and among the Natchez Indians, the daughters follow the mother and the sons remain with the father. In other cases, as in Zara and in Bosnia, the father takes the adult children, while those of tender years are left in the mother's hands. Often the children belong to the innocent party; unless children are regarded as a burden, when the opposite rule prevails; or unless the system of kinship determines the disposition of the offspring, when an equitable adjustment is otherwise made.

Very similar in variety and character are the customs governing the disposition of the property when a marriage is dissolved. As a general rule among rude peoples the divorced man is free to marry again; but with regard to the second marriage of a divorced woman usage greatly varies. Often her freedom in this respect is restricted; and sometimes she is absolutely forbidden to remarry. In Samoa she may not rewed even after the husband's death; and among the ancient Aztecs the remarriage of a divorced couple with each other was strictly prohibited.

It appears to be practically a universal rule among uncivilized races that the repudiated wife or the woman who legally puts away her spouse shall return to her own family or clan, whose duty it is to receive her. In general, among backward peoples, even where great liberty of separation is allowed, divorce is far less frequent than is popularly believed. Their conservatism is surprizing. The American tribes, for example, are conspicuous in this regard. Very commonly among low races custom frowns upon divorce after children are born. Often the woman has as much liberty as the man in obtaining divorce. It needs but a glance at the usages of the American aborigines in this respect to perceive that among barbarous or savage tribes the lot of the married woman is not always so dark as it is frequently painted, and many similar proofs elsewhere exist. Indeed, a sound social policy regarding the problems of marriage, divorce, and the family cannot be formed without a careful study of comparative racial customs in this field. (Consult: Westermarck, "Human Marriage," ch. xxiii.; Post, "Entwicklungsgeschichte des Familienrechts," 1890; idem, "Afrikanische Jurisprudenz," 1887, vol. i.; Möllendorff, "Das Chinesische Familienrecht," 1895; Alabaster, "Notes and Commentaries on Chinese Criminal Law," 1899; Araki, "Japanisches Eheschliessungsrecht," 1893; Hozumi, "The New Japanese Civil Code," 1904; Munroe Smith, "The Japanese Code and the Family," in *Law Quarterly Review*, 1907; Howard, "History of Matrimonial Institutions," 1904, vol. i., ch. v., where the literature is cited.)

Origin of Modern Divorce Problem

To understand the influences which aided in molding the conceptions of the founders of the Christian church relative to marriage and divorce, it is needful to study the legal and social environment. By each of the three systems of law with which originally the Christians were most acquainted marriage was treated as a private or lay contract, and therefore its dissolution was allowed. Among the Greeks, at any rate subsequently to the Homeric age, divorce was practised. By the Athenian law, which probably was not entirely supplanted by the Roman until 212 A.D., it was freely granted to either spouse. The benefit, however, inured mainly to the husband, since to begin proceedings for a divorce the wife was required to present in person to the archon a written statement of her desire; and this, in a society where popular sentiment relegated woman to a seclusion truly Oriental, it was in practise exceedingly hard to do.

By the Jewish law, as it still existed at the dawn of the present era, divorce was the one-sided privilege of the man. At most there was only a faint trace of the woman's later right, sanctioned by the Talmud, of demanding a separation. Legally, for the slightest reason, as the school of Hillel maintained, the husband could put away the wife by simply handing her a "get" or bill of divorce. By the written law only in two cases for grave misconduct was he deprived of this power; tho in practise there were several ameliorating conditions which tended to put a check upon arbitrary action. Thus, while divorce was a private transaction, certain formalities had to be observed in connection with the "get" which secured the restraining influence of publicity; and in case the wife was unjustly repudiated the dower, representing the ancient *mohar*, or purchase price of the bride, had to be paid to her from the husband's property. Moreover, some of the limitations of the husband's despotic power recognized by the Mishnah or oral law may already have been in force; and the highest ethical sentiment among the Jews had long been decidedly against too great freedom of divorce. It was the rabbi's duty as much as possible to discourage it and to effect reconciliation between husband and wife.

Negatively, however, it was the later law of Rome which had most to do with shaping the ideas of the Christian fathers relative to the nature of marriage and the doctrine of divorce. By the beginning of our era all the older and stricter forms of marriage, under which divorce was solely the man's prerogative, had been practically superseded by free contract in which husband and wife were placed on an equal footing. Divorce became a formless private transaction to which the woman was as freely entitled as was the man. No intervention of court or magistrate was essential. So far, indeed, was carried the theory of absolute liberty of either spouse to dissolve the contract that, according to Cicero, the jurists in one case were in doubt whether a divorce did not legally arise *ipso facto* through the consummation of a second marriage by one of the parties during the lifetime of the other. Augustus introduced an important change in the interest of publicity, requiring the party wishing a divorce to declare to the other his purpose in the presence of seven witnesses who must be Roman citizens of full age; otherwise the divorce to be null and void. The general result was that during the later republic and the early empire the laxity of the nuptial bond became a notorious scandal. Wedlock was dissolved on purely selfish or absurdly trivial grounds. According to Seneca, in Rome divorce no longer brought with it any shame, and there were women "who reckoned their years rather by their husbands than by the consuls." Nevertheless, the abuse was more a result than a cause of the gradual decline of Roman morals during the two centuries following its conquest of Carthage. It is significant that the family life of the people at large, notably that of the middle classes in the provinces, was not seriously tainted by the social corruption of the capital where all the causes of moral degeneration were especially active. (Consult: Meier-Schömann, "Der attische Process" 1883–87, ii., 510; Hruza, "Polygamie und Pellikat," 1894; idem, "Ehebegründung nach att. Recht," 1892; Müller and Bauer, "Die griech. Privat- und Kriegsalterthümer," 1893, in Müller's "Handbuch"; on the Hebrew law, Mielziner, "The Jewish Law of Marriage and Divorce," 1884; Lichtschein, "Die Ehe nach mosaisch-talmudischer Auffassung," 1879; especially Amram, "Jewish Law of Divorce," 1896; for Rome, Wächter, "Ueber die Ehescheidungen," 1821;

Rein, "Das röm. Privatrecht," 1836; Esmein, "Mélanges," 1886; Jörs, "Die Ehegesetze des Augustus," 1894; Lecky, "History of European Morals," 3d ed., 1881, ii.; and the works of Freisen, Geffcken, Woolsey, and Howard elsewhere cited.)

It is not surprizing that the founders of the Christian Church should have regarded the laxity of the marriage bond as a sign, if not the primary cause, of the degeneration of Roman society. From the beginning an earnest effort was made so far as possible to restrict the liberty of separation and to prohibit the persons separated on proper grounds from contracting further marriage; but the various passages of the New Testament relating to the subject are disjointed and confusing in their details. Many vital questions are either completely ignored or else left in such obscurity as to open the way for the wide divergence of doctrine and the bitter controversies of future ages, especially those of the Reformation period. The final triumph of the canonical theory of the absolute indissolubility of a valid marriage was gained only after twelve centuries of conflict. For four centuries the Bible passages were debated by the fathers and the councils before the "strict construction" interpretation of Augustine and his followers clearly prevailed. Nearly all were agreed that divorce is forbidden except for the one cause mentioned by Matthew; but not all conceded the equal right of the sexes in this regard. There was a like want of harmony touching the lawfulness of remarriage after divorce. According to Augustine adultery is the only scriptural ground of separation; but even this does not dissolve the nuptial tie. Moreover, those who, following the letter of Matthew's text, would for this offense allow the man, but not the woman, the right of repudiation, he reproached with violating the great principle of Christian teaching: the equality of the wedded pair. These views were adopted by the Council of Carthage (407 A.D.) which thus anticipated the final settlement of the canon law. Before that settlement, however, centuries of compromise were to intervene. From Constantine to Justinian the divorce legislation of the Christian emperors was practically untouched by these doctrines of the Church, while in dealing with the newly converted Teutonic peoples the rigid Augustinian rules were relaxed in various ways. Ecclesiastical dogma and ecclesiastical practise were sadly out of joint.

Early Christian Teaching

Everywhere, at least among the newly converted peoples of Europe, as proved in the most convincing way by the penitentials, full divorce with remarriage was allowed on various grounds. During this period authority had perforce to yield to social expediency. Not until 1164, in the fourth book of Peter Lombard's "Sentences," is found the first clear recognition of the "seven sacraments," among which that of marriage appears. The theory of the sacramental nature of wedlock had two consequences which involved the whole medieval problem of separation and divorce. First is the dogma of the indissolubility of the marriage bond; and, second, the exclusive jurisdiction of the Church in matrimonial causes.

In theory divorce proper is entirely eliminated from the mature law of the Western Church. Inconsistently, however, in the canons the word "divorce" is used in two senses, neither of which harmonizes with its ancient and right meaning as a complete dissolution of the bond of true wedlock. First, the term *divortium a mensa et thoro* means a separation of husband and wife which does not touch the marriage tie. Secondly, the term *divortium a vinculo matrimonii* is commonly employed to designate, not the dissolution of a valid union, but the judicial declaration of nullity of a spurious marriage which on account of some impediment is void, or at least voidable, from the beginning. Yet it must not be assumed that in effect absolute divorce was not tolerated by the fully developed canon law, as that law existed on the eve of the Reformation. Theological subtlety had devised two exceptions to the rule that a genuine marriage could not be dissolved, thus opening the door to manifold hardship and corruption. First is the *casus apostoli* or *privilegium Paulinum*, by which the Christian convert, if abandoned by his infidel spouse, is permitted to contract a new marriage. By the second exception the Church violated the theory which she had sanctioned since Peter Lombard, that a contract *de præsenti*, or in words of the present tense, constitutes a valid marriage whether followed by actual wedded life or not; for the mature doctrine of the canon law, which in our own days is still obeyed by the Roman Church, allows the unconsummate marriage *de præsenti* to be dissolved through papal dispensation or ipso facto by taking holy orders. Thus, accepting the Church's own definition of marriage, divorce *a vinculo* did not quite disappear from the canon law; and in effect there was a far more prolific source of full divorce. To all intents and purposes, when judged from a rational modern standpoint, the decree of nullity was a divorce proper. It cannot be doubted that by this means there existed a wide liberty of divorce in the Middle Ages, altho it existed mainly for those who were able to pay the ecclesiastical courts for finding a way through the tortuous maze of forbidden degrees and other impediments. Moreover, in persistently sustaining the validity, tho not the legality, of clandestine pre-contracts *de præsenti* —contracts formed without witnesses, parental consent, official celebrant, or record—the Church was inviting social anarchy. In a divorce procedure masquerading under the guise of an action to nullify spurious marriages lurked the germs of perjury and fraud. Even in the days of Edward II., an English satirist complains of the "prodigious traffic" in divorces among husbands having false witnesses and "selver among the clerkes to send." Before the Reformation, the voidance of alleged false wedlock on the ground of pre-contract or forbidden degrees of affinity, spiritual relationship, consanguinity, or on some other canonical pretext, had become an intolerable scandal in Christendom. "Marriages have been brought into such an uncertainty thereby," justly complains a statute of Henry VIII., "that no marriage could be so surely knit or bounden but it should lie in either of the parties' power . . . to prove a pre-contract, a kindred and alliance, or a carnal knowledge to defeat the same." In short, bad marriage-law and bad marriages were the chief source of the divorce evil during the Middle Ages. (See Geffcken, "Ehescheidung vor Gratian," Leipsic, 1894; Esmein, "Le Mariage en Droit Canonique, 2 vols., Paris, 1891; Freisen, "Geschichte des Canonischen Eherechts, 2d ed., Paderborn, 1893; Howard, "Matrimonial Institu-

Canon Law

tions," vol. ii., chap. 11, where the authorities are cited.)

With the rejection of the sacramental theory of marriage at the Reformation it was inevitable that more liberal ideas respecting divorce should arise. A great impulse was then given to the development of social control through the State. From the outset the continental reformers took a bold stand; for the Protestant doctrine of divorce, like the Protestant conception of the form and nature of marriage, was shaped mainly by the thought of Martin Luther. In his dictum, "marriage is a worldly thing," lay the germs of future civil marriage and its counterpart, civil divorce. Liberty of divorce is the fruit of the Reformation; and from the start it has been especially favored by the more extreme Protestant sects. At first full divorce was generally sanctioned for two or more causes; while the more radical theologians, like Lambert of Avignon and Martin Bucer, Milton's teacher, went almost as far as the modern statute-maker in multiplying the permissible grounds of divorce. Yet even the most advanced thinkers of the sixteenth and seventeenth centuries to a large extent still appealed to authority rather than to reason and experience in their attempts to solve a great social problem. Only gradually, after three centuries of struggle, has civil divorce, on rational grounds sanctioned and regulated by the state, been almost universally established throughout the civilized world.

Civil Divorce

Hence it is not surprizing that the Puritan, the vanguard of Protestantism, should have taken the lead in instituting civil marriage and therefore civil divorce. The American type of divorce legislation has its origin in Puritan New England. In the five Southern provinces before the Revolution not a single instance of either full divorce or of separation from bed and board has been discovered. Courts with competent jurisdiction were not created. The statute-book is absolutely silent on the subject. A few marriages were dissolved by the legislature in Pennsylvania. In New York civil divorce existed during the Dutch régime; and after the English conquest in 1664 the magistrates may have granted decrees, doubtless under the supposed sanction of Dutch law. But, unless on this ground during the brief period of transition, judicial divorce *a vinculo* ceased in New York with the English conquest; and what has just been said of New York for the provincial era is true also for New Jersey. The case is very different for the Northern colonies. In most respects throughout New England from the outset the broad modern doctrines of the *Reformatio Legum* of Edward VI.'s commission, tho even now not fully accepted in the mother country, were put in practise by Puritan and Separatist alike. The most advanced ideals of Protestantism were realized. The American conception of divorce as belonging, not to the criminal, but exclusively to the civil jurisdiction, has its birth in the seventeenth century. For more than 100 years in the New England colonies the canonical decree of separation from bed and board—which the early reformers were inclined to reject as not consistent with the usage of the primitive Church—was practically, tho not wholly, abandoned; while, on the other hand, a dissolution of the bond of matrimony was freely granted for adultery, desertion, and even on other grounds. For Massachusetts the records are but partially preserved. Between 1639 and 1692 some forty actions for divorce or annulment have been discovered; while between 1739 and 1776 at least 147 such suits were tried by the courts. The complete record would doubtless disclose many more. From 1650 onward Rhode Island authorized divorce *a vinculo*. This colony was sadly afflicted by the evil of legislative divorce. During nearly the entire provincial period the assembly, side by side with the courts, acted on divorce petitions. The divorce legislation of Connecticut gained surprizingly early maturity. In the middle of the seventeenth century no society in the world, with the possible exception of Holland, possest a system so modern in character. Separation from bed and board was rejected. Reasonable grounds of absolute divorce were sanctioned. Husband and wife were treated with even justice; and, altho legislative divorce was permitted and liable to abuse, the greater part of the litigation seems always to have been entrusted to the regular courts.

During the seventeenth century, almost simultaneously in Holland and America, the foundation—the essential principles and the tendency—of modern divorce law was laid. Elsewhere the full and logical development of State control came several generations later. In its original form the law of 1792, instituting civil divorce in France, practically sanctioned free dissolution of marriage at the pleasure of the parties. A vast number of decrees was the natural result. Accordingly in 1803 the Code Napoleon substituted a more conservative provision, allowing absolute divorce for five causes. In turn the law of 1803 was abrogated in 1816, and civil divorce was restored only in 1884; but the liberal policy of France, as exprest in the Code Napoleon, undoubtedly has had a powerful influence on the extension of civil marriage and divorce throughout Europe. The act of 1884 sanctions absolute divorce, on the petition of either spouse, for adultery, cruelty, violence, and "injure." So wide is the interpretation of "injure" that it amounts almost to an "omnibus" clause. Separation or limited divorce is also sanctioned by the present law.

Secularization of Divorce Law in Europe

Previous to 1900 the laws of divorce in German lands were complex, obscure, and well-nigh past finding out. Prussia alone had three different systems; and Bavaria was in the same plight. The conditions were probably as unsatisfactory, so far as the character of the law was concerned, as they are in the United States. By the imperial code of 1900 absolute divorce is sanctioned for five causes: (1) adultery; (2) attempt on the life of either spouse by the other; (3) malicious desertion; (4) when either spouse has been guilty of grave violation of the obligations based on the marriage or of so deeply disturbing the marital relation through dishonorable or immoral behavior that the continuance of the marriage cannot be expected from the other; and (5) insanity (Geisteskrankheit) of three years' standing. It may reasonably be doubted whether any "omnibus" clause remaining in the laws of the American states gives wider discretion to the court than does the fourth of these grounds. The law, however, appears to be conservatively administered, for the number of divorces is rapidly decreasing. In 1899 9,563 decrees were granted; while in 1901, under the new code, the number had sunk to 8,037.

In England—more conservative than Protestant Germany—no immediate change in the canon law of divorce was effected by the Reformation, for the liberal provisions of Edward VI.'s commission failed of adoption. Even the Puritan Revolution, which produced the civil marriage ordinance of 1653, seems to have attempted no divorce legislation. Except by Parliament, full divorce was not granted until 1857; and the procedure in securing a legislative divorce was attended by manifold scandal and hardship. The privilege of divorce was thus in effect a monopoly of the rich and powerful. The sole relief obtainable in the courts was the ecclesiastical decree of separation from bed and board; and this was allowed only for two causes, adultery and cruelty.

By the existing law of England three forms of separation are recognized; and jurisdiction is vested wholly in the civil courts. Full divorce may be granted for the adultery of either spouse; but the woman is treated with grave injustice. For while the husband may secure an absolute divorce on account of the simple adultery of the wife, the wife is unable to free herself from an unfaithful husband unless his infidelity has been coupled with such cruelty as "would have entitled her to a divorce *a mensa et thoro*"; or "with desertion, without reasonable cause, for two years and upward"; or with certain other aggravating offenses. Since 1860 the decree *nisi* has been in force, with the right of the king's proctor to intervene. Secondly, the law allows a decree for "judicial separation" "with the same force and the same consequences" as the former ecclesiastical sentence *a mensa et thoro*, which was abolished in 1857. In the third place, the existing law provides for what is commonly called "magisterial separation" through which, by the issue of "protection," "maintenance," and "separation" orders, the court is able to secure a deserted wife the enjoyment of her own property, with a just share in the delinquent partner's goods, and to protect the woman against a brutal husband's violence. In England, as in European countries generally, few divorces are granted as compared with the United States; but the divorce-rate is rising. The number mounted from 127 in 1860 to 390 in 1887. In France, for each 1,000 marriages celebrated, 14 divorces were decreed in 1885 and 24 in 1891, the population showing a very small increase. A similar movement is shown by the statistics for Holland and Sweden; and even for Catholic states like Greece, Belgium, and Bavaria.

Present English Law

During the colonial era the foundation of American divorce-law had been laid. Its tendency and essential principles were determined. At the Revolution it seemed clear that a free and tolerant policy in this regard must prevail in the United States. Under the Federal Constitution the states within their respective borders have exclusive control of matrimonial and divorce legislation. Congress has conferred the same power upon the organized territories; but it legislates directly for the District of Columbia and Alaska. As a result there are (1907) fifty-one distinct divorce codes—counting those of Porto Rico and Hawaii—whose provisions are inharmonious or conflicting, altho in many of their vital features they are slowly approaching a common type. Jurisdiction belongs to the courts. Formerly the grant of divorces by the legislatures was a wide-spread evil. In nearly all the states, directly or indirectly, it is now prohibited by constitutional enactment; and since 1886 Congress has put a stop to it in the territories. Delaware discontinued the practise only under the constitution of 1897; while in Connecticut it still survives.

Legislation in the United States

At no time, except between 1872 and 1878, has divorce been provided for by law in South Carolina. In the other fifty-one states—using "states" to include the districts, territories, and insular possessions—full divorce is permitted; while in twenty-three states separation from bed and board is likewise allowed. Moreover, in seven jurisdictions the courts are authorized to decree separate maintenance which is practically the same as separation from bed and board. The number of legal causes of divorce *a vinculo* varies from one (adultery) in New York, District of Columbia, and, practically, in North Carolina (1905), to fourteen in New Hampshire. Several of these grounds reveal the tendency of modern thought to free itself from traditional authority in dealing with this social problem. Thus forty-two states have admitted drunkenness (intoxication, intemperance) as a sufficient cause for dissolving the marriage bond. Failure to provide for wife or family is recognized by twenty-one codes. Vagrancy of the husband is a cause in Missouri and Wyoming. By the statute of Rhode Island a marriage may be dissolved when either spouse is guilty of "habitual, excessive, and intemperate use of opium, morphin, or chloral"; and a similar law exists in Maine, Massachusetts, Mississippi, and Porto Rico.

Equally lacking in uniformity and even more confusing are the laws regarding remarriage after divorce. It eighteen states no restraint whatever is placed on the immediate remarriage of either party with another. Elsewhere restrictions are placed upon one or both of the persons either as a penalty or to allow time for proceedings in error or on appeal. Thus, in case of adultery, marriage with the accomplice during the life of the former spouse is forbidden in Louisiana, Pennsylvania, and Tennessee; while such a union is absolutely prohibited by the law of Delaware. In South Dakota and New York the defendant guilty of adultery may not marry any person during the life of the aggrieved; altho in New York, on certain conditions, the court may remove the restriction after five years. By the criminal code of Florida the guilty defendant may not marry anew. Under the Act of 1901, in the District of Columbia the defendant is absolutely restrained from remarriage, except with the former spouse. The wisdom of such severity in case of adultery will be questioned by the enlightened reformer. Exceptionally drastic treatment of this offense, as compared with other grounds of divorce, appears to arise in a traditional reverence for authority rather than in a thoroughly informed regard for the social welfare. In several states, under various conditions, the placing of a temporary or perpetual restraint on further wedlock is left to the court's discretion. Such is the case of Michigan, Mississippi, Virginia, and Alabama; while in Georgia the question is left to the jury, subject to the court's revision. Three of the New England states discriminate against the defendant. In Vermont, since 1878, the libelee may not marry any person other than the libelant for three years, unless the latter dies. Since 1883 the statute of

Remarriage

Maine forbids the party obtaining the decree to remarry in two years without the court's permission, while during that period the adverse party is absolutely restrained; nor at any later time may he remarry without the court's consent. In Massachusetts, since 1881, the offending person, without petition to the court, may remarry only after two years. Moreover, Massachusetts, following the English precedent, has adopted the decree nisi; and in principle her example has already been followed by Maine (1883), Oklahoma (1893), Rhode Island (1902), New York (1902), and California (1903). This device is a good one, giving the litigants time for second thought; and it should be carefully considered in future legislation. Nine states of the West, foregoing any attempt to impose a penalty, are content to fix a period within which neither person may marry again; and usually, if proceedings in error or on appeal be instituted, the restraint is extended to final judgment, or to thirty days beyond it as in Kansas and Oklahoma. This term of delay varies from three months in North Dakota to one year in Colorado and Wisconsin. On the other hand, two Western states are more stringent, discriminating against the guilty person. Thus Illinois (1905) requires such person to wait two years, and Montana (1895) three years; while in those commonwealths one year and two years respectively is the period for the aggrieved. An anomalous condition of the law should be noted. Owing to the want of precision and uniformity in the legislation of the states, the restraints placed on the marriage of divorced persons are practically futile. In 1829 the supreme court of Massachusetts (in Putnam *vs.* Putnam, 8 Pick., 433–35) decided that if a man, "being a resident in the state, for the sake of evading the law, goes into a neighboring state where such a marriage is valid, and is there married and immediately returns and continues to reside here, the marriage is valid here, and after his death his widow is entitled to dower in his estate." This precedent was followed by New York in 1881 (Van Voorhis *vs.* Brintnall, 86 N. Y., 18); Washington in 1900 (Willey *vs.* Willey, 22 Wash., 115–21); and California in 1903 (Estate of Wood, 137 Cal., 129). The prevailing doctrine of the courts appears to be that a marriage good where it is contracted is good everywhere; but there are opposing decisions.

Clandestine Divorces

The principal sources of clandestine divorces are the statutes relating to residence and notice. Notice to the defendant through publication in the newspapers, still quite generally permitted, is especially capable of abuse; but in recent years a number of states have enacted rigorous laws governing notice when personal service cannot be had. The provisions regarding residence are conflicting, lax, and wanting in precision. They invite migration for divorce. At present the term of previous residence for the plaintiff, or at least for one of the parties, varies from six months to five years; but the prevailing period is one year, at least twenty-eight commonwealths, under various conditions, having that requirement. Massachusetts, in particular, has a most stringent law. A divorce will be granted for any lawful cause, occurring in the state or elsewhere, when the libelant has lived for five years in the commonwealth; or, when the parties were inhabitants of the state at the time of the marriage, if the libelant has been such an inhabitant for three years before the libel was filed, provided neither came into the state for the purpose. With these exceptions, as expressly provided in the act, a divorce will not be granted for any cause, if the parties have never lived together as man and wife in the commonwealth; nor for any cause occurring in another state or country, unless, before it occurred, they had so lived together in the commonwealth, and one of them was there living at the time it took place. Moreover, Massachusetts, like Maine, Delaware, and Tennessee, has attempted to prevent clandestine divorce through the evasion of her laws. When an inhabitant of the commonwealth goes outside the state to obtain a divorce for a cause which occurred in the state while the parties there resided, or for a cause which would not be recognized as lawful therein, the "divorce so obtained shall be of no force or effect" in the commonwealth.

1867–86

The appearance in 1889 of the government report, compiled under the direction of Hon. Carroll D. Wright, disclosed something like the real facts regarding divorce in the United States. This report contains fairly complete statistics, drawn from a careful analysis of the manuscript court records in all the states and territories for the twenty years, 1867 to 1886, inclusive. The facts revealed are sufficiently startling. In the entire country during this time, 328,716 petitions for full or partial divorce were granted. From 9,937 decrees in 1867, the number rose to 11,586 in 1871; 14,800 in 1876; 20,762 in 1881; and to 25,535 in 1886; thus, comparing the last year with the first, showing an increase of 157 per cent, while the population grew but 60 per cent during the same two decades. Again—to express the result in terms of the divorce-rate—in 1867, it is estimated, there were 173 divorces to 100,000 married couples, while in 1886 the number had risen to 250. As a matter of fact, in the last-named year, the average divorce-rate in the U. S. was higher than for any other country collecting statistics, except Japan. In that country, according to Professor Willcox, there was "more than one divorce to every three marriages, and more than four and a half times as many divorces as there were in the U. S., altho the population of Japan was only about two thirds as great." Of the whole number of divorces during the period, 112,540 were granted to the husband, and 216,176 to the wife. Among the principal causes, at each stage of the wedded life, only for adultery were more decrees granted on the husband's petition than on those of the wife. But the relative numbers granted on the wife's petition vary greatly—from 39.3 per cent in North Carolina to 77.9 per cent in Nevada. These figures are one indication of the relative significance of the divorce problem for women.

Several important generalizations may be drawn from the available statistics. In the U. S., as in Europe, the divorce-rate is higher in the city than in the country. Again, Mill, Bodio, Farr, Bertillon, and other investigators have shown that in Europe the marriage-rate falls in hard times and rises again on the return of prosperity. According to Willcox ("A Study of Vital Statistics," in the *Political Science Quarterly*, vol. viii., pp. 76–77), this rule appears to hold good for the U. S. Furthermore, Willcox has demonstrated that the average divorce-rate for the whole country is affected in the same way, sinking in times of

war and industrial depression, and rising on the restoration of business. The report of 1889 enables us to determine pretty accurately what part of the vast number of decrees is due to lack of uniformity in the state laws. It shows that the evil of migration for divorce is greatly exaggerated by popular opinion. Twenty years ago it was commonly assumed that perhaps 90 or 95 per cent of divorces were obtained by migration to jurisdictions where decrees could be secured on easier terms than at home. The facts disclosed by the report were a great surprize. While it does not provide materials for an exact deduction, it was discovered that in over 231,000 divorces in twenty years where the place of marriage was known, more than 80 per cent were granted in the states where the marriages were celebrated. "Now," to quote Mr. Dike's summary, "as it was also shown that divorce on the average does not take place until more than nine years after the marriage, and as 23 per cent of the population of the country had moved from the state where born," it seems safe to say that not to exceed 2 or 3 per cent of divorces were secured by persons migrating to other jurisdictions for the purpose. At present the relative number of such clandestine divorces is doubtless much less than in 1886, for in many vital points the laws of the states then chiefly responsible for the evil have become more stringent. Indeed, already in 1889, the Rev. Samuel W. Dike, of Auburndale, Mass., the able secretary of the National League for the Protection of the Family—to whom is especially due the inception of the great government report just mentioned—was led to declare that "the establishment of uniform laws is not the central point" of the divorce problem. Moreover, since 1900, the action of the federal and certain state courts is significant. In a number of cases arising in various states they have declared null and void decrees secured in jurisdictions where the plaintiffs were not bona fide residents, even when they had dwelt in such jurisdictions for the statutory term prescribed as a condition for obtaining a divorce. Thus both the statutes and the courts are distinctly discouraging to the "divorce colony."

It appears, likewise, that to some extent the evil of lax administration of the divorce laws by the courts is exaggerated by popular opinion. The report shows that in seventy counties scattered over twelve states over 30 per cent of all petitions for divorce were rejected. There is a prevailing notion that a large number of persons who seek divorce do so in order at once to contract new marriages. Unfortunately there are no collected data adequate to settle this question for the U. S. Such foreign statistics as are available show that restrictions upon the remarriage of divorced persons would not affect in a large degree the divorce-rate. They indicate that within the first two or three years after dissolution of marriage divorced men are not much more inclined to remarry than are widowers, while during the same period a greater number of divorced women than widows renew the nuptial ties. Whether the number of divorces is greatly influenced by legislation is a question which has given rise to decided difference of opinion. In 1883 Bertillon took the position that statutes extending the causes of divorce or relaxing the procedure in divorce suits have little influence "upon the increase in the number of decrees." For the U. S., at any rate, this view cannot be entirely sustained. The divorce movement is indeed mainly dependent upon social forces which lie far beyond the reach of the legislator. Yet it seems almost certain that there is a margin, very important tho narrow, within which he may wisely exert a restraining influence. He can create a legal environment favorable to reform. Good divorce-laws—laws which are clear, certain, and simple, laws which cannot be evaded, which are not a "dead letter," laws which express the best results of social experience—constitute such an environment, and they may even lower the divorce-rate. They may check hasty impulse and force individuals to take time for reflection. They may also, by securing publicity, prevent manifold injustice in the granting of decrees.

In Europe the divorce-rate is rising, while the marriage-rate is falling. The same is doubtless true of the U. S., judging from the scanty materials available. It is by no means creditable to the American people that with eleven exceptions —the six commonwealths of New England, with Ohio, Indiana, Michigan, California, (1905), and Iowa (1906)—the states are making no effective provision for the collection of divorce statistics.

Reform 1887–1906

At present there is no means of determining the average rate for the whole country; but every practical reformer and student of social ethics will rejoice that Congress has already provided for a second report on marriage and divorce, covering the period since 1886. The director of the census is already engaged on the work. The report, doubtless, will show substantial progress. Indeed, there is much hasty and misdirected criticism of American divorce-laws that ignores the remedial legislation of the last twenty years. Within that period the foundation of what may become a common and effective divorce-code for the whole union has slowly been laid. More and more in their essential features the divorce-laws of the states are duplicating each other, and they are becoming better. Little by little, as a detailed examination of the whole body of enactments reveals, more stringent provisions for notice to the defendant have been made, longer terms of previous residence for the parties required, and more satisfactory conditions of remarriage after the decree prescribed; while the more dangerous "omnibus" clauses in the list of statutory grounds have been repealed. At least eight states severely punish the soliciting of divorce business. Moreover, saner opinions regarding the true nature and the real source of the divorce evil are beginning to prevail.

First of all it is needful to free the mind from hampering traditions, and to accept the judgments of history. The guiding light will come, not from authority, but from a rational understanding of the existing facts. The appeal to theological criteria, born of primitive and very different conditions, is vain. The vast literature which seeks to solve social questions by juggling with ancient texts is largely a monument of wasted energy. Much of it is sterile, or it serves but to retard progress and to befog the issue.

The divorce movement is a portentous and almost universal incident of modern civilization. Doubtless it signifies underlying social evils vast and perilous. Yet to the student of history it is perfectly clear that this is but a part of the mighty movement for social liberation which has been gaining in volume and strength ever since the Reformation. According to the sixteenth century reformer, divorce is the "medicine" for the

disease of marriage. It is so to-day in a sense more real than Smith and Bullinger ever dreamed of. Certain it is that a detailed study of American legislation produces the conviction that, faulty as are our divorce-laws, our marriage-laws are far worse; while our apathy, carelessness, and levity touching the safeguards of the matrimonial institution are well-nigh incredible.

Nowhere in the field of social ethics, perhaps, is there more confusion of thought than in dealing with the divorce question. Some people look upon divorce as an evil in itself; others regard it as a "remedy" for, or a "symptom" of, social disease. To the Roman Catholic, and to those who believe with him, divorce is a sin, the sanction of "successive polygamy," of "polygamy on the instalment plan." At the other extreme are those who, like Milton and Humboldt, would allow marriage to be dissolved freely by mutual consent, or even at the desire of either spouse. According to the prevailing opinion, however, as exprest in modern legislation, divorce should be allowed, with more or less freedom under careful state regulation. Yet divorce is sanctioned by the state as an individual right; and there may be occasions when the exercise of that right becomes a social duty. The right, of course, is capable of abuse. Loose divorce-laws may even invite crime. Nevertheless, it is fallacious to represent the institution of divorce as itself a menace to social morality. It is a result and not a cause; a remedy and not the disease.

Ethical Aspect

This is the principle upon which rests the whole modern theory of social control. In the Western world the extension of the sphere of secular legislation practically to the whole province—the whole outward or legal province—of marriage and divorce is a fact of transcendent interest. In this regard the Reformation marks the beginning of a social revolution. Luther's dictum that "marriage is a worldly thing" contained within it the germ of more history than its author ever imagined. The real trend of evolution has not at all times been clearly seen or frankly admitted; but from the days of Luther, however concealed in theological garb or forced under theological sanctions, however opposed by reactionary dogma, public opinion has more and more decidedly recognized the right of the temporal lawmaker in this field. As a result, in the U. S., not less than elsewhere in countries of Western civilization, marriage, divorce, and all the institutions of the family are emerging as purely social institutions, to be dealt with according to human needs. Definitely the state seems to have gained control of matrimonial administration. Yet it must be conceded that the influence of legislation in curing social disease is very restricted. Apparently, if there is to be salvation, it must come through the vitalizing, regenerative power of a more efficient moral, physical, and social training of the young. The fundamental causes of divorce lie far beyond the reach of the statute-maker. They are rooted deeply in the imperfections of human nature and the social system, particularly in false sentiments regarding marriage and the family. Beyond question, as in the Middle Ages, the chief cause of divorce is bad marriage-laws and bad marriages. The conviction is deepening that for the wise reformer, who would elevate and protect the family, the center of the problem is marriage and not divorce. One Gretna Green for clandestine marriages, like that at St. Joseph, Mich., is the source of more harm to society than are a dozen divorce colonies, like that at Sioux Falls, S. D. Indeed, the "marriage resort" is the mother of the "colony." The wise reformer must deal with causes and not with effects. He will not waste his energy in punishing divorced people by refusing to solemnize their marriages. Rather he will strive to lessen the social evils of which the divorced man or woman is the victim. Let ecclesiastical conventions, if they would serve society, concern themselves with restraining the original marriages of the unfit. Let them reflect on the social wickedness of joining in wedlock the innocent girl with the rich or titled rake; or of uniting those who are tainted by inherited tendencies to disease and crime.

Reform will come mainly, not through legislation, but through a new and more rational education which shall embrace the whole complex problem of sex, marriage, and the family. Still the legislator has important work to do. In particular it seems worth while to strive for more uniform laws in the states. Ideally, a common code embracing the entire body of matrimonial law is desirable, if it might be gained without too great a sacrifice of local control; for it would conduce in many ways to social order. Yet it seems inexpedient, perhaps undesirable, to strive for a uniform list of statutory causes of divorce. It is precisely with respect to the legal grounds of divorce that theological conservatism and social liberalism are in sharpest antagonism. From the scientific points of view, as already seen, divorce in itself is not immoral. On the contrary, it is quite probable that drastic, like negligent, legislation is sometimes immoral. It is not necessarily a virtue in a divorce-law, as often assumed, to restrict the application of the remedy, regardless of the sufferings of the social body. If it were, the only logical course would be to imitate South Carolina and prohibit divorce entirely. The most enlightened judgment of the age heartily approves of the policy of extending the legal causes so as to include offenses other than the one "scriptural" ground, such as intoxication from the habitual use of strong drinks or narcotics, as being equally destructive of connubial happiness and family well-being.

Uniform Divorce Law

Accordingly, until recently (1906), practical workers have thought best to confine the movement to an effort to procure the adoption by the several states of a model statute designed to prevent clandestine divorce; that is, to a statute dealing mainly with procedure. Such is the character of the bill drafted in 1899–1900 by the Conference of State Commissions on Uniform Legislation. But a more comprehensive effort has just been started by the "National Congress on Uniform Divorce-Laws." At its Washington session (Feb. 19–22, 1906), after earnest and enlightening discussion, this body, composed of delegates from forty states, adopted a series of seventeen resolutions on which is based "An act regulating annulment of marriage and divorce," agreed upon by the congress at its Philadelphia session in November, 1906. The policy of the act is conservative. Both full and partial divorce are provided for. Divorce *a vinculo* is permitted for adultery, bigamy, conviction and sentence for crime followed by imprisonment, extreme cruelty, wilful desertion for two years, and habitual drunkenness for two years. Divorce *a mensa* may be

granted for the same six causes, and also for "hopeless insanity of the husband." The decree nisi, to become absolute after one year, is adopted; and there are careful provisions for residence, notice, and procedure. The congress also submitted draft-acts providing respectively for the "return of statistics relating to divorce proceedings" and for the "return of marriage statistics." In its first resolution the congress wisely declares that "no federal divorce-law is feasible." Moreover, it is significant of its right understanding of the problem, that the body urges a like effort to secure a uniform marriage-law.

GEORGE ELLIOTT HOWARD.

DIVORCE STATISTICS: The sources are the registration or other reports of the ten states and eight or ten foreign countries making annual reports, the special report of the United States Department of Labor of 1889 on Marriage and Divorce in the U. S. and some European countries, a British House of Lords report, and the coming report of the Census Office, due early in 1908, if not sooner. The following summary is entirely from official sources. The tables show the movement of divorce in thirty-nine years:

	1867	1877	1887	1897	1905
Maine	408	495	...	...	848
New Hampshire	136	237	325	429	471
Vermont	157	178	186	233	272
Massachusetts	318	520	796	1,123	1,554
Rhode Island	195	197	248	372	382
Connecticut	500	412	387	413	491
New England	1,714	2,039	.....	.....	4,018

Three states in the middle West give the following:

	1867	1877	1887	1897	1905
Indiana	1,096	1,151	....	3,080	3,844
Michigan	449	927	....	....	2,800
Ohio	901	1,160	1,750	2,727	4,124
Totals	2,446	3,238	.....	.....	10,768

Totals for the nine states (California now reports statistics but the report is not available): In 1867—4,160. In 1877—5,277. In 1905—14,786. These nine states in 1886 had nearly 24 per cent of the divorces of the entire country. Divorces in Connecticut are practically stationary, tho population has nearly doubled in forty years. In Rhode Island divorces increase about as fast as population. In the other states the increase in divorces far exceeds the increase in population. In the entire country there were 9,937 divorces in 1867 and 25,535 in 1886.

United States

The statistics of the causes of divorce indicate only the technical grounds on which the divorces were granted and depend on the condition of the laws in the various states, ease or difficulty of proof, and the condition of public sentiment. Technically in the twenty years covered, 38 per cent were granted for desertion, 20 per cent for adultery, 16 per cent for cruelty, and 4 per cent for drunkenness. A special examination of nearly 30,000 cases in forty-five counties of twelve selected states showed that intemperance was "a direct or indirect cause in 20.1 per cent of the whole number." In 17.5 per cent of all the cases in the country the statement is positive that there were no children. In 43 per cent more no mention was made of children entering into the case. Where children do appear the average number is 2.07 to each couple.

Light is thrown on the extent of migration for divorce by comparison of the state of the divorce with the state where the parties were married. Of the 328,716 divorces in the years 1867–86 the place of marriage is known in 289,546 cases. Of the remaining 31,389 more than one fourth were in Connecticut, where this particular is not required in the petitions for divorce. And of these 289,546 cases, 80.1 per cent had been married in the very state where the divorce was granted. As 9.17 years on the average elapse between marriage and divorce, and more than 20 per cent of the population of the country was living in some state other than that where born, it is evident that the migration from one state to another for

the purpose of divorce is very small. Some recent figures from North Dakota, to which migration for quick divorce has been most marked in recent years, are suggestive on this point. Mr. J. L. Coulter reports in the *American Journal of Sociology* for most of the state. The excessive divorce-rates were confined almost wholly to four out of the thirty-nine counties, and the ratio of divorces to marriages or population for the entire state was smaller, even before recent improvements in the law of North Dakota, than in Massachusetts, which is the best of the New England States. It is probable that the census report will show that the restrictions several of the states have put on the ease with which these migratory divorces are obtained, in increasing the length of residence required before divorce, in making all divorces to take effect only after the lapse of six months or a year, and in requiring the defense of cases by the state, have borne fruit in the decrease of migratory divorces throughout the country. The effect of many of the restrictions is seen not so much in the absolute decrease of divorces as it is in a slackened rate of increase.

An increasing number of foreign countries, since the U. S. report of 1889, have begun to report divorce statistics annually. For Europe we give the following outline:

Europe

Austria granted 748 divorces and separations in 1882; 856 in 1894; and 1,864 in 1904. Belgium had 130 in 1867; 354 in 1886; 548 in 1896; 932 in 1904. In the last year the ratio to marriages was 1 to 61. Canada granted only 135 in all in the twenty years ending in 1888. Denmark granted 479 in 1871; 577 in 1881; 316 in 1896; and 549 in 1905, or 1 to 33.5 marriages. France under the old law had 2,181 in 1867. Under the law of 1884 they rose to 6,245 in 1885, and in 1904 were 9,860, or 1 to 30 marriages. England and Wales had 130 in 1867 and 727 in 1899. Scotland had 32 in 1867 and 96 in 1886. Ireland had 4 in 1871 and 7 in 1886. The German Empire had 5,342 in 1882 and 9,563 in 1899. Under the Uniform Law for the Empire, which went into effect at the beginning of the next year, there were 8,034 divorces in 1900 and 8,037 in 1901. Italy granted 723 separations in 1869 and 591 in 1890. The Netherlands granted 133 divorces in 1867, 438 in 1887, and 1,498 in 1905. Norway granted 33 in 1870, 71 in 1890, and 185 in 1903. Greece granted 88 in 1884 and 103 in 1892. Rumania had 276 in 1871, 403 in 1881 and 762 in 1890. In Russia all confessions granted 1,046 in 1867 and 1,388 in 1885. Finland had 55 in 1875 and 129 in 1904. Poland had 163 in 1867 and 345 in 1886. Sweden had 128 in 1867 and 316 in 1892. Switzerland had 190 in six cantons in 1867 and 1,102 in all in 1876, the first year under the Uniform Law, and 1,243 in 1904, or 1 to 20.4 marriages.

Australasia

Australasia, including Tasmania and New Zealand, granted 404 divorces and separations in 1896 and 485 in 1902. A new law went into effect in New South Wales in 1892, adding four or five causes for divorce to the single old one granting divorce to the husband for the adultery of the wife. Divorces increased from 102 in that year to 305 in 1893. A similar change took place in Victoria for a like reason. But the increase has been much less since. Japan has reported marriages and divorces since 1884, when there were 109,905 divorces. These rose to 117,964 in 1887 and in these years the ratio to marriages was 1 to 2.6. In 1897 there were 124,075, but the next year they fell to 99,465 and the following year to 66,626, and have been somewhat below the latter figure ever since, being 65,392 in 1903. The ratio to marriages is now somewhere about 1 to 5, which is a little higher than in one or two of our states at times. The sudden change since 1897 is probably due to the introduction of the regulation of divorce by public law after the manner of Western nations, divorce having formerly been the sole affair of the families immediately concerned. Perhaps a considerable number of divorces in Japan escape statistical record.

Samuel W. Dike.

DOCK STRIKE OF LONDON, 1888, THE: In its importance to the labor question of England, this strike was perhaps of greater relative value than any other. The East End of London had for years been the despair of philanthropists and reformers. The work of unloading and carrying to the warehouse the cargoes of ships requires as little skill as any labor that one can do; and, for that reason, the dock-gates were practically the lowest rung in the ladder. The hopeless apathy which the men displayed to all attempts to organize them into unions made it seem that all efforts were wasted. When, however, the Gas Workers' Union was formed in 1888, and the gas men gained substantial improvements in their lot, the "dockers" began to pluck up courage, and the trade-union that Mr. Tillet was organizing grew rapidly. The strike itself broke out on Aug. 12th over a small dispute at the West-India Dock, South. The real grievances had long rankled in the minds of the men. Two days later, all the men from the West-India Dock, South, being out, they sent to Tom Mann asking his help in organizing, and in calling out the men working in the other docks, with which the banks of the Thames are dotted for miles.

Occasion

After two days' continual speechmaking outside the various dock-gates, nearly all the dockers responded to the call. John Burns now volunteered his assistance, and from this time became the leading figure in the struggle. In ten days all the riverside workers, including stevedores, painters, scalers, corn porters, deal porters, coal heavers, seamen and firemen, carmen, lightermen, bargemen, and all whose work in any way affected that of the "docker," came out on strike; most of them without making any demand for themselves, but simply to show their sympathy with the dockers, and strengthen the claims they were making. Some 150,000 men were involved. Day after day during the whole of the five weeks that the strike lasted mass-meetings were held on Tower Hill, at which all the news and the orders of the day were given; the meetings then marching in procession with banners and emblems westward to the city and back. The leaders meantime worked night and day at the gigantic task of organizing and providing sustenance for the heterogeneous mass now depending on them. Stirred by the example of the riverside workmen, who had voluntarily made such sacrifices, all England was roused to sympathy with the men, and liberal subscriptions began to pour in. Clergymen and members of the nobility subscribed. At least $200,000 passed through the hands of the committee. Nor was this feeling confined to England

Extent

alone. In Australia their cause was taken up in an unprecedented manner, subscriptions being raised in all quarters; indeed, the generous support from Australia may be said to have insured the victory, for thousands of pounds were sent from thence during the last two weeks of the strike. From first to last the men held firm to their demands, which were: "No man to be taken on for less than four hours at a time; contract-work and piece-work to be abolished, and wages to be raised to sixpence (twelve cents) per hour, with eightpence (sixteen cents) per hour for overtime." All who knew the conditions of dock-work felt that the demands were so moderate that the men could not afford to accept less; while, on the other hand, the dock companies remained obdurate. The whole trade of the port of London was at a standstill; the effects began to be felt in every home, until the general public began to take a direct interest in the struggle, demanding that there should be an end to it. On Sept. 6th a conciliation committee met at the Mansion House to act as intermediaries between the directors and the men. To this committee, which consisted of Cardinal Manning, the Bishop of London, the Lord Mayor of London, Sir Andrew Lusk, Sir John Lubbock, and Mr. Sydney Buxton, most of the final negotiations were due. Finally, principally through the efforts of Cardinal Manning and Mr. Sydney Buxton, the strike was brought to a close on Sept. 14th, by the directors granting all the men's demands, which were to come into operation on Nov. 4th. The gaining of better conditions by the dockers is the least important of the results ensuing from this strike. It opened a new page in the history of English labor movements. Before then, with very few exceptions, each trade had been obliged to fight its own battle single-handed; in this case not only did all the kindred workers unite with them, undertaking all the hardship and misery that a strike means, with no other purpose in view than the betterment of their brothers, but all the other trades helped, too, by money and sympathy. Never before was the feeling of solidarity so greatly evinced. The chord so strongly struck also wakened into life the public conscience on other matters; and the influence of the strike is felt even at the present day.

Demands

Victory

ALFRED HICKS.

DOLLEANS, EDOUARD: French Professor in the Faculty of Law and Lecturer on Political Economy at Lille. Early in life in the office of the secretary of the zinc mines and foundries. He became deeply interested in the subject of social betterment, and was in 1898 and 1899 especially engaged in the cause of the day-laborers of the lower classes; and that he might be in closer touch with them he lived at that time in the Rue des Fouraceaux, near the night-workers of Montrench Sons Bois. He has written books and papers on very various economic subjects. He has been an active writer for the abolition of the State's regulation of prostitution. He is a member of the Union for Social Peace. *Address*: Rue de Médicis, Paris.

DOMESTIC SERVICE: The condition of domestic service in the United States has been affected by two historical facts. The first is the change made within a hundred years by the substitution of the factory system of manufactures for the previous domestic system. This change, involving a division of labor, has necessitated a readjustment of the work within the household. It has increased the demand for persons giving all of their time to household work, and it has limited the supply. The division of labor is not yet fully accomplished, and out of this fact grows a part of the friction found in domestic service. The second historical fact is the series of political revolutions of the century acting in connection with certain economic and social forces.

Development in the United States

Domestic service in America has had three distinct phases. During the early colonial period service of every kind was in general performed by "redemptioners." The colonization of the New World gave opportunity for the transportation and subsequent employment in the colonies of large numbers of persons who as a rule belonged to a low class in the social scale. These redemptioners, who paid their passage to this country by selling themselves into service, were found in all the colonies, tho more numerous in the Southern and Middle colonies than in New England. In Virginia and Maryland they apparently outnumbered negro servants until the latter part of the seventeenth century. Some of these redemptioners and many of their descendants became in time wealthy and prominent members of their communities, especially at the North, but for a long time they were generally considered the offscourings of English cities, and formed a distinct class in the social order lower than their masters or employers. In view of this fact, a reproach was of necessity attached to all belonging to the class and to the designation applied to them.

A second phase came about the time of the Revolution, when at the North the indented servants as a class were gradually supplanted by free laborers and at the South by negro slaves, who inherited with large interest the reproach attached to redemptioners. The social chasm that had existed at the North between employer and employee under the system of bond servants disappeared. The free laborers, whether employed in domestic service or otherwise, were socially the equal of their employers, especially in New England and in the smaller towns. They belonged by birth to the same section of the country, probably to the same community; they had the same religious belief, attended the same church, sat at the same fireside, ate at the same table, and had the same associates as their employers. They were in every sense of the word "help." A survival of this condition of affairs is seen to-day in farming communities, especially at the West. In the South, on the contrary, the social chasm became impassable, as negro slavery entirely displaced white labor.

This condition of democratic service at the North and slavery at the South continued in both sections from the time of the Revolution until about the middle of the last century. Between 1850 and 1870 four important political changes revolutionized the character of domestic service, and have introduced the third period in the history of the subject.

The first of these was the Irish famine in 1845. Previous to this time the emigration to this country from Ireland had been small, averaging not more than 20,000 annually between 1820 and 1846. In the decade previous to the famine the average number of arrivals had been less than

35,000 annually. In 1846 the number was 51,752, and this was more than doubled the following year, the reports showing 105,536 arrivals in 1847. In 1851 the number of arrivals from Ireland had risen to 221,253. Since that time the number has fluctuated, but between 50,000 and 75,000 persons annually come to this country from Ireland. A large proportion of these emigrants, 49 per cent during the last decade, have been women who were classed as "unskilled laborers." Two occupations were open to them. One was in factories, where, as manufacturing processes became more simple, unskilled labor could be utilized. The Irish emigrants soon displaced New England women, who found new opportunities for work of a higher grade. The second occupation open to the Irish was household service. Here physical strength formed a partial compensation for lack of skill and ignorance of American ways, and the Irish soon came to form a most numerous and important class engaged in domestic employments.

Emigration

A second important European change influencing the condition of domestic service was the German Revolution of 1848 with the events preceding and resulting from it. Before this period the emigration from Germany had been insignificant, fewer than 15,000 coming to this country annually between 1830 and 1840. In 1840, owing to political reasons, the number had risen to 29,704; but in 1841, after the accession of Frederick William IV., it fell to 15,291. It soon became evident that the hopes raised by the accession of the new monarch were without foundation, and emigration rapidly increased, until the number of emigrants coming to America reached nearly 75,000 in 1847. During the year of the Revolution the number decreased; but the failure of the cause of the revolutionary party and the political apathy that followed again increased the movement toward America. This reached its climax in 1854, when the number of Germans arriving in this country was 215,009—a number equaled but once since that time, altho the number has averaged nearly 150,000 annually during the last decade.

A large number of these emigrants have been women, the proportion of women emigrating from Germany being greater than from any other foreign country except Ireland. The ranks of domestic service have been recruited from their number also, the Germans being second only to the Irish as regards the number and proportion engaged in this occupation.

A third political influence affecting the question was the establishment of treaty relations between the U. S. and China in 1844. This fact, and the discovery of gold in California in 1848 and the building of the Union Pacific Railroad in 1867–69, opened the doors to the emigration of considerable numbers of Chinese. Many of these found their way into domestic service, and on the Pacific coast they have become formidable competitors of other nationalities in this occupation.

These political and economic conditions in Europe and the breaking down of long-established customs in Asia have thus, since 1850, brought to this country large numbers of men and women who have performed the household service previously given by native-born Americans. The presence of the Irish in the East, the Germans in the West, the Scandinavians in the Northwest, and the Chinese on the Pacific coast has thus introduced a new social as well as economic element at the North. It has led to a change in the relation of employer and employee; the class line that was only faintly drawn in the early part of the century between employer and "help" has been changed into a caste line, which many employers believe it to their interest to preserve. The native-born American fears to lose social position by coming into competition with foreign labor.

While this change has been taking place at the North in the character of the service owing to political conditions in the Old World, a similar change has taken place at the South, growing out of the abolition of slavery in 1863. The negroes who had previously performed all domestic service for their personal expenses have since then received for the same service a small remuneration in money. This fact prevents now as effectually as during the slavery period any competition in domestic service on the part of native-born white employees.

An indication of these various changes in the condition of domestic service is seen in the history of the word "servant." As used in England and in law at the time of the settlement of the American colonies, it signified an employee, and no odium was in any way attached to the word. This is indicated by the various definitions given in the early dictionaries, *servant* being defined as "a man or woman that serves another." But five things led to gradual disuse of the word: First, the reproach connected with the word through the character and social rank of the redemptioners; second, the fact that when the redemptioners gave place at the South to negro slaves the word "servant" was transferred to this class, and this alone was sufficient to prevent its application to whites; third, the leveling tendencies that always prevail in a new country; fourth, the literal interpretation of the preamble of the Declaration of Independence; and fifth, the new social and political theories resulting from the introduction of French philosophical ideas. At the North the word "help," as applied especially to women, superseded the word "servant," while at the South servant was applied only to the negro. From the time of the Revolution, therefore, until about 1850, the word "servant" does not seem to have been generally applied to white persons of American birth in either section. Since the introduction of foreign labor at the middle of the century, the word "servant" has again come into general use applied to white employees; not, however, as a survival of the old colonial word, but as a reintroduction from Europe of a term signifying one who performs so-called menial labor, and restricted in its use, except in a legal sense, to women who perform domestic service. The present use of the word has come not only from the almost exclusive employment of foreigners in domestic service, but also because of the increase of wealth, and consequent luxury, in this country, the growing class divisions, and the adoption of many European habits of living and thinking and speaking.

Use of Words

Domestic service has also been affected by the economic conditions of the century and it conforms to the general economic laws governing other industries. This is seen in the laws affecting wages. In domestic service, as in other occupations, wages tend to increase; wages are lowest in the South and highest on the Pacific

coast; skilled labor commands the highest wages. In many other ways the general conformity of domestic service to economic law could be shown.

Some of the difficulties presented to the employer of domestic service may be thus stated: The difficulty of assimilating into the family those who are of a different nationality, and consequently hold different industrial, social, religious, and political beliefs; the spirit of restlessness that everywhere prevails among the working classes, tho not peculiar to them, and the resulting brief terms of service; the necessity of engaging for skilled labor the assistance of unskilled laborers; the lack of reliable means of communication with those desiring employment; the prevailing indifference among employers to the action of economic law and the failure to realize that in domestic service as elsewhere the course followed by one employer has an appreciable effect on the condition of the service as a whole.

Difficulties

On the side of the employee the advantages in domestic service as an occupation are high wages, the healthfulness of the work, that it gives the externals of a home, training in household affairs, and congenial employment to those whose tastes lie in this direction. These advantages are offset by the disadvantages that lie in the fact that there is little or no opportunity for promotion in the service, the utter lack of organization in the occupation, the irregularity of working-hours, the lack of free time evenings and Sundays, the impossibility of having more than the externals of a home, and the absence of all opportunities for personal improvement and social advantages. The most serious disadvantage is the badge of social inferiority placed on the class of domestic employees. This badge consists in the use of the word "servant" and of the Christian name in address, the wearing of a livery, the enforced acknowledgment of social inferiority, and the giving of fees. The latter custom has perhaps done more than any other one thing to change what should be an honorable employment into a menial service.

The underlying difficulty in the present condition of domestic service is the almost universal failure to recognize it as a part of the great industrial question of the day. Domestic service is amenable to economic law in precisely the same manner as are other forms of labor, and until the study of the subject is made to begin at this point all plans to bring about a better condition of affairs must prove fruitless.

That a beginning has indeed already been made is clearly evident. There is a distinct, positive, and direct improvement in the literature of the subject.

The faultfinding, the sentimental, the goody-goody magazine article is gradually disappearing with the appearance in its place of genuine contributions to the subject. The attitude of the daily press toward the subject of domestic service also shows much improvement.

The historical investigations of the subject have been few in number, but of great value. Mr. Albert Matthews has placed all students of the subject under obligation to him by his exhaustive study, "The Terms Hired Man and Help," as Mr. James D. Butler had previously done by his investigations on "British Convicts Shipped to American Colonies," and Dr. Karl Frederick Geiser on "Redemptioners and Indented Servants in the Colony and Commonwealth of Pennsylvania."

The public library is always first to create as well as to satisfy a demand for literature on subjects of general interest. It is therefore not surprizing to find that the Providence Public Library as far back as 1893 issued a bibliography of all works and magazine articles on domestic service, which has been followed by the still more exhaustive reference list published in 1898 on the general subject of domestic science, and that the Salem Public Library has a similar list. The New York State Library has published a comprehensive bibliography of the whole subject of domestic economy, and it sends out, to all parts of the state, traveling libraries of the best volumes on the same subject—the list of the volumes included being in itself an excellent guide to the study of household economics. But the greatest of all steps in advance has been made by those libraries that have changed the classification of works attempting to treat scientifically the subject of domestic service, from the class of domestic economy to that of economics proper. The change seems slight, but it is a recognition of the intimate relation that exists between domestic service and other forms of industry.

Literature

Among the most thorough of the statistical investigations is that carried on by Miss Isabel Eaton—recently fellow of the College Settlements' Association—in regard to negro domestic service in the seventh ward of Philadelphia.

It was early recognized that some of the most difficult factors of the problem concerned the intelligence office, and investigations on a somewhat limited scale were carried on in several cities, but largely owing to political considerations it was not deemed advisable to publish the results. The most thorough and systematic investigation undertaken in this direction has been that of Miss Frances A. Kellor, whose "Out of Work," based on a study of more than 700 agencies, has laid bare the evils of the present system of securing new employees, as seen by employer, employee, and manager of the agency. A body of facts has thus been made available that must prove of the highest service in any attempt to cope with the notorious evils attending many agencies.

The state bureaus of labor have in several instances done valiant service to the cause through the official investigations carried on. As far back as 1872 the Massachusetts Bureau of Statistics of Labor devoted four pages and a half of its annual report to domestic labor. But the first real investigation of the subject made by a state bureau of labor was probably that undertaken by the Minnesota Bureau in 1890. This has been followed by special investigations in other states—notably Kansas and Michigan—and in Canada. Most of all is encouragement to be found in the comprehensive investigation recently carried on under the direction of the Industrial Commission.

Domestic service has been until very recently a field untouched by the statistician and investigator. The studies already made show not so much what has been done, as how much yet remains to be done. But the territory is already being occupied.

Much has been done in the direction of introducing courses in household economics into the curricula of various state universities, while the

University of Chicago, Teachers' College, and Simmons College have done noteworthy work in this direction. Such courses naturally include a study of domestic service.

Study and investigations have led to organization, and the first association in the field was the National Household Economic Association, formed in 1893, with branches in many states, some of which did admirable work.

The Lake Placid conference that met first in 1899 is not strictly an organization, but an informal gathering of workers who have discust the subject particularly on its scientific side, since the attendance has been largely made up of those interested in the educational and scientific side of household economics. Its proceedings give an admirable summary of the latest scientific discussions of the subject.

Organizations

The most recent as well as the most important of all such organizations has been that of the Inter-Municipal Committee of Household Research, formed "for the purpose of studying existing phases of household work, to aid in securing fair conditions for employer and employee, and to place their relations on a sound business basis." Much has already been accomplished by it, especially in the direction of investigating employment agencies, establishing a bureau of information, and studying the conditions under which Southern colored girls are brought to the North to enter domestic service. Its program for the future lays out a constantly enlarging sphere of activities.

It is not surprizing, in view of all the agitation of the question in our own country, to find that a similar interest has been aroused elsewhere. In Germany, that home of conservatism in all domestic affairs, an elaborate statistical investigation has been carried on by Dr. Oscar Stillich, and its results published in an exhaustive work entitled "The Status of Women Domestics in Berlin." Nor again is it surprizing to find that neither official nor domestic Berlin has taken kindly to the investigation, since bureaucracy has in it no place for private initiative, and the *Kinder, Küchen, Kirchen* theory of domestic life has resented what has been deemed unwarranted interference in private affairs.

Only by the continuation of the method of investigation and by acting in accordance with the results of these investigations can permanent relief be found.

Lucy M. Salmon.

Ed.—According to an investigation made by Professor Salmon, in 1895, the average weekly cash wage to domestic servants was for women, $3.23, and for men, $6.93 (tho 40 per cent of the men did not receive board and lodging besides and were largely on the Pacific coast). In 245 Massachusetts homes the servants' average daily time on call was twelve hours and a half, and on duty ten hours and a half.

The main difficulty of the servant question seems to many to lie in the fact that for young, intelligent, healthy women there is a steadily increasing demand in occupations more inviting than domestic service. Ordinary mistresses, therefore, under the present system, must increasingly look forward to obtaining as household servants only the inefficient or the old. It is inevitable. On domestic service as now conducted there is a stigma. Till people are willing to marry or receive cooks and housemaids on an equality with girls in offices, stores, and factories, girls will prefer such life to domestic service, even at lower pay. Domestic service, moreover, even in the best homes, usually implies constant submission to one person's will, and constant confinement, except, perhaps, for one "evening out" a week. In the store or the factory, girls almost always have all their evenings and Sundays perfectly free, and when at work are with others under fixt regulations rather than under a personal master. Almost anybody would prefer such a measure of freedom, even with low pay, to higher pay and less freedom.

The way out does not consist in trying to treat servants better or in training of servants. These are well but will not meet the real trouble. Professor Salmon, Miss Jane Addams, Mrs. Charlotte P. Gilman, and others are agreed that the way out is by putting housework on the professional basis of all other work done by persons living away from the house, thus avoiding restrictions, directing themselves, and working regular hours, as office cleaners now work. Mrs. Gilman points out also that if the 200 families which live in most city blocks could cooperate, they could hire thirty trained cooks who could serve the 1,000 people better than 200 cooks each working separately, and with vast saving of care, money, and time. Such arrangements would be more economical and free the home from the presence of inefficient and often ignorant strangers, and raise the whole status of household work.

Miss Jane Addams, in an article in *The American Journal of Sociology* for March, 1896, finds it perfectly natural that girls should prefer factory labor, with its social equality and industrial independence. She says:

> "If the 'servant' attitude were once eliminated from household industry, and the well-established one of employer and employee substituted, the first step would be taken toward overcoming many difficulties. . . . Most of the cooking and serving and cleaning of a household could be done by women living outside and coming into a house as a skilled workman does, having no 'personal service' relation to the employer. There is no reason why the woman who cleans windows in a house should not live as full a domestic and social life as the man who cleans windows in an office."

DONI, FRANCESCO: Italian communist; born in Florence, about 1503. In 1552 appeared at Venice his "I Mondi," and the year after his "I Inferni," in which he describes his ideals of a communistic state, where there is community both of property and of wives. The books were translated into French, and seem to have arrested some attention, but to have developed few thoughts that were new. Doni died in 1574.

DONISTHORPE, WORDSWORTH: English writer and lecturer; born in Yorkshire, England, 1847; educated at Leeds School and Trinity College, Cambridge. He traveled in Europe and was imprisoned in Strasburg in 1870 for taking part in a riotous republican demonstration, but was soon released. He was called to the bar in 1879. In 1880 he founded the State Resistance Union, of which he was the first president. In 1881 the basis of its operations was widened under the title of Liberty and Property Defense League, and the Earl of Wemyss became its president. During the years 1887–88 he edited *Jus*, the organ of individualism. In 1887 the Free Libraries Act was applied to Kensington, and he fought the question till 1890, when the vestry surrendered and paid his share of the rate, to-

gether with his costs. In 1887 Donisthorpe drew an Adulteration Bill, which was brought into the House of Lords by the Earl of Wemyss, and passed the first reading, but owing to the lateness of the session was dropt. He claims to belong to the individualist school, which he considers "Anarchist in principle and final aim, but opportunist in action. So long as we are unprepared for private enterprise in any department of activity, such as the enforcement of the fulfilment of contracts, let the State do such work as well as it possibly can." In politics he calls himself republican; in religion, atheist; in morals, egoistic hedonist. He is the author of "Principles of Plutology" (1876); "Serfdom, Wagedom, and Freedom" (1880); "Overlegislation" (1883); "Capitalization of Labor" (1887); "Individualism" (1889); "Plea for Liberty" (1891); "The Future of Marriage," in the *Fortnighily Review* (February, 1892); "Love and Law"; and "Bastardy," in the *Free Review*.

DONNELLY, IGNATIUS: American lawyer and editor; born in Philadelphia, 1831. His father, Dr. Philip Carroll Donnelly, was an eminent physician in that city. After graduation from the high school he entered upon the study of law, and in 1853 was admitted to the bar. Two years later he was nominated by the democrats for the House of Representatives, but declined the nomination. In 1856 he moved West, and in 1859 started the *Dakota County Sentinel*. In 1857 he was nominated for state senator by the republicans, but was defeated. He was the first to organize the Dakota County Agricultural Society. In 1859 he was elected Lieutenant-Governor of Minnesota, and since then took an active part in the political life of the West. In 1874 he started the Anti-Monopoly Party of Minnesota, and became a leader in the People's Party. For some years he edited *The Representative*, a leading People's Party organ published in Minneapolis. He died in 1901. Among his works may be mentioned: "The Great Cryptogram"; "Atlantis"; "Ragnarok"; "Doctor Huguet"; "Cæsar's Column"; and "The Golden Bottle."

DOUAI, DR. ADOLF: A German-American Socialist; born in Altenburg, 1819; studied philosophy and theology in Germany, and became a private tutor in Russia. Receiving the degree of Ph.D. at Dorpat, he returned to Altenburg and established a private school. Arrested and, after being once discharged, rearrested and imprisoned one year for his socialistic utterances and his part in the Revolution of 1848, he escaped to Texas in 1852, and as a journalist and teacher traveled through many of the states, carrying socialism with him. He took part in the early Socialist organizations in New York City, and was editor of the *Arbeiter Union*, established in 1871, and from 1878 to his death, in 1888, associate editor of the *New Yorker Volkszeitung*.

DOUGLASS, FREDERICK: American antislavery orator and journalist; born at Tuckahoe, near Easton, Md., 1817. His father was white, his mother a negro slave, and he was reared as a slave on the plantation of Col. A. E. Lloyd until 1827, when he was transferred to a relative of Colonel Lloyd's in Baltimore. There he worked in a shipyard, and taught himself to read and write. In 1838 he escaped, disguised as a sailor. Coming to New York, and eventually to New Bedford, he married a negress there and worked as a day-laborer for several years. Taking part in antislavery meetings, he aroused great interest by his eloquence; and in 1841 he was sent out as a lecturer by the Massachusetts Anti-Slavery Society. He lectured in the United States and in England, where money ($750) was raised to purchase his freedom. In 1847 he founded in Rochester a weekly (first called *Frederick Douglass's Paper*, and later *The North Star*) which was continued till 1860. During the Civil War he did much to promote negro enlistment, and three of his sons served in the Union Army. In 1870 he founded at Washington, D. C., *The New National Era*, which he turned over to his sons. From 1876 till 1881 he was U. S. Marshal for the District of Columbia; 1881–86, recorder of deeds; and 1889–91, U. S. Minister to Haiti. He died in 1895. He wrote "The Life and Times of Frederick Douglass" (1882.)

DOUKHOBORS. See DUKHOBORTSKY.

DOVE, PATRICK EDWARD: Scottish land reformer; born at Lasswade, near Edinburgh, 1815. He studied in France and Germany, as well as Scotland, and in 1850 published "The Theory of Human Progression and Natural Probability of a Reign of Justice, the First Part of a Projected Treatise on the Science of Politics." It arrested attention of scholars like Hamilton and Charles Sumner. In it he comes to conclusions as to land very nearly similar to those of Henry GEORGE; and Mr. George, when lecturing in Edinburgh in 1884, praised his book very highly. Some have even claimed that it was from this book that Mr. George drew some of his ideas. Dove seems to have been a universal genius, writing alike on the sport of Scotland, theological discussions, and the science of government. He contributed the article on government for the "Encyclopædia Britannica," and won recognition by his books in various quarters. He died in Scotland in 1873.

DOW, NEAL: "Father of the Maine Law"; born in Portland, Me., March 20, 1804. His parents and all his ancestors for many generations were Friends, and he was brought up in that faith. He was educated in public and private schools, and later at the Friends' Academy, New Bedford, Mass.

In his youth he was a whig, but on the birth of republicanism he joined that party, and later became a member of the Prohibition Party as soon as he became satisfied that prohibition through the Republican Party was impossible. He was twice Mayor of Portland, and twice a member of the legislature. In his first mayoralty term, in 1851, he framed an anti-liquor bill and carried it to the legislature two days before its adjournment; the bill was reported the next day precisely as he had written it, was put through all its stages by a vote of eighty-six to forty in the House and eighteen to ten in the Senate, enacted on the same day, and took effect on its approval by Governor Hubbard (a Democrat) the next day. It is known in all the English-speaking world as "the Maine Law." Mr. Dow entered the army, September, 1861, as colonel of the Maine Volunteers, of 1,000 men, which he recruited. He also recruited the Second Maine Battery. In April, 1862, he was commissioned brigadier-general by Mr. Lincoln. He was twice wounded in battle, and was cap-

tured and taken to Libby Prison at Richmond, Va., where he was retained eight months and then exchanged for Fitz-Hugh Lee.

He visited England three times, delivering about 500 addresses under the auspices and as the guest of the United Kingdom Alliance. In 1880 he was the candidate of the Prohibition Party for president. In 1894 his completion of his ninetieth year was celebrated all over the world. He died Oct. 2, 1897.

DRAGE, GEOFFREY: English sociologist; born 1860; educated at Eton and Christ Church College, Oxford. He traveled for some years, studying at Berlin and Moscow, and later visited America, Africa, and Australia, attending nearly all the parliaments of the world, and taking great interest in political and social questions. In 1891 he was appointed secretary to the English Royal Commission on Labor, organized the office staff, and prepared the series of reports on foreign countries. He has written: "Criminal Code of Germany" (1885); "Cyril" (1889); "Eton and the Empire" (1890); "The Unemployed" (1894); "Eton and the Labor Question" (1894); "Old Age Pensions" (1895).

DRINK QUESTION. See LIQUOR TRAFFIC; TEMPERANCE, ETC.

DUKHOBORTSKY or DUKHOBORS: A religious communistic sect originating in Russia about the middle of the eighteenth century, many members of which, after repeated persecutions, removed to Canada (western Manitoba) in 1898. The Dukhobors owe their name (Russian, *spirit-wrestlers*) to the fact that they have combated the orthodox doctrine of the divinity of the Holy Spirit. This in itself shows that they began as one of the multitudinous sects which have broken away from time to time from the formalism of Russian orthodoxy in the direction of a simpler faith, with emphasis upon the humble brotherly social life inculcated in the Gospels. The Dukhobors seem to have held that Christ was merely a godlike man, and that His spirit has migrated into many persons. All people, they hold, are equal as children of God, and there is no need of there being any rulers. The only law is to do what is right. They accept the Ten Commandments and the "useful" portions of the Bible. All else is allegory, tho the Dukhobors have no symbols, forms, creed, or ecclesiastical organization. They have no marriage ceremonies, believing marriage to be a question of the inclination of the heart only. Wives and husbands are sisters and brothers, and are called "old man" and "old woman."

This short statement of their faith shows that they represent a reaction both from Russian governmentalism and ecclesiasticism, inevitable in an empire where absolutism, bureaucracy, and church formalism have been carried to the extreme, yet where the common people have always had traditions of a communal life and to a large extent of a Christianity applied in humble brotherly living. (See MIR; RUSSIA; TOLSTOY.) The Dukhobors have simply been one of the most enduring and, latterly, best known of many similar sects.

It is also evident how both the Russian Government and the Russian State Church would oppose such a sect. The sect seems to have been founded in Kharkov, tho all their early history is wrapped in uncertainty. They wrote no books partly because most of their members were illiterate and partly because secrecy compelled their propaganda to be carried on by word of mouth. The sect, however, spreading, in 1799 some of the Dukhobors were sent to the mines by the government. Alexander I., becoming Czar in 1801, favored toleration, but in 1826, under a new czar, persecution was renewed, and in 1837 the Dukhobors were banished to the Caucasus. Here, however, the Mohammedans treated them well, because it was evident that they were not Christians, since they would not fight. After years of quiet growth, persecution began again in 1897, upon the Dukhobors at first consenting to and then refusing army service. Peter Verigin was their leader in this, and has since continued leader. Pobiedonostseff, the ecclesiastical head of the Russian Church, also at this time undertook to bring all the religious elements of the empire into conformity with the Russian Church. A severe persecution resulted. Many of the Dukhobors were killed, imprisoned, banished, flogged, fined. Finally, tho the Russian press was forbidden to allude to the subject, the matter got out and through Leo Tolstoy, D. A. Hilkoff, Aylmer Maude, and others (mainly Friends) many thousand Dukhobors were enabled to emigrate to Canada (some of them at first to Cyprus). By 1900 some 7,000 Dukhobors were settled in three different colonies in Manitoba, on over 600 sq. m. provided on nominal terms by the Canadian Government. Settled here, tho with many hardships, the Dukhobors showed great ability at road-making, bridge-building, etc., but their peculiar ideas as to society and business got them into trouble with the Canadian authorities. In 1902 they suffered great hardships, and later many of them, including women and children, set out in winter to seek barefoot "the Christ," on a pilgrimage over the wastes of Manitoba snow, till they were turned back to their homes by the Canadian Government. The cause of their leaving their homes on this fanatical winter exodus—there were also "nudity processions"—seems to have been unwillingness to accept Canadian customs. Led by one Bodgánsky, they declared that they could not make private property of "God's cattle" nor use animals as beasts of burden. Returned to their homes, however, a statement from Verigin induced them to enter for their homesteads and conform to the Canadian law, and since this they have gone quietly on. Verigin himself came to Canada in 1903. The Dukhobors, tho thus in many ways fanatically religious and in their ignorance easily moved by advisers, work hard, and live quietly, men and women working in the fields. They work in shifts from five A.M. to eight P.M. Mr. Aylmer Maude says of them ("A Peculiar People," p. 231):

History

In Canada

Characteristics

> It would be hard to find a community consisting of an equal number of men among whom there is less crime, and more industry, honesty, and hospitality, or more personal attention by the hale adults to the needs of the old people and the children. They are sober, temperate, healthy, and there is no prostitution (and apparently little looseness in sexual matters) among them. Compared with the fancy pictures drawn by some enthusiasts they are disappointing, but compare well with ordinary human beings; they are a worthy and estimable folk in spite of their obstinacy, sectarian exclusiveness, and their too great dependence on a very fallible authority.

The Dukhobors have not always practiced communism, and some of the Canadian colonies are much more communistic than others, but their thirty different villages are now largely and some of them almost wholly communistic. At least they buy and sell and conduct business collectively. The only power among them is vested in an assembly of the elders. The colony has brought many thousand acres under cultivation, has invested largely in farm machinery, with many steam-mills, sawmills, flour-mills, etc.

DUMA. See RUSSIA.

DUNCAN, C.: Labor Member of the British Parliament; born at Middlesborough, 1865; was apprenticed in the engineering trade after a short term of schooling. In 1890 he threw himself into the labor movement, and was elected to the town council. In 1895 he organized the unemployed in Middlesborough. Coming to London in 1898 he was chosen president, and (1900) secretary of the Workers' Union. He is also president of the Marylebone branch of engineers. In 1906 he was elected M.P. for Barrow-in-Furness. *Address*: 16 Agincourt Road, Hampstead, N. W., London, England.

DUNCAN, JAMES: American granite cutter; secretary of the Granite Cutters' International Association; born in Kincardine County, Scotland, 1857; educated in an Aberdeen night-school. Coming to America and entering his trade, he became secretary of the New York branch of the Granite Cutters' International Association in 1881, and national secretary and treasurer in 1895. In 1894 he was made vice-president of the American Federation of Labor. He led successfully the eight-hour contention of his craft in 1900; and he has adjusted many disputes, strikes, and lockouts. He is editor of the *Granite Cutters' Journal*. *Address*: Quincy, Mass.

DUNCKER, FRANZ: One of the founders of the Hirsch-Duncker trade-unions of Germany, born in Berlin, June 4, 1822. He studied philosophy and history at Berlin University, and entered the publishing business. In 1862 he bought Besser's publishing establishment and changed it to the Franz Duncker'sche Buchhandlung. In 1865 he became president of the Berlin Trade-Unions, and four years later he associated with Max Hirsch, the founder of the trade-union movement named after him. He was also one of the founders of the Progressive Party in the Reichstag. Died in 1888.

DUNKARDS, DUNKERS, or TUNKERS (from a dialectical form of German *Tunken*, "one who dips"): The name of a sect of American German Baptists who call themselves Brethren. The sect was founded in 1708 at Schwarzenau in Westphalia, as an outcome of the Pietist movement, under the lead of Alexander Mack, tho he is not held as its founder. Persecuted at home, between 1719 and 1729 the Dunkards came to America and settled in Pennsylvania, and subsequently in other states. In their early history the sexes dwelt apart, and marriage, tho not forbidden, was discouraged. A certain community of goods was also established. These features have now disappeared. The sect is marked by its simple life and dress. Dunkards refuse to take oaths or serve in war. They hold love-feasts and celebrate the ceremonial of feet-washing and the anointing of the sick with oil. Their creed is evangelical Christianity. Their ministers usually receive no salary. Most of the members are farmers. The first settlement was "Ephrata," near Lancaster, Pa., but this branch has nearly died out. In 1901 they had about 100,000 communicants in twenty-five states and five foreign countries, with 720 congregations, and 2,600 ministers serving mainly without salaries.

DUNOYER, CHARLES: French economist; born at Carennac, Lot, 1786; studied law at Paris. Together with Charles Comte he established, in 1814, *Le Censeur*, but was compelled to discontinue it in 1816. Eighteen months later, however, it was resumed under the title *Le Censeur Européen*, and continued until the assassination of the Duke of Berry, in 1820, and consequent troubles led to its entire suspension. After this Dunoyer devoted himself exclusively to economics. Appointed prefect of the department of the Allier and, in 1832, prefect of the Somme, he entered the Council of State in 1838. The Revolution of 1848 was a heavy blow to him, Royalist and Liberal as he was, but he remained on the Council of State until the *coup d'état* of 1851. Bitterly hostile to the Second Empire, he wrote a work directed against the new order of affairs. He died in Paris in 1862. Palgrave's "Dictionary of Political Economy" says of him: "Dunoyer was one of the great economists of the nineteenth century. He was a warm supporter of the theories of Malthus on population; but he was no believer in the theory of rent, considering that there was only one factor in production—i. e., labor." His miscellaneous works ("Notices d'Économie Sociale"), and the second edition of his chief work, "La Liberté du Travail," were published in 1886.

E

EASLEY, RALPH MONTGOMERY: Chairman of the Executive Council of the National Civic Federation; born in Schuyler County, Ill., 1858; educated in the public schools. He was proprietor and editor of the *Hutchinson* (Kan.) *Daily News* from 1883 to 1891, and postmaster of Hutchinson from 1882 to 1887. From 1887 to 1890 he edited the department of political economy for the *Chicago Inter Ocean*. In 1893 he organized and became secretary of the Civic Federation of Chicago; and in 1900 he organized the NATIONAL CIVIC FEDERATION, whose chairman he has since been.

ECONOMY. See THRIFT.

ECONOMY, COLONY OF. See HARMONISTS.

EDEN, SIR FREDERICK MORTON: English writer on economy; born in 1766; a graduate of Oxford University; chairman and one of the founders of the Globe Insurance Company; wrote various statistical and other monographs, but is mainly known for his great work on the poor, which is described by its title, which is almost a catalog: "The State of the Poor, an history of the labouring classes in England from the Con-

quest to the present period, in which are particularly considered their domestic economy with respect to diet, dress, fuel, and habitation, and the various plans which from time to time have been proposed and adopted for the relief of the poor, together with Parochial Reports relative to the administration of Workhouses, and Houses of Industry; the state of Friendly Societies, and other public institutions, in several agricultural, commercial, and manufacturing districts" (1797). A storehouse of information, it ranks with the travels of Arthur Young as one of the first sources of economic information for its period. He died in 1809.

EDGAR, REV. ALEXANDER ROBERT: Superintendent of the Central Methodist mission (Wesleyan Church), Melbourne, Australia, since April, 1893; born in Tipperary County, Ireland, 1850; educated in national schools and theological institute. He was president of the Victorian and Tasmanian Wesleyan Conference in 1901, and has been associated with many of the principal social movements in Melbourne for the past twenty years. He was appointed by the governor in council chairman of the Wages Board in relation to the Factories and Shops Act of 1896, and was a member of the royal commission appointed to inquire into causes of unemployment in 1899. *Address*: Lonsdale Street, Melbourne, Australia.

EDGEWORTH, FRANCIS YSIDRO: Political economist; born in Edgeworthstown, Ireland, 1845. After several terms at Trinity College, Dublin, he entered Oxford in 1867, graduating with a "first class" in 1869. Devoting himself to mathematics, he published "Mathematical Physics" in 1881, and wrote numerous papers on statistical questions for the British Association and other bodies. He lectured on political economy at the Ladies' Department of King's College, London, and in 1888 was appointed to a professorship of political economy in that college, and in 1890, on the resignation of the late Prof. Thorold Rogers, to the Tooke Professorship of Economic Science and Statistics in the same college. In 1891 he was called to the chair of political economy at the University of Oxford, which position he still holds. Editor of the *Economic Journal*. *Address*: All Souls' College, Oxford, England.

EDGEWORTH, MARIA: English novelist; born at Blackbourton, Oxfordshire, England, 1767. An intimate friend of Malthus, Richard Jones, and Ricardo, her writings aim to popularize and inculcate, among children especially, the main points of the orthodox school of political economy with its worship of "self-help" and individualism. Her novels, "Belinda," "Parents' Assistant," "The Orphans," "Moral Tales," "Popular Tales," "Rosamond," "Egerton Abbey," "Castle Rackrent" (1800), "The Absentee," "Ennui," "Ormond," and "Helen" (1834), are not all concerned with economics directly, but point varied forms of the same general moral. She died in Edgeworthstown, Ireland, in 1849.

EDUCATION: Among the various definitions of the word "education," the following examples have been selected as being among the best:

Definition

"The purpose of education is to give to the body and to the soul all the beauty and all the perfection of which they are capable" (*Plato*).—"Education includes whatever we do for ourselves and whatever is done for us by others for the express purpose of bringing us nearer to the perfection of our nature" (*John Stuart Mill*).—"Education is the preparation for complete living" (*Herbert Spencer*).—"Education is the harmonious and equable evolution of the human faculties by a method based upon the nature of the mind for developing all the faculties of the soul, for stirring up and nourishing all the principles of life, while shunning all one-sided culture and taking account of the sentiments upon which the strength and worth of men depend" (*Stein*).—"Education is the sum of the reflective efforts by which we aid nature in the development of the physical, intellectual, and moral faculties of man in view of his perfection, his happiness, and his social destination" (*Compayré*).—"A gradual adjustment to the spiritual possessions of the race" (*Butler*).—"Education is the superior adjustment of a physically and mentally developed conscious human being to his intellectual, emotional, and volitional environment" (*Horne*).

Every civilized nation has had an educational aim peculiar to itself, and a criterion by which it has judged the product of its educational machinery. With the Spartans it was the production of the soldier. In Athens, a few centuries later, the stern, military aim had been superseded by one which included beauty and the sensuous delights of living. When the Roman arms were supreme there came another ideal: not radically different from the others, for it included physical strength to bear those arms, and intellectual power that peoples might be governed. Since the revival of learning, four centuries ago, educational aims have broadened, and can no longer be stated in narrow terms. It is not enough to train for war as in Sparta, nor for esthetic enjoyment as in Athens, nor for heaven, forgetting earth, as in medieval Europe, but for life in its best and broadest sense—life that is joyous through health, that reaches out into unexplored scientific fields, that sees beauty in right action, that rethinks and makes loftier the noble thoughts of all ages, that believes that what is best for earth is good enough for heaven, and that feels that not to leave the world better than it finds it is to be disgraced. Certainly this is no narrow and sordid educational creed.

The school is the institution through which the family or the people have attempted to realize in the child their educational aims and ambitions. In its inception, when the family was the supreme unit in social organization, the school was an instrument of its own construction, and the teacher a person with authority, delegated by the family to perform certain duties which it had long recognized as its own, but which were found to be better and more economically performed by proxy than otherwise. As time went on and state organization became powerful, its demands in many instances became so strong as to overrule the family in matters educational, and to establish a national aim which demanded state schools. This, however, has occurred more often under democratic forms of government in which the family has had a voice in the management of affairs, so that such schools are a result of a delegation of parental authority. In many instances, however, it has not been the State that has been constituted the family proxy in educational affairs, but the Church.

The School

The older nations were practically unanimous in not wanting to give girls any special opportunities to acquire knowledge, and the schools were therefore closed to them. With regard to the boys, however, they differed very widely, and the schools differed accordingly. Yet in one respect the schools of all countries and of all

times have had an element in common; that lies in the fact that each has been in a sense a macrocosm, of which the condition of the highest class of adult life are the microcosms. In other words, the school has even been a condensed sample out of the highest life of the people.

To consider the school as a preparation for life is a common figure of speech, and is in a sense true, yet only as life itself is its own preparation. John Dewey has made classic the expression "the school is life," and in so doing has done much to free us of the popular belief (and a natural one it is, too, when the word preparation is used) that life is something that may be gotten ready for and then entered upon much as one would make a suit of clothes, even to the sewing on of the last button, before wearing it. The very word "preparation," with its prefix *pre*, is suggestive of some initial step which is to be taken before one can proceed. And therein lies the danger. Not that it will lessen the care taken with the earlier steps, but that with the entrance upon active life the process of further adjustment and adaptation should cease. And that would mean stagnation. If, however, we adopt the figure of the school as a sample cut from the work and woof of life itself, there is no suggestion of limitation till the whole piece shall have been included within the sample. And we shall not be easily satisfied with the small sample which shows neither the pattern nor the dominant color, but shall go on weaving, until not only the figure in all its intricacies meets the eye, but every tint and shade and color which have given the whole web its beauty.

History of Education

In its inception the school seems to have been a voluntary and sporadic affair springing up as occasion demanded to meet the requirements of the comparatively few who had the wealth and the interest to have their children educated. Of Egypt, in its earliest centuries, Sayce says: "There is evidence that if there were not numerous elementary schools scattered over the country, yet teachers might always be had, and that reading and writing and the elements of arithmetic were accessible to those who desired instruction." Among the Babylonians, too, such must have been the case for nearly 4,000 years before Christ. According to Sayce, "every great town had its library on brick tablets which were thrown open to the public," and certainly such would have been of but little use without a somewhat general knowledge of the written language.

In China a considerable literature dates back to nearly 1,000 years before our Christian era; and in India, likewise, not only a literature, but relatively permanent institutions of learning, existed in very ancient times. It cannot be supposed, however, that these early schools benefited more than a comparatively small part of the people; nor that their influence was great. Yet in some nations either the State, or the religious organization, or both, recognized it or their own particular institutional needs, and met them through the establishment of schools. In Egypt both of these forces were at work in the educational field, and there were temple schools for the preparation of an esoteric priesthood, as well as military institutions to meet the needs of the army. Among the Hebrews the religious side alone was dominant in education, while in the Medo-Persian Empire the military forces were supreme.

Sparta

It remained, however, for Sparta to organize herself into what was in some respects an immense educational institution, and to provide material which fulfilled its educational ideal. This ideal was purely and simply a military one, and its product was the soldier. At the birth of a child the State asserted its authority, and decided for life or death. Children with bodily defects were put out of existence. The rest were adopted by the State, which thus became an alma mater in the truest sense of the word. The first seven years of life were spent with the mother, tho under the strictest State surveillance, whereupon the boys were transferred to public barracks. Here they were divided into squads which were under the direction of special officers; yet each boy was expected to attach himself to some one man who became his special tutor or "inspirer." Education along literary lines was restricted to the mere rudiments of reading, writing, and arithmetic. To furnish a wider education would have been a source of danger to the State, since learning establishes quite other distinctions than those of military power. But nothing that could make for physical strength and endurance was omitted. Running, jumping, walking, and boxing performed in the open air in the presence of the public, was the daily program, and each boy was urged on to do his best by his inspirer, while the muscles were hardened by the most rigorous habits of life. A premium, too, was put upon theft, as being a most important accomplishment for prospective warriors in an army without a well-organized commissary department. At the age of eighteen the Spartan boy entered the *Ephebeum*, and for two years underwent a course of training more nearly resembling the conditions of actual warfare. But not until the age of twenty was he admitted to the soldier's rank and permitted to take the field against the enemy. At thirty he became a full citizen and was compelled to marry, tho still residing in the public barracks, and being allowed to visit his wife at infrequent intervals only.

Since healthy motherhood was an essential to a healthy citizenship, some little attention was given to the physical training of the girls; but beyond that nothing was done for their instruction. Such was the first great State university.

When, with the march of time, the Athenian state arose, mere brute force had partly lost its supremacy, and the potency of appeal to the intellect was recognized. Such a recognition brought with it a new educational aim, that of making the orator. In providing the orator, however, the State took a much less important part than had been the case at Sparta. In fact, it seems probable that the State did no more than to provide suitable buildings which were let out to private teachers. On the side of physical education, however, the more active, feeling no doubt that in the last resort national safety depended upon strength at arms, demanded public provision for its development.

Athens

But the emotional and esthetic nature of man had altered, and the brutal criticism of the Spartans was being replaced by the sensualistic, beauty-loving characteristics of the later Athenians. And this change of hearts was soon reflected in the educational system. So we find the curriculum of the Athenian youth divided into two great groups of subjects: (1) Music, which included every discipline of mind which was presided over by a muse—seven in all—and (2) gymnastics, which included every activity leading to the perfection of physical health and strength.

During the first seven years of life the child was kept in the house; then he was sent to school, or rather to two schools: that of music, and that of physical culture. Half a day was spent in each. In the former the time was chiefly devoted to the study of poetry and music, tho the prose literature of history and politics found no unimportant place. The physical exercises were divided into five classes: leaping, running, javelin-casting, discus-throwing, and wrestling.

The children of nearly all the free citizens attended these earlier schools, but only those of the wealthier classes went further. The latter, however, at an age of from fourteen to sixteen years, entered the gymnasium and began the process of active preparation for the duties of citizenship under the direct surveillance of the State. Here only slight regard was paid to the intellectual side of education, altho instruction was given in the laws; but the physical and social sides received much attention. "He [the young Athenian] now learned to ride, to drive, to row, to swim, to attend banquets, to maintain a conversation, to discuss the weightiest questions of statesmanship, to sing and dance in public choruses, and to ride or walk in public processions. If he abused his liberty and behaved in a lawless or unseemly way, he was called to account by the severe discipline of the *Areopagus* which attended to public morals."

At the age of eighteen the youth's name was registered upon the record of the *demos* or commonwealth, and after passing an examination he entered the two-year period spent as an *ephébos* or citizen novice. The first of these years he passed in the vicinity of Athens in military drill and the study of tactics; the second on the frontiers in actual military operations, and at its end he became a full citizen of state. But such a graduation into the active affairs of the republic did not by any means mean the cessation of educational progress. Quite the reverse, for the State still maintained an individual control which influenced every sphere of action. But to use figures common to-day, tho unknown in those times, the change to citizenship was one from required courses to one of full electives. During the earlier training all were cast in the same mold, and there was little opportunity for individual merit to assert itself. Afterward the environment was wholly selective, and picked its leaders, promoting some to the highest positions of honor and authority, while others, through the stratification that always takes place in social and educational institutions, found themselves occupying subordinate places. Thus we find the Athenian republic to have been a "culture state" in the fullest sense of the word.

In Rome, for centuries after its foundation, the school was the home, the forum, and the army. Others there were none. Some few teachers there may have been, but they have left no record of themselves; and what little instruction in letters there may have been was had at the father's knee. The first school, so far as we know, was established in the year 250 B.C. From that time formal instruction gradually became

common, and schools available for those who cared to make use of them. They were not, at least until a comparatively late date in Roman history, in any way supported by the State. After the Roman conquest of Greece (146 B.C.) Greek scholars came in large numbers to the Roman territory, and the schools were dominated by their influence.

Rome

In the higher schools Greek was the sole language of instruction until the edict of 112 B.C. The emphasis, however, was placed on the grammatical and philosophical aspects of Greek literature; and gradually, when Greek was replaced by Latin, their aim centered in the production of the orator. The term *Ludus* was applied to the elementary school, and *schole* to that of higher grade. In the *scholē*, rhetoric, oratory, grammar, some elements of geography, arithmetic, geometry, and music were taught, and if we may judge by Quintilian's "Institutes of Oratory," the famous educational classic of the time, some of those subjects were well taught.

Dancing was taught by private tutors, and physical exercises were practised in the Campus Martius, but neither found any place in the curricula of the schools. In the higher rhetorical schools some philosophy was added to the literary studies, and the course bore some resemblance to that of the New England college of a century ago.

The education of the earliest generation of Christians was obtained in the pagan schools, in those great imperial academies which existed in Europe, Asia, and Africa, even down to the fifth century, and which perhaps attained their highest development and efficiency in Gaul. The first attempt at a special education for Christians was made at Alexandria, developed by Clement and Origen. The later Latin fathers took a bolder stand, and rejected the suspicious aid of heathenism. Tertullian, Cyprian, and Jerome wished the antagonism to be recognized from the earliest years, and even Augustine condemned with harshness the culture to which he owed so much of his power. Yet the Church favored education, and instructed her parish priests to found and conduct schools. The stormy times of the early Middle Ages were little favorable to education. They were the Dark Ages. What intellectual light there was, was confined to the monasteries. Yet for the most part this was limited and fettered by ecclesiastical traditionalism, developing at best the philosophy of the schoolmen.

Early Christian

Throughout the medieval centuries it was not believed that intellectual development was conducive to the highest religious attainment; education therefore suffered, and the schools of the ancient type were allowed to go out of existence. With the exception of a few higher institutions of learning at Alexandria and some few great European centers of population, schools were maintained only in connection with cathedrals, monasteries, and other religious organizations. Aside from those destined for religious preferment, only a few found their way to these institutions, and learned only the rudiments of language, together with enough astronomy to be able to compute the church festivals, geometry to lay out the church lands, arithmetic to keep simple accounts, and music to carry on the religious services.

Medieval

A most important part of the monastery was the writing-room, where missals, psalters, and breviaries were copied and illuminated; and too often a masterpiece of classic literature was effaced to make room for a treatise of one of the fathers or the sermon of an abbot. Yet the monasteries of Monte Cassino, Fulda, or Tours did not a little to promote education and to preserve much that otherwise would have been lost. The seven arts of monkish training were grammar, logic, rhetoric, music, arithmetic, geometry, and astronomy, the first three forming the *trivium*, and the four others the *quadrivium*. In the same period the Saracens in Spain and the Greeks in the Byzantine Empire at least preserved ancient learning, if their schools developed little new thought.

The ninth century saw the dawn of intellectual life; and in the twelfth century universities began to develop out of the schools attached to the cathedrals and monasteries. When a teacher of eminence—like Abelard or Peter the Lombard at Paris or Irenæus at Bologna—appeared, students flocked around him. The members of the *studium generale*, for mutual support, formed themselves into a corporation called a university. The University of Paris existed as a separate body as early as 1169; and toward the end of the thirteenth century Pope Nicholas I. granted it the right of endowing its graduates with the power of teaching everywhere. It had at first only a faculty of arts, divided into four nations, known as French, Picard, Norman, and German or English. Faculties of theology, medicine, and canon law were added in the seventeenth century. The college of the Sorbonne, founded in 1250, became identified with the faculty of theology. The University of Bologna devoted itself mainly to law, and numbered 12,000 students at the end of the twelfth century. It claims to be the oldest.

Older Universities

According to the "Minerva Jahrbuch der Gelehrten Welt," the following are the dates of origin of the older universities: Bologna, 1119; Montpellier, 1180; Paris, 1200; Oxford, 1200 or 1249; Valencia, 1209; Padua, 1222; Naples, 1224; Toulouse, 1229; Salamanca, 1239 or 1250; Cambridge, 1257; Ferrara, 1264; Coimbra, 1290; Lyons, before 1300; Rome, 1303; Perugia, 1307; Pisa, 1316; Grenoble, 1339; Valladolid, 1346; Prague, 1347 or 1348; Vienna 1365; Heidelberg, 1386; Würzburg, 1402; Turin, 1404; Aix, 1409; St. Andrew's, 1411; Rostock, 1419; Louvain, 1426; Poitiers, 1431; Caen, 1433; Florence, 1438; Catania, 1445; Barcelona, 1450; Glasgow, 1450 or 1451.

There was, too, at least one development of popular education. Among the Brethren of the Common Life, who were found in the Northern Netherlands, education was for all. The metropolis of their organization was Deventer, the best-known name among them that of Gerhard Groote. They devoted themselves with all humility and self-sacrifice to the education of children. Their schools were crowded. Bois-le-Duc had 1,200 pupils, Zwolle 1,500. For a whole century no part of Europe shone with a brighter luster.

Europe, however, was preparing for the revival of learning. Throughout the western part of the continent the "new learning" made schools popular. Vittorino da Feltre may be taken as a type of the teachers among the nobles of this era. He seems to have reached the highest point of excellence as a schoolmaster of the Italian Renaissance. The mind awoke to institutions concerning development according to natural laws, and to a conception and hope of independence and progress. Erasmus, Montaigne, Rabelais, Calvin, and Melanchthon did much to open long-blinded eyes. They brought the schoolmaster into the cottage, and laid the foundations of the system which is the chief honor and strength of modern Germany—a system by which the child of the peasant, by slow but certain graduations, receives the best education which the country can afford. Melanchthon, from his editions of school-books and his practical labors in education, earned the title of *Præceptor Germaniæ*. Aristotle had been dethroned from his preeminence in the schools, and Melanchthon essayed to fill his place. He wrote elementary books on each department of the *trivium*: grammar, logic, and rhetoric; and made some way also with the studies of the *quadrivium*, writing the "Initia doctrinæ Physicæ," a primer of physical science. He lectured at the University of Wittenberg, and for ten years (1519–29) kept a private school in his own house.

Reformation

The so-called Latin school, the parent of the gymnasium and the lyceum, spread all over Europe, and was especially flourishing in Germany. One school stands preeminent before the rest. Johann Sturm of Strasburg ("The German Cicero") was the friend of Ascham and the tutor of Queen Elizabeth. He attracted scholars from all Europe: Portugal, Poland, and England sent their contingent to his halls. In 1578 his school numbered several thousand students; he supplied at once the place of the cloister and the castle. His pupils wrote elegant letters, delivered fluent Latin speeches, and were familiar, if not with the thoughts, at least with the language of the ancients. The Public School Commission of 1862 found that the lines laid down by the great citizen of Strasburg, and copied by his admirers, had remained unchanged until within the memory of the present generation. John Amos Comenius was the antithesis of Sturm. Born a Moravian, he passed a wandering life in poverty and obscurity. But his ideas were accepted by the most advanced thinkers of the age. His school-books were spread throughout Europe. Progressive educators of our time echo the words of Comenius when he urges the instruction of the young, "not by beating into them a mass of words, sentences, and opinions gathered out of books, but by opening their understanding through things themselves."

The Protestant schools were now the best in Europe. Catholics would have remained behind in the race if it had not been for the Jesuits. Ignatius Loyola developed numerous schools through the order which he founded, and the program of studies, which dates from the end of the sixteenth century, is in use, with certain modifications, in English Jesuit schools at the present day. In 1550 the first Jesuit school was opened in Germany; in 1700 the order possest 612 colleges, 157 normal schools, 59 novitiates, 240 residences, 200 missions, 29 professed homes, and 24 universities. The College of Clermont had 3,000 students in 1695. Every Jesuit college was divided into two parts: the *studia superiora* for higher education, and the *studia inferiora* for lower education. The latter, corresponding to the modern gymnasium, was divided into five classes. The first three were classes of the rudiments, accidence, and syntax of grammar; the last two of humanity and rhetoric. The motto of the school was *lege, scribe, loquere*, "learn not only to read and write a dead language, but to talk it." Purism was even more exaggerated than by Sturm. No word might be used which did not rest upon a special authority. The order disdained history, science, and philosophy, its labors being wholly directed to the propagation of the Catholic faith, and the ability to write in Latin in the most approved way.

The Jesuits

It is impossible to estimate the influence of the Jesuits upon the world's civilization. During 200 years they controlled over 600 colleges and many universities, a control lasting till almost the end of the eighteenth century. They cared not so much for education as for the power to be gained by having the schools in their hands. In 1831 Roothar, the general of their order, somewhat improved their curriculums, but modern governments have on the whole done well to oppose these schools. They taught the accomplishments the polite world

wanted, but stifled thought and inquiry. Montaigne, Locke, and Milton all criticized this form of education, and gave us stimulating and suggestive thoughts. Milton's tractate "Of Education" is most important. Meanwhile at Port Royal, in France, the Jansenists Arnauld, Lancelot, and Nicoll taught with such success that they excited the jealousy of the Jesuits, and were suppressed.

Rousseau's "Emile," a treatise on education, was published in 1762. It produced a profound impression, and has affected teaching until very recent times. With him nature is supreme. He protests against the shams of government and civilization, and pities the sorrows of the poor. He lays great stress on the earliest education. The first year of life is in every respect the most important. Nature must be closely followed. The chief moral principle is: do no one harm. Emile is to be taught by the real things of life, by observation and experience. At the age of twelve he is scarcely to know what a book is; to be able to read and write at fifteen is quite enough. Then a new stage opens, when he is to learn history, science, and the machinery of society. Basedow founded a school somewhat on these principles at Dessau, and later Salzmann did the same at Schnepfenthal. It was the age of romanticism.

Great Educators

The end of the eighteenth century saw a great development given to classical studies. The names of Cellarius, Gesner, Ernesti, and Heyne are perhaps more celebrated as scholars than as schoolmasters. To them we owe the great importance attached to the study of the classics, both on the Continent and in England. They brought into the schools the philology which F. A. Wolf had organized for the universities. Johann Heinrich Pestalozzi reverted to concrete education from objects. Born at Zurich in 1745, he converted his house into an orphan asylum; he saved from degradation over 100 children and issued volumes on education. He died in 1827 near Basle, overwhelmed with mortification; but to-day his ideas of training rather than instructing are accepted in elementary schools all over Europe. Froebel continued his work. He made many mistakes before fixing upon his final vocation, and even this proved a failure so far as he personally was concerned. A victim to great griefs, he died believing that his life had been lived wholly in vain. It is with the Kindergarten that we associate the name of this benefactor of little children. To him the child was a plant and the school its nursery. Too much of the seed which he sowed fell in stony places, much also fell on good ground and has brought forth fruit abundantly. Among the modern contributors to the methods of education the names of Herbert Spencer and Alexander Bain hold a high place. Mr. Huxley did a great deal toward teaching exact science in a popular way; and the name of Arnold will always be remembered in England as the ideal of a great head-master.

Great Britain and Ireland

Summary of Educational Statistics

Institutions.	Date of report	Registered students or pupils	Professors or teachers
England and Wales.			
Universities:

The following list shows the principal dates in the history of the system of elementary education in England:

1833. First grant (£20,000) made by Parliament for elementary education in England and Wales to be administered by the national and British foreign school societies (annually renewed).

1838. Committee of House of Commons appointed to investigate the education of the poorer classes.

1839. Committee of council on education established; annual grant increased to £30,000.

1846. Minutes issued by council on education recognizing definitely denominational schools and denominational training colleges for teachers; pupil-teacher system recognized.

1847. Commission of inquiry into education in Wales.

1858–61. Duke of Newcastle's commission on state of popular education.

1861. Code (Lowe's) issued establishing system of payment by results (i. e., of examination of individual pupils).

1870. Elementary education act (Forster's) passed.

1876. Amending act passed establishing the compulsory principle and creating school attendance committees for its enforcement in districts having no school-board.

1880. Law obliging local educational authorities to make by-laws for the enforcement of compulsory school attendance.

1891. Law providing for an extra grant for schools remitting tuition fees.

1893. (1) Law making eleven years the minimum age for exemption from school attendance, and requiring an examination in a grade not lower than the fourth for every child seeking exemption from school attendance; (2) law authorizing school-boards to make special provision for the elementary instruction of blind children and of deaf-and-dumb children.

1897. Law providing a special grant for the benefit of "voluntary" (chiefly denominational) schools at the rate of five shillings per capita of average attendance; also authorizing the federation of voluntary schools and the allotment of the grant at the discretion of the governing bodies of the federations.

1899. (1) Law (Defective and Epileptic Children's Act) "empowering local educational authorities, at their discretion, to establish special schools or classes for mentally or physically defective children and special boarding institutions for juvenile epileptics"; (2) law raising the minimum age for exemption from school attendance from eleven to twelve years; (3) creating a board of education to replace "the education department and the science and art department, providing also for the transfer to the new board of certain powers exercised by the charity commissioners with respect to educational trusts and endowments, and for the transfer to the board of the educational functions of the board of agriculture." Further, the law authorizes "a consultative committee, to be constituted by an order in council, consisting of persons qualified to represent the views of universities and other bodies interested in education for the purpose of framing, with the approval of the board of education, a register of teachers and of advising the board of education on any matter referred to them by the

board." The law also authorizes the board "to inspect any school supplying secondary education and desiring to be so inspected."

1900. Law authorizing local authorities to extend the upper limit of compulsory attendance from the thirteenth to the fourteenth year of age.

1902. Law reorganizing the national system of education, abolishing elected school-boards, and transferring their duties to county and municipal councils. (London excepted.)

1903. Law reorganizing system of education in London on the lines of law of 1902.

Auxiliary Legislation.—1889–91: Technical instruction laws authorizing county councils to levy a tax not exceeding a penny in the pound for the support of technical schools. 1890: Local taxation, customs, and excise law, placing the surplus of the liquor duties at the disposal of county councils, with the privilege of applying the same to technical instruction.

Elementary Schools

The system of public elementary education in England is in the process of transition from the basis established by the law of 1870 to that of 1902, which went into operation March 26, 1903. The new conditions established by the latter law relate almost exclusively to the local administration of schools. The provisions of the law of 1870 and subsequent amending laws are continued in force, except such as are explicitly annulled by the law. The local authorities in charge of elementary schools are county and county borough councils, replacing the former elected school-boards, and having general charge of (1) board schools, henceforth to be known as council or provided schools, and (2) voluntary (i. e., chiefly church) schools, to be known as non-provided. The county and municipal councils become the local agents for the disbursement of the government grant for elementary education. The councils are further empowered to raise the additional moneys required for the maintenance of elementary schools by local taxes, which are henceforth to be applied to both the provided and the non-provided schools.

The educational functions of the councils, excepting that of raising school money by taxation, may be delegated to education committees constituted under schemes formed by the respective councils and approved by the board of education. Every scheme for the formation of an education committee must provide for the appointment by the council of a majority of the members of the committee and for the inclusion of women in the committee. Where the local education authority is a county council, all public elementary schools must have a body of managers, to be constituted by the local authority. In the case of non-provided (i. e., church) schools, these managers must include foundation managers, not exceeding four (excepting in special cases), and managers appointed by the local authority, in the proportion of two to every four foundation managers. The managers of the non-provided school must carry out the directions of the local education authority as to the secular instruction to be given in the school, including any directions with respect to the number and educational qualifications of the teachers to be employed for such instruction, and for the dismissal of any teacher on educational grounds. If the managers fail in these respects, then the local education authority itself shall have the power of carrying out the direction in question, but no direction given under this provision shall be such as to interfere with reasonable facilities for religious instruction during school hours. The managers of the school must also, without any charge to the local authority, provide the schoolhouse, keep it in good repair, and make such alterations and improvements in the buildings as may reasonably be required by the local education authority.

It is expressly provided that the local education authority shall have power to inspect non-provided schools, and that its consent shall be required to the appointment and dismissal of teachers, head-teachers excepted; but the councils may not withhold consent to the appointment nor interfere with the dismissal of teachers on religious grounds. Moreover, in non-provided schools "assistant teachers and pupil teachers may be appointed, if it is thought fit, without reference to religious creed and denomination. (Head-teachers appointed independently of the local authorities are chosen on denominational grounds.) In any case in which there are more candidates for the post of teacher than there are places to be filled, the appointment shall be made by the local education authority, which shall determine the respective qualifications of the candidates by examination or otherwise."

In provided schools no sectarian instruction is allowed. Non-provided or denominational schools are prohibited by a conscience clause from forcing religious instruction upon children whose parents object to the same. The provisions with respect to compulsory school attendance are unchanged. Every local authority is obliged to make by-laws under which the upper limit of age for compulsory attendance must not be less than twelve years, and at the discretion of the local authorities may be raised to fourteen years.

Sources of Support

The government grant, which furnishes at present very nearly half the support of elementary schools, is applied on the same conditions to provided and non-provided schools. The balance of the support for both classes of schools is provided by local taxes. In the case of a non-provided school in which fees have hitherto been charged, the local authority shall, "while continuing to allow fees to be charged in respect to that school, pay such proportion of those fees as may be agreed upon, or, in default of agreement, determined by the board of education and the managers."

In the third schedule of the law it is declared that the duty of a local education authority shall include the duty to provide a sufficient amount of public-school accommodation without payment of fees. The law declares that the designation "elementary school" shall not include any school carried on as an evening-school under the regulations of the board of education.

Higher elementary schools are organized to qualify the pupils to enter any of those callings in which scientific methods have to be employed. With this object in view, the course of instruction, tho not exclusively scientific, is based on science, and all the scholars are trained to make accurate measurements and to perform and record simple experiments. One foreign language and elementary mathematics are included in the curriculum, while careful attention is given to drawing. The course of instruction extends over four years. Government supervision of elementary schools is maintained by an inspectorial service.

Summarized Statistics of Elementary Schools

	1870 (Revised Code.)	1902
Schools (institutions) inspected by government inspectors	8,281	20,158
Voluntary schools	8,281	14,275
Board schools	.....	5,878
Departments under separate head teachers in those schools	12,061	31,372
Scholars for whom accommodation is provided	1,878,584	6,681,295
Percentage to estimated population	8.80	20.54
Scholars on the school registers	1,693,059	5,881,278
Percentage to estimated population	7.66	18.08
Scholars in actual average attendance	1,152,389	4,788,400
Percentage to estimated population	5.21	14.72
Percentage to scholars on the school registers	68.06	81.41
Average attendance for payment in infant schools and classes	.....	1,486,023
Average attendance for payment in schools for older scholars	.....	3,302,377
Average attendance of scholars who earned grants upon examination in class subjects	.....	.....
Scholars qualified for grant in specific subjects	.....	.....
Number of departments in which singing was taught:

Half-time scholars	.....	.....
School libraries	.....	8,504
Savings-banks	.....	7,071
Certificated and provisionally certificated teachers	12,467	67,813
Assistant teachers	1,262	36,265
Additional teachers	.....	17,588
Pupil teachers	14,304	29,218
"Annual grant"	£562,611	£5,275,883

The principal events in the movement for organizing secondary education in England may be seen in the following:

1835. Appointment of select committee to inquire into means of extending a knowledge of the arts and of the principles of design among the artizan classes.
1836. Grant of £1,500 for the establishment of a normal school of design.
1837. Normal school of design opened.
1852. Department of practical art constituted.
1853. Science department added to the department of art. Reorganized department empowered to maintain special schools of art and science, to draw up examination schemes and conduct examinations of schools and classes complying with specified conditions, and to distribute government grant to the same.
1853. Charity commission appointed to inquire into the condition and management of charities and to frame schemes for their administration; educational endowments thus brought under supervision.
1856. Control of the department of science and art transferred to the committee of council on education.
1861. Lord Clarendon's commission to inquire into the nine leading public schools (secondary).
1864. Lord Taunton's commission to inquire into the condition of additional secondary schools (endowed grammar, proprietary, etc.). Report of commission published in 1868.
1865. Endowed schools law passed.
1894. Commission appointed (Bryce's) to consider "What are the best methods for establishing a well-organized system of secondary education in England, taking into account existing deficiencies and having regard to such local sources of revenue from endowment or otherwise as are available or may be made available for this purpose?"
1895. Report of commission published.
1902. Education law passed authorizing local authorities to raise funds for and exercise a measure of control over secondary education.

Secondary Schools

In the regulations respecting secondary schools issued in 1903, the board of education were careful to define the limits of secondary education, and in so doing clearly recognized the distinction between secondary schools and technical institutes and classes; thus the authority of the government has been won for those who advocate an extended course of general education as a prerequisite to specialized training. The term "secondary" as defined by the board applies to "any day or boarding school which offers to each of its scholars, up to and beyond the age of sixteen, a general education, physical, mental, and moral, given through a complete graded course of instruction of wider scope and more advanced degree than that given in elementary schools."

The instruction must be general; that is, it must give a reasonable degree of exercise and development to the whole of the faculties, and not confine this development to a particular channel, whether that of pure and applied science, of literary and linguistic study, or of that kind of acquirement which is directed simply at fitting a boy or girl to enter business in a subordinate capacity with some previous knowledge of what he or she will be set to do. The course of instruction must be complete; i. e., must be so planned as to lead up to a definite standard of acquirement in the various branches of instruction indicated in the foregoing, and not stop short at a merely superficial introduction to any of them. Finally, the instruction must be graded in its various branches. The grants payable under the regulations are made in respect to a four years' course only.

A certain minimum number of hours in each week must be devoted to the group of subjects commonly classed as "English" (including the English language and literature, geography, and history), to ancient or modern languages, and to mathematics and science. Ample time is left to include provision for systematic physical exercises; for drawing, singing, and manual training; for the instruction of girls in the elements of housewifery, etc.

In addition to the general requirements, certain specific conditions are laid down by the education board, to which a secondary school must conform in order to share in the government grant. The most important of these conditions are as follows: The school must be efficient and must not compete unduly with a neighboring school; no religious test or requirement as to religious observances or attendance upon religious exercises shall be imposed upon day scholars; the curriculum and time-table of the school must be approved by the board of education; a full account of the income and expenditure of the school must be annually submitted to the board; the fees charged must be approved by that body; the school premises, equipments, and appliances must be satisfactory; the school must meet regularly during not less than thirty-six weeks in the course of the school year, and for not less than four hours each school day.

Statistics

The number of schools inspected under the board of education in the year ending Dec. 31, 1903, was 135, as compared with ninety-five in the preceding year. Twenty-five of these were inspected on the application of the county authorities aiding them. Twenty-three were proprie-

tary schools, and thirty-three were private schools. Seventy-five were for boys, forty-nine for girls, and eleven for both boys and girls. Sixty-one were schools receiving grants under the regulations of the board for secondary schools, and in the case of forty-one of these the inspection was required for compliance with the regulations.

In 1903 there were 31,090 scholars receiving organized day courses of instruction in 226 secondary day schools (Division A; offering extended courses in science), an average of 137 scholars in each school. Of these pupils 25,047 were taking elementary courses and 6,043 advanced courses of instruction. In 1903, 2,645 scholars were examined in science and 1,191 in art subjects. The grants paid amounted to £130,470 ($652,350), being an average payment per scholar under instruction of £4.19.0 (about $25). Up to Dec. 31, 1903, 142 schools in England and sixty-six in Wales and Monmouthshire were recognized as eligible for grants under the regulations for secondary day schools, Division B. Of the schools in England 114 were endowed schools, two were county or municipal schools, six were established by stock companies, ten were conducted by religious bodies, and ten by bodies of local managers. The number of pupils following approved courses of instruction in the schools of Division B during the school year 1902-3 was 10,094, and the grants paid amounted to 26,750 or an average payment of £2.13.0 for each scholar. For more recent educational statistics, see GREAT BRITAIN.

Scotland

Scotland has had a system of public schools dating from a law of 1696, which required that a school be established in every parish. The country was thus prepared for a system of universal school-boards as provided for by the law of 1872. The law differed also from the English law of 1870 in that, following the traditions of the old parish system, it made provision for both elementary and secondary schools. The latter did not share in the treasury grant, but by subsequent laws were allowed support from local taxes. Whereas compulsion has been gradually introduced into the English system, the Scotch law made education compulsory for all children between the ages of five and thirteen (raised to fourteen in 1883) or until a certificate of exemption should be secured.

Religious instruction in the schools of Scotland was left to local authorities, with the simple restriction of a conscience clause making the attendance of children at the religious exercises optional with the parents. A grant in lieu of fees (law of 1889) had the effect of making the schools practically free schools. By regulations of 1899–1900 a standard of attainment—that of the merit certificate—was fixed, which was regarded as the satisfactory outcome of an elementary school course. The merit certificate (called also the leaving certificate) of the elementary school entitled the holder to exemption from further attendance. Under these circumstances it was found desirable to increase the requirements for the certificate, and in 1903 a supplementary course was arranged, which candidates for the merit certificate were obliged to pursue at least one year. At the same time the requirements for transfer to a secondary school were arranged on a somewhat different basis. The supplementary course must provide for the instruction of the pupils in the following subjects according to a well-graduated scheme: English (including history and geography), mathematics (including arithmetic), at least one language other than English, and science and drawing, according to a scheme approved for the leaving-certificate examination in these subjects.

In 1885 the Scotch education department arranged for the inspection of endowed and other secondary schools applying for the service. Three years later the department established a leaving certificate for students who, on the completion of a course of secondary study, pass the certificate examination. The number of secondary schools inviting inspection in 1903 was ninety-four, of which thirty-two were higher class public schools, twenty-four endowed schools, and thirty-eight private schools. The number of candidates for the leaving certificate in 1888 was 972; in 1903 it was 19,509. A large number of university and professional authorities accept the certificate in lieu of such preliminary examinations as are held under their direction. Through the service of inspection and examination the secondary schools of Scotland have been brought into close relation with the education department.

Under the local taxation (customs and excise) act of 1890, and other acts providing for the application of public funds to secondary and technical education, the local authorities expended for these purposes in 1901–2 the sum of £58,407 ($292,035). On March 27, 1904, a bill to amend the education laws of Scotland was introduced into the House of Commons. Like the English law of 1902, it pertained chiefly to the local control of schools; in particular the bill proposed to make the county or county district the unit of local administration in place of the parish. The bill was, however, withdrawn at the close of the session.

STATISTICS OF ELEMENTARY EDUCATION IN SCOTLAND

	1872	1903

Ireland

The system of national education in Ireland dates from 1831, when a board of commissioners for education was created by the government. In 1845 the board was incorporated by royal charter, and in 1861 a supplemental charter was granted, under which ten members must be Ro-

man Catholics and ten Protestants. The board is always composed of representative men, who adhere to the policy of strict impartiality in religious matters. Only the resident commissioner is a salaried officer. He is the official head of the education department, with offices at Dublin. Upon him rests the responsibility for carrying out the details of the system of national education and also the administration of the government appropriations for the same. The schools under the supervision and fostering care of the board are supported by State and local funds. They may be denominational schools (i. e., Roman Catholic or Protestant) or mixed in respect to religion, but the rights of the parents in the matter are strictly guarded by a conscience clause in the school regulations, which provides that no child be allowed to attend a religious exercise of a denomination other than his own, except upon the written request of the parent.

Grants to aid in building schoolhouses are allowed by the commissioners, but must be proportioned to the amount raised locally. The State pays also the larger proportion of the salaries of teachers, requiring a minimum annual augmentation from local funds of £12 ($60). Altogether the State defrays about ninety-four per cent of the annual expenditure for the schools. In order to avoid religious complications the State provides the text-books for secular branches which are issued at a small cost to the pupils.

Local civil authorities have no control over the schools. The local managers of schools, who are generally clergymen, come into direct relations with the board of commissioners. They appoint and dismiss teachers, and arrange the details of the school work. Of a total of 2,936 managers in 1902, 2,363 were clerical. The commissioners have direct control of the special class of schools called "model schools," for which they provide the buildings. These schools, as their name indicates, are intended to afford models of the best methods of instruction and organization, and to serve as practise schools for students in training colleges or normal schools." They numbered thirty in 1902, with an enrolment of 8,969 day pupils, included in the statistics given in the following paragraph.

School Authorities

A compulsory school-law was passed in 1892, but it has been imperfectly enforced, and Ireland still stands below the other divisions of the United Kingdom in respect to school attendance, as is shown by the most recent statistics. These give the following rates of attendance to enrolment: England, 82.3 per cent; Wales, 77.9; Scotland, 85.2; Ireland, 70.8.

Convent and monastery schools afford a large part of the provision for elementary education, and receive, under certain conditions, aid from the government. The number of such schools fulfilling the conditions for aid in 1902 was 373, with an enrolment of 110,769. The schools of the Christian Brothers form a large part of the provision for elementary education, especially in the cities, where their schools are both numerous and flourishing. Their system of education has taken deep hold upon the people, and among their former pupils are some of the most influential men in every city and large town of Ireland.

For the training of teachers for the national schools there are one national and six denominational normal schools, which receive aid from the government. They report 1,090 students in training in 1903. Of the 13,144 teachers employed in the national schools in 1903, 57.2 per cent had received professional training. Provision for agricultural instruction is an important feature of the national system. Instruction in the theory of agriculture is compulsory in all rural schools for boys in the fourth, fifth, and sixth classes, and optional for girls. Complaint is made that the instruction in this branch has been altogether too bookish, and recent efforts have been directed to putting it on a practical basis.

The commissioners maintain also two model agricultural schools; and in 1897 they reported thirty-eight school-farms in connection with elementary schools, and 116 schools having gardens attached.

The French system of education is characterized by centralized control, through organization, and comprehensive scope. The executive chief is a cabinet officer, the minister of public instruction. The minister has extensive administrative power, and also takes the initiative in measures for the development of the system. The centralized control of the system is facilitated by its organization into academies or administrative divisions, seventeen in number. Each academy comprizes a university, one or more university faculties, a group of secondary schools (lycées and communal colleges), and its quota of primary schools. The chief officer of the academy is the university rector, who is appointed by the president of the republic, and subordinate only to the minister of public instruction. The authority of the rector extends to all grades of education, but the interests of higher and secondary education is relegated to academic inspectors, of whom there is one for each department comprized in the academy. The system of public instruction comprizes three departments—primary, secondary, and superior—each under its own chief or director. This division follows the lines of historic development. The secondary schools (lycées and communal colleges) form with the universities a system of liberal education, crowned by specialized training for the learned professions. In this respect they preserve something of the relations that existed before the Revolution between the University of Paris, the mother university, and the colleges that clustered around it. The separate administration of secondary and of higher education is a survival from the Imperial University. The work of the republic in these two provinces has been that of gradual transformation in the spirit of scholastic freedom and in accordance with modern demands. On the other hand, the system of State primary schools is almost wholly the creation of the republic. The work was begun in 1878 by the appropriation of a fund of $23,000,000 to be advanced to the communes, one half in subventions, the other half in loans, to aid them in building schoolhouses.

France

The first official school statistics published under the republic (1876–77) showed for the 36,097 communes 71,547 schools. Of these, 59,021 were classed as public schools, but of this number, 13,205, or 22 per cent, were schools belonging to religious orders. If instead of schools the number of classes be considered, it appears that 32 per cent were in charge of members of religious orders.

The measures by which the republic has freed

France

[1] With the exceptions indicated by foot-notes, these statistics are from the report of M. Maurice-Faure, chairman of the financial committee of the Chamber of Deputies. Budget for 1902 (session 1901).
[2] Expenditure for 1896–97, including all public primary schools and primary normal schools.
[3] *Statistique de l'enseignement primaire*, 1896–97.
[4] Excluding the clerical seminaries (petits séminaires) preparatory to the theological schools, enrolling about 23,000 young men.

the public schools from all relation to the Church were adopted under the direction of Jules Ferry, who was appointed minister of public instruction in 1879. Comparatively little is left to local initiative in respect to the support of public education. Even the local school-tax is levied by the State and collected by State officers. The mayor and civil councilors of every commune (city or rural) have the right to inspect the local schools in respect to the condition of school-buildings, furniture, and supplies, and the health and conduct of pupils; but they have no authority over the schools.

Primary Schools

The department of primary instruction, as organized by the law of Oct. 30, 1886, comprizes infant schools and classes, elementary primary schools, higher primary schools, schools of manual apprenticeship (authorized by law of Dec. 11, 1880, and eventually transformed into national training-schools, "écoles nationales professionnelles"). The departmental normal schools are also included in the category of primary schools. The line of separation between these different classes of schools and the division among them of the prescribed subjects of primary instruction are determined by special regulations elaborated in the superior council of public instruction. These schools are all free and secular, and the teachers in every case must be appointed from the laity. The law with respect to compulsory attendance applies only to the elementary primary schools.

In the infant schools, children of both sexes from two to six years of age receive together physical, moral, and intellectual training adapted to their tender years. These schools are wholly in the charge of women; the teaching force includes a directress, and an assistant, if the number of children is more than fifty. Communes are not obliged by law to found and maintain maternal schools, and it is only in communes having above 2,000 inhabitants, of which at least 1,200 are concentrated in one locality, that these schools are included in the number of public primary schools entitled to support by the commune and to State subventions. These schools have proved to be better adapted to cities than to rural districts. A little more than ten per cent of the communes report at least one infant school.

The elementary primary schools are for the instruction of children from six to twelve years of age; that is, the obligatory school period. In communes having neither infant schools nor infant classes, the age for admission to the elementary primary schools is lowered to five years, while it is raised to seven where there is an infant class. Children above thirteen years of age cannot be admitted to the elementary primaries without special permission. The elementary primary schools may be for boys only, in which case the instruction is given by men; for girls only, or mixed as to sex, in both of which cases the instruction is given by women.

According to the law of March 20, 1883, a commune is bound to provide a school not only in each chief town, but also in all villages or centers of population remote from towns or separated from each other by three kilometers, and containing at least twenty children of school age.

Advanced primary instruction is given either in higher primary schools or in "complementary courses." The establishment takes the latter name if it is annexed to an elementary primary school, and the former if it has a distinct location and is under a separate direction. The complementary courses comprize one or two years. The higher primary schools may comprize two or more years, and must be provided with as many rooms as there are classes. They are called full-course schools (écoles de plein exercise) when they comprize at least three years' study.

Pupils in the Primary Schools at Specified Dates

Year	Total number of pupils	Boys	Girls	In public schools	In private schools	In secular schools	In schools belonging to religious orders
1876–77	4,716,935	2,400,882	2,316,053	3,823,348	893,587	2,648,562	2,068,373
1881–82	5,341,211	2,708,510	2,632,701	4,359,256	981,955	3,567,861	1,773,350
1886–87	5,596,919	2,829,127	2,767,792	4,505,109	1,091,810	3,877,185	1,719,734
1888–89	5,623,401	2,833,218	2,790,183	4,446,851	1,176,550	3,915,915	1,707,486

Secondary Education

To the department of secondary instruction belong the lycées, or State classical colleges, for boys; the State lycées for girls; and the communal colleges established by the communal or local authorities and aided by the State. In 1901 the lycées for boys numbered 109 and enrolled 54,830 pupils. The communal colleges numbered 227, with an enrolment of 33,372. This gives a total of 88,202 boys in the public secondary schools. The church secondary schools for boys in 1899 enrolled 91,825 pupils (of these 23,000 in the "petit séminaires" for students intending to enter the priesthood), and private secular secondary establishments for boys, 10,182 pupils. The public lycées and colleges for girls had an enrolment in 1901 of 14,162 students, and there were also 4,158 girls pursuing courses of secondary instruction in classes under public auspices. The attendance upon convent and private secondary schools for girls is not known. The lycée is the typical secondary school. The local colleges have the same curriculum so far as circumstances permit, and students often pass from a college to a lycée for the completion of their studies.

Scope of Secondary Education

Secondary education, as the term is technically used in France, comprizes a complete scheme of education whose goal is the bachelor's degree. It is secondary, not in the sense of a second stage in a continuous process, as implied by the same term in the United States, but in the sense of a higher order of education than that which is technically termed "primary." The distinction between the two arises from the notion that the learned classes, those who are destined for professional careers and for leadership in the State, should be educated from their earlier years in a different manner and in a different class of subjects from the laboring masses. Under this conception the term "secondary education" carries the idea both of social and of scholastic distinction. The men trained in the secondary schools lead the councils of the nation, shape its policies, and form the enlightened opinion which is essential to its stability; hence the government is particularly concerned as to the influences which prevail in secondary education and as to its intellectual outcome. In both respects secondary education as organized in France has been unsatisfactory to the present republic. As regards curriculum and methods of instruction this dissatisfaction is part of that general unrest in secondary education which is manifest in all countries, and which in France, as elsewhere, has been of much longer duration than the republic itself. This unrest, which is conveniently tho inadequately summed up as the conflict between the classics and the sciences, is in fact an inheritance from the eighteenth century. The recent decree for the reorganization of the State secondary schools of France is the solution offered by the republic for a problem which has occupied every successive government from the Revolution to the present time.

But the existing government has a cause of anxiety with respect to secondary education quite apart from the question of studies and methods of instruction. The studies of the independent schools, like those of the State schools, are regulated by the requirements for the degree examination, which is a State function; but the spirit and general conduct of the former schools are very different from those of the State schools, and apparently more in consonance with the feelings of the higher classes of the country.

Enrolment in Secondary Schools for Boys

Classes of Institutions	1887[1]	1896[2]
State schools:		
Lycées	53,816	53,290
Colleges	36,086	32,224

University Education

To the department of higher education belong the universities and the special schools of university rank which are under the minister of education. Paris is the seat of these special schools, and also of the principal university. Under the law of 1896, fifteen of the former faculty groups have been organized into independent universities. They registered 29,377 students in 1900, an increase of 11,772, or 68 per cent above the number enrolled in the faculties of 1888. The professors of the State universities are appointed by the president of the republic in advice with the minister of public instruction.

The following table shows the distribution of university students in the different faculties. For more recent statistics, see FRANCE.

Faculties	Number of University Students			
	Jan. 15, 1900		Jan. 15, 1901	
	State universities	Independent universities	State universities	Independent universities
Law	9,709	1,109	10,152	996

GERMANY

Prussia is taken as a type of German school administration.

Administration

Education in Prussia is in the hands of the Minister of Ecclesiastical, Educational, and Medical Affairs. He is a member of the cabinet, and is responsible to the king for all educational matters.

The councilor at the head of the provincial education department is the provincial school councilor, and he is the official intermediary between the central and local authorities in Prussian education. The members of the provincial school board are appointed by the Minister of Education and confirmed by the king.

Further, each province is divided into "governments" (Regierungen), of which there are thirty-six. Each has a school board consisting of six officers, two appointed by the king and four by the provincial education department. These boards are appointed for six years, and their main duty is the supervision of the primary schools and the training and appointment of teachers.

Elementary Schools

The Kreise (or school districts) may be urban or rural. The head of the city administration is the mayor, or burgomaster, who is a paid official, and whose appointment must be approved by the king. The head of the rural Kreis is the Landrath. In cities a subcommittee of three or five members of the city council act as the local school board, while in villages and towns three or five leading citizens are nominated to act as the local board.

The drawing up and prescribing of courses of study, as well as the certification of all teachers, are retained entirely in its own hands by the State.

State inspection of primary schools is very irregular, as the teacher is so thoroughly well trained that frequent inspections are considered unnecessary. The State reserves to itself the power of a court of appeal in all cases of dispute between teachers and local managers. The actual local management is in the hands of the mayor or the priest. The power of the clergy, indeed, over the school is so great as to be one of the most serious grievances of the German teacher.

All German primary schools are denominational, but the greater part of the religion taught is non-sectarian and there is the right of withdrawal; there are a small number of little schools, called "Simultanenschulen," where children of mixed creeds are taught together, but, as a rule, each faith has its own school. In some towns, such as Krefeld and Cologne, these two separate schools, Catholic and Protestant, exist under the same roof and use the same playground, etc. Nevertheless, the two schools are perfectly independent of each other, with separate teachers and text-books, and with separate local managers.

School Laws.—Children under thirteen years of age cannot be employed in factories, and even those over thirteen only providing they have complied with certain school requirements. The age of compulsory attendance at school in Prussia is from six to thirteen in the country, and six to fourteen in the town. That is the law; but, as we shall see later on, certain exceptions are made in cases of extreme poverty, etc., and, as a rule, the law is less stringently applied in the case of girls than of boys. It has been in vogue so long, and has been so consistently enforced, that the habit of regular attendance has become automatic.

STATISTICS OF THE PUBLIC ELEMENTARY SCHOOLS, PRUSSIA, 1891–2 AND 1900–1

	1891–2	1900–1
1. Public elementary schools	56,563	58,164
2. Fully occupied teachers (male and female)	12,032	144,484
3. Pupils of elementary schools	7,925,688	8,829,812
4. Expenditure for elementary schools, marks	242,399,000	412,886,000
5. State contributions, mk.	69,310,000	120,357,000
6. Number of:		
a. Inhabitants to each elementary school	874	969
b. Pupils to every 100 inhabitants	16.03	15.66
c. Pupils to each fully occupied teacher	66	61
d. Cost of school maintenance for each pupil, mk.	31	47
e. State contribution for each pupil	8.75	13.63
f. Cost of school maintenance of each elementary school	4,285	7,159
g. State contribution for each elementary school	1,225	2,075

Secondary Schools

The name of "Higher Educational Institutions" is, in Prussia, bestowed on those schools that form the connecting link between the elementary schools on the one hand and the universities and other higher colleges on the other. In the south German states these institutions, corresponding to the French "écoles secondaires," are often called "middle-class schools," whereas in Prussia by middle-class schools are understood higher elementary schools. There are three kinds of complete higher educational institutions, viz., Gymnasia, Realgymnasia, and Higher Realschulen, and to these correspond three kinds of incomplete institutions, viz., Progymnasia, Realprogymnasia, and Realschulen. The complete institutions have nine classes, the Latin names of which—sexta, quinta, etc., up to prima—still recall the original existence of only six classes. But long before, the two

upper classes of the Gymnasia had a two years' course, and thus arose a lower and upper prima and a lower and upper secunda.

The Gymnasia owe their origin to the old Latin schools, and have gradually developed themselves, since the time of the Reformation, so as to acquire their present shape. Down to most recent times they were the only institutions that possessed the right of preparing for university studies.

In the second half of the eighteenth century there arose Realschulen or "Higher Burgherschools," as educational institutions originally not for the learned professions, but only for civil and commercial life. The classical languages were replaced in them by French and English, and special stress was laid on mathematics and natural science. The course was at first a much shorter one than that of the Gymnasium, but gradually institutions were developed with a larger number of classes, in which instruction was also given, to a moderate extent, in Latin, but not in Greek. These schools received in Prussia, in 1832, a more definite organization, and at the same time a leaving or final examination was introduced into them, by which admission to certain higher studies was obtained.

In 1882 the Realschulen of the first order, with teaching of Latin, received generally, in Prussia, the name of Realgymnasia, a designation that had already before occurred in other federal states.

The higher educational institutions are partly State, partly communal. Many of the latter, however, receive subsidies from the State treasury.

The permanently appointed, academically trained teachers are called "Oberlehrer" (senior masters); a number of them also have the title of "Professor."

The salary of the senior masters starts, in Prussia, at 2,700 marks, and rises, by seven three-yearly stages, to 6,000 mk. In addition, they receive an allowance for house rent, which in the larger towns amounts to 660 mk., and in Berlin to 900 mk. The salary of the rectors of institutions rises to 7,200 mk. Besides, they mostly have a free house or a corresponding compensation for rent.

The establishment and management of higher girls' schools, in Germany, was for a long time left exclusively to private enterprise, and in the Roman Catholic parts of the country they are still, as a rule, in the hands of conventual institutions. Not till the third decade of the last century were public higher girls' schools established as municipal institutions, but still in comparatively small numbers. State regulations as to the organization, course of instruction, and inspection of these schools have been issued in more recent times, and are in general less incisive than those applying to boys' schools. Three quarters of the higher girls' schools are still under private management. As a rule, the higher girls' schools that are not exclusively boarding-schools, supply also elementary education. The children enter the lowest class, or the lowest of the preparatory school, at their sixth year, and pass through a nine or ten years' course. In Prussia the normal duration of the course is nine years, but with the addition of an extra class with optional subjects.

Universities

The German universities are exclusively State institutions. As regards their origin, four somewhat distinct periods are noticeable.

First Period.—The Middle Ages. Growing up on the soil of the universal Church and its spiritual life, the universities, in this period, reduce the western world to the formative discipline of Greek philosophy and science, especially of the Aristotelian system. Further, they promote the thorough scientific organization of the church-doctrine and of the ecclesiastical law, and bring about a knowledge of Roman law and ancient medicine.

Second Period.—The sixteenth and seventeenth centuries. This is the period of transition between the Middle Ages and modern times; the sixteenth century, the time of the Renaissance and Reformation, the seventeenth century, that of the rise of the modern state and society, and at the same time of modern philosophy and natural science. In the movement of the sixteenth century the universities take a considerable part, not equally so in those of the seventeenth century: the new philosophy and natural science were not born within their walls. The result was that they remained behind the time and fell into discredit.

Universities

Third Period.—The eighteenth century. This is the period of the reception of modern philosophy and science by the German university, at the same time the period of transition from the old principle of the obligatory standard of instruction to the principle of liberty of thought and teaching. The German university, in this period, had obtained the lead, not only in the mental life of the nation, but at the same time in the development of university affairs of the whole European world.

Fourth Period.—The nineteenth century. This is the period of the advance of the single branches of learning, and of the organization of scientific research. The research in the field of natural science and of history is emancipated from all philosophical or theological dogmatism, so as to gather and work up facts by individual labor. In this the German university maintains the lead; it attracts investigators, disciplines the various forces, and organizes labor. In its teaching this change appears prominently in the development of the seminary system.

All the universities possess considerable assets, in the shape of buildings, collections, etc., besides endowments for the purpose of bursaries or for the provision of the families of deceased professors. But only a few, like that of Greifswald, possess property that yields considerable revenues, from which a large part of the costs of maintenance is defrayed. Others receive subsidies from independent public funds, that are devoted to special purposes, as, for example, Göttingen, from the Hanoverian monastic funds. As their own earnings we may also mention the proceeds arising from the clinical hospitals, and from certain fees or charges. By far the larger

portion, however, of the total university expenses is covered by direct State subsidies.

The chief representative of the university is the rector, or in some universities the prorector, especially where the reigning sovereign, or a prince of the royal house, is made rector magnificentissimus. The rector or managing prorector is elected, by a process differing in the various universities, by the total number of the ordinary professors (in Göttingen by a general meeting embracing also the extraordinary professors). He is chosen from their midst for one year, but the election requires to be confirmed by the ruling sovereign. In most universities the senate is composed, in addition to the rector, of the latter's immediate predecessor, of the deans of faculties, of the senators specially elected for one year by the ordinary professors, and of the university judge.

The teaching-staff of the university is composed of ordinary professors, honorary professors, extraordinary professors, "privat-docents," and lecturers (lectors), to whom must be added technical teachers and instructors of bodily exercises.

Only those persons who have matriculated are considered as students, properly so called, of the universities. In addition there are authorized hearers and temporary auditors, who have been admitted by the rector to attend lectures with the consent of the teacher. The normal qualification for immatriculation is the possession of a leaving-certificate of a higher educational institution with nine classes.

The obtaining of the academical degree constitutes the theoretical conclusion of the university course. In Germany such degrees have now a practical importance only for those who intend to devote themselves to an academical career. One can become a clergyman, a judge, a barrister, a physician, a higher-school teacher, without possessing an academical title. The large number of graduations, which still take place every year, is explained by the consideration which the title enjoys of old in public estimation, and by the wide-spread partiality in Germany for titles in general, among physicians also by the endeavor to be marked off from quacks.

Statistics of German Universities (1903–4).

	Total No. of students and hearers	No. of matriculated students	Students of theology
Berlin	14,007	7,774	335

Total	6,338	17,419	12,148

The elementary teachers receive their professional education in preparatory institutions and seminaries. In some states there are only seminaries without separate preparatory schools, but in such the seminary course lasts all the longer, as a rule, six years.

There are in the German Empire 121 seminaries for the preparation of male teachers and twelve for females.

Technical Schools

The technical high schools of Germany deal with the four technical departments of training for architects, civil engineers, mechanical engineers, and technical chemists. Darmstadt and Karlsruhe have a special department for electro-technology, while in the other high schools, except in Hanover, this subject is combined with mechanical engineering, in the latter town with the chemical-technical branch. Besides, as technical departments, Berlin has a special division for ship-building and for marine-engine construction, Brunswick for pharmacy, Karlsruhe for forestry, Munich for agriculture.

In all the high schools the mathematical-physical subjects, and those of general education, have been combined into a "General Department," but in Stuttgart these form two separate branches.

The regular course of study in the separate departments has been laid down, in all the high schools, with due regard to their interdependence and to the necessity for keeping the aims of the various studies separate. Although these schemes are not actually prescribed, they nevertheless afford the students a sure guidance in conducting their studies in such a manner that, within a given time (usually four years), they may be enabled to acquire the scientific training necessary for their profession.

Sweden

The common schools in Sweden are primarily the concern of the parish. Nevertheless they receive considerable assistance from the State and are under the superintendence of State and ecclesiastical authorities. Every parish consti-

tutes a school district, the legislative authority of which is vested in the church assembly.

The school board performs the functions of preparatory and executive administration; it consists of the rector, who is ex-officio president, and of at least four other members (male or female), elected by the church assembly.

There must be at least one common school in every district. When possible, the school ought to be divided into two departments, viz., the infant school for new beginners and the common school proper for more advanced pupils. For those who have passed through the complete course at the common school, proper arrangements are made in many places for free continuation courses.

These courses have diverse names and organizations. For pupils who have been through the common school and entered some trade, a so-called continuation school is arranged. This school provides for a yearly instruction of at least 180 hours, distributed on certain evenings of the week, or often centered within one or two short terms. Pupils engaged in practical work may, on leaving the common school, continue in the higher division of that school, where extended instruction is afforded.

Besides these regular schools, there are others —a sort of provisional institution. When certain parts of a school district are so remote that the children belonging to it cannot readily avail themselves of the common school, it is allowable to establish in its place minor common schools with a weaker teaching staff and a more restricted course.

Elementary Schools

People's High Schools.—During the last decades numerous efforts have been made in Sweden for the promotion of knowledge also among the adult population of the lower classes of the community, or among others who either through their trade or profession are prevented from attending the regular schools. These efforts have taken form, partly in the so-called "People's High Schools" and in the kindred "Workmen's Institutes," both of which institutions have originated on Scandinavian or Swedish ground, and partly in the so-called "university extension" movement, according to a pattern received from England. To this has of late years been added a great activity in popular public lecturing, which is being embraced with a steadily growing interest, and is arranged for by associations specially formed for the purpose.

People's high schools (Folkhogskolor) are institutions which only exist in the three kingdoms of Scandinavia and also in Finland. Their purpose is to furnish adult members, especially of the peasantry, with an education at once civil, patriotic, and practical. There are now thirty of these schools.

People's high schools are all located in the country. Most of them now have buildings of their own, with residences for the teachers and a certain number of pupils, the rest of the pupils living in adjacent houses. Gymnastic halls are provided in some schools, and are also used by the people of the neighborhood for meetings.

Most of the schools were originally private enterprises, but nearly always supported by grants from the county councils and agricultural societies, as well as the State. No special courses of instruction are fixt, and there is no examination on leaving.

Secondary Education

Under this head come the public schools for boys supported by the State, as well as the private schools of the same standing, and also the higher schools for girls, which in range of instruction closely approach the former.

During the school year 1902–3 the entire number of public secondary schools as supported by the State amounted to 82.

During the school year 1900–1, 36 schools had nine classes, 1 six classes, 38 five classes, 1 four classes, 2 three classes, and 1 two classes.

Universities

Sweden has two State universities, viz., in Upsala, founded 1477 (the oldest in Scandinavia), and in Lund, founded 1668, chiefly with a view to promote a closer union of the provinces then newly acquired from Denmark with the rest of Sweden. To make up for the lack of a State university in Stockholm, the capital, private munificence has there established a private university; the same thing has been done also in Gottenborg, the second city of Sweden. Besides this there has existed in Stockholm since 1815 a medical faculty, the Caroline Institute, founded and supported by the State. There are two private universities, the University of Stockholm and the University of Gottenborg.

Italy

For administrative purposes the country is divided into communes and provinces. A commune is the smallest division of territory having a local government. A commune is governed by a "sindaco" (mayor) and a communal council (both elective). A province is governed by a "prefetto" (a kind of territorial governor) and a provincial council. The prefetto is appointed by the national government.

The education department is organized throughout the kingdom under one sole head and system, so that the grade of one student corresponds to the grade of another.

Elementary Instruction.—By "primary school" is meant a school having a five years' course of elementary studies. The course is divided into two sections. The first, named "inferior," is of three years and is obligatory by law upon every child after becoming six years of age. The second section is named "superior" and occupies two years. It is a progressive and complementary continuation of the former, but not compulsory.

The school program of the two sections embraces the rudiments of the Italian tongue, practical arithmetic, rudiments of Italian history, geography, reading and writing, first principles of the rights and duties of a citizen, the metric system, and elementary gymnastics.

Secondary Schools (Ginnasii and Licei).—The ginnasio has a five years' course, divided in two sections, the curriculum of studies including the Italian language and literature, Latin, history, geography, arithmetic, and gymnastics. The second or "superior" section occupies two years; the curriculum continues the above studies and adds Greek, French, and mathematics. Then follows the "liceo" with a two years' course, having a curriculum which completes the gymnasial instruction, and adds German or French, philosophy, physics, and natural history.

This is the routine of studies to be pursued in order to prepare for admission to the university;

in the aggregate it embraces a five years' elementary course, a five years' gymnasium course, and a two years' lyceum course—in all twelve years of continued study before a pupil becomes qualified to enter a university; this for every student in the whole kingdom.

In 1900–1 there were 269 "ginnasii governativi," so called, with an attendance of 31,668 males and 1,178 females, a total of 32,846. In the same year there were 150 "licei governativi," so called, with an attendance of 12,983 males and 287 females, a total of 13,270.

The above statistics of gymnasiums and lyceums for 1900–1 are incomplete. The latest figures which give the whole attendance are as follows:

Total gymnasiums in the kingdom, 708 in 1895–1896, divided into governativi 183, and non-governativi 525, with an attendance of 59,778 students, 25,444 belonging to the first class and 34,334 to the second.

Total lyceums in the same year 332, governativi 116, non-governativi 216, with an attendance of 17,689 students, 10,945 of whom were governativi and 6,744 non-governativi.

Universities

The term "university" is applied in Italy only to those schools of the highest grade in which the students are instructed in special branches for the profession of their choice, and after a four or five years' course, according to the requirements of the profession selected, they are prepared, graduate, and receive the diplomas of doctor of medicine, doctor of laws, etc. There are in Italy twenty-one universities, quite uniformly distributed throughout the kingdom, four of which are independent of government control.

There are also numerous Convitti or boarding-schools both for boys and for girls, agricultural schools, art schools, and various schools of technology.

For other countries, see each country.

United States

Early History

The first school to be established within the present boundaries of the United States was, so far as we have any record, in New Amsterdam, now New York, in the year 1633. Its first teacher was Adam Roelandsen. The work of the school was strictly elementary. Whereas the colonists in Virginia seemed to have been moved by the missionary spirit, establishing schools principally for Indians and orphans, and the Puritans in New England recognized at first only a need for higher education for the maintenance of a learned clergy, the Dutch began at the bottom, with their own children. In the matter of popular education they were leaders. Still earlier than this, in the year 1616, an attempt had been made to found a school in the Virginia Colony, but because of the Indian massacre of 1622 the movement failed.

With the failure of this attempt nothing more was done for a number of years. In fact there is no certainty that any schools were established in Virginia until nearly 1640, when schools began to be founded by private bequest. One Benjamin Symms left by will 200 acres of land and eight cows for a free school in Elizabeth County. The justices of the peace of the county, together with the minister and church wardens of the city parish, and their successors, were to be trustees of the funds. The school opened in 1636.

New England

Within the New England Colony, which figured much more prominently in educational matters than did any other, the first school was established at Boston in 1635. This was the famous Boston Latin School, first presided over by Philemon Parmount, later by Ezekiel Cheever. One year later Charleston arranged with William Witherell "to keep a school for twelve months, to begin the eighth of August, and to have £40 this year." Later schools were established at Salem, Dorchester, Cambridge, Roxbury, and Braintree. They were all in a sense secondary schools since admission to them presupposed at least some slight knowledge of the English language. Since even so much proficiency was not by any means the rule with the children of the colony, the general court in 1647 framed the most important school-law of our whole history. This law marks a tremendous step forward; so far forward in fact that its enforcement was practically impossible.

Yet has this law been the model for a vast amount of subsequent legislation, and may be taken as the mother of all our school-laws. It contained all the essentials of the purest democracy. The teacher was to be appointed by the people and paid by the people "to teach all such pupils as shall resort to him, to write and read," without a shadow of class distinction. Nor was the law simply permissive; it was mandatory as well, requiring that schools be established, and that a fine of £5 await those communities that failed to observe its edicts. There was to be an elementary school for towns of fifty families, and a grammar school for those of 100 families. But like so many laws enacted since its day, this one had its weak point, well-nigh ruining its usefulness. The fines were too small. The town disposed to do so could pay its fine much cheaper than it could keep its school, and many were disposed to do so. In fact, it has been said that Boston alone, of all the towns within the colony, complied fully with the law of 1647 during all the years that it was on the statute books.

Within the Connecticut Colony schools were established at Hartford as early as 1639, and it is even probable a year earlier at New Haven, and in other towns soon after. The other New England colonies were much later in the establishment of schools.

Central States

In the early days of the Middle West the settlers came from the Eastern States across the mountains, and those institutions which had taken long years to evolve in the older states were adopted, ready made, in the newer. The federal government encouraged this adoption, including in the official act which incorporated the Northwest Territory (from which the older states west of the Alleghanies were formed) the following clause: Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." These were no idle words. Altho not intended to be mandatory in any narrow sense, they were, nevertheless, prophetic. No newly occupied country in the whole world's history has ever seen schools established so nearly coincident with the first settlements, nor schools of so high an order in so short a time. In some respects it has even passed the earlier settled region to the East. Its schools contain a larger proportion of the children of school age, both in the elementary and secondary grades. It has, too, a larger total number of pupils in the schools, and makes a greater annual expenditure for school purposes.

Institutions for secondary and higher education flourish particularly in the Central States, which have also been preeminently the home of coeducation, the first college in the country admitting both sexes being that of Oberlin, while the lower schools, almost without exception, have been coeducational from the start.

The South

The South, altho in some parts settled early, has been slow in establishing an organized system of public schools. In the earlier years this was due largely to a prevailing sentiment in favor of private schools, or education within the family by means of tutors. As a consequence, the poorer classes were not educated, or were forced to attend the so-called "pauper school." There were, however, many private schools and academies of a high order throughout the South, and those who were able to pay found educational opportunities in abundance. Especially was this true of the girls, for the South was a leader in the founding of seminaries for them. It was not until the close of the Civil War that the states took up the problem of the education of the masses, but since then they have struggled with it most manfully in the face of odds not equaled in any other part of the country. Many conditions have made the problem difficult. First, the region, never a wealthy one, had been impoverished by the tremendous expense of a war fought within its own confines. Second, 6,000 000 of totally uneducated colored people were freed and left upon their hands for assimilation and some form of education. This involved the setting up of a double system, with all the extra expense which such a plan involves. Third, the population is largely rural, necessitating a greater outlay of money to bring the school to every child than is the case where the population is more urban. Fourth, no part of the country has so large a proportion of its population within the limits of school age as has the South—a most encouraging fact from some points of view, but perplexing to the financiers of public school problems.

Prior to 1870, however, every Southern state had made constitutional and legislative provisions for free schools and a general system of education. In twelve cities the schools were under some form of state control, eight had provided for county supervision, normal schools had been started in six, agricultural and industrial colleges in a still larger number, and in the large cities progress had been made in grading the schools. It is true that the North had helped in this work through the Peabody and other funds, and the federal government had extended its aid; but the great bulk of the labor and funds came from the South itself. Considering that but thirty years have elapsed since its educational machinery was

really started, magnificent progress has been made. The percentage of total population enrolled in the schools, as well as of children of school age, has doubled in that time; the actual number of pupils attending school more than quadrupled; ten days have been added to the school year; and the per capita expenditure for school purposes has been nearly doubled. In proportion to its wealth, the South to-day taxes itself more heavily for its schools than does the great western portion of the country, tho not as yet quite so heavily as the North and East. Yet, in spite of the rapid progress made, much is still to be done before the schools of the South are upon the same footing of general excellence as those of the other portions of the country.

The West

Unlike the great central portion of the U. S., the territory farther west was not occupied, altho admirably suited for agricultural purposes, and promising permanent homes from the very beginning. It was, rather, taken possession of by civilization, through a series of unrelated migrations to particular localities far removed from other settled territories, from which centers of population little frontiers were sent out, until the settlements have now little wholly unoccupied land between their borders. This peculiarity of occupation, and particularly, in some instances, the reasons underlying the special migrations, have influenced educational development to some extent; but in the end the result has been the same as in the Eastern portions of the country, and to-day we find the public school a flourishing institution, even in the remotest corners of this vast western domain. Its schools rank high. Altho but thinly settled, the region enrolls a greater percentage of its population (five to eighteen years) in its schools than does any other part of the country. In its expenditure for school purposes it is generous, exceeding any other portion of the country in per capita outlay.

As the grammar-schools throughout the early colonies declined in efficiency toward the latter part of the eighteenth century, a new institution was coming to the front, providing a means of education that was far-reaching. This was the academy, the successor of the old grammar-school, and the forerunner of the modern high school. From about the time of the Revolution until the middle of the nineteenth century, it was the undisputed leader in secondary education, and altho now in a sense deposed by the public high school, the academy has not outlived its usefulness. In their inception, academies were of two general classes: (1) The local academy, which aimed to do little more than to supply the educational needs of its immediate neighborhood; and (2) the academy of a more pretentious type, with a course of considerable breadth, drawing its students from a wide field. Those of the former class were frequently but ephemeral, while many of the latter possest considerable endowment, and were established upon a permanent basis. The academy was essentially a private institution, but as will be shown later in many instances received such substantial recognition from the state as to warrant its being included under the public school system. So closely did the early academies resemble their predecessors, the grammar-schools, that it is not easy to determine the first, either as to time or place. The first, however, to become incorporated was one which was founded in Philadelphia in 1753, through the efforts of Benjamin Franklin. In Massachusetts the first to incorporate was the Phillips Academy at Andover, started in 1778, tho not chartered until two years later. Phillips Academy at Exeter, N. H., was founded at about the same time. Dummer Academy was the third to be chartered in New England, being incorporated in 1782, tho its history begins in 1761, when Lieutenant-governor Dummer bequeathed his mansion and 330 acres of land for the establishment and support of a school. Two years later the school was opened at Byfield, Mass. Because of the celebrity of its first master, Samuel Moody, it may rightly be called the mother of the New England academy. For nineteen years Master Moody managed this school, and made it, says Charles Hammond, "the best type of an English grammar-school that had existed on American soil since the days of Ezekiel Cheever."

The common-school system of the U. S. is in most of the states organized under four different units of administration:

School Systems

1. The school district is the smallest unit in school administration and the most democratic feature in the entire political organization. Under the earlier colonial conditions it arose most naturally. In some form or other, the district school system exists to-day in a great majority of the states. In Maine, New Hampshire, Vermont, Massachusetts, New Jersey, and Indiana, it has, however, been entirely superseded by the township system. In many other states (as, for instance, Rhode Island, Connecticut, Wisconsin, Minnesota, Illinois, the Dakotas, and the upper peninsula of Michigan) it exists alongside of the township system. In some states the district is primarily a subdivision of the town or township; in others, of the county. In nearly all, the voters within the district elect the school officers and levy taxes, tho in some those functions are performed by the county.

2. The township and the incorporated city are the units in school organization which are fast superseding the district. Consolidation in school matters is as crying a question as it is in manufacture and finance, and will perhaps prove a greater blessing. The township organization is but a merger of districts with practically the same rights and privileges as were invested in each of the original districts. The officers are chosen at the annual town-meetings by all the electors, or, as is sometimes the case, the township is the unit of school government, and the schools are made uniform throughout its extent. It is less formally democratic and more fully centralized than the system which it is superseding, and has the advantage of forcing the wealthier portions of the township to contribute to the support of the schools in the poorer communities, thus bringing about a more uniform standard of excellence. But a comparatively few states, and those for the most part among the older ones (Maine, New Hampshire, Vermont, Massachusetts, New Jersey, and Indiana), have compulsory township organization by legislative enactment. Massachusetts was the first to abolish the district system (1882), and was followed by New Hampshire (1886), Vermont (1892), and Maine (1893).

In at least twenty other states—Connecticut, Florida, Georgia, Illinois, Iowa, Kansas, Louisiana, Michigan, Minnesota, Missouri, Nebraska, Pennsylvania, Ohio, New York, North Carolina, North Dakota, Rhode Island, South Dakota, Tennessee, and Wisconsin—there is permissive legislation looking toward some form of school centralization, tho in most of them it is as yet being carried out to only a slight extent.

3. Throughout the South, the county has been the general unit in all forms of government, and consequently the basis of school administration. As a result those functions which were in the earlier times in New England performed by the district school board, such as the examination and appointment of teachers, providing school buildings, and raising school-funds, etc., are the duties of the county officials.

4. The state is the supreme unit for general school legislation. Beyond this it hardly goes, tho where a state board of education, or its equivalent under any title, is maintained, it exercises some administrative powers. In no sense, however, does the state exercise supervisory powers over the actual work of instruction, since in many states it would be manifestly impossible for the state superintendent of instruction to pay even brief visits to all the schools within his jurisdiction in the course of his term of office.

Secondary Education

By the middle of the nineteenth century, public elementary education, supported by taxation, had been established in all parts of the country. The first city to establish a public high school with a two to four years' course of study was Boston, Mass., in 1821. Previous to 1840 six other cities, all but one in New England, had established similar schools: Portland (1821); Worcester (1824); New Bedford (1827); Cambridge and Taunton (1838); and Philadelphia (1839). Within the next decade seven more high schools had been added to the list in the North Atlantic States, one (New Orleans, 1843) in the South, and three (Cleveland, 1846; Cincinnati, 1847; and Toledo, 1849) in the North Central.

The number of students receiving secondary instruction (the ninth to the thirteenth year's

Statistics of Secondary Education

work of the course of study) was 822,235 in 1904, as against 367,003 in 1890. The number has more than doubled in fourteen years. Of these pupils, 652,804 were enrolled in public institutions, and 169,431 in private institutions and in preparatory departments of institutions for higher education. The public high schools enrolled 77 per cent of the entire number of secondary students. Secondary students constituted a little more than one per cent of the entire population in 1904, having increased from 0.59 per cent in 1890. The number of teachers engaged in public high schools and in private schools of the same grade was 36,326.

The increase in public high schools has been very rapid in recent years. In 1890 there were 2,526 such schools, and in 1904, 7,230. Of the students in the public high schools 323,028 were studying Latin; 364,923, algebra; 11,158, Greek; 176,039, geometry; 251,397, history; and 43,052, chemistry. The number studying Latin in 1892 was 39 per cent of the entire number of students attending public high schools, and in 1904 the percentage had increased to 50.81. The value of the school property of the high schools of the U. S. amounts to nearly $158,000,000; that of private schools of the same grade amounts to about $70,000,000. About one half of the private schools are controlled by religious denominations.

The federal government at Washington has never attempted any control over public instruction in the several states, and in this respect offers a marked contrast to the continental countries of Europe. The need of some national agency which should act in an advisory relation to the schools of the country, collect statistics, and serve as an educational clearing-house, was early felt, however; and in 1867, upon motion by James A. Garfield, who delivered at the time an address which was a masterly review of American education and its needs, Congress passed a bill establishing a department of education, placing Henry Barnard at its head as commissioner. Since the establishment of the bureau, annual reports containing from 800 to 2,500 pages have been issued in addition to nearly 300 separate volumes and pamphlets of the greatest value upon a great variety of educational topics. The annual reports contain, besides detailed statistics covering all the educational institutions of the country, special chapters upon the history and philosophy of education in the U. S. and foreign countries, and other subjects invaluable to the student.

Colleges and Universities

Nine colleges were established during colonial times. These were: Harvard University, 1636; William and Mary College, 1693; Yale College, 1701; Princeton University, 1748; University of Pennsylvania, 1751; Columbia University, 1754; Brown University, 1764; Rutgers College, 1766; and Dartmouth College, 1769. Before the year 1800 no less than thirteen others were established, making a total of twenty-two at the beginning of the nineteenth century. The following table shows the number of colleges and universities established by decades for the various geographical divisions of the U. S.:

	N. Atlantic	S. Atlantic	S. Central	N. Central	Western	Total
1890–99	2	8	13	20	11	54
1880–89	6	14	11	37	6	74
1870–79	9	6	16	24	6	61
1860–69	13	9	13	31	7	73
1850–59	15	12	8	40	7	82
1840–49	7	2	8	18	1	36
1830–39	9	10	4	13	..	36
1820–29	3	3	5	9	..	20
1810–19	4	..	1	..	..	5
1800–9	5	3	..	..	..	8
Total	73	67	79	192	38	449 [1]

[1] Thirty-four of these were maintained by the various states.

The following table shows the states and territories maintaining universities in 1903, together with the year of establishment, and the number of students in each for the years 1875 and 1903:

STATE UNIVERSITIES

	Date of Foundation	1875		1903
		Students	Faculty	Students

Thus it will be seen that in a little more than twenty-five years the number of students in attendance at the state universities increased nearly twenty times (fourteen institutions added during the period). Six out of the ten largest universities in the country (1903) are upon the list, and more than that number which are doing work of as high a character as any.

schools of technology. Comparing 1904 with 1890, the total number of men had increased from 44,926 to 86,006, and the number of women from 10,761 to 32,023. Of the entire number (118,029), 52,131 were in classical courses and 13,009 in other courses for general culture; 9,540 in general science courses; and 2,196 in agriculture, excluding short-course students.

It is interesting to note that the total value of property possest by these institutions for higher education amounts to $465,216,545. Seven of these institutions have endowments of more than $5,000,000 each; and eight have from $2,000,000 to $5,000,000. The total amount of benefactions of all kinds for educational purposes, as well as for philanthropic purposes, for the year was, of course, very much larger than this.

For nearly two centuries after the establishment of the first college at Cambridge, Mass., only occasional and sporadic attempts at specialization in higher education had been made in America.

Professional Education

It is true that, during the later years of that period, some few special schools for each of the so-called learned professions had been established, but the students in attendance were so few, and the successes so moderate, as to argue that the people, as a whole, had not as yet felt the need of special preparation on the part of their ministers, physicians, and lawyers, beyond what could be had in the academic institutions and, for the two latter professions, through apprentice work under some competent practitioner. The earlier colleges had courses especially arranged to meet the needs of the pulpit, and were in many cases primarily established as theological schools. The application of their courses to the demands of medical or legal practise was not so direct, tho furnishing a broad foundation. It is estimated that among the

STATISTICS OF HIGHER EDUCATION, 1903–4

The total number of institutions for higher education reporting to the Commissioner of Education in 1904 is 607, of which 121 admit women only; 130 universities and colleges admit only men to the undergraduate department, and 313 admit both men and women. Of the 43 schools of technology, 24 report women among their undergraduates. The total number of students resident at these institutions in 1904 was reported at 118,029. Of these, 71,817 men and 24,413 women were in universities and colleges for men and for both sexes; 6,341 were in colleges for women; 14,189 men and 1,269 women were in

3,500 physicians in the country at the close of the Revolution, not more than 400 had received medical degrees, and it is doubtful if the number of lawyers having received legal instruction in an institution of learning was even as great as that. But as time went on, and the subject-matter to be covered in any adequate professional preparation was increased, the educational machinery adapted itself to the new demands, and special departments, or schools, sprang up wherever the need seemed to be the greatest, some in connection with colleges already founded, and some as separate institutions. Theology

was first to enter the field, with medicine second, and law the last among the three great professions. Pharmacy, dentistry, and veterinary practise followed in order, until we have to-day upward of 500 institutions preparing specialists in these various callings.

Summary of Statistics of Professional Schools for 1903–4

Theological Education

The first religious denomination to establish a theological school was the Dutch Reform Church in America. This was in 1784 under the direction of Dr. John H. Livingston, pastor of the Collegiate Church of New York City. Until 1810 Dr. Livingston taught gratuitously in connection with his pastoral work. In 1810 his work was transferred to Rutgers College. Two other theological schools were established before the nineteenth century, one by the Roman Catholic denomination at Baltimore, and another by the United Presbyterians at Service, Pa. From 1820 to 1902, 129 theological schools were founded in the U. S.

Legal Education

The first law-school in the U. S. was established at Litchfield, Conn., in 1784, by Judge Tappan Reeve, and was conducted there until 1833, when it was discontinued. Only two other definite attempts to establish schools of law were made in the eighteenth century. Both of these were in connection with colleges already established, and both were failures, if we may judge from the immediate discontinuance of the work. The first was at the University of Pennsylvania in 1791; and the second at Columbia in 1797. It remained for Harvard to establish the first law-school of permanency, with degree-granting privileges; and this she did in 1817. Previous to the establishment of a faculty of law at Harvard, the University of Maryland, in 1812, had formally established such a faculty comprising seven instructors. A law department was first established at Yale College in 1824, tho the LL.B. degree was not conferred until 1843. The University of Virginia established a department of law in 1826, and it has been in continuous operation ever since, even during the four years of civil war.

Medical Education

The first medical school in the country was established in 1765 as the chair of medicine of the University of Pennsylvania. In 1767 a second medical school was established. This was not in its origin a separate school, as its predecessor had been, but a medical department in connection with King's College, now Columbia, at New York City. Harvard was the second of the academic institutions to provide medical instruction (1782). Nine schools of medicine were in operation at the end of the second decade of the nineteenth century. In 1902 there were 154 such schools, of which 123 are "regular," 10 eclectic, and 21 homeopathic.

The number of professional schools, students, and graduates in 1904 was distributed as follows: *Theological*, 153 schools, 7,392 students (187 of these were women), 1,620 graduates; *law*, 95 schools, 14,306 students (of these 163 were women), 3,288 graduates; *medical*, 152 schools, 26,949 students (including 1,188 women), 5,702 graduates; *dental*, 54 schools, 7,325 students, 2,192 graduates; *pharmaceutical*, 63 schools, 4,457 students, 1,308 graduates; *veterinary*, 11 schools, 795 students, 198 graduates.

Agricultural and Mechanical Colleges

There are in the U. S. sixty-six agricultural and mechanical colleges: fifty for white students, and sixteen for colored. Most of these are included in the list of universities and colleges already considered. A few are classed with secondary institutions or with state normal schools. These sixty-six institutions are endowed by the acts of Congress approved July 2, 1862, and Aug. 30, 1890. In 1904 they received in the aggregate: from the states and territories in which they are situated, $5,654,758; from the income derived from the land received under the grant of 1862, $730,004; and from later land and money grants $1,315,959. The federal government in 1904 contributed about 19 per cent of the income of these colleges, as compared with 21 per cent in 1903. The total number of students in the collegiate departments of the institutions for white students was 20,894 (18,743 men and 2,151 women).

In the institutions for colored students there were 2,228 men and 1,926 women in the preparatory departments, and only 372 men and 299 women in the collegiate departments. According to the provisions of the act of Congress of Aug. 30, 1890, no part of the money received from the endowment provided by that act ($25,000 a year to each state or territory) can be appropriated for foreign languages, whether modern or classic. This instruction is, however, provided for out of other funds. The total value of the property owned by these institutions is $74,564,424, of which $3,775,965 belong to the institutions for colored students.

In 1904 there were 269 public and private normal schools reporting to the Bureau of Education. There were 63,627 students in these institutions, 10,848 of whom graduated at the close of the scholastic year. In 1890 there were 178 in-

stitutions, 34,814 students, and 5,237 graduates. The total number of students has nearly doubled, while the number of graduates has more than doubled. Besides these, there were 23,612 students of pedagogics in universities, colleges, and high schools in 1904. State appropriations for public normal schools in 1890 amounted to $1,312,419. Current expenses had reached $3,927,808, and expenditures for buildings $915,443. One hundred and forty-nine public normal schools report an aggregate of $26,914,525 as the value of their school property.

Teachers' Training-Schools

In 1904, 149 manual and industrial training-schools reported to the Bureau of Education. The number of pupils for that year was 65,495 (35,327 boys and 30,168 girls), and the current expenses $1,480,685. EDWIN G. DEXTER.

EDWARDS, ALLEN CLEMENT: Member of Parliament (Liberal and Labor); journalist; born 1868, E. Knighton, Radnorshire; became trade-union official, barrister-at-law, author, journalist. He has been labor editor of *The Sun*, and special commissioner for *The Daily News*; elected to Parliament, 1906, for Denbigh District (National Liberal). *Address*: 4 Pump Court Temple, London, E. C.

EDWARDS, ENOCH: Member of Parliament (Labor); president of the Miners' Federation, Great Britain; born 1852; became a collier and secretary of the N. Staffordshire Miners' Association in 1877. He went to Burslem in 1884, and became mayor and alderman. He has also been president of the Midland Miners' Association. Elected to Parliament for Hanley, 1906, as a representative of the Miners' Associations. *Address*: Miners' Offices, Burslem.

EIGHT-HOUR DAY, THE (see also EIGHT-HOUR PHILOSOPHY and EIGHT-HOUR DAY, PRACTICABILITY OF. For statements as to the working-hours of different countries, see HOURS OF LABOR): We consider in this article the movement to reduce the hours of work to eight, since in all countries the effort to shorten the hours of labor has held a day of eight hours to be at present the goal to be striven for.

I. History

The history of the short-hour movement begins in England. Thorold Rogers says ("Six Centuries of Work and Wages," pp. 327 and 542):

> It is plain that the day was one of eight hours. . . . The artizan who is demanding at this time an eight-hours' day in the building trades is simply striving to recover what his ancestor worked by four or five centuries ago.

Some writers deny this, but even according to the Statute of Apprentices (5 Eliz., c. 4), when the hours of labor were to be twelve in summer and during day-light in winter, two and a half hours were allowed for meals, while the law was notoriously not observed. In the seventeenth century there is good evidence that the hours were growing considerably longer. William Petty (*q. v.*), whom Karl Marx with no little reason calls "the father of political economy, and to some extent the founder of statistics," says that in the last third of the seventeenth century there was a ten-hour day. In the eighteenth and nineteenth centuries we come to more certain facts. From 1790 to 1820 the hours were practically unlimited, and often even for children fifteen hours and over. Those who would know the horrors perpetrated in England during this period of the triumph of absolute laissez-faire should read Karl Marx's sketch of the period, in the first volume of his "Capital," based on documentary evidence. Mills were often run day and night; children were obtained in gangs from the poor-law guardians and worked in two sets, lodged in sort of pens with one set of beds; one set of children occupying the beds while the other set worked, and vice versa. The children were carried from the beds to the mills and from the mills to the beds. Where this was not done hours were over twelve. Terrible evils resulted, and in 1796 a board of health in Manchester was appointed to investigate the conditions in the mills, the investigation being caused by the statements of a physician, Dr. Aikin. In 1802 the elder Sir Robert Peel brought in and carried a bill to allay the worst evils. It accomplished little, but furnished a precedent. It applied only to pauper apprentices and limited the hours of only the little children to twelve! The short-hour agitation, however, had commenced. Says Sidney Webb and Harold Cox's "The Eight-Hours' Day" (p. 15):

England

> At the beginning of the present century the ordinary working-day of the English artizan appears to have varied from eleven to fourteen hours. In the new industries, such as the textile manufactories, the employers, being free from traditions, often exacted a still longer day. The London bookbinders were working twelve and a half hours a day (fourteen less meal-times) in 1780, when a trade-union was formed to obtain a reduction of an hour a day.
>
> This movement became successful in 1786. King George III. was the first employer to accord the boon, which he did to the "finisher" in the Royal Library. The "second hour" was gained in 1794, and another half-hour about 1810, after an unsuccessful strike in 1806. Eighty years ago, therefore, the London bookbinders had won for themselves the ten-hour day.

In 1815 another parliamentary inquiry took place and an act of 1819 forbade the employment of children under nine, and fixt the hours of children of nine to sixteen at seventy-two hours per week exclusive of meal-times. In 1824 a bill was passed partially giving trade-unions the right to organize, and from this time agitation became more active. In 1825 Sir John Hobhouse carried through Parliament another bill, making legal provision for a Saturday half-holiday. Already, however, further progress was demanded. Says "The Eight-Hours' Day":

> The eight-hours' dream has certainly been in the minds of trade-unionists in England ever since the repeal of the Combination Laws in 1824, and has recurred at every season of reviving industrial prosperity since that time.
>
> And even before this date a serious proposal to reduce the hours of factory labor to eight hours was apparently made by Robert Owen in 1817. At that date, when even children were kept at work in the textile mills for fifteen or sixteen hours a day, the proposal of an eight-hour day must have

seemed simply absurd. Robert Owen instituted a regular working-day in his mills at New Lanark of ten and a half hours net, and he lived to see an even shorter day made universal in the textile industry.

Factory Legislation

In 1830 Richard Oastler (*q. v.*), "the Factory King," became converted to the labor movement, and commenced, and for eighteen years, through persecution and imprisonment, carried on his agitation for a ten-hour day. His motto was "ten hours and a time-book." He accomplished little, however, till Lord Ashley (the Earl of Shaftesbury, *q. v.*) took up his cause. In 1831 Sir John Hobhouse secured an act forbidding in the cotton trade the employment of persons under twenty-one by night, and all persons under eighteen over sixty-nine hours. In 1832 Tom Sadler, the factory representative, moved a ten-hour bill.

In 1833 an act mainly due to Lord Ashley limited the hours of children under thirteen to forty-eight, and enacted several advantageous subsidiary provisions. Agitation, however, went on.

The manufacturers, too, threw every obstacle in the way of the factory acts. Most of the provisions hitherto applied only to certain trades like the cotton trades; but in 1840 a commission found grievances very wide-spread, particularly in mining, where men, women, and children worked half-naked, eleven, twelve, and often sixteen hours. This produced the Mining Act, which forbade the employment underground of women and of boys under ten.

The Act of 1844, under Sir Robert Peel's government, classified adult women as "young persons," and extended the provisions of the Mining Act to the textile trades, yet left so many loopholes to the manufacturers that they scarcely opposed it, tho even Liberals like Cobden and Bright protested against most of the factory acts.

In 1847 was enacted the great ten-hour bill introduced by Mr. Fielden. It enacted a ten-hour day for both men and women. It was unquestionably a great advance, and yet its enactments were so often avoided that in 1850 another bill was passed to try and enforce its provisions. Agitation continued.

In 1860 there was a revival of the nine-hour movement, but industrial depression, later, made it cease. Beginning with 1871, however, there were numerous strikes for a nine-hour day, and by 1872 such demands had been granted to most skilled artizans. Legislation, too, went on. Omitting minor bills the Act of 1864 extended the factory acts to many trades, the Act of 1874 reduced the hours in the textile trades from sixty to fifty-six and a half a week, the Act of 1878 codified all the factory acts. In 1878 and 1879, however, many employers undertook to revive the ten-hour day, and there were many strikes (*q. v.*). In 1881 the present Socialist movement began in England, and by 1886 produced a strong agitation for an eight-hour day. Says "The Eight-Hours' Day" (pp. 21–33):

Recent History

During the year 1888 the movement received a very great impetus from the growth of the "New Unionism." The new sense of solidarity in the ranks of labor, which was so marked a feature of the matchmakers' strike in 1888, led to the formation and rapid extension of trade-unions among workers who were either unskilled or who had, for other reasons, hitherto been without organization. As these unions were formed usually under the prevailing Socialist influence, and especially through the exertions of Messrs. John Burns and Tom Mann, most of them adopted an eight-hours' bill as a part of their program. One of the most flourishing of these new unions, the "Gas-workers and General Laborers' Union," demanded, in Nov., 1888, a reduction of their hours from twelve to eight per day. In nearly all the gas-works in the United Kingdom this reduction was conceded without a strike, and in many cases was accompanied by a slight increase in wages. Such a signal success gave an immense impetus to the general eight-hours' movement.

The International Trade-Union Congress had appointed the 1st of May, 1890, for a simultaneous international demonstration in favor of an eight-hours' law. . . . It was decided to hold a London demonstration in Hyde Park on the first Sunday in May, and a similar decision was taken in other towns. No fewer than sixteen platforms had to be provided, and at least a quarter of a million persons were present. Experienced journalists agreed that no demonstration for twenty years had equaled it in magnitude.

Several prominent employers granted the eight-hour day. Mr. Rae's "Eight Hours for Work," published in 1894, collects much evidence. The author commenced his studies of the subject merely to get information. His conclusion he thus states:

All experience indorses the wisdom of reducing the hours of labor. . . . The available evidence is unexpectedly copious, and its teaching is unexpectedly plain and uniform. In the course of the investigation I have found it impossible, personally, not to grow a stronger and stronger believer in the eight-hour day. Shorter work-hours have left every nation that has chosen them at once healthier, wealthier, and wiser; and the shortening to eight seems, if I may say so, to be blessed above its predecessors. According to positive experiences of it, the eight-hour day has been almost invariably fair. . . .

One firm, Messrs. Watts & Manton, say: "The habits of the people are changing; there is a greater desire for home life and greater longing after the means by which it is to be rendered more agreeable." Mr. Johnston, flax-spinner and ex-Mayor of Belfast, says that under the long hours the boys used to lounge about the street corners and frequent the public houses, but since the hours were shortened they attended reading-rooms in large numbers, and when tired of reading would amuse themselves with games. Mr. C. Wilson, manufacturer, Hawick, told the labor commissioner that his men had been using their leisure wisely, and had improved during the years they have now enjoyed it.

Mond & Co. state explicitly of a small reduction made in their works: "To the men it has been the greatest boon. It has had the most material effect in improving their health and decreasing the amount of drunkenness, which before the adoption of the system was very great indeed. The interference of the police is not called for now as it used to be." Messrs. Johnson of Stratford, after four years' experience of the eight-hours' system, say that they have now a more intelligent set of men, and that the men and lads have come, in consequence of their greater leisure, to improve themselves by attending technical classes in the evening.

See Hours of Labor.

Next to England came Australia in agitating the short-hour movement, and with such success that Australia may be called an eight-hour country. Our account is abridged from Messrs. Webb and Cox's "The Eight-Hours' Day":

Australia

When the gold discoveries had given the first great impulse to the growth of industry in Australia, the usual working-day for artizans seems to have been ten hours. During the early prosperity of Victoria artizans' wages rose to a fabulous height, and the trade-unions, instituted on English models, were able practically to impose their own terms. The old ideal of an eight-hour day soon came to the front.

The record of the movement in Australia begins with a public meeting held by the stone-masons in Melbourne at the beginning of April, 1856. An "eight-hour league" was formed at a meeting of the united trades, and immediate notice was given by public announcement that, after the 21st of April, 1856, no man belonging to the unions represented would work for more than eight hours a day. The strength of the artizans,

position in the labor market at that time was such that no resistance was possible, and the eight-hour day, thus won by less than three weeks' agitation, has ever since been general among the artizans of Melbourne. The 22d of April has annually been kept by them as a public holiday, and is now known as the Eight-Hour Day.

From Melbourne the eight-hour movement quickly spread to the other parts of the colony, then very sparsely inhabited, and also to New South Wales. An eight-hour day was generally established in various skilled trades in Sydney, within a few years, but by no means universally adopted, especially in the smaller towns. Subsequently the movement spread to Brisbane, Adelaide, and most of the towns of New Zealand.

At the time when the Melbourne workmen obtained their eight-hour day there was neither need nor possibility of securing it by legal enactment. A royal commission, however, was appointed in 1882 to investigate the subject. The evidence taken revealed that the supposed universal sentiment in favor of an eight-hour day had not sufficed to protect various large classes of workers, such as bakers, shop assistants, and attendants in restaurants, from being kept at work for excessive hours.

As a result, in 1885 an act fixt an eight-hour day for all women and boys, and provided many other labor regulations.

Both in Queensland and New Zealand bills establishing a normal eight-hour day were passed by the Lower House of the legislature, which is elected by manhood suffrage, but were rejected by the Upper House, representing the propertied class.

The eight-hour movement on the Continent of Europe seems to have arisen first in Paris.

One of the first results of the revolution of 1848 was a decree limiting the hours of labor.

France

This decree (dated March, 1848) enacted that the hours of labor should not exceed ten per diem in Paris, and eleven per diem elsewhere in France. It was modified by the law of the 9th of Sept., 1848, which established twelve hours net as the maximum working-day. This hasty legislation was completely ineffective. No inspectors were appointed or other means taken to secure the enforcement of the law.

To the plutocratic Cæsarism which followed the republic, the law itself was altogether repugnant. It was not explicitly repealed; but it was ingeniously made inoperative by a series of decrees.

With the advent of the third republic, a change came over the attitude of the government. In May, 1874, fifteen inspectors were appointed to control the operation of the law of 1848 and its amendments. In the same year, and again in 1883, more stringent factory laws were enacted for women and children. On the other hand, in Nov., 1885, an administrative circular was issued, excluding from the operation of these laws all workshops where only human labor force was used, and where fewer than twenty workers were employed in one building.

The law of 1848 was, however, so far effective that it was thought necessary, by a decree of 1889, to exempt from its observance laborers employed on works executed by order of the government in the interest of the national safety and defense.

The German Empire

In Germany the demand for a law limiting the hours of labor has formed a part of the agitation of the Social Democratic Party. Meanwhile factory legislation, both imperial and State, has to some extent regulated the labor of women and children, and this has, as usual, tended to reduce the hours of men. The law of 1st of June, 1877, with the amendments of the 17th of June, 1887, prescribed a maximum day of ten hours for persons under sixteen. But the laws were very imperfectly enforced, and mills employing young persons often ran eighty-four hours a week. Artizans worked eleven and twelve hours a day. In Leipsic the masons, in 1889, carried a ten-hour day; but this was a local arrangement, not generally followed.

The movement for an eight-hour day exists chiefly among the Social Democrats, whatever their trade, and among the coal-miners. In 1888 the coal-miners in Westphalia struck for an eight-hour day, and secured the intervention of the young emperor in their favor. Accordingly, in Westphalia, Silesia, and Saxony the miners work only an eight-hour shift wherever a high temperature prevails; this limitation of the hours in unhealthy mines was adopted by the Berlin Labor Conference in May, 1890. Many of the workers in the mines, and other industrial establishments of the Prussian Government, have since received the boon of an eight-hour day. Other trades are moving in the same direction.

Switzerland enjoys the distinction of having been the first country to declare in its very constitution the legislative right of the nation, in its political organization, to limit the working-day even for male adults. Nor has this power been allowed to sleep. The Federal Factory Labor Law of 1877 limits the maximum hours of labor for all adult labor in factories or workshops to eleven per day, and to ten on Saturdays or public holidays.

During 1890 a law was passed limiting the hours of railway employees to ten.

Other European Countries

In Holland, Denmark, Austria, Italy, and Spain a large number of the labor organizations adopt an eight-hour day as a part of their program, and such a measure is frequently pressed upon the legislatures of some of these countries by the members representing the working classes. The international demonstration of the 1st of May, 1890, was largely participated in, not only in all these countries, but also by Poland. It may, indeed, be said generally, as regards the Continental nations, that wherever the wage-earners are organized at all, their organizations demand an eight-hour law. But labor organizations do not exist, for effective purposes, among any but a minority of the workers on the Continent.

Meanwhile, as if to stave off the demand for an eight-hour law, factory legislation of the ordinary type is being everywhere adopted or rendered more stringent. Belgium and Holland, long the fields of the most unrestrained exploitation of labor, have both enacted lengthy codes of labor regulations; in France, Germany, Spain, Italy, and Austria, the law is being strengthened; Russia and Denmark and Sweden have entered the same path. In some respects, indeed, such as the minimum age for children's work, the provisions relating to the employment of mothers at the time of childbirth, and the prevention of ex-

cessive overtime, England has already lost its honorable lead in factory legislation.

The short-hour movement early developed in the United States. As early as 1806 the organized ship-builders and calkers in New York City sought to obtain a reduction of hours to ten. By 1825 strikes for a ten-hour day were numerous.

The hours of labor at that time seem to have been about twelve per day for artizans. The textile workers were less fortunate. The working-day, even for women and children, often began at 4.30 A.M., and went on for fifteen hours. Most of the New England mills ran thirteen hours a day all the year round. It is not generally remembered that the factory girls of Lowell, in the classic days of the "Lowell Offering" (1832–40), worked seventy-eight hours per week. In 1831 an organization of working men was formed at Boston to secure, among other objects, a ten-hour day. A wide-spread agitation resulted in innumerable strikes, few of which were successful. The ten-hour day became, however, general in Baltimore between 1835 and 1840, as the result of a strike among the laborers. Shortly afterward President Martin Van Buren (April, 1840) proclaimed that the working-day in the navy yard at Washington and all other public establishments should be reduced to ten hours. This led to a general adoption of the ten-hour day in ship-building establishments which has been since maintained. In 1847, however, the masters made a determined but unsuccessful attempt to revert to longer hours.

The United States

On June 16, 1845, a large mass-meeting, attended by 5,000 persons, was held at Pittsburg, Pa., for the same purpose, and led to similar action elsewhere. In Oct., 1845, the first national industrial convention in this country was convened at New York, to organize concerted action toward the same end. Mass-meetings and strikes for the ten-hour system now became very frequent, and in many cases were successful.

In 1845 the textile workers of Massachusetts petitioned the legislature for a ten-hour bill. The first legislation on the subject that we have been able to trace is a law of 1849 of the State of Pennsylvania, providing that ten hours shall be a day's work in cotton, woolen, silk, paper, bagging, and flax factories, and masons had generally won the ten-hour day. The textile operatives were less fortunate. Some of the mills at Lowell adopted the new hours in 1853, but as late as 1865 the mills at Southbridge were still running thirteen hours.

In 1866 the National Labor Union was formed at Baltimore, and it was this body which gave the first great impulse to the movement.

The agitation thus set on foot received legislative recognition in Connecticut in 1867, when it was decreed that eight hours' work should be a day's lawful labor unless otherwise agreed.

On June 24, 1869, a bill for an eight-hour day was introduced into Congress by General Banks, whose wife was once a factory girl at Lowell. This passed the House and Senate, promptly received the signature of President Grant, and was enforced in the navy yard at Charlestown, Mass., July 6th of the same year, tho the employees were notified that the government would reduce wages one fifth; but that those who so desired could work ten hours at the old rates.

In 1869, however, the so-called eight-hour philosophy was formulated by two Boston men, Ira Steward and George E. McNeill. On account of the extent to which this philosophy has affected the American labor movement, we consider it in an especial article. A Grand Eight-Hour League had been formed previously, but had disappeared, when these two men, with a few friends, organized the small but influential Boston Eight-Hour League. With the aid of Wendell Phillips and others, they succeeded the same year in securing the establishment of the Massachusetts Bureau of Statistics of Labor, the parent of all other labor bureaus. Mr. McNeill was deputy and chief manager. The Bureau's statistics largely aided the eight-hour movement. Agitation for shorter hours became general. There were numerous strikes, many of them successful. Eight-hour leagues were formed in many cities, and there were many strikes; 20,000 workmen paraded New York City demanding the eight-hour day. In 1874 Massachusetts enacted a ten-hour law for women and for children under the age of eighteen.

Eight-Hour League

The industrial depression which set in after 1873 throughout the U. S. caused the question of any further reduction of the hours of labor to fall temporarily into abeyance. The great railway strikes of 1877, and other labor disputes during this period, related mainly to proposed reductions in wages. This is probably the reason why the Knights of Labor did not make the eight-hour day at first an express demand. Even at the General Assembly in 1878, when a full "Declaration of Principles" was adopted, the eight-hour day was not expressly mentioned. The eight-hour clause, "To shorten the hours of labor by a general refusal to work for more than eight hours," was apparently added about 1883. However, a vigorous effort to institute an eight-hour day was made in many parts of the U. S. in the spring of 1886. *Bradstreet's* estimated the number of strikers for shorter hours in May, 1886, at 200,000, of whom 50,000 were granted their demands, while 150,000 secured shorter hours, generally with full pay, without a strike. But on June 12, 1886, the same paper estimated that one third of these had lost what had been conceded to them, and predicted that a still larger number would lose the advantage gained. The great meetings held at Chicago in May, 1886, in support of the movement were taken advantage of by the anarchists to spread their ideas, and this led to the so-called Haymarket riot.

During the years 1888 to 1890 numerous attempts were made to secure an eight-hour day in particular trades and particular localities, and at the convention of the Federation of Labor at St. Louis in 1888, it was decided to hold mass-meetings in every city on the eight-hour question on four days in the year, including July 4, 1889; Labor Day, Sept. 2, 1889; and Washington's birthday, Feb. 22, 1890.

It was also decided to strike, trade by trade, for the eight-hour day on each 1st of May, one trade at a time, all the other trades being pledged to support it all over the country. The carpenters were chosen to strike in 1890. To a large extent they did so, and in many cities won the eight-hour day, tho in some where they won the hours were subsequently lengthened. In 1891 the miners were to strike, and some did, but dissensions prevented a general movement. Since

then the movement has taken a more desultory form.

For more recent developments and the present conditions of the hours of labor, see HOURS OF LABOR.

EIGHT-HOUR PHILOSOPHY, THE (see also EIGHT-HOUR DAY, HISTORY OF, and PRACTICABILITY OF): In England, Australia, and Europe the eight-hour movement is not based upon any one particular economic view, but is favored by Socialists, individualists, and trade-unionists, on various lines of argument. In the United States, however, it has developed historically largely based upon a so-called "eight-hour philosophy," brilliantly stated and so impressed upon the leaders of the trade-union movement that it has colored their whole history to such a degree that it cannot be understood without a knowledge of this philosophy.

The philosophy was mainly developed by two men, leaders in the Eight-Hour League formed in Boston about 1869. Ira Steward (*q. v.*), the so-called "founder" of the philosophy, and George E. McNeill (*q. v.*), its brilliant spokesman, who, as first deputy and manager of the Massachusetts Bureau of Labor, and also to a large extent the "father of the American Federation of Labor," impressed the philosophy, in innumerable labor addresses and articles upon the whole labor movement.

The philosophy, however, has been most extensively written out by Mr. George Gunton (*q. v.*), at one time a confidential coworker with Mr. Steward and Mr. McNeill, who received Mr. Steward's papers after his decease, and upon them largely based his book "Wealth and Progress," tho in the opinion of some he has somewhat misstated Mr. Steward's ideas and has certainly perverted them to an argument for protection, utterly foreign to the views of Mr. Steward and Mr. McNeill. In spite of the fact, however, that Mr. Gunton has lost the confidence of his former labor friends, we are still largely indebted to him for a summary of the philosophy.

It may be said in general that the eight-hour philosophy traces almost all economic ills to poverty, and claims that to gradually reduce the hours of labor, thus giving men opportunity to realize their wants, and therefore make efforts to gain higher advantages, is the one way to naturally and permanently relieve poverty.

Says Mr. Gunton in "Wealth and Progress," in stating the argument:

> The chief determining influence in the general rate of wages in any country, class, or industry is the standard of living of the most expensive families furnishing a necessary part of the supply of labor in that country, class, or industry. . . .
>
> The laborer cannot and will not work for less than that which will furnish him a living. He will, as experience shows, often work for less than what will supply him with exceptional comforts and luxuries, but he will not continuously work for less than will furnish him with that which, by constant repetition and force of habit, have become necessities. Before he will forego these he will refuse to work, and inaugurate strikes, riots, and other means of endangering the peace and prosperity of the community. . . .
>
> This explains why we always find that those whose families are largest, or those who have more cultivated tastes and wants, and, therefore, whose cost of living is higher than the great mass of their class, are constantly chafing under the pressure of their unsatisfied demands.

It being thus determined that wages cannot be much higher or lower than the standard of living, the eight-hour philosophy next asks, What determines the standard of living? This it answers, in Mr. Gunton's words, as follows:

> The standard of living in any community will be high or low according as the social life of the masses is simple or complex, or, in other words, as the number of the daily wants of the people is large or small. It is lower in Asia than in Europe, lower in Europe than America, lower at Five Points than on Fifth Avenue, for the reason that the wants of the people in the former places are fewer and simpler than those in the latter. . . .
>
> **Wants**
>
> But if the standard of living is governed by the wants, the question that next arises is, What determines the wants?
>
> Man is a twofold being. He has a physical and a social nature, and, consequently, he has social as well as physical wants. The latter arise from his animal existence, and the former from his social relations. Therefore, his physical wants, like those of the lower animals, are few, and mostly hereditary, while his social wants are acquired and have no conceivable limit. . . . If we examine the history of man, we shall find that his wants are few or many, and high or low, according to the quality of the habits and customs of the society in which he moves. . . .
>
> Therefore, how to increase the wants, develop the character, and consequently advance the wages of the laboring classes, ultimately resolves itself into the question, How can the social opportunities of the masses be enlarged?
>
> Now, so long as nearly all the laborer's time not occupied in eating and sleeping is devoted to the former, as at present, no commensurate development of the latter is possible. Therefore, the first condition for increasing the opportunity of the masses to develop their social character, and thereby increase their natural capacity to consume wealth, commensurate with their power to produce it, is more leisure. By leisure, however, we do not mean merely unoccupied time. Enforced idleness is unoccupied time, but it is not leisure. The masses, the world over, have a great deal of unoccupied time, but it is mainly in the form of idleness, and not that of leisure. Tho idleness and leisure are both unoccupied time, the economic and social influence of the one is directly opposite to that of the other. Idleness tends to impoverish, dwarf, and degrade, while leisure tends to enrich, develop, and elevate character. It is very important, therefore, to distinguish clearly between leisure and idleness. Nor is this difficult to do if we observe their essential characteristics. . . .
>
> The immediate and most important question, the answer to which is necessary to enable us to take the first correct step toward preventing enforced idleness, is how to wisely and permanently increase the leisure time of the laboring classes. To this question we are now in a position, on the basis of sound economic principles, to give a definite and emphatic answer, which is—reduce the hours of labor.
>
> In proposing a reduction of the hours of labor as the indispensable first step toward promoting industrial and social reform, we do not say that it is the only means that will, under any and all conditions, tend to promote that end.
>
> But while there are other more or less effectual means of promoting the same end, such as education, free lectures, public libraries, parks, museums, and art-galleries, these are and must necessarily remain practically ineffectual, so far as lifting the community from its present industrial and social mire is concerned, unless the leisure time of the masses is increased.

It is thus that the eight-hour philosophy reaches its conclusion to concentrate all present economic effort on reducing the hours of labor. But this is by no means the whole of the philosophy. It goes on to show how a reduction in hours will also employ the unemployed, and by setting them to work, and giving them money to spend, increase their consumptive powers, and so still more raise the standard of living. Says Mr. Gunton on this point in a tract, "The Economic and Social Importance of the Eight-Hour Movement":

> The adoption of an eight-hour system would tend to increase wages in two ways: first, by reducing enforced idleness; second, by creating new wants and raising the standard of living. The immediate effect of the general adoption of an eight-hour workday would be to reduce the working-time of over 8,000,000 adult laborers about two hours a day. This would withdraw about 16,000,000 hours' labor a day from the market without discharging a single laborer. The industrial vacuum thus created would be equal to increasing the demand for labor nearly 20 per cent. In other words, without increasing either our home or foreign market, but simply to supply the present normal consumption, it would create employment for 2,000,000 laborers, which is nearly equal to 70 per cent of the total number of able-bodied paupers and unemployed laborers in America, England, France, and Germany. In thus eliminating enforced idleness it would remove the first great obstacle to industrial reform and social progress.

Again, the employment of 2,000,000 of new laborers would necessarily tend to increase the number of consumers, and thereby enlarge the market for commodities to that extent. That such a result would tend to increase wages is very clear. Altho wages would not necessarily rise in the same proportion that enforced idleness is reduced, all the influences would be in that direction. It is a law in all nature that the power of primary forces increases directly as the opposing forces are reduced. Since enforced idleness is the most powerful obstruction to a rise of wages, by removing the unemployed the direct influence of the social forces which tend to promote the rise of real wages would be increased.

Effects of Short Hours

Manifestly, therefore, the immediate effect of the adoption of this measure would be to remove the greatest obstacle to industrial peace and progress, and prepare the way for increasing the natural influences which tend to enlarge the general consumption of wealth and raise wages.

The second effect, which would be more gradual, permanent, and far-reaching in its nature than the first, would be the result of the increased leisure and social opportunity upon the social character and consumption of the masses. With the removal of enforced idleness, and its degrading influences, over 8,000,000 laborers would leave their work each day less exhausted, mentally and physically, and have two hours' more leisure. This would mean so much positive opportunity for family life and for general social intercourse, and in a much fresher and more cheerful mood. With increased leisure and less exhaustion, the laborer will be continually forced or attracted into new and more complex social relations, which is the first step toward education and culture in the broadest and deepest sense of the term. In short, it means his gradual introduction into a new social environment, the unconscious influence of which would necessarily awaken and develop new tastes and desires for more social comforts. He would naturally begin to desire more wholesome and better appointed homes, more literature, entertainment, and a greater amount of general social intercourse, not to speak of the intellectual, moral, and social improvement that would necessarily result from such conditions. The purely economic effect of this would be little short of revolution. In proportion to the frequency and extent with which the new desires were gratified, the development of which no power on earth could prevent, would they crystallize into urgent wants and necessities. The satisfaction of these would soon become an essential part of the standard of living demanded by the social character and habits of the people, and therefore would make a general rise of real wages inevitable. In fact, these are the only kind of influences which ever did, or ever can, permanently increase the general rate of real wages. This increased consumption and rise of wages means enlargement of the home market, and thereby making a greater concentration of capital and the use of wealth-cheapening machinery possible.

Such in brief are the main points of the eight-hour philosophy as far as its economics are concerned. As far as its practical program is concerned a few other points must still be noted:

1. The eight-hour philosophy claims that this method of raising wages, by shortening the hours of toil, is not only based on the laws of economics, but suited to the character of all abiding progress, in that it can be introduced without either overturning the present system or jeopardizing the reasonable interests of employers, until all working people be lifted up to a level where cooperative methods can be introduced and the wage system be gradually replaced by one where workmen shall be their own employers.

2. The eight-hour philosophy claims that it is suited to the political and ethical sense of working men, in that it teaches them to look for advance of wages, not to legislative enactment or any other form of paternalism, but by their own efforts in gaining the shorter day, and so lifting themselves up to a fuller manhood.

While it takes this position it recognizes the proper place of government, by asking, as the first step in securing the short-hour day, that government establish an eight-hour day, not indeed in all factories, but in all government works; thus showing what can be done, what an eight-hour day means; making it thus an object lesson both to employers and employees, and so leading the community, not by law, but by example.

3. The eight-hour philosophy recognizes that while industrial progress must come from the working classes lifting themselves up through combination to higher standards of living, the power to combine and agitate for shorter hours implies already a degree of development. Hence, by working along the lines of least resistance, and by following the deep principle that to those who have is given, it holds that the eight-hour movement will develop first among the higher paid artizans, and then, through their gaining higher standards of living, will reach down and lift up those at present unable to organize for themselves. Thus the eight-hour philosophy has always sought and found its chief home among the more intelligent and the better organized trade-unions.

Perhaps the whole of the philosophy may be best summed up in the resolutions passed by the Boston Eight-Hour League at its convention of 1872, drafted by Mr. Steward himself:

Resolved, That poverty is the great fact with which the labor movement deals;

That cooperation in labor is the final result to be obtained;

That a reduction in the hours of labor is the first step in labor reform; and that the emancipation of labor from the slavery and ignorance of poverty solves all of the problems that now most disturb and perplex mankind.

Resolved, That we demand legislation on the hours of labor, as follows:

1. An amendment to the patent laws of the United States, by which an exclusive right to make or sell shall be forfeited when persons are employed in manufacturing an article patented more than eight hours a day.

2. An amendment to the acts of incorporation of cities and towns, requiring them to adopt the eight-hour rule in the employment of all mechanics and day-laborers, and the same hours to apply to the same class of work for the state, whether directly or indirectly, through persons, firms, or corporations contracting with the state.

3. Manufacturing corporations to adopt the eight-hour system or surrender their charters.

4. All persons under twenty-one years of age to be employed not more than eight hours a day.

5. Eight hours to be made a legal day's work in the absence of a written agreement.

Resolved, That this legislation, tho affecting directly but a small per cent of the people, will establish the facts most important for the working classes to learn;

That eight hours do not mean less wages;

That men are never paid, as a rule, according to what they earn, but according to the average cost of living;

That in the long run—within certain limits—less hours means more pay, whether they work by the day or work by the piece;

That reducing the hours increases the purchasing power of wages as well as the amount of wealth produced;

That dear men mean cheap productions, and cheap men dear productions;

That six cents a day in China is dearest, $3 a day in America is cheapest;

That the moral causes that have made $3 a day cheaper than six cents a day will make higher wages still cheaper;

That less hours mean reducing the profits and fortunes that are made on labor or its results;

More knowledge and more capital for the laborer; the wage system gradually disappearing through higher wages;

Less poor people to borrow money, and less wealthy ones to lend it, and a natural decline in the rates of interest on money.

More idlers working, and more workers thinking; the motives to fraud reduced, and fewer calls for special legislation;

Woman's wages increased, her household labor reduced, better opportunities for thought and action, and the creation of motives strong enough to demand and secure the ballot;

Reaching the great causes of intemperance—extreme wealth and extreme poverty;

And the salvation of republican institutions.

EIGHT-HOUR DAY: PRACTICABILITY OF (see also Eight-Hour Day; History of, and Philosophy of): It is necessary to distinguish at the outset between the *immediate* and *ultimate* effects. There are few branches of industry in the United States in which as much work can be immediately turned out in eight hours as in ten. It has indeed been done, by doing away with irregular attendance, frequent pauses, dawdling, etc., but the piece system of wage remuneration has had so extensive a sway in this country that it has squeezed out virtually all wasted time. If, however, we compare the per-capita product of an eight-hour day, after the lapse of several months or years, with that obtained at present, say, in a ten-hour day, may not the change stimulate production and yield even a larger quantum of material goods? Any person who has carefully studied the results of the historical tendency to shorten the hours of labor will be inclined to answer in the affirmative and

for the following reasons: Shorter hours in modern industry mean (1) increased physical efficiency, and (2) greater intelligence and inventiveness among the wage-workers, and (3) promote a purer family life, which in turn means better trained workmen and fewer paupers, tramps, and criminals, to be maintained out of the national product.

The fact, however, that numerous trades have succeeded in reducing the hours of work without suffering a corresponding reduction in compensation does not demonstrate that similar results would follow upon a general reduction of hours throughout all industry. For, in the first place, it is only too obvious that the advantage of a single trade in the way of high wages or short hours may be won at the expense of fellow workmen in other trades. In the case of the carpenters and masons it is clear that unless they did as much work in eight hours as formerly in ten the cost of buildings would be increased and laboring men would foot the bill by paying higher rents. If all trades should succeed in reducing hours, without increasing the average hourly output so as to maintain production, the result would be a general increase in prices; in other words a loss in real, effective income.

Nor is it clear that the particular trade that has won a shorter day has really improved its position even tho it may have succeeded in maintaining the daily rate of wages; for by such reduction in working-time it may have sacrificed an increase in earnings that it could otherwise have obtained. If it merely maintains wages at the prevailing rate in a period of rising prices and wages, it has suffered a loss in real income, since its earnings will buy less in the market.

Again, an increase in wages is often won at the expense of increased idleness in the trade, so that the support of unemployed members of the union may eat up the whole increase in earnings.

These considerations show that, in the long run and taking all industries in the aggregate, no general reduction in the hours of labor is possible without a resultant loss of real wages, unless production is maintained. If any one economic principle passes unquestioned, both among political economists and business men, it is the principle that wages in the aggregate and in the long run depend upon product.

There are, indeed, exceptions to this rule in industries affording monopoly profits. This class of industries is a very large one and is every day increasing in number. It embraces virtually all the industries classed under the head of transportation and communication, which by virtue of their exclusive sites or rights to land, public highways, etc., are natural monopolies. Another large class of industries possess special privileges in the way of patents, etc., which afford them monopoly profits. And lately there has come into prominence the immense interests enjoying profits beyond those prevailing under free competition, simply because they possess sufficient capital to destroy competition—the so-called capitalistic monopolies. Inasmuch as these monopoly profits exceed the normal or usual profits in industries where competition is free, they could be reduced without expelling capital and thus diminishing employment. If working men are strongly enough organized to enforce their demands, they can obtain a reduction in hours in these numerous industries without fearing an ultimate increase in prices to rob them of their gain.

Reduction of Hours Need Not Reduce Production

But even in industries wherein free competition has restricted profits to the normal rate, it is entirely possible for working men to obtain an advance in wages or a reduction in hours without affecting prices. But it will be at the expense of the smaller employers, who are driven out of business as a consequence of their inability to pay increased wages out of their meager profits. The whole tendency of labor organization and higher wages has in fact been to favor the large and well-equipped establishment at the expense of small, inefficient employers, with the ultimate result of making profits bear the cost of higher wages. But it has also promoted the centralization of industry and the growth of capitalistic monopolies mentioned in a previous paragraph.

In the third place, working-time may be shortened without causing higher prices or reductions in wages, by the adoption of improved machinery or processes. In fact, it is one of the glories of America that the high cost of labor has always stimulated the invention and adoption of labor-saving machinery; and it may be urged as an argument in favor of shorter hours that they would so promote the education and intelligent interest of wage-workers as to increase the number of useful inventions that enrich the community.

What has been the experience in the U. S., and particularly in Massachusetts, which has led the way in such state legislation?

The Massachusetts Act of 1874 provided a penalty of $50 for any owner or manager of a manufacturing establishment who "wilfully employed a woman or minor for more than ten hours a day, or sixty hours a week." The word "wilful" however, furnished employers with a convenient means of escape, which with other defects made it almost inoperative for several years. In 1879, however, the word "wilful" was struck out, and in 1880 additional amendments so strengthened the law as to make it fairly effective. Employers who had opposed the law from the outset now made strong efforts to secure its repeal, representing that their expenses of production were so greatly enhanced that they were unable to compete with rival factories in the neighboring commonwealths of New England and New York, which were operated eleven or eleven and a half hours a day. They submitted their books to show that the labor cost of their goods had increased almost proportionately with the forced reduction of hours. While they could not prevail upon the legislature to repeal the law, they succeeded in having an official investigation of the question made by the State Bureau of Statistics of Labor.

The report of Carroll D. Wright, then chief of the Massachusetts bureau, vindicated the ten-hour law. Colonel Wright's famous report of 1881 declared (p. 457) that "Massachusetts with ten hours produces as much per man or per loom or per spindle, equal grades being considered, as other states with eleven and more hours," and also that "wages here rule as high, if not higher, than in the states where the mills run longer time." He added: "So far as the tables show there is no reason why the mills in New York, Connecticut, Rhode Island, New Hampshire, and Maine should not be run on the ten-hour basis in harmony with the system in successful operation in Massachusetts." The result of this report was that opposition to the law died away for a time in Massachusetts, and that the neighboring states soon enacted similar laws.

Massachusetts' Experience

From that time to this, public opinion in Massachusetts has upheld the ten-hour law, and approved the extension of its principles despite the contention of Massachusetts manufacturers that it handicapped them in their competition with rival establishments in other states. Thus as late as 1895 the "Bulletin of the National Association of Wool Manufacturers" in a series of articles on "Factory Legislation in New England," which was subsequently reprinted by the Arkwright Club, affirmed that "vast sums of Massachusetts capital have gone into other New England states, driven away from home by the adverse conditions created by legislation."

Fortunately, statistics are at hand which afford simple but fairly effective tests of the assertion that Massachusetts' industries are threatened with ruin by restrictive labor legisla-

tion. In the first place, Massachusetts' cotton industry, the business chiefly affected by short-hour laws, has fully kept pace with that of rival states in the North. In 1870, four years before the enactment of the ten-hour law, Massachusetts had 39.5 per cent of all the cotton spindles in the North Atlantic states, six years after the passage of that law, Massachusetts' proportion was 45 per cent; in 1890 it was 47.5 per cent, and in 1900 53.5 per cent. It is difficult to see what clearer proof could be demanded of the beneficial results of the Massachusetts short-hour laws of 1874 (sixty hours a week) and 1892 (fifty-eight hours).

Again, that the maximum industrial efficiency of a community has been reached under the nine-and-a-half-hour day of England and Massachusetts may be questioned in view of numerous successful experiments with the eight-hour day. A record of these experiments will be found in the books devoted to this question. One of the most notable of these experiments was made by the large machinery manufacturers, Messrs. Mather & Platt, of Salford, England, who employed 1,200 workmen. Their reduction in hours from fifty-three to forty-eight per week resulted in so little diminution of the output that the British Government decided to make a similar reduction in the royal arsenals. But for the most convincing demonstration of the benefits of the eight-hour day one must go to the Australian colonies, where it is nearly universal.

Once more, at the present time there is a growing recognition of the destructive effects upon the life and health of wage-earners, of machine methods and processes of utilizing harmful materials.

It has rarely been so tersely stated as in these words of Professor Clark of Columbia University:

> If you want a man to work for you one day, and one day only, and secure the greatest possible amount of work which he is capable of performing, you must make him work for twenty-four hours. If you would have him work a week it will be necessary to reduce the time to twenty hours a day; if you want him to work for a month, a still further reduction to eighteen hours a day. For the year, fifteen hours a day will do; for several years, ten hours; but if you wish to get the most out of a man for a working lifetime, you will have to reduce his hours of labor to eight each day.

It is an absolute waste to have the workmen in our manufacturing and transport industries die as young as they do. The English mortality statistics (the only accurate figures that we possess of deaths by occupations) show that the death-rate of occupied males is almost twice as great in the industrial as in the agricultural districts. Taking 1,000 as the standard of measurement, we find the mortality among dock-laborers to be 1,829 as compared with 604 among schoolmasters. The enormous disparity points to a most unprofitable organization of industry. And in the U. S., according to the unanimous testimony of American and foreign observers, the working men are worn out at an even earlier age than in England or elsewhere.

A French authority was forced to the conclusion that the maximum working-time should be eight hours in all branches of industry wherein peculiar conditions exist, such as the employment of children or women, special risks of danger, particles of dust in the atmosphere, etc. "The limitation of hours to eight per day," he says, "would have the best effects upon the general health and mental activity of the working classes and would diminish their chronic sickness and mortality."

Dr. Ilia Sachnine after an exhaustive study (La Journée de Huit Heures au Point de vue de L'hygiene et de la Medicine, Lyon, 1900), concludes that the abnormal sickness and mortality among working people is due not simply to poisonous or noxious substances in the materials of work, but also to fatigue, which affects the nerves.

Health and vigor are of primary importance to any body of workers, and whatever policy will promote the health of the community will in the long run prove the best policy, even if its adoption may temporarily cut down profits. The Massachusetts cotton industry affords an excellent example of the wisdom of this policy, notwithstanding the dissatisfaction of a part of the employing classes. For as a result of Massachusetts labor legislation and the competition of Southern factories, Massachusetts factory owners have been obliged to seek the latest inventions and improved processes, to produce finer and more attractive goods. As the Southern mills have naturally begun with the production of coarse grades, the Massachusetts manufacturer has endeavored to avoid competition by confining himself to the higher grades. This has of course called for more and more skill on the part of Massachusetts operatives and has led to the establishment of textile schools. The grand result is that Massachusetts has a body of workmen who have leisure to appreciate the public libraries scattered throughout the state; to perfect their technical training as well as to acquire that degree of culture and knowledge which makes an intelligent citizenship and to discharge the duties imposed by that citizenship. What American would hesitate in choosing between this system and the system of the Southern factory villages, where men, women, and children can be regarded as little better than working animals? Even as regards the production of material goods, it is nothing but short-sightedness to regard the Southern industry with its eleven-hour day as superior to the Massachusetts industry with a fifty-eight-hour week.

The objection made to the higher system is that such progress has to be paid for out of the profits. Every capitalist would prefer to continue his machinery in use until it is entirely worn out, and with large profits such as are made now in the South he will do so. But diminished profits in Massachusetts have made the Massachusetts manufacturers the leaders in improving machinery and methods. It is not too high a price to pay for progress.

In discussions of the shorter-hours' question it is usual to refer to the moral aspects and to consider the effects of a shortening of the working-time upon the home life of wage-earners, their pleasures (and more particularly their use of liquor), and in general their disposition of the added hours of leisure. But as a matter of fact no well-grounded distinction can be made between the moral and economic effects, for any change that improves the morals of a community will in the end produce an increase in the amount of material goods made by that community. The family furnishes the really fundamental education of the growing generation—the education of character; and the family life thus really determines the quality of the rising generation as efficient or non-efficient wealth producers. If a reduction in the hours of labor does promote the growth of a purer and better family life, it will unquestionably result in the production of greater material wealth on the part of the generation trained under its influence; nothing else in fact will so effectively diminish the vast number of

criminals, paupers, and idlers, who, in the present generation, consume the people's substance.

Shorter hours improve the worker and therefore also increase product by increasing home life.

A very little observation serves to show that home life can scarcely exist in a family whose head must work twelve or thirteen hours a day. For two or three additional hours must be spent away from home in traveling to and from work and in eating luncheon, and that leaves the workman scarcely more than his sleeping-hours. He may as a result see his children once a week, if he does not have to work on Sunday. The wife's life is darkened even more by the long-hour day, especially if she also be a working woman. Even if the day be one of only ten hours, she must arise as early as five o'clock to prepare breakfast for her husband and herself so that they may be at their work places at seven. Beginning at that early hour her day will be a very long one.

Home Life

Long hours of work exhaust the toiler and unfit him for reading or light social pleasures in the midst of his family in the evening. His body and mind crave excitement and drive him to the saloon, where he drinks heavily. And thus the very appetite for stimulants, created by exhausting hours of labor, is cited in certain quarters as a fatal objection to the shortening of working-hours. The assertion that additional leisure would be spent in drinking and carousals is frequently made the basis of argument against shortening the hours of work. And of course it is always possible to adduce numerous instances of such results. Unskilled and lowly paid laborers may find no other way of spending their leisure, but it is certainly not so among the skilled craftsmen. No complaint has been made that carpenters and masons are now more addicted to intoxicants than they were before they won the eight-hour day. On the contrary, the impression everywhere prevails that drunkenness has decreased in their ranks and in other classes where hours have been shortened. The phenomenal growth of university extension lectures, evening-schools, and public libraries can be explained in no other way than by the increasing participation therein of the wage-workers. The following quotation from a letter by John Mitchell, president of the United Mine Workers, testifies to the improvement in drinking-habits wrought by the shorter working-day:

> You would be surprized to note the progress the coal-miners are making since the inauguration of the eight-hour day three years ago. In many places they are organizing libraries, they are taking a greater interest in public questions, and their family life has become much improved and sweetened. Formerly when they came home in the evening they were so exhausted that they felt crotchety and cross. Now they come home in better time and can always afford to give the "old woman" a smile. But above all, you would be surprized to note what this change has wrought in the mining regions in reducing drunkenness. The eight-hour day is the greatest temperance advocate I know of.

Outdoor recreation and sports have thriven wonderfully among the working people who enjoy short hours and have contributed much to the general improvement in health observed in recent years. An even more profitable way of spending their leisure has appeared among the English and Australian working classes, whose working-hours are shorter than those of American wage-earners, namely, home gardening. Sydney and Melbourne are metropolitan cities with the largest part of their population in suburban homes. The wage-earner by leaving his work early in the afternoon can easily manage to live in a cottage of his own out in the suburbs and can keep his own garden. It has been said that "the city of Melbourne has a wall of security in the belt of working-class cottages by which it is encircled; and the pride of the modest owners in their little home and garden diverts them not merely from political but from convivial temptations."

Thus far we have been discussing what may be called the immediate effects of the eight-hour day. Of greater importance are those more general and remote effects that will be manifested in the industrial success or failure of the next generation of workers whose training and education will be carried on under the shorter-day system.

There is a popular belief that reduction of hours, by diminishing the amount of work performed, would create a demand for additional workmen. Thus, the organ of one of the most enlightened and conservative trade-unions in the U. S. says of the eight-hour bill which has passed the House of Representatives:

> If we can succeed in passing this bill it will create such a demand for labor as was never experienced; it will raise wages and give a boost to the labor movement that will make it respected by those who are its antagonists.

Among working men, indeed, the favorite argument in favor of shorter hours is that more labor would then be required to accomplish equal results. It is believed that the eight-hour day would result in the absorption of the great mass of the unemployed, who are constantly tempted to underbid the employed, thereby keeping down wages, as well as using up large funds set aside by the labor-unions for the maintenance of their unemployed members. Most of the literature in the Eight-Hour Series published by the American Federation of Labor emphasizes this particular effect of a shorter working-day. (See EIGHT-HOUR PHILOSOPHY.)

It looks plausible; but it must not be hastily accepted on account of mere plausibility.

Let us suppose that the daily working-time in bakeries is reduced to eight hours a day, and that in order to maintain the supply of bread employers must engage more workmen. The number of persons unemployed is by so much diminished and the number of consumers correspondingly increased. Other trades will therefore expect an increased demand for their goods, and more workmen will be employed to meet this demand, until the unemployed are all at work and everybody is happy. So easy a solution of the labor question is evidently based on a fallacy somewhere, else it would long since have met with general adoption. In the case of the bakers, it will be recognized that the employment of more men will increase the employers' wages bill, which must in the long run be made up by higher prices on account of the tendency of profits to uniformity in all industries. But if the price of bread is increased working men generally will have less money for other things; their purchases of clothing, furniture, books, etc., will dwindle and business in these industries will fall off until in the end many more workmen will be discharged than were originally taken on by the bakers. The number of unemployed will be greater than ever. This is because the aggregate product of the community has been diminished.

As a remedy for the problem of the unemployed the reduction of the hours of labor is therefore illusory. If any one is inclined to scout this conclusion as mere "theory," let him study the labor question in Australia. There the eight-hour day is universal, and yet nowhere else in the world has distress on account of unemployment been greater than it was in Australia in the long depression of the nineties.

Will Not, However, Employ the Unemployed

The effects of reducing the hours of work, therefore, may be summarized as follows:

1. Production, and therefore wages, may be maintained without the employment of additional laborers by: (*a*) "Hauling in slack rope," i. e., abolishing intervals of rest, dawdling, irregular attendance, etc. (*b*) More intense application to work, speeding of the machinery, etc. (*c*) The adoption of improved processes and labor-saving machinery.

2. Production may be maintained by the employment of additional workmen at the expense neither of the wage-earner nor of the consumer, by: (*a*) Eliminating the small employer and concentrating labor in large establishments which can flourish on lower rates of profit by reason of large returns. (*b*) Making monopoly gains pay the increased expenses of production.

3. From a social point of view, production will be increased by any change in industrial organization which diminishes the number of idlers, paupers, and criminals. Shorter hours of work, by allowing higher standards of comfort and purer family life, promise to enhance the industrial efficiency of the wage-working class (improved health, longer life, more content, and greater intelligence and inventiveness).

4. Reduction of the hours of labor will not abolish the problem of unemployment. (See HOURS OF LABOR.)

ADNA F. WEBER.

ELBERFELD SYSTEM: Attention has been widely attracted to the methods of poor relief adopted in Elberfeld, and copied in many German cities. In 1823 the Prussian Government authorized each commune in the Düsseldorf circle to take charge of its own poor relief, but until 1850 the old system, founded upon that of the French Empire, remained in vogue. A system in the charge of wealthy individuals was then tried, but proved very costly. At the instigation of Daniel von der Heydt, a banker of Elberfeld, the existing scheme was authorized.

For poor-law purposes the city is divided into 546 sections, each section consisting of about 300 people. Every fourteen sections constitute a district. Over each section is placed an almoner; and over each district, which has fourteen almoners, is appointed an overseer. All these officers are under the control of a central committee of nine, of which the mayor is ex-officio president, four members are town councilors, and the other four are ordinary citizens. The 546 almoners and thirty-nine overseers are unpaid, but all is under city control.

The duties of the almoners are extensive and precise. Every person needing relief makes application to the almoner of his own district. It is then the duty of the almoner to institute full and particular inquiries into all the circumstances of the case. He is also required to keep himself constantly informed so long as the applicant may continue to need relief. Every fortnight the fourteen almoners of each district meet under the presidency of the district overseer; the reports of each are then considered, and the minute-book prepared for the Central Committee. That committee also meets fortnightly on the day following the meetings of the almoners and overseers. The small size of the sections enables each almoner, without difficulty, to make himself thoroughly familiar with all the distress of his district, and with every exaggerating or favorably modifying circumstance connected with it. Being a citizen and not a paid official, he has no interest but to state the facts as plainly as may be, and to see to it that the relief shall be such as is best suited to the necessities of each case. Relief is granted according to a fixt and uniform scale, which is so framed as to secure that only the minimum necessary for bare subsistence is supplied to the applicant and his family. Any small sums he may earn are considered and deducted so as to bring his rate of relief to the standard minimum. One of the instructions of the almoner is that he is bound to use every possible effort to secure employment for those who may be in receipt of relief.

But while relief is thus strictly limited, much more is really done. For the almoner coming to know the comparatively small section over which he is assigned, and there being developed a civic interest in his work, he is able to help the needy in many ways before they come in need of money relief. He helps the unemployed to find work, the sick to obtain medical attendance; to the beginner in dissipation he gives the word of counsel which often rescues him from evil. He becomes a little father to his section. He is allowed by the city to loan tools, sewing-machines, etc. The best men take these positions. According to W. H. Dawson ("The German Workman," 1906), among 600 almoners recently in charge was 1 who had been in office forty-nine years; 19 in office over thirty years; 81 over twenty years, and 268 over ten years. They included 243 business men, 319 professional men, 9 farmers and landowners. Women aid through their *Frauenverein*, and are now beginning to be appointed as supplemental official almoners.

Little Fathers

The result is that tho the population has increased from 50,000 in 1852 to 162,000 in 1904, the number receiving either temporary or permanent help has only increased from 4,000 to 7,689, a decrease from 8 per cent in 1852 to 4.7 per cent in 1904, or nearly one half. The relief given in 1852 was $44,660, or eighty-nine cents per head of population, and in 1904 (including poorhouse, orphanage, etc.), $143,530, or eighty-eight cents per head, with far better results. Berlin, Cologne, Dresden, Stuttgart, and other German cities have adopted the same general system.

Results

ELECTIONS (see also AUSTRALIAN BALLOT PRIMARIES; CORRUPT PRACTISES ACTS; REFERENDUM): Elections seem to have originated in the general assemblies of citizens (or perhaps in the old labor-gilds (see GILDS), as in the Roman concilia (see ROME), the Athenian ecclesia (see ATHENS), or the Teutonic assemblages of freemen (see SWITZERLAND). When these passed away, first in fact and then in form, in the growth of despotism and autocracy, the custom of election was preserved in the monastic fraternities, ecclesiastical conventions, free cities, and trade-gilds. Favored electors, as in Germany, often elected emperors or even kings.

Election by popular vote is now becoming again the rule in all civilized countries, with a tendency everywhere to be by universal adult suffrage, tho to-day for the most part only by adult male suffrage (see SUFFRAGE). The United States was the first country to establish this in a large way in modern times, tho even in the states, when they became independent, the suffrage was limited in each one of the commonwealths by property and other qualifications.

THE UNITED STATES

Elections in the U. S. are numerous and frequent, and here is one of the main sources of their evil. Federal elections come every four years; state elections come usually every year; municipal elections come also yearly, sometimes on the same day and sometimes on different days from the other elections. In the case of each

Frequency

election (federal, state, and municipal) the voter has numerous candidates to vote for. In federal elections he votes for electors for president and vice-president; in state elections he votes for governor, lieutenant-governor, congressmen, representatives to the state legislatures, secretary of state, attorney-general, sometimes judges, and several other officers. In city elections he usually votes for mayor, aldermen, common councilors, school board, commissioners of various departments. Besides this he is usually called upon to vote yea or nay on various questions of granting license or no. For each office three or four parties each nominate different candidates. The result is that frequently the voter has to have before him several hundred names. The ballot upon which the average city voter has to record his choice is often a blanket sheet covered with confusing names. Under the present system, then, the first characteristic of American elections is that even the voter who desires to be honest cannot go by his own personal knowledge of the candidates. It is impossible for him to know personally and to judge between the claims of the different men. He, therefore, is compelled to be guided in his choice by his party, by hearsay, or by the press. Here comes in the opportunity of the professional politician.

For the misuse of elections, see CORRUPTION.

Primaries

The machine controls elections mainly through the primary. The primary is determined by its roll of ward voters entitled to vote in it. This roll is prepared by the ward committee. It knows its own men. Others are admitted to the primaries on the votes of those already admitted. To gain admission, one often has to give a pledge to support the committee. Independent men are gotten rid of or refused admission. Subservient primaries are thus easily gotten. Honest men object to such measures, and either stay away or give up in disgust after fruitless efforts to capture the primary.

Bogus lists of voters are often made. Men are brought in from other districts to vote for the machine.

When the primary meets a "slate" is brought in, and usually the names on it receive the nomination from the subservient primary. If a few opponents are present, they are usually allowed to make opposing but fruitless nominations, the committee being sure of the result. The chairman appointed by the meeting is almost always the tool of the committee. If there should be a split or division, sometimes a disturbance is purposely created, and in the confusion the chairman can declare the nominations carried. Often shouters and roughs are brought in to shout down all opposition. Usually when there is a division, it is merely a fight within the party, between two ward or city cliques, for offices, both of which are subservient to the machine. Honest battles in the primaries are almost unknown, and "reformers" have almost given up in despair attempting to capture the primaries of the old parties under the present system. Their only hope seems to be to make independent nominations of their own. They sometimes win, in cases of the uprisings of indignant citizens, but the indignation does not last, and pretty soon the regular work of the old party machine wins again. Nor is there usually much hope in playing corrupt Republican primary against corrupt Democratic primary, especially in city politics, because the machine which once gets hold of a city usually gets such complete hold of it that in that city there is little rivalry between the two parties. With the rarest of exceptions, New York City is always Democratic and Philadelphia always Republican. So even with many smaller cities. Even where the cities are uncertain, certain wards in each city can always be counted on for a certain party. Sometimes, too, the same municipal ring controls the primaries of both parties. Such are some of the difficulties of reaching the primaries.

Above the primary is the convention. The convention is usually safe for the machine, because the machine has already captured the primaries that send the delegates. The machine nominates a temporary chairman, and he is elected usually by subservient delegates; if not, roughs and shouters are brought in. He names the committee on contested seats, which committee, passing on the titles of delegates, can admit the friends and refuse admission to the opponents of the machine. In all doubtful cases the machine favors itself. It then gets the chairman of the convention, and has practically all power in its hands. Such are some of the methods of American electioneering.

When it comes to the voting, the ward and county committees are instructed to see that the full party vote is polled and that all the doubtful are canvassed. Money is sent to the different committees to buy those who can be bought. Men are hired to go among the trade-unions and secure the labor vote. Papers are bought up or filled with paid editorials and paid "news." The papers of the foreign populations are subsidized. Campaign circulars are prepared suited for special classes and addrest to clergymen, to merchants, to "the American working men." "Orators" are put upon the stump and sent to every district. National orators are carried in special trains from city to city. Carefully prepared reports of extempore speeches by the rival candidates are put in the daily press. Mud, if necessary, is slyly thrown. Sometimes lies are circulated at the last minute when it is too late for the opposing party to refute them. "Claims" are made showing that all the country is going one way. Processions and monster parades are formed. Those away from home get their railway fare paid if they will go home and vote for a certain party. The railroads grant free passage to those who will vote in their interest. Taxes are paid for votes. Minor forms of corruption are resorted to. Such are some of the elements of American elections.

Campaigns

It is to be noted, however, that in a few states reform methods as to primaries and elections have been instituted and are being agitated in almost all states. See article PRIMARIES.

GREAT BRITAIN

The English election system is in many ways different. Corruption is very rare. After the general election of 1906 there were only five election petition trials. In Worcester, which has had the reputation of having the most electoral corruption, a ward committee chairman stated that out of more than 7,600 voters at the polls less than 300 were bribable.

The fact that elections do not all come at the same time attracts general attention to each separate election, and makes dishonesty more difficult, while extending the interest of all classes.

The English system of "heckling," or of having the candidate appear before his constituents with any one free to question him, is often only a farce, but some consider that it interests and educates the separate voters. The main reason, however, for purer elections is the important Corrupt Practises Act (*q. v.*), which limits the amount of campaign expenses that may be incurred, and compels the candidate to have his expenditures all go through the hands of one man, who must make a rigid report, to be scrutinized by members of the other party. This and the ease of nominations, with the irregularity and comparative infrequency of elections, presents the development of the party machine system.

Mr. Albert Shaw thus briefly describes the nominating and polling machinery after the election writs have been made out:

"The names of candidates must be left at the clerk's office, inscribed upon official blanks, a week before the election. Accompanying each name must be the signature of a 'proposer,' a 'seconder,' and eight other citizens. Only such persons as have been nominated in this way may be voted for. Nominations being all in, the list is at once printed and conspicuously bulletined. The announcement contains the full names, residences (street and number), and occupations of the nominees, and the names of the proposer and seconder in each case. If only one nomination has been made in any ward, the nomination is itself the election, and the polls will not be opened in that ward."

Nominations

France

The French electoral system is quite different from either that of the U. S. or Great Britain. Here, again, we do not have the appearance of the party machine, as in the U. S., tho the government often plays an unfortunate part through its use of secret service money in aiding candidates favorable to the administration. There is not much direct bribery, on account of the strictness of the law; but the candidate who can spend for campaign posters, meetings, or sometimes for bodies of supporters, who will keep his meetings in order and disturb or break up the meetings of his rival, has an undue advantage. One reason, perhaps, that the party machine has not developed is that the French governments have been so unstable and parties broken into so many groups that there has been small chance for strong parties to develop. A more effectual reason, however, is the use of the second ballot, in use in France and several European countries. According to the law, there is no election unless some candidate has secured at least one quarter of the registered voters, or at least a half plus one of the votes cast. If no candidate has received this another polling must be held a fortnight later, when a simple majority of the ballots cast suffice for a choice. The result of this is that on the first election day votes may be scattered among different candidates without risk, for they all tell against the common enemy, and on the second election they can all be rallied for that candidate of a party who has received the highest vote. The first ballot thus serves as a democratic way of nominating candidates, with little need of conventions, campaign committees, etc. Elections were formerly by the *scrutin de liste*, or the voting for all the deputies allotted to a department by all in the department. Now, however, some elections are universal, or the election of one candidate by each district.

Second Ballot

ELECTORAL COLLEGE, THE: The Constitution of the United States (see PRESIDENT) calls for the election of the president by electors chosen by the people of each state. This body of electors is called the Electoral College. Each state chooses a number of presidential electors equal to the number of its representatives in both houses of Congress. These electors meet in each state on a day fixt by law and give their votes in writing for president and vice-president. The votes are transmitted, sealed, to the capitol, and there opened by the president of the Senate in the presence of both houses and counted. The electors cannot be members of Congress nor holders of any federal office.

The aim of this law was to secure the election of the president in a quiet, deliberate way by trusted representatives of the people. It was feared that the masses might not elect the best men if left wholly to themselves, and that popular direct elections might lead to disturbances. It was thought, too, that as the electors' votes are counted promiscuously, and not by states, each elector's voice would have its weight. He might be in a minority in his own state, but his vote would, nevertheless, tell, because it would be added to those given by electors in other states for the same candidate.

No part of their scheme seems to have been regarded by the constitution-makers of 1787 with more complacency than this, altho no part had caused them so much perplexity. No part has so utterly belied their expectations. The presidential electors have become a mere cog-wheel in the machine. They have no discretion, but are chosen under a pledge to vote for certain men—a pledge of honor merely, but a pledge which has never (since 1796) been violated. The plan, too, has done positive harm. It has made the election virtually an election by states, for the present system of choosing electors by "general ticket" over the whole state causes the whole weight of a state to be thrown into the scale of one candidate and party. Hence in a presidential election the struggle concentrates itself in the doubtful states, where the parties are nearly equally divided, and is languid in states where a distinct majority either way may be anticipated, because, since it makes no difference whether a minority be large or small, it is not worth while to struggle hard to increase a minority which cannot be turned into a majority. Hence also a man may be, and has been, elected president by a minority of popular votes. (See PRESIDENT.)

ELECTORAL REFORMS. See AUSTRALIAN BALLOT; CORRUPT PRACTISES ACTS; DIRECT LEGISLATION; PRIMARIES; PROPORTIONAL REPRESENTATION.

ELECTRICITY: (For Electric Lighting, see LIGHTING; for Electric Railways, see RAILROADS AND STREET RAILROADS.) It is a common thought that we are passing out of the age of steam into the age of electricity, and this is affecting social problems in many ways. It is not affecting social problems in one way, however, in which it was widely claimed that it would a score of years ago. It was widely urged at that time

(see D. A. Wells's "Recent Economic Changes," 1889) that the introduction of electric power, with its ease of transmission and dispersion, would render unnecessary the concentration of production in great factories and industrial centers, would bring back the era of home manufactures and the small producer, increase the possibilities of competition, and arrest many industrial evils, and especially those of monopoly and its resultant ills. Twenty years ago this was a stock argument against socialism. To-day this argument is little heard. It is more than a question of motive power that produces the economy of the factory and the tendency to combination. The latter especially is a question of the market rather than of the means of material production. Electric plants themselves are developing monster factories, and combination is if anything more developed under electricity than under steam. Especially has the use of electric motor power, widely transmitted, aided in the connecting of towns and cities by electric car lines, and the combination of these into gigantic systems. The sale again of electric power by one company to different companies tends to bring them sooner or later into one general combination. Electricity certainly thus far has not prevented the steady disappearing of competition. It is on the other hand believed by many that the use of electricity will aid the advance of many reforms in the line of socialism.

When the telephone can enter every home and electric power be furnished every house, many domestic operations, like sewing, can be managed by electricity, and meals be ordered at cooperative ovens by telephone. It is in such ways that many believe that our "domestic problem" is to be largely worked out. When one realizes how far the weather signal service has affected and may affect agriculture and navigation, how commerce to-day is dependent upon the telegraph and telephone, how easily power can be sold from one center to widely distributed factories, it means such a development of combination (rather than competition) that communities will not long like to be dependent on private companies for the power of so many activities, but will come to own and operate the centers of power, allowing with this of great freedom of individual operation.

How far industry is being revolutionized to-day by electricity is not always realized. Yet the value of electrical apparatus manufactured in the United States in 1906 was estimated at $260,800,000. In Great Britain the growth of electrical industries is seen that in 1895 there were thirty-eight such companies and thirty-three municipalities, with electric plants, and in 1905 187 companies and 237 municipalities. Yet the use of electricity seems but in its beginnings. Electric railways (not street-railways) were scarcely used in commerce in 1904. Electric motor-cars, the electric cab service, electric elevators are commercially but little older. Electro-metallurgy and electric chemistry were only beginning in 1900. Wireless telegraphy was not commercially used before 1901. The New York Edison Co., for selling electric power, only completed its plant in New York City in 1901. The electrical transference of music, the telharmonium, dates from 1907. Yet the possibilities of electricity seem inexhaustible. It has been calculated that 7,000,000 of horsepower can be generated and electrically transmitted almost any distance by the Niagara Falls alone. Electric power in California is now transmitted 230 miles. In Africa it is seriously proposed to work the South African mines with power from the Victoria Falls. It is believed that steamers will before many years cross the Atlantic with stored electric power, instead of having to carry enormously expensive and bulky tonnage of coal. It is probable that goods will be carried in electric trains of some nature which already have run some distance at the rate of 140 miles per hour. Electric motors, many believe, will make air locomotion practicable. The use of electricity is the physical industrial question of the day.

ELECTRIC LIGHTING. See LIGHTING.

ELLIOT, EBENEZER: English poet, called the "Corn-Law Rhymer"; born at Marlborough, near Sheffield, 1781. The son of a manufacturer of the somewhat rough early type, he received little education, but read widely and early wrote verse. Entering business himself, he met with some success, but also with losses, which he laid to the Corn Laws. He developed a fierce indignation against the law that had kept him poor as an employer, and that prest so hardly on the workers whom he wished to benefit. In "The Splendid Village," "The Village Patriarch," and, above all, in "The Ranter," the reader feels the depth of his feeling for the poor and his hatred of the landlord class. In the "Corn-Law Rhymes" (1831) the whole of his bitter anger breaks out, and the famous rimes play no small part in the agitation which finally abolished the Corn Laws. He died soon after seeing their abolition in 1849.

ELLIS, HENRY HAVELOCK: English physician and author; born at Croydon, Surrey, 1859; educated in private schools and St. Thomas's Hospital, London. From 1875 to 1879 he was engaged in teaching in New South Wales; and on his return to England he qualified as a medical practitioner, but soon gave up his practise to devote himself to scientific and literary work. He is fellow of the Medico-Legal Society of New York and of the Anthropological Institute of Great Britain, and honorary fellow of the Chicago Academy of Medicine. He edited the "Contemporary Science Series" (1889) and Vizetelly's "Mermaid Series of Old Dramatists" (1887–89). Among his works are: "The Criminal" (1890); "Studies in the Psychology of Sex" (5 vols., 1897–1906); "Affirmations" (1897), etc. *Address:* Carbis Water, Lelant, Cornwall, England.

ELMIRA REFORMATORY, NEW YORK: The sociological experiments and results arrived at in Elmira Reformatory, N. Y., entitle it to an article by itself. (See PENOLOGY.)

The Elmira Reformatory was opened in 1876, when the first inmates were received. The institution, however, did not take its distinctive position until 1877, when the bill providing for the "indeterminate" sentence was incorporated in the statutes.

System

According to this bill, convicts sent to Elmira cannot be sentenced for any definite term, altho a maximum term can be given. The length of residence of the convict is left wholly to the decision of the management, and this gives the key to the whole institution. On his arrival the con-

vict is carefully examined as to his history, mental and physical characteristics, and all circumstances of his case, and is then treated as a moral patient, built up into self-supporting character as rapidly as possible, and only allowed to go out (unless the maximum term intervenes) when in the opinion of the management he is capable of self-supporting citizenship. He is, however, even then only allowed to go out for the first six months on parole, being kept in close correspondence with the management until he has proved himself worthy of absolute freedom.

Such is, in brief, the thought of the reformatory. But the way the convicts are built up into character is by teaching them how to work. In 1888 the New York Legislature passed the Yates Bill, practically prohibiting the industries then being carried on at Elmira by the convicts, and absolutely forbidding the application of power machinery to prison labor, to prevent its competition with outside labor. It forced the prisoners into immediate idleness, and the management scarcely knew what to do. But in a few hours the whole industrial life of the institution was revolutionized. All thought of making profit was given up and industrial classes were commenced simply for the good of the men. The whole mass of convicts, too, for sake of exercise, were brought out and drilled in military exercise. The result of both measures has been good beyond all expectation. The military exercise gives the convicts a carriage and bearing, both mental and physical, that makes them wholly different. To-day they form a notable regiment of men, organized, officered, and commanded by those convicts proving themselves the most worthy, and with their own band, and all appointments of a regiment.

The reformatory population is divided into three grades: first, second, and third. Each man upon admission to the institution is placed in the second grade, from which, by making a good record in demeanor, school of letters, and trades-school, he may rise to the first grade or, by failure to do this, may drop to the third. Six months of proper institutional record in the second grade insures promotion to the first grade; a like six months in the first grade entitles the prisoner to consideration by the board of managers for parole. For improper demeanor, if sufficiently serious, reduction in grade is possible at any time. Poor school work, if below certain prescribed standards, and persisted in for a month or more, also necessitates grade reduction. After reduction to the third grade, at least one month of proper record is required before eligibility for promotion can be considered.

Grades and Wages

Under the Elmira Reformatory system it is designed that each prisoner, from the date of his admission until granted his absolute release, shall be taught the value of self-support and to this end his personal account is credited with a small daily amount, intended to represent wages, and is debited with the cost of all he receives, be it for meals, lodging, clothing, medical attendance, or fines incurred; nothing being furnished gratis with the exception of his first outfit of clothing, and a few other necessary articles of like character. It is possible for a prisoner of average health and intelligence to defray all his institutional expenses, as enumerated above, and still have remaining to his credit, when released, a small balance, sufficient to pay for his transportation to place of employment, and temporary subsistence until he receives his first wages in free life.

The prisoners take their meals in dining-rooms, to which they are assigned according to grade. The food supplied to the three grades is uniform in quality, but the ration of the first grade admits of a somewhat greater variety than does that issued to the second and third grades.

First-grade prisoners who have been economical in their various expenditures, and have thus obtained a certain credit balance, showing a specified sum saved, occupy a separate dining-room and are allowed a more extended dietary than their fellows, their accounts being duly debited with the cost of the additional items received. These prisoners are also permitted to converse while at table, another privilege not accorded to inmates using the other dining-rooms.

The engagements of each inmate are intended to absorb his thoughts completely during most of his waking moments, and they are sufficiently varied, tho systematized. The program is varied for individuals. There are those who are employed at productive labor or in domestic service.

Classes

A majority of the trades-school pupils spend a portion of two days a week in the drawing-class room. Wednesday and Saturday afternoons work is suspended in the shops and trades-class rooms and the four hours are devoted to drilling and military ceremonies. There are evening-class meetings for every man as often as twice a week, and for those most nearly illiterate and those taking special courses as often as four times a week. On Sundays there are classes in ethics. There are kindergarten classes for the under-witted, classes for the others in all branches of study, from elementary subjects to the higher sciences and philosophy. The elementary classes are usually taught by advanced convicts. The main classes are, however, industrial.

At the present time twenty-nine trades, as enumerated in the following list, are taught in the trades-school: Barber, bookbinder, brass-smith, bricklayer, cabinet-maker, carpenter, clothing cutter, electrician, frescoer, hardwood finisher, horseshoer, house-painter, iron-forger, machine-wood-worker, machinist, molder, paint mixer, plasterer, plumber, printer, shoemaker, sign-painter, steam-fitter, stenographer and typewriter, stone-cutter, stone-mason, tailor, tinsmith, and upholsterer.

In many workshops containing scores or even hundreds of workers, convicts are the only teachers and convicts the only watch on guard. Much attention is given to physical training. Every convict, on coming in, is physically examined, and then the endeavor is made to develop to the norm that which is abnormal.

The principal regulations governing paroled men, which are printed on the certificates issued to each, are these:

1. The graduate shall proceed directly to the place of employment provided for him and there remain, if practicable, for at least six months from date.

2. In case he finds it desirable to change his employment or residence, he shall first get the consent of the managers through the general superintendent.

3. He shall on the first of every month, for the period of six months or more, and until absolutely released by the managers, forward to the general superintendent a report of himself certified by his employer or an agent of the managers, which report shall state whether he has been constantly under pay during the month and if not, why not, and how much

money he has expended and saved, together with a general and full statement of himself and surroundings.

4. He shall in all respects conduct himself honestly, avoid low and evil associations, and shall abstain from intoxicating drinks.

Each man is advised, prior to his departure, that he need not fear to communicate with the management in case he loses his situation or becomes unable to labor by reason of sickness. He is assured that he may at all times rely upon the aid and counsel of the managers and superintendent, and that, in case of disaster, he may find the reformatory a desirable retreat. If the terms of the conditional release are faithfully complied with for a period of six months, the board of managers, by vote at one of their monthly meetings, grant absolute release, which operates the same as a pardon by the governor.

Results

The results of the plan are the most favorable. According to the report for 1906, there had been received on the indeterminate term (1876–1906) 15,107 prisoners (besides 709 on definite term from U. S. federal courts). Of these 33 had been absolutely released, 10,216 paroled; 1,347 had had their maximum sentence expire; 48 had been pardoned; 31 had escaped; 248 had died; 1,963 had been transferred to other prisons, hospitals, etc.; 1,221 were in prison. Of the 1,016 who had been paroled the year ending Sept. 30, 1906, 348 had served well and earned absolute release, and 530 were serving well, tho their time of parole had not expired, indicating a probable reformation of 86.4 per cent.

The gross cost of maintenance for 1906 was $237,059. Income from sales, etc., was $8,209. The per diem cost of maintenance per capita was .44 cents. The *Year Book* of the reformatory, bound, printed, and, in part, written by the convicts, can be had ordinarily on application. The closing sentence of one *Year Book* says: "The time will come when every punitive institution in the civilized world will be destroyed, and all places for the treatment of crime be hospitals, schools, workshops, and reformatories." (See also Penology; Crime.)

ELY, RICHARD THEODORE: American economist, educator, and writer on social and economic questions; born in Ripley, N.Y., 1854. Until the age of eighteen he lived in the country, working on a farm of which, for a time, he had entire control. His father was a civil engineer, and for some time he was employed on his engineering corps in laying out a railroad. After completing the course of the State Normal School he entered Dartmouth College, going from there to Columbia College, where he was graduated in 1876. Afterward he continued his studies in German universities, receiving the degree of Ph.D. from Heidelberg in 1879. A year after his return to America he was called to Johns Hopkins University, where he was professor of political economy until 1892, when he resigned to take the professorship of that science at the University of Wisconsin.

Professor Ely has made a record of incessant activity as university professor and lecturer. More than any other man he was identified with the formation of the American Economic Association. In Baltimore he was for one year (1885–86) a member of the city tax commission and for two years (1886–88) a member of the State Tax Commission. He has taken an active part in the Chautauqua movement, has lectured for several years at the annual summer assemblies, and is a member of several societies, notably the Christian Social Union, of which he was the first secretary. Dr. Ely has written numerous works and contributed largely to the leading periodicals and papers; and he has become a recognized leader of American public opinion in matters of economics and applied ethics. He has devoted particular attention to the study of taxation, socialism, the labor question, and municipal government. His "Taxation in American States and Cities" and the "Labor Movement in America" represent pioneer work in their respective fields. Among other works of his may be mentioned: "French and German Socialism in Modern Times" (1883); "The Past and Present of Political Economy" (1884); "Problems of To-Day" (1888); "Social Aspects of Christianity" and "An Introduction to Political Economy" (1889); "Outlines of Economics" (1894); "Socialism and Social Reform" (1894); "The Coming City" (1902); and "Studies in the Evolution of Industrial Society" (1903). He edited the "Citizen's Library of Economics, Politics, and Sociology."

Professor Ely has been called a Socialist, and altho he has steadfastly denied this, he has continued none the less earnestly to write and speak against monopolies and in favor of the public ownership of natural monopolies, of trade-unions, and of other progressive measures, when the circumstances make them practicable.

ELY, ROBERT ERSKINE: American economist; born at Binghamton, N. Y., 1861; educated at public schools and Amherst College; studied divinity at Union Theological Seminary, graduating in 1888. From 1891 to 1901 he was president of the Prospect Union of Cambridge, Mass., and in the latter year became director of the League for Political Education, of New York City. In social reform Mr. Ely is an opportunist. He believes in the gradual extension of public ownership as experience shows it to be best for the common welfare. *Address:* Care of City Club, 55 West Forty-fourth Street, New York City.

EMERSON, RALPH WALDO: American poet, essayist, and philosopher; born in Boston, 1803; studied at Harvard University (1817–21), and became pastor of a Unitarian church in Boston in 1829. He resigned in 1832, owing to differences in thought and opinion. After that he lived a retired life, chiefly in Concord, becoming eminent as an author and lecturer. In the midst of his literary labors he found time to manifest his interest in great public questions as they arose. He was deeply interested in Brook Farm, tho he never resided there. He was earnest and outspoken in his views against slavery. At Waltham, in 1845, Emerson attacked slavery with no feeble weapon:

> It is certain that, if it should come to question, all just men, all intelligent agents, must take the part of the black against the white man. Then, I say, "Never is the planter safe; his house is a den; a just man cannot go there except to tell him so." Nature fights on the other side; and as power is always stealing from the idle to the busy hand, it seems inevitable that a revolution is preparing, at no distant day, to set these disjointed matters right.

In 1844 he had touched upon another crying evil, the seizure of colored sailors of Massachusetts when they went into the ports of Carolina:

> Gentlemen, I thought the deck of a Massachusetts ship was as much the territory of Massachusetts as the floor on which

we stand. It should be as sacred as the temple of God. If such a damnable outrage can be committed on the person of a citizen with impunity, let the governor break the broad seal of the state; he bears the sword in vain. The great-hearted Puritans have left no posterity. The rich men may walk in State Street, but they walk without honor; and the farmers may brag their democracy in the country, but they are disgraced men.

As early as 1838 he addrest a letter to President Van Buren protesting against the wrongs then endured by the Cherokee Indians at the hands of the government. His antislavery speeches, his remarks on the attack made upon Charles Sumner in 1856, his speech in behalf of the Kansas farmers in the same year, his eulogies of John Brown in 1859, his speech of welcome to Kossuth at Concord Bridge in 1852, his speech at the centennial celebration of Concord Fight in 1875, and many other brief addresses, are the fearless utterances of the reformer. He was an active citizen in practical ways, and was punctual in his attendance at the town meetings, where he often took part in debates; yet he sympathized to some extent in the no-government theories of his friends Alcott and Thoreau, influenced by his partly socialistic, partly individualistic philosophy. He died at Concord in 1882.

EMINENT DOMAIN: The right of eminent domain is the right to take private property for public uses. It is a common phrase in America, tho until recently little used in England, and seems to be derived from a phrase of Grotius ("De Jure Belli ac Pacis," l. 1, chap. iii. vi. sec. 2). The Fifth Amendment to the United States Constitution provides that it must always be used with just compensation to the owners of the property taken.

EMPLOYERS. See PROFITS.

EMPLOYERS' ASSOCIATIONS (see also CITIZENS' INDUSTRIAL ASSOCIATION): Employers' associations, of one kind or another, have existed from the days of the medieval gilds (see GILDS) or even earlier, but for the most part, except for the gilds, have been short-lived, and often only temporary agreements, or combinations formed to accomplish certain common ends, or the defeat of striking unions, etc. More recently, however, in the United States, in England, and Germany, these agreements are developing into permanent organizations. For Germany (where they are called Cartels), see article TRUSTS. In Great Britain there were reported in 1903 thirty-eight national associations and federations and 727 local associations, formed largely to affect legislation. In the U. S. the Citizens' Industrial Association (*q.v.*), a federation of such associations formed in 1903, claims from 400 to 500 local associations affiliated with it in forty-three states of the union and there must be some not affiliated with it. The first president of the association, Mr. Parry, is quoted by Professor Adams ("Labor Problems," 1905) as characterizing trade-unionism as a "system that coerces and impoverishes the worker, ruins the capitalist, demoralizes our politicians, and destroys our trade—a system which seems hopelessly and irremediably bad, a bar to all true progress, a danger to the state, and a menace to civilization." The National Association of Manufacturers, with 500 local associations, is a distinct but somewhat similar organization. Professor Adams makes the following quotations from its circulars, indicating plainly enough its animus and methods:

"The National Trade Association of Manufacturers is the largest and strongest trade organization in the world—whether one considers capital invested, hands employed, or output. . . . The association concerns itself with national and state legislation, publicly and powerfully if required, secretly and just as powerfully if that seems best. It knows what its own members and all manufacturers desire; it knows what they want antagonized. It pushes wise legislation it defeats unwise legislation." In another publication, says Professor Adams, the association announced its deep hostility to the Hoar Anti-Injunction Bill, and to the bill limiting the working-day upon all materials manufactured for the government to eight hours, and then continued: "The determination is that, unless the business interests have lost their intelligence and their fighting spirit, these unwise or dangerous tendencies shall be combated; and all of the persistence and ingenuity at the command of the greatest trade body in the world, and of all its members, are brought to bear in exactly the right way at exactly the right time, and in exactly the right place. . . . At Washington the association is not represented too much either directly or indirectly. Sometimes it is known in a most powerful way that it is represented vigorously and unitedly. Sometimes it is not known that it is represented at all. It is easy to see that in the advocacy of public measures certain methods are most effective and most proper to be pursued. It is also true that this continuous effort is sometimes most successful when it is not known exactly whence the pressure comes."

Professor Adams also quotes the following from the declaration of principles of the National Metal Trades Association:

After "disavowing any intention to interfere with the proper functions of labor organizations," and announcing their intention not to discriminate "against any man because of his membership in any society or organization," the employers further declare:

(4) The number of apprentices, helpers, and handy men to be employed will be determined solely by the employer. (5) Employers shall be free to employ their work people at wages mutually satisfactory. We will not permit employees to place any restriction on the management, methods, or production of our shops, and will require a fair day's work for a fair day's pay. Employees will be paid by the hourly rate, by premium system, piece work, or contract, as the employers may elect. (6) It is the privilege of the employee to leave our employ whenever he sees fit and it is the privilege of the employer to discharge any workman when he sees fit. (7) The above principles being absolutely essential to the successful conduct of our business, they are not subject to arbitration. In case of disagreement concerning matters not covered by the foregoing declaration, we advise our members to meet their employees, either individually or collectively, and endeavor to adjust the difficulty on a fair and equitable basis.

By no means, however, do all employers feel this way. Nor do all employers act on these lines. The Mason Builders' Association of Boston has long been favorable to trade-unions, and very many associations of employers are coming to find that to treat with organized labor, in collective bargaining, is the easiest, best, and safest way. In fact one of the distinct dangers of the future is said by many to lie in the danger of combinations between organizations of capital with organizations of labor, to raise prices, limit output, etc., contrary to the interests of the public. (See TRADE-UNIONS.)

Almost all economists and thoughtful trade-unionists welcome the formation of employers' associations, because tho in the formative and transitive period they may lead to heated and prolonged conflicts with labor-unions, especially when the employers' associations are newly formed like newly formed trade-unions, in the long run it must work for organized peace. Indeed, trade agreements and collective bargaining, which almost all economists are agreed to be the main hope of industrial peace, are almost impossible without employers' associations on the one hand which can enter into agreements with the trade-unions on the other. There have been strikes of employees to try to force their employers into an

employers' association and so carry out certain contracts.

Such associations, tho sometimes, like foolish trade-unions, doing temporary harm, are undoubtedly on the line of progress, to that organized peace which is slowly replacing unregulated competition.

EMPLOYER'S LIABILITY: Among the many problems which the modern industrial system offers for solution is that of securing to the workingman a just compensation for the accidental injuries incident to his employment. The common laws of England and the United States offer only such protection as is afforded by the rules of what is briefly known as the "employer's liability." It is axiomatic that each man is accountable for his own acts, voluntarily performed; but it is a further well-established principle that an employer is responsible for the acts done by his employee within the scope of his employment. This rule inures, not only to the benefit of outside parties, but also, within certain limits, to that of employees; so that where an injury to an employee is chargeable to the negligence of the employer or of his personal representative, an action may be brought for the recovery of damages. In reading the following summary of the employer's duty, it must constantly be borne in mind that each statement is subject to qualifications and refinements, differing locally, and that the employer may be found to be not liable for his apparent negligence because of the defenses of assumption of risk, contributory negligence, or fellow-service.

Common Law

The briefest statement of the rule of the employer's duty is that he is required to use due care for the safety of his employees while they are engaged in the performance of their work. This is taken to include the use of all reasonable means and precautions, the facts in each particular case being taken into consideration. If such provisions have been made as a reasonably prudent man would supply if he were himself to be exposed to the dangers of the employee's position, the charge of negligence will not be sustained. In the case of corporations, the supreme court has said that that degree of caution and foresight is required which a corporation controlled by careful and prudent officers would be expected to exercise.

The required degree of care is not capable of absolute determination, but is proportioned to the dangers which the employee must face. The ordinary incidents of railroading, mining, and of certain classes of manufacturing are, in themselves, in comparison with many other employments, unusually dangerous. In such cases the measure for ordinary care is advanced beyond the requirements resting on the employer under less dangerous conditions. Excepted from this rule is the position of the employee who is engaged expressly for the purpose of making repairs or of remedying known conditions of danger. Place, materials, tools, and appliances are all subjected to the same test of reasonable safety and an adequate adaptation for the work in view. The employer cannot be made an insurer, nor is he bound to experiment with every invention that promises a greater degree of safety. He will not be allowed to disregard them entirely, however, and particularly where a device is shown to be of marked value. The law of general usage largely controls, and this may at one time compel the adoption of what, at an earlier day, would not have been considered an essential. The duty of keeping places and appliances in repair devolves on the employer, but under limitations that are not at all agreed upon by the courts. In general, the care of simple tools and the avoidance of obvious dangers may be left to the employee at his peril, while conditions demanding closer examination or greater skill for their discovery and remedy are chargeable to the employer.

Ordinary Care

Springing out of the duty of maintenance and repair is that of inspection. The measure of this duty varies with the nature of the circumstances, as of simple or complex machinery, stable or rapidly deteriorating instrumentalities, etc. Nothing more is to be required in any case than a reasonably careful inspection, both as to thoroughness and frequency. Passing from the inanimate and irresponsible instrumentalities, we find the rule that the employer must be reasonably and properly careful and diligent to secure employees of such qualifications and in such numbers as will enable his business to be carried on without unnecessary risk to those engaged in it. This involves proper care in the original hiring, due diligence in subsequent inquiry, and the maintenance of a suitable system of conducting business and in the organization of the working force. Related to these duties is that of making and enforcing proper rules and the giving of suitable instructions, where the business is such as to warrant them.

Duties of Organization

The duties above enumerated are generally considered as being matters of personal obligation, of which the employer can relieve himself only by their performance; or in other words, they are non-delegable, and must be performed, if not by the employer, then by his personal representative, for whose acts he is responsible. It is for negligence of one or another of these duties, resulting in injury to an employee, that actions for damages may be brought under the common law liability of the employer. As already mentioned, certain defenses are open to the employer, which will now be noticed in the order named above.

According to the doctrine of assumption of risks, a workman of mature years and ordinary intelligence, offering himself for employment, is presumed to know and appreciate the conditions and to assume the risks ordinarily incident to the undertaking; or, as is often said, the law imports into his contract of employment an agreement to assume the ordinary risks of the service, and such other risks as may be known to and appreciated by him; and if the accident occasioning an injury is traceable to causes embraced within this description, the employer will not be held liable therefor. Risks which may be obviated by the exercise of reasonable care on the part of the employer are to be classed as extraordinary, and these the employee is held not to have assumed unless he knows and comprehends the dangers arising from the employer's negligence. If the dangers are open or are duly brought to his knowledge, an employee entering upon or remaining in service is presumed to have

Assumption of Risks

waived his claim against his employer for resulting damages. If a complaint is made, however, and is answered by a promise to repair, the employee will be relieved of the risk for a reasonable time, after which it will again devolve upon him if he continues to work without the repair actually having been made.

When a risk involves such a degree of danger that a man of ordinary prudence would not assume it, the employer's defense would be, not that the employee assumed the risk, but that he was negligent in engaging in work under such circumstances, and that by such contributory negligence he is debarred from any recovery of damages. The doctrine of comparative negligence, according to which the court weighs the negligent acts of the two parties and attempts to apportion the fault, has been followed in some jurisdictions; but it is commonly said that in cases of mutual fault the courts will neither cast all the consequences on the employer, nor attempt any apportionment thereof. Statutes have been enacted in some jurisdictions, however, and notably by the Congress of the U. S., requiring the courts to take notice of the comparative negligence of the employer and the injured employee, and to render judgment accordingly.

The remaining defense of the employer is what is known as the fellow-servant rule, or the doctrine of common employment. This rule has been stated thus: "A master is not bound to indemnify one servant for injuries caused by the negligence of another servant in the same common employment as himself, unless the negligent servant was the master's representative." This doctrine was enunciated in England in 1837, and independently the next year in this country; and as a result of the growth of the number of employees in large undertakings and the consequent lack of immediate supervision by the employer, its application has come to be of the utmost importance. What constitutes common service is impossible to determine by fixt rule; and various tests, as of departments of work and of contemplated risks, questions of rank, and whether the same person may not be as to certain acts a vice-principal and as to others a co-servant, have been propounded and discust more or less favorably in various jurisdictions. The courts of different states contradict each other in their rulings on these points, while within the same state, and even in the Supreme Court of the U. S., opinions have shifted from time to time so as to effect practical reversals of former positions. It was said in an opinion from that court a few years ago that "there is perhaps no one matter upon which there are more conflicting and irreconcilable decisions in the various courts of the land than the one as to what is the test of common service so as to relieve the master from liability for the injury of one servant through the negligence of another." And it may also be said that the stream of litigation on this point shows no signs of diminution.

Fellow-Servant Rule

Reasons for the doctrine are hardly better fixt than are the rulings under it, and it seems quite within bounds to say that none of them justifies the exclusion of employees from the benefit of the rule of *respondeat superior*, that makes the principal responsible for the acts of his agent. As to the defense of the assumption of risks the inquiry may equally be raised as to why the laborer should be compelled to bear the burden of pure accidents or of the results of the so-called "acts of God"—the *vis major* of the Roman law—which befall in the prosecution of undertakings the benefits of which are to be reaped by the employer; while as to the plea of contributory negligence, it would seem to suffice as a reason why such a plea should not be accepted as a complete defense when we observe that it is in itself a confession of negligence on the part of the employer, to the consequences of which the employee is only a contributor.

Each of these defenses has been the subject of legislation looking toward definition and restriction. Thus, in Colorado the doctrine of common employment as a defense is practically abolished, while several states eliminate or restrict it in connection with railway labor. State mining regulations and laws requiring safety appliances on railways and in factories frequently contain provisions excluding the defense of assumed risks and contributory negligence where the injury results from the employer's failure to conform to the requirements of the statute. The results of such legislation are, however, only the securing of a partial relief, at best. The real difficulty is to be found in the principle of the law, and is well exprest in the following statement contained in the preamble of a German accident-insurance bill of 1881. Speaking of the employer's liability law then in force, it was said: "To burden the person injured with the requirement of furnishing proof of negligence on the part of the employer or his agents transforms the beneficence of the law for the workingman into an illusion in the majority of cases. The procurement of such evidence, sufficiently difficult in any event, is not seldom rendered impossible as respects some of the most severe injuries brought about by natural forces, such as happen in mines, establishments with steam boilers, and factories for the manufacture of explosives. Herein the condition of the work place, the implements and appliances, upon which the whole case of the workman really turns, are so altered by the accident itself as to be unrecognizable; while those persons through whose testimony alone negligence in many cases can be proven have been killed or injured in the accident."

Legislation and its Difficulties

In continental Europe, as in England and America, the idea of the employer's liability was at first embodied in the general law of negligence, and employees were under no special rule. The Code Napoleon presented a development closely resembling that of our own common law, except for its omission of the doctrine of common employment, and its recognition of a doctrine of comparative liability. It is said that the law was in general interpreted more favorably to the workingman by the continental courts than was the case in England. The German common law restricted the employer's liability to cases of defective machinery or appliances, and those of the employment of incompetent superintendents. In 1871 the empire adopted a statute on the subject, with the intention of extending the employee's rights and of simplifying procedure in the recovery of damages. That the law was not satisfactory is indicated in the quotation given in the foregoing, as well as by the fact that Germany was the first country to adopt the principle of insurance as opposed to the older one of individual liability.

Europe

In all countries it was necessary to prove the default of the employer or his agent before an injured employee could recover damages for injuries. In other words, the trade risk or *risque professionnel* rested on the employee. Legislation to fix more exactly the relative rights and liabilities of the two parties was enacted by various countries in the early part of the last century, and such laws are still generally in force; tho there is in every European country of industrial importance, unless Switzerland be excepted, some provision for the insurance of working men against accident, or for workmen's compensation, which has for most purposes superseded the earlier type of law. It can hardly be denied that the adoption of one or other of these plans, or of some other provision by which the burden of the industrial risk would be shifted from the shoulders of the worker and made a proper charge against the industry, and the right of his recovery of damages made more secure, would mark a great advance over present conditions in the United States.

Labatt, 1904; *The Legal Relations Between the Employed and their Employers in Pennsylvania, Compared with the Relations Existing between Them in Other States*, by Albert S. Bolles, 1901; *Four Lectures on the Law of Employers' Liability at Home and Abroad*, by Augustine Birrell, 1897; *Employer and Employee under the Common Law*, by the U. S. Bureau of Labor, 1901; *Industrial Accidents and Employers' Responsibility for their Compensation*, in the *Seventeenth Annual Report of the Bureau of Labor Statistics of the State of New York*, 1899. All enactments by the state and federal legislatures of the U. S. relative to *employers' liability*, and a selected list of *current decisions on the subject*, are published in the *Tenth Special Report* (1904), and the bimonthly *Bulletins of the U. S. Bureau of Labor*.

The following summary or digest, prepared and published by the U. S. Bureau of Labor, is based on its compilation of the labor laws in 1903, revised to include the legislation of 1904:

The legislation enacted in the various states with regard to the liability of employers for injuries sustained by employees may be grouped as follows: (1) Statutes declaratory of the common-law doctrine with regard to the liability of employers, their duty toward employees, etc.; (2) statutes modifying the fellow-servants doctrine by adopting the theory (*a*) that all superior employees are vice-principals as regards their subordinates, and (*b*) that co-service is not a bar to an action for injuries caused by the negligence of an employee in a different department; (3) statutes by which employers have been, either entirely or in regard to certain classes of injuries, deprived of the protection afforded by the defense of common employment; (4) statutes holding employers liable in damages for injuries caused by reason of employers' failure to comply with specific provisions of law concerning conditions of ways, machinery, appliances, and plants, hours of labor, or other statutory regulations for the protection and safety of employees; (5) statutes concerning the right to recover damages for injuries resulting in death; (6) statutes concerning accident insurance, relief associations, etc.

Common-Law Liability

The States of California, Montana, North Dakota, and South Dakota have enacted statutes stating the common-law doctrine by declaring employers liable for injuries sustained by employees in consequence of the discharge of duty, or in obedience to the employers' directions, or on account of the want of ordinary care on the part of the employers, exceptions being made in the case of losses suffered in consequence of the ordinary risks of business or of the negligence of fellow servants. Statutes passed in Connecticut and in Minnesota define the term "vice-principal," and require employers to provide their employees with a safe place to work and to furnish reasonably safe tools, machinery, etc. A Georgia statute provides that "except in the case of railroad companies, the master is not liable to one servant for injuries arising from the negligence or misconduct of other servants about the same business." Statutes providing that persons who are in a position to give orders or directions, or who have supervision over work, are vice-principals, have been enacted in Arkansas, Connecticut, Indiana, Massachusetts, Minnesota, Mississippi, Missouri, Montana, New York, Ohio, Oregon, Porto Rico, South Carolina, Texas, Utah, and Virginia. Statutes providing that co-service is not a bar to an action for injuries caused by the negligence of an employee in a different department have been enacted in Arkansas, Indiana, Massachusetts, Mississippi, Missouri, Montana, Ohio, Oregon, Porto Rico, South Carolina, Texas, Utah, and Virginia. These statutes in most states apply only to the railroad service.

Modifications

Statutes by which employers have been either entirely or in regard to certain classes of injuries deprived of the protection afforded by the defense of common employment have been enacted in thirteen states and territories. In Colorado the statute applies to all industries, and thus practically abolishes the fellow-servant doctrine. In Arizona, where the statute applies to all corporations, there is a proviso that the corporation must have had previous notice of the incompetence, carelessness, or negligence of the fellow servant in order to become liable. In Maryland the statute applies to steam and street railroads, mines, quarries, excavations, etc. In Florida, Georgia, Iowa, Kansas, Minnesota, Missouri, New Mexico, North Carolina, North Dakota, and Wisconsin these statutes abrogate the fellow-servant doctrine in the railway service only.

Twenty-eight states and territories have statutes and one state has a constitutional provision holding employers liable in damages for injuries sustained by employees by reason of the failure of employers to comply with specific provisions of law concerning condition of ways, machinery, appliances, plants, etc., hours of labor, or other statutory regulations designed for the protection and safety of employees. In Indiana, Kansas, Massachusetts, Mississippi, New Mexico, New York, Ohio, and Porto Rico these statutes apply to industries generally; in Arkansas and North Carolina, to railroads and mines; in Iowa, Minnesota, Nebraska, Vermont, Virginia, and Wisconsin, to railroads only; in California, Colorado, Illinois, Maryland, Michigan, Missouri, Pennsylvania, and Utah, the statutes, and in Wyoming, a constitutional provision apply to mines only; in Washington the statutes apply to sawmills; in the District of Columbia, New Jersey, Pennsylvania, and Rhode Island employers are liable for damages to their employees for injuries due to failure to provide fire-escapes on factories, workshops, or other places of work; in Rhode Island, for failure to provide proper protection on elevator shafts, and in Illinois for failure to provide guards on the thrashing machines, corn-shellers, or other machines run by horse-power. A federal statute provides that any employee of a railroad company engaged in interstate commerce who may be injured by any locomotive, car, or train by reason of the company's failure to comply with the provisions of the law requiring the placing of safety couplers and power brakes on engines and cars, "shall not be deemed thereby to have assumed the risk thereby occasioned, altho continuing in the employment of such carrier after the unlawful use of such locomotive, car, or train had been brought to his knowledge."

Nearly all the states and territories have enacted laws changing either wholly or in part the common-law rule that no action for damages caused by the killing of a human being can be maintained, namely: Alabama, Arizona, California, Colorado, Delaware, District of Columbia, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oregon, Porto Rico, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Virginia, Washington, West Virginia, Wisconsin, Wyoming. These statutes usually give the widows, dependents, executors, etc., the same right to recover damages as if death had not resulted from the accident. In a number of these states the statutes fix the maximum amount that may be recovered in such cases. In Utah the constitution provides that the right of action to recover damages for injuries resulting in death shall never be abrogated, and the amount recoverable shall not be subject to any statutory limitation.[1]

The following states have included in their statutes regulating the liability of the employer, provisions to the effect that no contract restricting the liability imposed by the statutes or waiving the benefit of the same shall be legal and binding: Arkansas, Colorado, Florida, Georgia, Indiana, Iowa, Maryland, Massachusetts, Minnesota, Mississippi, Missouri, Montana, New Mexico, North Carolina, North Dakota, Ohio, Oregon, South Carolina, Texas, Virginia, Wisconsin.[2] In Wyoming this is provided for in the constitution.

Relief and Insurance Institutions

The States of Indiana, Iowa, Maryland, Massachusetts, Michigan, Montana, New York, Ohio, Pennsylvania, and South Carolina, and also Porto Rico, have statutory provisions concerning relief or insurance funds or associations for the compensation of injured workmen. These laws differ greatly in their scope and purpose. An Ohio statute prohibits railroad corporations from compelling employees to join relief organizations or entering into contracts with the employees whereby the latter waive or surrender their right to damages. In Michigan it is unlawful for a company or corporation to require employees to take out life or accident

[1] An identical provision exists in the Constitution of New York (Art. I., sec. 18).—ED.

[2] In New York such waivers or releases are void at common law (Johnson *vs.* Fargo, 98 App. Div. 436).—ED.

policies in any particular insurance organization, and all contracts requiring or stipulating that employees should procure such policies are void. Employees may, however, contribute toward voluntary mutual benefit funds and have the amount of the contributions deducted from their wages. In Iowa, Montana, and South Carolina statutes provide that contracts of insurance, relief, benefit, or indemnity in case of injury or death between employees and employers in the railway service, or the acceptance of such relief, etc., do not constitute a bar or defense to a cause of action for injury. The Indiana statute provides, however, that a settlement may be made after the injury. In Indiana the law declaring contracts releasing employers from liability void does not apply to voluntary relief departments or associations organized for the purpose of insuring employees. The South Carolina law authorizes manufacturing companies to become members of mutual companies or associations for insurance against accidents to their employees. Railroad companies having relief departments for which members are required or permitted to pay dues are required to pay persons entitled to the benefits the amounts agreed upon, the law providing that the acceptance of such relief does not estop an employee or his representatives from recovering damages for injury or death caused by the negligence of the employer. In Massachusetts, New York, and Porto Rico the statutes provide that employers who contribute toward insurance funds or relief societies or have insured employees in insurance companies may prove in mitigation of the damages recoverable by an employee, such proportion of the pecuniary benefit received by the employee from such fund or society as the contribution of the employer bears to the whole contribution to the same. A Massachusetts statute expressly authorizes the organization of railway relief associations and permits steam and street railway companies to associate themselves with such organizations. Such associations must report their membership, financial operations, etc., to the board of railroad commissioners, who have authority to inspect their books and papers. The by-laws of such associations must be approved by the railroad commissioners before they can conduct their operations.

The Maryland statute[1] differs from all other laws passed in this country in that it provides for a form of cooperative insurance under the immediate control of the state. It provides that any corporation, partnership, or individual engaged in operating any coal or clay mine, quarry, steam, or street railroad in Maryland, and any incorporated town, city, or county engaged in constructing a sewer, excavation, or other physical structure, or the contractor for such town, city, or county, shall be liable for damages flowing from an injury to or the accidental death of an employee or servant. If the injury was caused by the joint neglect of the employer or his servant on the one hand, and the injured or deceased person on the other, then the employer is liable for one half the damages sustained by the injury or death.

The employers above mentioned may, however, be relieved of this liability if they pay the following annual sums for each employee into the hands of the state insurance commissioner: Operators of coal- or clay-mining or quarrying, $1.80; operators of steam railways, $3; operators of street or trolley railways, sixty cents; cities, towns, counties, or contractors, such sum as the insurance commissioner may deem necessary. The employers, etc., may deduct a sum not exceeding one half the amount payable to the insurance commissioner from the wages of employees. The insurance commissioner may extend the benefits of this insurance scheme to other occupations than those indicated. The only indemnity provided for under this scheme is the payment, in case of death by accident as above mentioned, of $1,000 to the administrator or executor of the deceased or to the widow, husband, or children. The insurance commissioner has the custody of the funds and is required to invest them in safe securities.

Any party subject to the provisions of this act who is making better provision, either by way of payment in case of death, injury, sickness, or old age, or all combined, than he would be obliged to do under this scheme may be absolutely released by the commissioner from the liability imposed by virtue of this act, but the legal effect of the act may be revived whenever the party fails to continue the scheme or system on account of which the order of release was granted.

EMPLOYMENT BUREAUS. See PUBLIC EMPLOYMENT BUREAUS.

ENFANTIN, PROSPER: French communist; born in Paris, 1796. Coming under the influence of St. Simon, he acted with Bazard as leader of the movement after St. Simon's death in 1825. The two leaders attracted a considerable following. In 1831 the school attempted communism on some property of Enfantin's at Menilmontant. But commencing as a devotee of mysticism, Enfantin finally adopted the doctrine of "free love"; this brought him into trouble with most of his fellow religionists. Bazard differed from Enfantin, who became, after Bazard retired, the sole chief of the St. Simonians, called "the supreme father" in their somewhat fantastic religious forms. But their practises produced troubles. Enfantin was condemned on Aug. 28, 1832, in company with Charles Duveyrier and Michel Chevalier, to a year's imprisonment and a fine of 100 francs for having assisted, without previously obtaining permission, in the formation of an association consisting of more than twenty members, and in the promulgation of articles injurious to public morality. The penalty was before long commuted, and Enfantin made his way to Egypt, where he studied the question of piercing the Isthmus of Suez. Subsequently he returned to Paris, and was appointed, in 1845, a director of the first company for constructing a railway from Paris to Lyons.

After the Revolution of 1848 Enfantin founded, in conjunction with Charles Duveyrier, the journal *Le Crédit*, which continued to appear till 1850. Finally he became the administrator of the second Paris, Lyons and Mediterranean Railway Company, a post which he continued to hold till his death, at Paris, in 1864. Before the fall of the St. Simonian school, Enfantin published, in conjunction with others, "Doctrine de St. Simon, Exposition," 2 vols., 1830–32; afterward, in his own name, "Economie politique et Politique," "Morale," etc.

ENGEL, ERNST: German statistician; born in Dresden in 1821. After completing his studies and traveling extensively, he became, in 1850, manager of the recently founded Royal Saxon Statistical Bureau. In 1858, on account of attacks from the Saxon Chamber, which his official activity had called out, he resigned this position and founded a mortgage insurance company at Dresden, but in 1860 was appointed director of the Prussian Statistical Bureau at Berlin, where he remained twenty-two years, earning the position of one of the leading statisticians of Europe, and issuing many private as well as official works. In 1882 he retired to private life, residing near Dresden until his death in 1896. From 1860 until 1882 he was editor-in-chief of the "Jahrbuch für amtliche Statistik des Preussischen Staates," and from 1875 of the "Statistische Korrespondenz." He was the author of many works, mostly statistical, and some of great human interest. Among these may be mentioned "Der Preis der Arbeit" (1872) and "Der Wert des Menschen" (1883).

ENGELS, FRIEDRICH: German socialist; born at Barmen, Rhenish Prussia, 1820. A clerk from 1837–41, he discharged his military duties and then entered his father's cotton business at Manchester, England. Visiting Paris in 1844, he met Karl Marx and became his lifelong friend. In 1847 he went with Marx to Brussels. Banished from Paris and Brussels, Marx and Engels published the famous communist manifesto. (See SOCIALISM.) From 1848 to May, 1849, he was with Marx on the *Neue Rheinische Zeitung*, published at Cologne. He took part in the South-German uprising of 1849. On the suppression of the revolution he returned to England and re-

[1] Held unconstitutional by the Baltimore Court of Common Pleas, April 27, 1904.

entered his father's business, remaining in it till 1869; after this he resided in London. He wrote numerous German works, but is best known as the editor of the second and third volumes of Karl Marx's works, published after Marx's death. Engels spoke ten languages, and wrote in English the "Condition of the Working Classes in England in 1848." Among his German works are "Die Entwickelung des Sozialismus von der Utopie zur Wissenschaft" and "Der Ursprung der Familie, des Privateigenthums, und des Staats." He died in London, 1895.

ENGINEERS, AMALGAMATED (marine and general): One of the largest and strongest of English trade-unions, organized in 1851, as an amalgamation of several societies, and mainly through the efforts of William Newton and William Allan. Allan was elected the first secretary, and annually reelected till he died in office in 1874, making his union a model of the trade-unions of his day. In 1892 it elected seventeen salaried officers. It has become one of the more conservative of the English unions. In 1904 it had 660 local branches with 89,403 members in the United Kingdom and 6,703 in other countries. Their funds at end of 1904 were £605,981, and their income during the year £371,730. Of this £120,580 was spent in unemployed and emigration benefits, £111,368 in superannuation benefits, £53,884 in sick and accident benefits, £41,735 in working expenses, £11,496 in strike benefits, £10,423 in grants to other societies.

ENTAIL: The legal meaning of "entail" is "the act or custom of limiting inheritance of land to a particular class of heirs," or "an estate settled with regard to the rule of its descent" (Wharton's "Law Lexicon"). The origin of entail is to be looked for in feudalism under which system each man's rights, duties, and social consideration depended on his relation to the land, and therefore it seemed well to try and fix the tenure of land and permit its disposition. Entails were thus a political and social institution, and were found in all countries where feudalism existed. In most countries, however, they have disappeared in the course of the political changes of the latter part of the eighteenth century. In England they have survived, tho greatly changed by many and complicated laws.

ENTREPRENEUR: This is a French word, to-day frequently used in English to designate the person who organizes and directs the productive factors. The English words formerly used for this, *undertaker* and *adventurer*, are now used in other senses. The true meaning of this word in French is contractor.

EPILEPTICS. See HOSPITALS.

ESSENES: A Jewish sect of mystic ascetics, who combined Jewish, Greek, and Oriental doctrines with communistic and ritualistic modes of life. They are not spoken of in the Bible, probably because they dwelt in retired communities. They represent the mystic and ascetic forms of Judaism, as opposed to the orthodox Pharisees and rationalistic Sadducees. Neither their name nor origin has been satisfactorily explained. They left no writings themselves, and Philo and Josephus are our only authorities as to their habits and beliefs. They appear to have separated themselves from the commercial and political life of the cities and towns, and to have dwelt in small and isolated villages. Most of them were not far from the Dead Sea. Their most distinctive characteristic was *ascetic communism*. They literally had all things in common. Philo says:

> There is no one who has a house so absolutely his own private property that it does not in some sense also belong to every one; for besides that they all dwell together in companies, the house is open to all those of the same notions who come to them from other quarters. There is one storehouse among them all; their expenses are all in common, as are their garments and food. They do not retain their wages as their own, but bring it into the common stock. They take care of their sick and honor their elders.

Every Essene rose before sunrise, and with his face turned toward the east, repeated his morning prayer. As soon as the light permitted they commenced their daily labors, farming, bee-keeping, cattle-raising, and such-like humble occupations. Each little colony had in its midst a room or hall where the members met at regular hours daily. They kept apart from commerce, war, and trade. Their dress was as plain and simple as possible—a light, sleeveless garment in summer, and in winter a warm hairy mantle. They cared only for decency and a moderate degree of comfort; luxury and show were unknown among them. Both during winter and summer they wore leathern aprons. At 11 A.M. they ceased work, bathed, drest themselves in spotless white linen, and assembled for their simple meal. A blessing was asked before the meal, and thanks returned after by a priest. They were both vegetarians and total abstainers. At the close of the meal they sung a hymn, and then worked again until sunset. The seventh day was one of perfect rest. On it they read and expounded the Law and their own peculiar writings. As their asceticism prohibited them from partaking of the feasts held at Jerusalem, and their mode of worship interfered with their entering the Temple, they broke the Law in one important point—they did not attend the regular feasts at Jerusalem. They forwarded their gifts instead. The majority of them were celibates, and they kept up their numbers by adopting children, whom they taught with great care and patience. If a man wished to join them, he was obliged to submit to a three years' novitiate, being rigidly excluded from their gatherings. At the end of each year he was advanced by ceremonies and privileges, and after three years became a full member. The only time oaths or vows were allowed was during the initiation into full membership. The candidate was bound by tremendous oaths to be worthy of the order and obedient to its rules. The Essenes were never very numerous. Philo gives their number as 4,000. After the destruction of Jerusalem they disappear from history.

They believed in the immortality of the soul, in a fixt Providence, in the future rewards of the righteous, and punishment of the wicked. They did not believe in the resurrection of the body. They were said to practise magic, and were believed by all Jews to have prophets among their members. It is probable that they derived from the Zoroastrian religion their celibacy, sun homage, abstinence from sacrifice, magical rites, and intense striving after purity. They were everywhere known for their kindness to the sick and poor. Their knowledge of roots and herbs enabled them to perform many acts of healing that to spectators seemed miraculous. They were greatly averse to slavery, and always opposed it.

With few exceptions they abstained from all public affairs, being invariably modest and retiring. Philo gives the three chief rules of their conduct as follows: "The love of God, the love of virtue, and the love of man." It has been the theory of some rationalists that Jesus spent some time among the Essenes, and sought to widen and propagate their theology and communism. (See De Quincey's "Essays on the Essenes.")

ESTATES: Term used in political history for classes or orders in society. Since the earliest civilizations the tendency to make distinctions in the relative position of one set of people toward others has appeared. Plato, in his "Republic," divides men into three classes: philosophers or magistrates, warriors or gymnasts, and laborers or artizans. The first are the wise thinkers, who are fit to rule; the second the fighters—men of force and action; the third are the bulk of the common people, whose first care is the supplying of every-day necessities; and as the one or other element predominated in the nature of the individual, so he became either philosopher, warrior, or artizan. What was first, however, the natural selection of ability soon becomes a matter of inheritance; and after a time the distinction was looked upon as a direct act of Deity. The castes of India, tho part and parcel of the Brahman religion, are unmistakably of such origin. According to Brahman theology, Brahma created three different men: one, the *Brahman*, emanated from his head, and was endowed with all knowledge of science and art; he has all wisdom and is king and head of all the earth. The second, the *Kohatriya*, came from Brahma's arms, and it was his right and duty, under the control of the Brahman, to make war and peace, to make laws and execute them, and to maintain social order and the division of the castes. The *Vaisyas* sprang from Brahma's feet, and were the tillers of the soil, the artizans, upon whom devolved the supplying of all the physical needs of humanity.

The development of the modern "estates of the realm" was brought about originally by the same natural selection of the fittest leaders of thought and the strongest protectors. In France, before the Revolution of 1789, the three estates were king, nobles, and clergy; while the three estates in England were king, lords, and commons. The substitution of commons for clergy in England was the direct result of the Reformation, and of the more independent thought of the English people. The conditions which M. Taine speaks of as being the reason of the power of the clergy undoubtedly still held good to some extent in England till Henry VIII. confiscated all their property. The English clergy, like their brethren in other new civilizations, were not only the most learned men, but also by their tact became powerful in the affairs of the nation. When, however, the Reformation swept away their monopoly of power over men's consciences, and when they lost their enormous estates, a new element began to arise. From early times the system of gilds had developed a certain amount of local self-government among the commoners, who had thereby gained confidence in their own judgment; and now a wish to act for themselves in matters concerning the whole nation grew up, which finally led to the execution of Charles I. and founding the Commonwealth. From that time the clergy ceased to have an independent standing of their own; and tho to-day the bishops have seats in the House of Lords by right of their office, they are practically no more than a section of the privileged class. Their place as rulers was taken by the wealthy commoners.

In France the "three estates" continued to hold sway long after their beneficial effects had ceased; until, indeed, the load of oppression had become more than could be borne. As there was not even a nominal representation of the people, the evils continued until the volcanic wrath of the people swept away all three estates, and put the management entirely into the hands of the bourgeois commoners. They, however, were not yet equal to the task, and the warrior had again to be looked up to. The bourgeois were called the fourth estate; but the great mass of the people—the working people—are not of any estate as yet, tho the lesson of history goes to show that in due season there will be no distinctions of estates or classes. Modern socialism is sometimes considered the rising of the fourth estate, which shall abolish all estate and introduce equality.

EVANS, FREDERICK WILLIAM: American Shaker; born at Bromyard, England, 1808; came to America in 1820. Apprenticed to a hatter, he managed to educate himself, and later traveled to New Orleans, also paying a visit to England. In 1830 he joined the Shakers at Mount Lebanon, N. Y., and in 1838 became assistant elder in the "North Family," and in 1858 elder of three families. From 1873 to 1875 he edited a little paper, *The Shaker and Shakeress*. Among his works are: "Autobiography of a Shaker" (1869); "Religious Communism" (1872); "The Second Appearing of Christ" (1873). He died in 1893.

EVANS, GEORGE HENRY: American editor; born at Bromyard, England, 1805; came to America in 1820. He edited and published the first labor papers in America: *The Man*, at Ithaca, N. Y., about 1822; "*The Working Man's Advocate*, New York, a part of the time 1825–30; *The Daily Sentinel* in 1837 in New York, and *Young America* in New York and Rahway, N. J., 1853. The demands advocated by Evans and printed at the head of *Young America* were: 1. The right of man to the soil. "Vote yourself a farm." 2. Down with monopolies, especially the United States Bank. 3. Freedom of public lands. 4. Homesteads made inalienable. 5. Abolition of all laws for the collection of debts. 6. A general bankrupt law. 7. A lien of the laborer upon his own work for his wages. 8. Abolition of imprisonment for debt. 9. Equal rights for women with men in all respects. 10. Abolition of chattel slavery and of wages slavery. 11. Land limitation to 160 acres. 12. Mails in the U. S. to run on the Sabbath. Evans became a friend of Horace Greeley, and followed the political movements of the time with interest. He died in 1855.

EVENING-SCHOOLS: The evening- or night-schools are supplementary to the day-schools. They may be either elementary, high, or professional. In countries where education is compulsory the evening-school usually has a professional character, and becomes a trade-school, combining, however, general information with professional instruction. Germany alone has about 750,000 pupils in these schools. The evening-schools of France are mostly professional (*écoles professionnelles*), and have a very high standing—giving both theoretical instruction and

practical training. Sweden, Norway, Holland, Belgium, Austria-Hungary, Spain, Portugal, Italy Russia, Switzerland, Rumania, have introduced schools of this character; and in most of these countries attendance is compulsory. Boys and girls are usually separate where the object is professional instruction. The expenses are borne by the municipality and the state or province conjointly; in some cases by private or professional organizations. Attendance is compulsory in all cases where the community supports the school. The period lasts from two to four years; i. e., from the fourteenth to sixteenth or eighteenth year. The law of Sweden (1898) provides that religion, Swedish language and literature, arithmetic, geometry, drawing, botany, and history should be taught as general branches; professional branches separately to girls and boys.

Great Britain has an extensive system of evening schools. In 1903–4 the government granted aid to 5,579 schools in England and Wales alone to the amount of £304,962. The enrolment was 469,686. They were partly of a professional, partly of a general character; in many cases both features were combined.

As in other instances, the United States have taken up the system of supplementary instruction by evening-schools extensively. This has become an absolute necessity in many large cities of the East and North, since the influx of adult foreigners has been so great during the last few years that something had to be done to initiate them into the language, history, and politics of the country. Accordingly, systematic attempts have been made to organize the evening-schools in such a manner that adults can attend without embarrassment. The evening-schools have, consequently, a double aspect: 1. They are to serve as an agency of general education, both elementary and higher, for all those who are able to understand English sufficiently well to profit by such instruction. The branches taught are those of the corresponding grades in the municipal schools. 2. The evening-schools are to make provision for the instruction in the English language, in civics, in American history, arithmetic, and other branches profitable to adult foreigners. These classes are arranged chiefly in national groups, i. e., German, Italian, French, Russian, Yiddish, etc. The Educational Alliance (*q. v.*) is doing excellent work in New York City along this line, particularly for the Jews from different countries.

In many of these schools instruction is given in free-hand and mechanical drawing, and other professional branches. Nevertheless, there is a great need for professional evening trade-schools where instruction is systematic for each profession on European models. The city of Berlin alone has twenty-five evening trade-schools, with an enrolment of over 25,000. While this system of trade-schools would add considerably to the school budget, the expenditure would be amply returned by superior work in craftsmanship, as is witnessed in all manufacturing centers of western Europe.

In addition to regular class instruction, New York City and other cities have introduced *free lecture courses* in the evening. These courses are of a scientific character on certain evenings and in certain localities; but more frequently they are of a popular, altho instructive character—dealing with literature, travel, history, etc. New York City began this system tentatively in 1890 with six centers. In 1904 there were 140 centers, 4,200 lectures with about 1,200,000 attendants. The city expended $545,000 for evening-school instruction during 1905.

EVOLUTION AND SOCIAL REFORM: That biological principles and the teachings of the evolutionary philosophy have an important bearing on social reform is to-day all but universally admitted; yet, strange to say, even the best writers and authorities are utterly disagreed as to the reform position to which these principles lead. Mr. Herbert Spencer and some other writers use the theory of evolution as an argument against state interference with private property and the necessity of industrial competition to human progress. Mr. Benjamin Kidd is equally clear that evolution teaches the necessity of a great expansion of state interference, tho it must be an interference which shall preserve and not destroy competition. Professor Huxley uses biology to ridicule Spencer's position, while Professor Ritchie and most Socialists make biology prove the necessity and practicability of an organic social life, where industrial competition shall disappear. Finally Prof. S. N. Patten, in his "Theory of Social Forces," a work published in January, 1896, says (p. 5): "Even the theory of evolution has had as yet but little influence on the social concepts and ideals of the race"; and he argues that economics are psychological quite as truly as biological. To understand this confusion it is necessary to ask what evolution is.

Definitions of Evolution

"Evolution," says Professor Huxley ("Evolution in Biology") "is at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it." He says again ("American Addresses," p. 10): "The hypothesis of evolution supposes that in all this vast progression there is no breach of continuity, . . . but that the whole might be compared to that wonderful process of development which may be seen going on every day under our eyes, in virtue of which there arises out of the semifluid, comparatively homogeneous substance, which we call an egg, the complicated organization of one of the higher animals."

But we can be more definite than this. Says Spencer ("First Principles," § 145):

"Evolution is an integration of matter and concomitant dissipation of motion, during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, and during which the retained motion undergoes a parallel transformation." But the word is often used in a still narrower sense than this, a sense which identifies it with some form of what is often also called Darwinism, and which makes it the theory of "the derivation or descent, with modification, of all existing species, genera, orders, classes, etc., of animals and plants from a few simple forms of life, if not from one" ("Century Dictionary").

Thus far all authorities are practically agreed. But when we come to ask how this evolution has taken place we find more disagreement. We do not here refer to the fundamental questions of how evolution started; whether it is teleological; what it teaches concerning the existing of a divine power in or above nature. With these questions we are not here concerned. But the authorities differ even as to the ways in which evolution works wholly apart from the question of its origination or any divine element in it. There may be more agreement than first appears, but it is necessary to refer to the different views of evolution in order to understand their bearing on social reform.

The evolutionary hypothesis did not originate with Charles Darwin. The general thought of evolution is as old indeed

as the Indian mystics and the Greek physicists. It finds a comparatively clear expression in Leibnitz's principle of continuity, and plays no small part in all German philosophy.

Various Forms of the Theory

Even in its Darwinian form it appears quite explicitly in the writings of Lamarck (Paris, 1809–22), of Dr. W. C. Wells, of Charleston, S. C. (1813), and of Sir Charles Lyell (1850). Lamarck taught, among other things, that the production of a new organ in an animal body results from the supervention of a new want (*besoin*) continuing to make itself felt, and a new movement which this want gives birth to and encourages. It is this law which has been principally associated with Lamarck's name, and is often referred to as his hypothesis of the evolution of organs in animals by appetence or longing, although he did not teach that the animal's desires affect its conformation directly, but that altered wants lead to altered habits, which result in the formation of new organs, as well as in modification, growth, or dwindling of those previously existing.

Mr. Alfred Wallace, as early as 1855 ("Ann. and Mag. Nat. Hist.," 1855), formally announced his belief in the theory of descent of species, and intimated that the manifest adaptation of certain varieties to their surroundings secured them the best chances of perpetuation. Later records show that Mr. Wallace did not stop at this stage of development.

But it was Charles Darwin who, in his great book, "The Origin of Species," first placed the idea of evolution clearly before the world and gained the gradual assent of almost the whole thinking world to his argument in general, if not in detail. Darwin's theory has as its special points the inherent susceptibility and tendency to variation according to conditions of environment; the preservation and perfection of organs best suited to the individual in its struggle for existence; the perpetuation of the more favorably organized beings, and the destruction of those less fitted to service; the operation of natural selection, in which sexual selection is an important factor; and the general proposition that at any given time any given organism represents the result of the foregoing factors, acting in opposition to the hereditary tendency to adhere to the type or "breed true." Since Darwin's day two main schools have arisen. One school, sometimes called the Lamarckian, holds to the distinguishing principle of Lamarck, that acquired variations can be transmitted, and that since these variations are and must be adapted to external agencies and surroundings, and hence of greater value to the individual and the race, such variations are most important in the differentiation of new forms of life. The other school, following Weismann in Germany, has in the name of pure Darwinism or neo-Darwinism claimed that there is no satisfactory evidence that those variations which are the result of mechanical causes (acquired variations) can be inherited, that every instance in which the effects of use and disuse, of mutilations and prenatal influences and the like are supposed to be shown are capable of another explanation.

Most embryologists to-day probably incline to the school of Weismann; but the other side is ably supported, nor must it be forgotten that both sides admit that some variations at least can be transmitted.

Nor must the agreement of the two schools and the general acceptance by all biologists of the principle of evolution by the struggle for life and the survival of the fittest be forgotten. Says Mr. Benjamin Kidd ("Social Evolution," p. 34):

> Progress everywhere from the beginning of life has been effected in the same way, and it is possible in no other way. It is the result of selection and rejection. In the human species, as in every other species which has ever existed, no two individuals of a generation are alike in all respects. There is infinite variation within certain limits. Some are slightly above the average in a particular direction as others are below it, and it is only when conditions prevail which are favorable to a preponderating reproduction of the former that advance in any direction becomes possible. To formulate this as the immutable law of progress since the beginning of life has been one of the principal results of the biological science of the century, and recent work, including the remarkable contributions of Professor Weismann in Germany, has all tended to establish it on foundations which are not now likely to be shaken.

With such a succinct statement as to the views of various schools of biologists as to evolution, we are now able to better understand the bearings of their views on social reform. That such a view must have deep bearing on social reform is obvious. That man's development is subject, in part at least, to the same laws which govern the development of plants and brute animal life no thinking man to-day denies, tho, as we shall see, good authority questions whether these are the only laws which control human progress. We pass, therefore, to consider the different applications of evolutionary thought to social reform.

The leadership in the application of the doctrine of evolution to social science belongs undoubtedly to Herbert Spencer, tho by no means all scientists follow his conclusions.

Herbert Spencer

Comte had already prepared the way by treating of human history as a natural process of continuous development, and much German philosophy tends the same way. But Herbert Spencer's "First Principles" (1862) first developed this thought into a connected system (*Synthetic Philosophy*), while his other works apply the thought to psychologic religion, ethics, sociology, education, etc. Bagehot's "Physics and Politics" applies the thought to politics. John Fiske's "Cosmic Philosophy" applies it still more to man's origin and development.

Herbert Spencer makes biology teach the folly of state intervention and the necessity of industrial competition. He argues that it is absolutely necessary to human progress that each individual should stand on his own legs, and that the "fittest" should survive. The struggle, he says, should go on "without violence" ("The Sins of Legislators" in "The Man versus The State"), but government should not interfere. He believes this process to be really benevolent, and says, "the poverty of the incapable, the distresses that come upon the imprudent, the starvation of the idle, and those shoulderings aside of the weak by the strong, which leave so many in shallows and in miseries, are decrees of a large, far-seeing benevolence" (quoted by Mr. William M. Salter in "Anarchy or Government" from "Social Statics"). Mr. Spencer also believes this competition to be just. Each one should gain "neither more nor less of benefit than his activities normally bring" ("Sociology," vol. ii, § 575). "The superior," he says, should "have the good of his superiority, and the evil of his inferiority," and he would put a veto "on all public action which abstracts from some men part of the advantages they have earned, and awards to other men advantages they have not earned" (ibid., vol. ii., § 567).

Mr. Spencer gives particular instances of what he means—he condemns public libraries, public museums, and public schools, since these mean the taxation of the more well-to-do for the benefit of the less well-to-do, and every one, he maintains, should have all the benefits of his exertions to himself, and none should have more benefits than his own exertions entitle him to ("The Sins of Legislators" and the "Great Political Superstition," in "The Man versus The State." Cf. "Sociology," vol. ii., § 569). This gives Mr. Spencer's general position, which he has developed at length in his "Social Statics," "Man versus The State," etc. (For a fuller statement of his view, see SPENCER.)

On questions of the method in evolution, Mr. Spencer follows the Lamarckian view. Mr. Benjamin Kidd, however (in his "Social Evolution"), takes Weismann's theory. Of the bearing of this difference on social reform, Mr. Kidd says (p. 191):

> "If the old view is correct and the effects of use and education are transmitted by inheritance, then the Utopian dreams of philosophy in the past are undoubtedly possible of realization. If we tend to inherit in our own persons the result of

the education and mental and moral culture of past generations, then we may venture to anticipate a future society which will not deteriorate, but which may continue to make progress, even tho the struggle for existence be suspended, the population regulated exactly to the means of subsistence, and the antagonism between the individual and the social organism extinguished, even as Mr. Herbert Spencer has anticipated" ("Data of Ethics," ch. xiv.). But if, as the writer believes, the views of the Weismann party are in the main correct; if there can be no progress except by the accumulation of congenital variations above the average to the exclusion of others below; if without the constant stress of selection which this involves, the tendency of every higher form of life is actually retrograde; then is the whole human race caught in the toils of that struggle and rivalry of life which has been in progress from the beginning. Then must the rivalry of existence continue, humanized as to conditions, it may be, but immutable and inevitable to the end.

Benjamin Kidd

Mr. Kidd argues that this is the law of all progress. He says (pp. 35–37):

Looking back through the history of life anterior to man, we find it to be a record of ceaseless progress, on the one hand, and ceaseless stress and competition, on the other. This orderly and beautiful world which we see around us is now and always has been the scene of incessant rivalry between all the forms of life inhabiting it—rivalry, too, not chiefly conducted between different species, but between members of the same species. The plants in the greensward beneath our feet are engaged in silent rivalry with each other, a rivalry which if allowed to proceed without outside interference would know no pause until the weaker were exterminated. . . . The trees of the forest which clothe and beautify the landscape are in a state of nature engaged in the same rivalry with each other. Left to themselves, they fight out, as unmistakable records have shown, a stubborn struggle extending over centuries, in which at last only those forms most suitable to the conditions of the locality retain their places.

But so far we view the rivalry under simple conditions; it is among the forms of animal life as we begin to watch the gradual progress upward to higher types that it becomes many-sided and complex. It is at this point that we encounter a feature of the struggle which recent developments of biological science tend to bring into ever-increasing prominence. The first necessity for every successful form engaged in this struggle is the capacity for reproduction beyond the limits which the conditions of life for the time being comfortably provide for. . . . Recent biological researches, and more particularly the investigations and conclusions of Professor Weismann, have tended to greatly develop Darwin's original hypothesis as to the conditions under which progress has been made in the various forms of life. It is now coming to be recognized as a necessarily inherent part of the doctrine of evolution, that if the continual selection which is always going on among the higher forms of life were to be suspended, these forms would not only possess no tendency to make progress forward, but must actually go backward. That is to say, if all the individuals of every generation in any species were allowed to actually propagate their kind, the average of each generation would continually tend to fall below the average of each generation which preceded it, and a process of slow but steady degeneration would ensue.

Natural Selection

Mr. Kidd applies this principle to man, and says (pp. 31–34):

These laws, the observer soon convinces himself, have not been suspended in human society. On the contrary, he sees that they must have their most important seat of action there. To recognize this truth, one has only to remember that the discovery which in our time has raised biology from a mere record of isolated facts to a majestic story of orderly progress was not suggested by the study of life among the lower animals. The law, by the enunciation of which Darwin most advanced the science of the nineteenth century, took shape in the mind of the great biologist, after observation of human society—that society in particular which we see around us at the present day. Speaking of the workings of his mind before the "Origin of Species" was begun, Darwin says: "In October, 1838—that is, fifteen months after I had begun my systematic inquiry—I happened to read for amusement Malthus on population; and being well prepared to appreciate the struggle for existence which everywhere goes on, from long-continued observation of the habits of animals and plants, it at once struck me that under these circumstances favorable variations would tend to be preserved and unfavorable ones to be destroyed. The result of this would be the foundation of a new species. Here, then, I had at last got a theory by which to work" ("The Life and Letters of Darwin," by his son, autobiographical chapter, vol. i.) . . . Looking around at the lowest existing types of humanity, and comparing them with the highest, one feels immediately constrained to ask, Do we ever fully realize how this advance of which we are so proud, and which is represented by the intellectual social distance between these two extremes, has been brought about. We talk vaguely about it, and take for granted many things in connection with it; but the number of those who have grasped certain elementary biological laws of which it is the result, and which have controlled and directed it as rigidly as the law of gravity controls and directs a body falling to the earth, is surprisingly small. . . .

Applied to Man

At the outset we find man to be in one respect exactly like all the creatures which have come before him. He reproduces his kind from generation to generation. In doing so, he is subject to a law which must never be lost sight of. Left to himself, this high-born creature, whose progress we seem to take for granted, has not the slightest innate tendency to make any onward progress whatever. It may appear strange, but it is strictly true, that if each of us were allowed by the conditions of life to follow his own inclinations, the average of one generation would have no tendency whatever to rise beyond the average of the preceding one, but distinctly the reverse. This is not a peculiarity of man; it has been a law of life from the beginning, and it continues to be a universal law, which we have no power to alter.

As a result of this view, Mr. Kidd believes that to insure progress society must insure the perpetuation of competition. This, he says, is against the immediate interests of the industrially weaker classes, and therefore they are advocating socialism, the essence of which Mr. Kidd finds to consist in the elimination of competition. But Mr. Kidd says this cannot prevail, because it would mean biological deterioration and death. Through all our Western civilization Mr. Kidd finds a process going on born of the superrational sanctions of Christianity, tending to altruism, lifting up the lower classes, by an ever-widening democracy not toward socialism, but toward a condition where all classes can compete on planes of more perfect equality. He says (pp. 154–65):

The Reformation liberated, as it were, into the practical life of the peoples affected by it that immense body of altruistic feeling which had been from the beginning the distinctive social product of the Christian religion (p. 154). The clue to modern history, he says, lies "in the fact that it has consisted essentially in the gradual breaking down of that military organization of society which had previously prevailed and in the emancipation and enfranchisement of the great body of the people hitherto universally excluded under that constitution of society from all participation on equal terms in the rivalry of existence. . . . And it tends to culminate in a condition of society in which there shall be no privileged classes, and in which all the excluded people shall be at last brought into the rivalry of life on a footing of equality, of opportunity, the significance of the whole process consisting in its tendency to raise the rivalry of existence to the highest degree of efficiency as a cause of progress, to which it has ever attained in the history of life.

Mr. Kidd thus formulates his conclusions as to social reform (pp. 237, 238):

In the era upon which we are entering, the long, uphill effort to secure equality of opportunity, as well as equality of political rights, will of necessity involve not the restriction of the interference of the State, but the progressive extension of its sphere of action to almost every department of our social life. The movement in the direction of the regulation, control, and restriction of the rights of wealth and capital must be expected to continue, even to the extent of the State itself assuming these rights in cases where it is clearly proved that their retention in private hands must unduly interfere with the rights and opportunities of the body of the people. But the continuity of principle may be expected to remain evident under the new appearances. Even in such cases, the State will, in reality, assume such functions *in order to preserve or secure* free competition rather than to suspend it. Hence, the general tendency must be expected to be toward State interference and State control, on a greatly extended scale, rather than toward State management. It may, perhaps, be inferred from this that the development of society in the direction indicated will itself be a movement toward socialism. This is not so. The gulf between the state of society—toward which it is the tendency of the process of evolution now in progress to carry us—and socialism is wide and deep. The avowed aim of socialism is to suspend that personal rivalry and competition of life, which not only is now, but has been from the beginning

Not Socialism

of life, the fundamental impetus behind all progress. The inherent tendency of the process of social development now taking place among us is (as it has been from the beginning of our civilization) to raise this rivalry to the very highest degree of efficiency as a condition of progress, by bringing all the people into it on a footing of equality, and by allowing the freest possible play of forces within the community, and the widest possible opportunities for the development of every individual's faculties and personality. This is the meaning of that evolutional process which has been slowly proceeding through the history of the Western peoples.

Contrary both to Mr. Spencer and to Mr. Kidd are the views of Professor Huxley. Of Mr. Spencer's view, Professor Huxley says ("Administrative Nihilism," an address delivered to the Midland Institute, Oct. 9, 1871):

One of the profoundest of living English philosophers, who is at the same time the most thoroughgoing and consistent of the champions of astynomocracy, has devoted a very able and ingenious essay to the drawing out of a comparison between the process by which men have advanced from the savage state to the highest civilization, and that by which an animal passes from the condition of an almost shapeless and structureless germ to that in which it exhibits a highly complicated structure and a corresponding diversity of powers. . . . All this appears to be very just. But if the resemblance between the body physiological and the body politic is any indication not only of what the latter is, and how it has become what it is, but of what it ought to be, and what it is tending to become, I cannot but think that the real force of the analogy is totally opposed to the negative view of State function.

Suppose that, in accordance with this view, each muscle were to maintain that the nervous system had no right to interfere with its contraction, except to prevent it from hindering the contraction of another muscle; or each gland, that it had a right to secrete, so long as its secretion interfered with no other; suppose every separate cell left free to follow its own "interests," and *laissez faire* lord of all, what would become of the body physiological?

The fact is, that the sovereign power of the body thinks for the physiological organism, acts for it, and rules the individual components with a rod of iron. . . . Hence, if the analogy of the body politic with the body physiological counts for anything, it seems to me to be in favor of a much larger amount of governmental interference than exists at present, or than I, for one, at all desire to see. But, tempting as the opportunity is, I am not disposed to build up any argument in favor of my own case upon this analogy, curious, interesting, and in many respects close as it is, for it takes no cognizance of certain profound and essential differences between the physiological and the political bodies.

Huxley Opposed to Spencer's View

Professor Huxley then goes on to state his own views, and says:

When men living in society have once become aware that their welfare depends upon two opposing tendencies of equal importance—the one restraining, the other encouraging, individual freedom—the question, "What are the functions of government?" is translated into another—namely, What ought we men, in our corporate capacity, to do, not only in the way of restraining that free individuality which is inconsistent with the existence of society, but in encouraging that free individuality which is essential to the evolution of the social organization? The formula which truly defines the function of government must contain the solution of both the problems involved, and not merely of one of them.

Locke has furnished us with such a formula, in the noblest, and at the same time briefest, statement of the purpose of government known to me:

"THE END OF GOVERNMENT IS THE GOOD OF MANKIND" ("Of Civil Government," § 229).

But the good of mankind is not a something which is absolute and fixt for all men, whatever their capacities or state of civilization. Doubtless it is possible to imagine a true "Civitas Dei," in which every man's moral faculty shall be such as leads him to control all those desires which run counter to the good of mankind, and to cherish only those which conduce to the welfare of society; and in which every man's native intellect shall be sufficiently strong, and his culture sufficiently extensive, to enable him to know what he ought to do and to seek after. And in that blessed state police will be as much a superfluity as every other kind of government.

But the eye of man has not beheld that state, and is not likely to behold it for some time to come. What we do see, in fact, is that states are made up of a considerable number of the ignorant and foolish, a small proportion of genuine knaves, and a sprinkling of capable and honest men, by whose efforts the former are kept in a reasonable state of guidance, and the latter of repression. And such being the case, I do not see how any limit whatever can be laid down as to the extent to which, under some circumstances, the action of government may be rightfully carried. . . . The question when to draw the line between those things with which the State ought, and those with which it ought not, to interfere, then, is one which must be left to be decided separately for each individual case. The difficulty which meets the statesman is the same as that which meets us all in individual life, in which our abstract rights are generally clear enough, tho it is frequently extremely hard to say at what point it is wise to cease our attempts to enforce them.

Professor Huxley wrote before Mr. Kidd's "Social Evolution" appeared; but among his latest utterances he showed that there was a deep division to be drawn between the biological laws which govern the development of the lower forms of creation and those which govern man. He says ("The Struggle for Existence," in the *Nineteenth Century*, February, 1888, pp. 165, 166):

Society, like art, is a part of nature. But it is convenient to distinguish those parts of nature in which man plays the part of immediate cause as something apart; and, therefore, society, like art, is usefully to be considered as distinct from nature. It is the more desirable, and even necessary, to make this distinction, since society differs from nature in having a definite moral object; whence it comes about that the course shaped by the ethical man—the member of society or citizen—necessarily runs counter to that which the non-ethical man—the primitive savage, or man as a mere member of the animal kingdom—tends to adopt. The latter fights out the struggle for existence to the bitter end, like any other animal; the former devotes his best energies to the object of setting limits to the struggle.

The history of civilization—that is, of society—is the record of the attempts which the human race has made to escape from this position (i. e., the struggle for existence in which those who were best fitted to cope with their circumstances, but not the best in any other sense, survived). The first men who substituted the state of mutual peace for that of mutual war, whatever the motive which impelled them to take that step, created society. But in establishing peace, they obviously put a limit upon the struggle for existence. Between the members of that society, at any rate, it was not to be pursued *à outrance*. And of all the successive shapes which society has taken, that most nearly approaches perfection in which war of individual against individual is most strictly limited.

Prof. D. G. Ritchie, in his "Darwinism and Politics," carries the argument still further, and shows, in the first place, that "the survival of the fittest" does not necessarily mean the survival of the best. He says:

The phrase "suryival of the fittest" is very apt to mislead, for it suggests the fittest or best in every sense or in the highest sense, whereas it only means, as Professor Huxley has pointed out, "those best fitted to cope with their circumstances" (article "The Struggle for Existence," in *Nineteenth Century*, February, 1888, p. 165), in order to survive and transmit offspring. Now when we come to consider society, we have to deal with a very complex set of phenomena, and what is fittest in one aspect may not be fittest in another. But natural selection implies no further morality than "nothing succeeds like success." If the struggle for food and mates be carried on on its lowest terms, the strongest and the strongest only would be selected. But cunning can do a great deal against strength. Now we cannot be sure that a good combination of strength and cunning will be selected: strength in some cases, cunning in others, is what we find by comparing different species of animals and different races of men. Again, the strongest and largest, and in many ways finest animals are not necessarily those most capable of adapting themselves to changed circumstances. The insignificant may more easily find food and escape enemies. We cannot be sure that evolution will always lead to what we should regard as the greatest perfection of any species. Degeneration enters in as well as progress. The latest theory about the Aryan race makes the Aryans come from the north of Europe, conquer the feebler races of the south, and, having proved its fitness in this way, prove its unfitness in another by being less capable of surviving in a warm climate than they; so that an Aryan language may be spoken where there remains little or no Aryan blood. Are we entitled to maintain, with regard to human races and human individuals, that the fittest always survive, except in the sense in which the proposition is a truism, that those survive who are most capable of surviving?

"Survival of the Fittest" Not the Best

Further, we must emphasize the fact that the struggle goes

on not merely between individual and individual, but between race and race. The struggle among plants and the lower animals is mainly between members of the same species; and the individual competition between human beings, which is so much admired by Mr. Herbert Spencer, is of this primitive kind. When we come to the struggle between kinds, it is to be noticed that it is fiercest between allied kinds; and so, as has been pointed out, the economic struggle between Great Britain and the United States is fiercer than elsewhere between nations. But so soon as we pass to the struggle between race and race, we find new elements coming in. The race which is fittest to survive, i. e., most capable of surviving, will survive; but it does not therefore follow that the individuals thereby preserved will be the fittest, either in the sense of being those who in a struggle between individual and individual would have survived, or in the sense of being those whom we should regard as the finest specimens of their kind. . . . Admirable, doubtless—this scheme of salvation for the elect by the damnation of the vast majority; but, pray, do not let us hear anything more about its "beneficence."

I am not speaking at random about these ethical applications of the conception of struggle for existence. Darwin himself, as always, is most cautious and guarded in his reference to anything that lies outside his own special sphere of observation. He looks forward to the elimination of the lower races by the higher civilized races throughout the world ("Life and Letters," i., p. 316). He points out how "a struggle for existence, consequent on his rapid multiplication," has advanced man to his present high condition; "and if he is to advance still higher, it is to be feared that he must remain subject to a severe struggle. Otherwise he would sink into indolence, and the more gifted men would not be more successful in the battle of life than the less gifted" ("Descent of Man," p. 319). This, doubtless, includes the old objection which Aristotle brought against Plato's communism, that man needs a stimulus to exertion and industry. But there is no jubilation, no exaltation of a natural law into an ethical ideal. And let us know how Darwin modifies this very statement in the words that follow:

"Important as the struggle for existence has been and even still is, yet as far as the highest part of man's nature is concerned there are other agencies more important. For the moral qualities are advanced, either directly or indirectly, much more through the effects of habit, the reasoning powers, instruction, religion, etc., than through natural selection; tho to this latter agency may be safely attributed the social instincts which afforded the basis for the development of the moral sense."

Socialists, however, usually go further than any of the above writers, and argue from evolution not only that the struggle for existence is not the only law of human progress, but that it teaches the development and survival of combination over competition. Says a recent writer (anonymously):

Society an Organism

This law of organic evolution does not stop with the development of the physical. It is the same throughout the entire realm of phenomena. It passes over into the immaterial and builds up political, social, and moral institutions in almost precisely the same manner as physical organisms are formed. In the political aspect of the world the start is also had with the individual or unit. Then follows a community of units, the town, for instance. The same law of development or community of vital interests results in the organization of counties, states, and nations, each a political organism, with functions peculiar to its specific plane of being or place in the body politic; but all, when perfected, working harmoniously together for the common good and equal rights of the units, the individual men and women that form the organism or political body. This same law of progressive development also foreshadows the time when there will be a confederacy of nations, a political world organism, a race unity, the highest functions of which will be to secure to the race—unit—man the freedom of a fair chance in the exercise of his inalienable right to preserve and enhance his inherent individuality.

Socialists believe in the evolution of competition. Says W. D. P. Bliss ("Handbook of Socialism," p. 21):

Competition was once mainly physical; this produced the survival of the fittest to survive in *physical strife*. "There were giants in those days," the Nimrods, the Goliaths, the Agamemnons, "kings of men." Organized society gradually restrained that physical strife, and competition became chiefly military between states. This was the distinguishing feature of the Greek State and of the Roman civilization. It produced an Alexander, a Hannibal, a Cæsar, and continued to the time of Napoleon, and is not yet dead. But gradually advancing fraternalism has replaced military by industrial competition. To-day men strive neither with guns nor with poisoned arrows, so much as with cornerings of the market and with poisoned groceries. It has produced the survival of the fittest to survive in such a strife—the Rothschilds, the Jay Goulds, the Vanderbilts, the Pullmans, the Napoleons of finance. Therefore, Socialists do not urge the abolition of competition. They simply say that it is time to lift competition to a higher level, and make it intellectual, and not industrial. As organized fraternalism has to a large measure put down physical strife, and is putting down militarism, so Socialists would have it gradually supplant industrial competition by industrial cooperation.

A recent work, however, on social evolution is Prof. S. N. Patten's "Theory of the Social Forces" (January, 1896). He says (p. 7): "Evolution has thus far been studied as a problem of biology. This has been due more to what I would call a happy accident than to any necessity of the situation. Darwin admits that he obtained the clue to his theory through reading Malthus's 'Essay on Population,' and in many respects the attitude of the author of the 'Origin of Species' is that of an economist. It is only by later writers that the economic elements in the problem are neglected, and that the theory is based solely upon biologic evidence. The happy accident to which I have referred is the fact that the history of past organic life is so plainly recorded in the various organisms of the present and in the fossil remains of earlier forms."

Professor Patten then goes on to argue that evolution is the result of the action of environment upon organism; that biology has studied organism (because of the "happy accident" that this is what could be best historically studied), but has neglected environment. He quotes Spencer as saying ("Psychology," vol. i., p. 134): "Throughout biology proper the environment and its correlated phenomena are either but tacitly recognized, or overtly and definitely recognized, are so but occasionally, while the organism and its correlated phenomena practically monopolize the attention." Here Professor Patten finds the weak point in current economic discussions. They have overlooked environment, and, says Professor Patten (p. 5), "the present environment of the race is so different from its predecessors that a new social philosophy is demanded to explain its effects." Hence Professor Patten's essay is "an attempt to recast current social philosophy and to introduce into it elements which thus far have been overlooked." These elements are largely psychologic, and, according to Professor Patten, deserve to rank equally with the biologic factors. By such an analysis of man's present environment Professor Patten forecasts "a social commonwealth," based upon a pure pleasure economy, even as state socialism, according to him, is the ideal of those suffering from the evils of a fair economy. This social commonwealth, however, he says, must not be assumed to be the highest or final state. "If a progressive evolution continues," he tells us (p. 6), "other societies will be possible, each of which will differ from its predecessor as radically as the society I describe differs from our present society." See also the article on BIOLOGY.

EXCISE DUTIES (from Latin *ex-cide*, cut off) are duties laid upon any commodity produced within a country in distinction from those custom duties which are levied upon imports. The derivation implies that the excise is something cut off from the price for the benefit of the State. It is an indirect tax, because, tho levied on the product, it falls on the consumer. Excise duties are an old form of duty, begun in England under this

name as early as 1643, being laid on ale and all forms of intoxicating drinks, and later on a long list of articles of food and clothing. The necessities of life were later excepted. Excise duties were at first duties on commodities produced in or out of a country. Robert Walpole, in 1733, introduced a famous excise scheme, whereby tobacco and, later, wine paid no duty, but were warehoused under the control of excise officers, and paid excise duties only as sold within the country. It produced a great excitement, and was abandoned. To-day excise duties are paid in England on many things, like beer, wine, spirits, tobacco, dogs, gun and game licenses, carriages, male servants, armorial bearings, railway tickets, by auctioneers, pedlers, farm brokers, tavern-keepers, etc.

In the United States excise duties were disliked as inheritances from the English Government, and an effort was early made to enact a constitutional amendment forbidding excise duties; but in 1790 Hamilton proposed and got passed an excise duty on spirits. In 1792 it was lowered, and under Jefferson abolished. The War of 1812 led to an excise duty on distilled spirits, domestic refined sugar, salt, carriages, etc. But in 1817 these were abolished, and no excise duty was levied till the internal tax of 1862. (For a discussion of excise duties, see TAXATION.)

EXNER, WILHELM FRANZ: Austrian technologist; born in Gaenserdorf, Lower Austria, 1840; frequented the polytechnic in Vienna; became teacher in the real-school in Elbogen, Bohemia, 1862, and in that of Krems in 1865. In 1869 he was appointed lecturer on engineering and mechanic technology at the forestry academy at Mariabrunn, and in 1875 professor of forestry, forestry-engineering, etc., at the agricultural college at Vienna. Since 1874 he has been inspector of trade schools for the ministry of commerce. In 1879 he founded the Technologische Gewerbemuseum (industrial museum) in Vienna, and has been its director ever since. Since 1882 he has been a member of the chamber of deputies of the Reichsrat, where he identifies himself with the German liberals. Since 1905 Exner has been a member of the Austrian Upper House. Among his works may be mentioned: "Holzhandel und Holzindustrie der Ostseeländer" (1876); "Das Moderne Transportwesen im Dienste der Land- und Forstwirtschaft" (1877); "Die Hausindustrie Oesterreichs" (1890). He has edited "Beiträge zur Geschichte der Gewerbe und Erfindungen Oesterreichs" (1873), and the "Mitteilungen des Technologischen Gewerbemuseums" (1880, sqq). *Address*: Technologische Gewerbemuseum, Vienna, Austria.

EXPENDITURES (Family. See also PRICES): According to the well-known laws formulated by Dr. Engels, head of the Prussian Royal Bureau of the Statistics of Labor, expenditures in different families conform to the following principles:

1. That the greater the income, the smaller the relative percentage of outlay for subsistence.

2. That the percentage of outlay for clothing is approximately the same, whatever the income.

3. That the percentage of the outlay for lodging or rent, and for fuel and light, is invariably the same, whatever the income.

4. That as the income increases in amount the percentage of outlay for sundries becomes greater.

These principles seem in the main substantiated by the most careful investigation.

THE UNITED STATES

The latest and most careful statement of the cost of living in the U. S. is the report by Mr. G. W. W. Hanger of the U. S. Bureau of Labor, from facts secured by the bureau as to 25,440 families in principal industrial localities in thirty-three localities, and comprizing the families of mechanics of all kinds, railroad employees, common laborers, and clerks earning less than $1,200 per year. The following are some of the tables:

Prof. John A. Ryan ("A Living Wage," p. 150, 1906) after a careful study of the evidence says:

"The conclusions that seem to be abundantly justified by the facts . . . may therefore be stated as follows: *First:* Anything less than $600 per year is *not* a living wage in any of the cities of the U. S."

Mr. Britt, of the *Railroad Man's Journal*, former editor of *Public Opinion*, contributed the following suggestive statements in *The Independent*, Aug., 1907:

Not long ago the Massachusetts Bureau of Labor statistics reported that in 797 stores in Boston the number of debtors on the hopeless list was 45,482, about 7½ per cent of the population of the city, with a total indebtedness of $570,912. In the list of non-payers 2.32 per cent, or a little over 1,000, were classed as moneyed people. Therefore more

[The average shown for each item of expenditure relates to those families only that reported expenditures for such items; the total expenditure per family is for all families.]

[1] Not including payments made by six families, in which principal and interest were combined.
[2] Not including interest paid by six families, included in principal.

than 7 per cent of the inhabitants of the entire city were unable through lack of funds to meet the current expenses of living.

To charge 45,000 people with extravagance or downright dishonesty is too wholesale an indictment. Was it not rather a failure in the hopeless struggle to make both ends meet and to maintain a decent standard of living at the same time? Have not these people been caught in a maelstrom of high prices and, in order to live in the present, been forced to neglect the obligations of the past and discount the possibilities of the future? In other words, are they not paying the cost of prosperity?

Rise of Prices

In two bulletins issued last year by the Bureau of Labor of the Department of Commerce and Labor statistics were presented showing the relation of the cost of living to average annual incomes in the year 1905 as contrasted with the ten-year period 1890 to 1899. In the first of these two bulletins wholesale prices of 259 articles of common consumption were tabulated for sixteen years with the following result:

The 1905 average contrasted with the year of lowest average prices during the sixteen years from 1890 to 1905, in each of the general groups of commodities, shows farm products 58.6 per cent higher than in 1896; food, etc., 29.7 per cent higher than in 1896; cloths and clothing, 22.9 higher than in 1897; fuel and lighting, 39.4 per cent higher than in 1894; metals and implements, 41.8 per cent higher than in 1898; lumber and building materials, 41.4 per cent higher than in 1897; drugs and chemicals, 24.1 per cent higher than in 1895; house-furnishing goods, 21.5 higher than in 1897, and the materials included in the miscellaneous group, 23.4 higher than in 1896.

Summing up these statistics it is seen that the average cost of these articles was 15.9 per cent higher than the average for the ten-year period. In the later bulletin, which deals with wages and hours of labor from 1890 to 1905, it is shown that average earnings per week in the latter year were only 14 per cent higher than the average from 1890 to 1899, leaving cost of living, according to these statistics, 2 per cent in the lead.

But these statistics do not bring the facts home to us with sufficient force. . . . Here again the tireless Bureau of Labor at Washington comes to our aid with statistics showing the incomes and the expenditures of a large number of families.

Households to the number of 25,446 in all parts of the United States, averaging approximately five persons to the family, have been canvassed with the following result: The average annual income per family is $751.34; the average annual expenditure is $689.61, leaving a margin between income and expenditure of $61.73 on the profit side.

Food, the basis of the physical life, constitutes by far the larger part of this expenditure, or 42.54 per cent; rent eats up 12.95 per cent; clothing takes 14.04 per cent; fuel and lighting account for 5.25 per cent; taxes and principal and interest on mortgages, which together with rent must cover the cost of lumber and building materials as well as ground rent, amount to 2.33 per cent; furniture and household utensils are answerable for 3.42 per cent, and sickness and death, no small part of the expense of which is chargeable to drugs and chemicals, demand 2.67 per cent.

The remainder is divided in small portions among insurance, labor, and other organization fees, religious purposes, charity, books and newspapers, amusements and vacations, intoxicating liquors, tobacco and "other purposes." Religion claims only .99 per cent; charity fares even worse with .31 per cent; while 1.62 per cent is dissolved in alcohol and 1.42 per cent goes up in tobacco smoke. Amusements and vacations are responsible for 1.60 per cent, and 1.09 per cent are devoted to the alleged improvement of the mind in the purchase of books and newspapers.

To make the matter still more concrete, the average family spends each year $114.83 for rent; $37.53 for fuel and lighting; $97.39 for clothing; $305.32 for food, and $148.73 for all other purposes. In the year 1905, therefore, this same family spent for food $71.28 more than in 1896; for clothing $18.32 more than in 1897, and for fuel and lighting $7.88 more than in 1894.

Dun's index figure of wholesale prices gives the best available basis of comparison, year by year. This shows that the average actual cost of commodities per individual in the U. S. on July 1, 1906, had increased over 1905 to a marked degree. Food of all kinds had risen from $47.399 to $49.385; clothing from $17.986 to $19.177; metals from $15.916 to $16.649, and miscellaneous articles of general use from $17.061 to $19.555. The total cost had risen from $98.312 to $105.216, the greatest increase that has taken place in any year for the last decade except from 1901 to 1902.

As compared with 1896 the total cost has increased from $74.317 to $107.516, a rise of more than 41½ per cent.

In order to find the actual cost per family from these figures, it is necessary to multiply the statistics for individuals by 4.7, the average number of persons per family according to the census of 1900, and to add to that the retailer's profit. Rent is not included in Dun's index, nor are taxes or principal and interest on mortgages. For purposes of comparison between various years, however, no better basis can be found.

This means the need of higher wages. Dr. Edward T. Devine, general secretary of the Charity Organization Society of New York, some time ago made an estimate which showed that:

"In New York, where rentals and provisions are, perhaps, more expensive than in any other large city, for an average family of five persons the minimum income on which it is practicable to remain self-supporting and to maintain any approach to a decent standard of living is $600 a year."

Latest Estimates

In 1907 he says that this estimate is without doubt now far too low. Prof. Albion W. Small, of the University of Chicago, is quoted as saying: "No man can live, bring up a family, and enjoy the ordinary human happiness on a wage of less than $1,000 a year." John Mitchell estimates the minimum wages that will maintain a workingman and his family in the coal region, according to the so-called "American standard," at $600 a year.

In 1906 five prominent social workers came together in New York, and, after fixing on a typical family of a man, his wife, and three children under earning age, the result of their calculations was that $931 was the minimum wages that such a man must earn to support his family decently; $3.10 a day for 300 working days.

The question was then submitted to sixteen other social workers in close touch with actual cheap living conditions. One group of six combined in averaging their estimates, and the result was placing the figure at $942 a year. The other estimates were $768 (two estimates), $879, $900, $901, $986, $1,078, $1,394, $1,403, and $1,449. It will readily be seen that a reasonable average of these estimates is $950 a year as the cost of a normal standard of living of such a family in New York City.

It has been calculated for Chicago by investigators at $900, by New Orleans investigators at $1,000, and by Philadelphia investigators as low as $600, the difference arising through the inclusion of items like insurance, savings, vacations, reading, and other "cultural" expenses in the higher estimates and not in the lower. The standard of living fixt in Philadelphia was an exceptionally low standard and one probably more closely resembling a subnormal standard than any of the others. These were all for families of six persons.

One of the latest of these investigations is that of Baltimore, which has resulted in the conclusion that $750 a year is the minimum amount required by a family of six persons. This investigation was made by the Maryland Bureau of Statistics, which has just issued a report.

Other Countries

The most extensive investigation thus far made in regard to different countries is probably that reported by the U. S. Commissioner of Labor for 1891. Tho now somewhat out of date, it is approximately equally so for all countries, and can be brought up to date by noting the changes in prices. (See Prices.) It is based on investigations in the iron, coal, glass, cotton, and woolen industries. The following tables are abridged from the report (vol. ii., pp 864, 865):

Countries	Income	Average Expenditures			
		Rent	Fuel	Food	Other
United States	$657.39	$76.03	$26.67	$250.62	$305
Great Britain	502.76	47.21	20.47	232.61	202
France	413.80	32.99	13.44	182.21	185
Belgium	433.27	29.93	15.99	200.64	187
Germany	320.02	27.07	10.59	168.82	123
Switzerland	358.56	25.44	23.48	179.28	130

Countries	Amusements and vacations	Intoxicating liquors	Tobacco	Books and newspapers	Religion	Charity
United States	$13.38	$22.82	$10.66	$6.41	$7.99	$3.93
Great Britain	23.55	23.22	11.43	4.95	6.74	3.08
France	17.43	25.77	6.29	2.33	0.96	1.83
Belgium	13.38	31.84	6.60	3.35	3.00	3.47
Germany	7.97	12.50	3.87	2.11	1.17	0.78
Switzerland	20.57	15.97	3.25	1.77	1.76	.....

Countries	Clothing			Taxes	Insurance	Societies	
	Husband	Wife	Children			Labor	Other
United States..	$33.68	$23.72	$54.83	$7.37	$24.84	$7.33	$8.64
Great Britain..	22.15	20.50	37.94	8.44	15.60	7.34	7.93
France.....	19.49	14.76	38.35	2.47	4.34	3.79	3.78
Belgium.....	23.98	12.38	48.25	4.69	2.75	3.23	5.08
Germany.....	20.04	11.29	25.88	3.54	10.34	1.36	3.15
Switzerland....	22.68	11.78	30.92	2.07	8.89	.39	3.35

These statistics for the U. S. are based on the expenditures of 487 families in the pig-iron industry, 293 in the bar iron, 70 in the steel, 309 in the bituminous coal, 104 in the coke, 66 in the iron ore, 639 in the cotton, 323 in the woolen, 773 in the glass. Each industry was averaged separately, and the above averages are the average of the industry averages.

For Great Britain, the statistics are based on the expenditures of thirty-nine families in the pig-iron industry, 73 in the bar iron, 72 in the steel, 137 in the bituminous coal, 11 in the coke, 164 in the cotton, 59 in the wool, and 22 in the glass. For France: 40 in the bar iron, 61 in the cotton, 128 in the wool. For Belgium: 7 in the pig iron, 45 in the bar iron, 9 in the bituminous coal, 4 in the coke, 24 in the glass. For Germany: 22 in the bar iron, 35 in the steel, 16 in the bituminous coal, 10 in the coke, 17 in the iron ore, 70 in the cotton, 23 in the woolen. For Switzerland: 46 in the cotton industry.

Great Britain

The following tables are compiled from reports of the English Board of Trade for 1903 and 1904:

Changes of Workmen's Expenditures in Cost of Living in London and Large Towns in Great Britain 1878–1903

Cost in the Year 1900 = 100

(From "Report of Board of Trade," 1904)

Average of Quinquennial Period, of which Middle Year is—	Food	Rent[1]	Clothing	Fuel and light	Total average weighted[3]
1880.....	139.7	86.6	108.5[2]	77.3	120.5
1885.....	119.8	90.1	102.9	74.1	108.2
1890.....	107.4	89.9	101.2	76.5	100.9
1895.....	97.3	96.3	98.8	74.8	95.5
1900.....	101.8	100.0	98.7	86.0	99.7

[1] The figures for rent apply to the years stated.
[2] Figures for the year 1881.
[3] The report allows food the weight of 7 out of 12; rent 2 out of 12; clothing 2, and fuel and light 1.

Budgets of Working Men's Family

[1] Budgets of French schoolmasters with same income as working men.

The English working men of the Mosley Commission which visited the U. S. reported answers to the Board of Trade, saying most of them (not all) that American working men were better fed than English working men, that their houses were more roomy, tho perhaps not more comfortable, that American rents were nearly double English rents, and that the cost of food and good clothing did not materially differ.

London Rents Paid by the Poor

(Compiled from "Board of Trade Report," 1904, and based on records of district committees of the Charity Organization Society.)

Year	Average Weekly Rent for Tenement		Mean per cent of rent in 1899
	One room	Two rooms	
1880.....	$0.78	$1.25	89.3
1890.....	.80	1.31	92.7
1899.....	.86	1.41	100.0

Paris XIII Arrondissement

329 one-room tenements averaged forty-five cents per week.
337 two-room tenements averaged sixty-two cents per week.
359 three-room tenements averaged eighty-seven cents per week.

Germany

(From U. S. Special Consular Report, XXXIII (1905)

A Prussian town working men's room (not poor) averaged fifty-one cents.
A Saxon town working men's room (not poor) averaged thirty-five cents.

Comparing German and English working men's expenditures, U. S. Consul Meyer (U. S. Special Consular Report XXXIII, 1905) finds that well-paid German and especially Saxon working men are more overcrowded and pay in Prussia fifty cents, and in Saxony thirty-five cents per week per room, where English working men of the same grade usually live in separate houses with not less than four rooms, and pay twenty-eight cents per week per room. Eggs are cheaper in Germany, wheat flour and butter are about the same, sugar is about double, and beef and mutton are considerably dearer than the cheapest quality in England, which is little, if at all, inferior. He says:

"Having closely observed many thousands of German workmen in and out of the workshop, I can say with conviction that they are hearty, well-nourished men, and that their children are well kept and well cared for. Parents are very seldom wasteful or self-indulgent. The mothers have the knowledge and the will to make money go as far as possible. The condition of the working classes in respect to food has greatly improved during the last half century, and particularly during the last twenty years; for, while wages have increased steadily, the cost of food has not."

Dr. Arthur Shadwell ("Industrial Efficiency"; a comparative study of industrial life in England, Germany, and America, 1906) finds that the cost of living in America (especially rent) is enough above English prices to neutralize the difference in wages in the case of skilled workmen in large industrial centers, tho he is not able to say this for all workmen and in all places. Between Germany and America he thinks this not true because the difference in wages is greater and the cost of living less.

F

FABIAN SOCIETY, THE (ENGLISH): A society which, as its basis states, consists of Socialists, and no one who cannot sign the basis is admitted to membership. It was founded in 1884 by a group of young people who were attracted by the teachings of the late Prof. Thomas Davidson of New York, then an occasional visitor to London. He advocated the formation of communities to live "the higher life," but his English disciples quickly adopted another line. The Socialist movement in England was just then beginning with Marxian ideas imported from Germany, and the Fabians resolved to adapt the German principles to English political conditions. They considered that the Kingdom of Heaven was within us, in the sense that it must be evolved out of the old system, by reforms, petty in themselves, but all making to one end.

Aims

To this general idea the Fabian Society has kept. Its basis states that the members aim at the reorganization of society by the emancipation of land and industrial capital from individual and class ownership, and the vesting of them in the community for the general benefit. In this way only can the natural and acquired advantages of the country be equitably shared by the whole people. The society accordingly works for the extinction of private property in land and of the consequent individual appropriation, in the form of rent, of the price paid for permission to use the earth, as well as for the advantages of superior soils and sites. The society, further, works for the transfer to the community of the administration of such industrial capital as can conveniently be managed socially. For, owing to the monopoly of the means of production in the past, industrial inventions and the transformation of surplus income into capital have mainly enriched the proprietary class, the worker being now dependent on that class for leave to earn a living.

If these measures be carried out, without compensation (tho not without such relief to expropriated individuals as may seem fit to the community), rent and interest will be added to the reward of labor, the idle class now living on the labor of others will necessarily disappear, and practical equality of opportunity will be maintained by the spontaneous action of economic forces with much less interference with personal liberty than the present system entails. For the attainment of these ends the Fabian Society looks to the spread of Socialist opinions, and the social and political changes consequent thereon. It seeks to promote these by the general dissemination of knowledge as to the relation between the individual and society in its economic, ethical, and political aspects.

The policy of the society has always been opportunist. It has endeavored to educate all classes and to gain something from all parties. To achieve its ends it uses whatever means are nearest to hand. It seeks to instruct its own members by the careful investigation of social and political problems, and having formulated a remedy for any particular evil, it tries to induce other Socialists and politicians to carry out its plans. Its members believe that there is evolution of ideas as well as of society. They decline to attach any sanctity to the doctrines of Marx, and they do not purpose to set up any other prophet in his place. They place the Golden Age in the future, and look to the young as those most likely first to perceive its dawn. Consequently their creed is always held open to revision, and their principles are maintained only as long as they withstand criticism.

Perhaps the most important social theory which the society has advocated, is the recognition of municipal ownership of monopolies and municipal trading as a practical embodiment of the Socialist idea. The municipal movement in England sprang up spontaneously apart from any social theory. Fabian writers interpreted its meaning and advocated its extension in every direction. This harmonized with their view that the people already possess wide powers, local as well as central, of which insufficient use was being made. Since the formation of the society Parliament has reconstituted a large part of the local government of England, by the creation of county, district, and parish councils, the reorganization of the government of London, and the recent great reform in the system of national education. In these changes the society found its opportunity, both for improving the laws as they were in preparation, and in directing toward social reform the newly constituted authorities.

Municipal Ownership

The Fabian Society holds fortnightly lectures and meetings at which papers on some social subject are read and discust. A few of these lectures and other papers specially prepared are published as *Fabian Tracts*, of which 133 have been issued. These deal with socialism in its various aspects and with proposed social and political reforms, while some explain the powers of local authorities which may be used to improve the condition of the people. Besides the tracts the principal publication issued by the society is "Fabian Essays in Socialism" (1889), several editions of which have been printed in America.

The society carries on educational work in different ways at different times. In some years a great deal of lecturing has been done by its members at meetings of other organizations, political associations, clubs, cooperative societies, and debating and mutual improvement societies connected with churches and other bodies. Sometimes it employs professional lecturers for these purposes, these lecturers being assisted by unpaid members. It has about 180 circulating library boxes, each containing about twenty-five books on political and social subjects, which are lent to any trade-union or other association on payment of a small annual fee. For these libraries there is a constantly growing demand.

Educational Work

The society has never attempted to form a political party, but it took part in founding, and is affiliated to, the Labor Party which at the election of 1906 returned twenty-nine members to Parliament. With the Socialist society called the "Independent Labor Party," which was formed largely as the result of Fabian agitation in the provinces, the society has always been closely allied. Its relations with the Social-Democratic Federation, though less intimate, have always been friendly. At the present time there are ten Fabians in the House of Commons, of whom five belong to the Labor Party and five to the Liberal Party. Among the former are J. Keir Hardie, the Chairman, and Will Crooks, the well-known member for Woolwich.

The society has now about 1,300 members residing chiefly in the London district, but also throughout Great Britain, with a few in America and other countries. Most of the English universities have affiliated societies of undergraduates, and there are a few other societies in provincial towns. The influence of the society has always been out of proportion to its numbers, because some of those who have inspired it from the first are men of exceptional

Prominent Members

ability. George Bernard Shaw, the dramatist, and Sidney Webb, the author, have been members of its executive board from the earliest days; and among other well-known persons who have been active Fabians are the Rev. Stewart Headlam and Graham Wallas (educationalists), Richard Whiteing (novelist), Mrs. Sidney Webb, Mrs. Annie Besant (up to 1890), Mr. and Mrs. Bland (the latter best known as "E. Nesbit"), the late William Clarke, and in recent years Percy Alden, M.P., Dr. Stanton Coit, and Mr. H. G. Wells. One of the oldest and most active members, Mr. Sydney Olivier, has just been appointed Governor of Jamaica.

The best exposition of socialism, as understood by the society, is Mr. Wells's book "New Utopia," tho the society is in no way committed to the views therein exprest. The offices of the society are at 3 Clements Inn, Strand, London, W. C., and the secretary is Edward R. Pease, one of the original members. EDWARD R. PEASE.

FACTORY LEGISLATION: The body of laws which has come into existence since the opening of the last century relating to the regulation of factories, workshops, and all places where industry is carried on, comes under the general title of "factory legislation," and it has stamped itself most emphatically upon the written law of all countries where the factory system has taken root, and also upon the social and moral laws which lie at the bottom of the forces which make written law what it is. The establishment of the factory system of labor, resulting in the congregation of large bodies of people working in the same branches of labor, called attention to industrial conditions, and while prior to the establishment of the factory system industrial conditions were apparently much worse than after its establishment, the workers under the old system were so distributed that their surroundings did not attract public attention, or, at least, the attention of legislators; but when great bodies were brought under one roof or into one community, whatever evils existed became noticeable, and the attention of the legislator was called to them. The factory system was first instituted in England. At the time there were few laws relating to master and man upon the statute-books of England, and those which did exist bore mostly upon criminal matters. There was one law, however, in force which had been considered by many as an obstruction to advancement in the mechanic arts, but which, with the establishment of the factory system, was to become the only point upon which labor legislation could turn. This old law was known as "The Apprenticeship Act," and was passed in 1562, during the reign of Elizabeth. It is to be found in 5 Elizabeth, c. 4. It provided that no one should work in certain trades as journeymen until after an apprenticeship of seven years. It was under this act that the custom of apprenticing pauper children by parish officers grew up, and under it there grew also the very worst practises, for the act allowed apprentices to be worked from 5 A.M. until between 7 and 8 P.M., from March to September, and, as the law expresses it, from September to March, from the "spring of the day until the night closed in." When the first cotton factories were erected in England, necessarily where watercourses were found sufficient to supply power, they became so numerous in such localities that the supply of children from the immediate neighborhoods was found to fall far short of the demand. The reverse of this condition prevailed in the agricultural counties, where general misery existed on every hand. The unprincipled poor-law guardians in the latter counties, being anxious to rid their parishes as speedily as possible of pauper children, were very eager to meet the requirements of the industrial communities where the factory system had been established for cheap labor. Children were, therefore, transferred in large numbers to the north, where they were housed in pent-up buildings adjoining the factories, and were kept to long hours of labor. These primary facts soon drew attention to the evils of the factory system as they appeared at its inception, and for the first time the consequences of congregated labor were made clearly apparent. A generation of operatives was growing up under conditions of comparative physical degeneracy, of mental ignorance, and of moral corruption; and it was then that the great questions began to be asked: Has the nation any right to interfere? Shall society suffer that individuals may profit? Shall the next and succeeding generations be weakened morally and intellectually that estates may be enlarged? These great questions forced themselves upon the public mind, and the fact that pauper apprentices might be better off under such apprenticeship than in the workhouse had no great weight under the influence of the religious and moral waves which affected England in the last quarter of the eighteenth century. The first man to ask such powerful questions of Parliament was Sir Robert Peel, in the year 1802. Sir Robert was a master manufacturer, to whom the new system of labor had brought wealth and power and station, but he sought to remedy the evils which, from his own personal experience, he knew had grown with the factory system; so in 1802 he introduced a bill, the object of which was to interfere by law with the natural tendencies of unrestricted competition in the labor of human beings; but he could not, under the sentiment of the English legislature that precedent must be sacred, go very far beyond the regulation of the labor of parish apprentices. His bill was therefore entitled "An act for the preservation of the health and morals of apprentices and others employed in the cotton and other mills and in cotton and other factories." The whole notion of Peel's measure was that as apprentices were already under statutory provisions, and were subjects of a legal contract, it was permissible that their hours of labor should be regulated by positive enactment; but Parliament, which was familiar with restrictions on the products of labor, and with restrictions of monopoly on labor itself, would not listen to any proposal to regulate what was called "free" labor for the purpose of avoiding even the most frightful moral evils. In the case of apprentices, however, it was conceded that restriction might be tolerated. Such a concession came under the power of precedent, and the Act of 1562, which had theretofore been an obstacle, became the very legal precedent the lawmakers of England must have before they could consent to protect human rights, and as that law had regulated the hours of labor of apprentices, Parliament crept through this narrow door, and allowed Sir Robert Peel's bill to restrict the hours of labor of parish apprentices at work in the factories; and so the first factory act known

In England

The Nineteenth Century

in legislation was passed. This act is known as 42 and 43 George III., cap. 73, and while it was of no great value to the operatives themselves, it has been of the greatest value to the world, for it made the assertion, which has never yet been retracted, that the nation did have the right to check not only open evils, but those which grow individually through the nature of employment. It dealt simply with the unregulated employment of apprentices. By the provisions of the law the employer was compelled to clothe his apprentices, whose work was limited then to twelve hours a day, night-work being prohibited. Every apprentice was to receive daily instruction during the first four years of his time, school attendance to be reckoned as working-time. There were many other regulations embodied in the act, stimulated by Sir Robert Peel. The law was substantially repealed in 1814, but in 1815 Sir Robert Peel came back to Parliament, told it that the act of 1802 "had become useless, that apprentices had been given up, but that the same exhausting condition, from which, Parliament had intended to relieve apprentices, was the lot of thousands and thousands of the children of the free poor,"

Progress

and in the following year (1816) Parliament instituted a great inquiry into the condition of the factory population, tho it did not enact a new law until 1819. Under this act the right of the nation to limit the age at which children might be admitted to the factories was established. From 1816 to the present time there has been no cessation in the attempts to regulate by law some of the conditions of labor; and in all countries where the factory system has taken any hold, as already stated, factory acts are to be found. Such legislation has had for its chief object the regulation of the labor of women and children, but its scope has been constantly enlarged by successive and progressive amendments until law has attempted to secure the physical and moral well-being of the workingman in all trades and to give him every condition of salubrity and of personal safety in the workshops.

The most elaborate code of factory laws is that of Great Britain, the present act being a consolidation of all the acts since Sir Robert Peel's law of 1802. In that country the law makes provision for sanitary conditions, for safety from accidents occurring from machinery, regulating employment and meal hours and the employment of young persons and women and children, providing for holidays, for the education of children, for certificates of fitness for employment, regulating overtime and night-work, and embodying a great many minor provisions, all looking to the well-being of the operative.

In France, the factory laws relate to the hours of labor and regulate some of the conditions. Female labor underground is forbidden, and boys below the age of sixteen are not allowed in such work.

Germany has a fair factory code, and is now in the experimental years of a great system of legal and compulsory insurance of work people, the results of which the empire and the governments of other continental countries are watching with great interest.

In this country nearly every state in which textile factories are found has factory laws of some kind, and many of them provide, as does Great Britain, a body of factory inspectors for the enforcement of legislation. Several states have regulated the age at which children can be employed in any manufacturing, mechanical, or mercantile establishment, for the attendance upon schools, and such matters; and they are following rapidly in the footsteps of Great Britain in providing that proprietors of factories shall make specific provision against accidents from dangerous machinery, providing penalties for the cleaning of machinery while running, etc.; and also providing that factories shall be well ventilated and kept clean; that hoistways, hatchways, elevators, and well-holes shall be protected by good and sufficient trap-doors or other appliances; that establishments of certain height shall be provided with sufficient fire-escapes, practically constructed, and that they shall be kept in good repair and free from obstruction. Factory acts, varying in their provisions, have been placed upon the statute-books of nearly every state of the union. To summarize these into a digest would require a volume by itself, but the principles involved in the factory legislation are those indicated, and they relate to the personal well-being and safety of the operatives employed. The effect of the laws everywhere has been to elevate the standard of employment, to improve the health and increase the longevity of operatives, to reduce their hours of labor from thirteen or fourteen per day to nine or ten, and to surround them with good sanitary, healthful conditions. Very many factory and workshop people in different countries find themselves in better surroundings, as to air and general sanitary conditions, while at work than in their homes. The improvement in the moral tone has been sufficient to warrant the existence of factory legislation, but the constant elimination of children from factory labor is one of its most beneficent results. CARROLL D. WRIGHT.

The United States

FACTORY LEGISLATION, DIGEST OF: (See also CHILD LABOR; INDUSTRIAL INSURANCE; RAILWAY LAWS; SUNDAY REST; SWEAT SHOPS). The subject is here limited for lack of space to the United States, Great Britain, and Germany. (For other countries, see those countries.) Free use has been made of the articles in the Bulletins of the U. S. Bureau of Labor on "Labor Legislation in the U. S.," by G. A. Weber, "Foreign Labor Laws," by W. F. Willoughby.

UNITED STATES

In factory legislation, the various states of the union have generally followed the precedent of the early English factory acts, and all this class of legislation has been restricted to the action of individual states. The right of a state of the union or of the federal government to enact such legislation rests upon the police power, that is, the right to pass any laws which, tho regulating or limiting property, contract or personal rights, are necessary to the safety, health, comfort, morals or well-being of society.

Factories and Workshops

What are usually known as factory acts relate to (1) the protection of the health of the employees, such as regulations requiring the proper ventilation, lighting, and heating of factories and workshops, the provision of exhaust fans to prevent dust or other deleterious products from being inhaled by the operatives, the lime-washing or painting of walls, the provision of seats and separate toilet facilities for females, and the prohibition of overcrowding; (2) the prevention of accidents, such as regulations prohibiting the employment of women and children to clean machinery in motion or operate dan-

gerous machinery, or of children to run elevators, requiring that machinery and vats containing molten metal or hot liquids be properly guarded, that mechanical belt and gearing shifters, means of communication between the engineer's room and rooms where machinery is used, and safety appliances on elevators be provided, that hoistway openings be properly railed off, that sides or railings be placed on stairways, that special precautions be taken in cases of dangerous or injurious occupations, or where explosive or highly inflammable compounds are handled, that fire escapes be provided, and that doors in factories and workshops be so hung as to open outward, and that they be kept unlocked; and (3) the conditions of employment of women and children, such as regulations restricting the hours of labor, prohibiting night work, and requiring intervals of rest during the working day. As nearly all the states have some form of factory regulation it would require too much space to discuss, at any length, the legislative enactments of each state on this subject. The present article will show therefore only the principal objects of factory legislation and the names of the states in which the legislation was enacted.

Provisions for protecting the health of employees apply in some cases to all factories and workshops, and in others to only those factories and workshops in which women and children are employed

Protection of Health

Ventilation.—A common provision of law concerning ventilation requires that every factory in which five or more persons are employed shall be so ventilated while work is carried on therein that the air shall not become so exhausted as to be injurious to the health of persons employed therein, and shall also be so ventilated as to render harmless, so far as is practicable, all gases, vapors, dust, or other impurities generated in the course of the manufacturing process or handicraft carried on therein that may be injurious to health. The states which have enacted laws requiring ventilation of factories and workshops are California, Connecticut, Indiana, Kansas, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, Washington, and Wisconsin.

Heating and Lighting.—The provisions relating to heating and lighting leave it to the factory inspector to determine whether they are sufficient for the health and safety of employees and to issue orders accordingly. The states having such provisions are Connecticut, Delaware, Indiana, Kansas, Maryland, Michigan, Missouri, New Jersey, New York, Ohio, Pennsylvania, Rhode Island.

Exhaust Fans, etc.—These provisions usually prescribe that exhaust fans of sufficient power, or other sufficient devices, shall be provided for the purpose of carrying off poisonous fumes and gases, and dust from emery wheels, grindstones, and other machinery creating dust. The states making such provisions are California, Connecticut, Illinois, Indiana, Iowa, Maryland, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, South Dakota, Washington, and Wisconsin.

Walls, etc.—Provisions of law requiring the lime-washing or painting of walls and ceilings at certain intervals, apply in some cases to all factories and workshops, and in others to bakeries only. The following states have such provisions: Indiana, Missouri, New Jersey, New York, Pennsylvania, and Wisconsin.

Overcrowding.—In some states the laws provide that the minimum air space per employee in a factory or workshop shall be 250 cubic feet in the daytime and 400 at night, while in others the amount of air space per person to be required is left to the judgment of the factory inspector. The states making such provisions are Indiana, Maryland, Missouri, New Jersey, New York, Ohio, Pennsylvania, and Wisconsin.

Toilet Facilities.—These provisions of law usually take the form of requiring separate water-closets, wash-rooms or dressing-rooms for the two sexes. A number of states have laws requiring the provision of wash-rooms in foundries. The following states have laws concerning toilet facilities in factories and workshops: California, Connecticut, Delaware, District of Columbia, Indiana, Iowa, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, West Virginia, and Wisconsin.

Prevention of Accidents

Laws for the prevention of accidents usually apply to all factories and workshops in which machinery is used, altho some of the provisions relate only to places where women and children are employed.

Cleaning Machinery.—The laws concerning the cleaning of machinery while in motion usually relate only to young persons and women. They have been enacted in Connecticut, Illinois, Indiana, Iowa, Louisiana, Massachusetts, Michigan, Missouri, New Jersey, New York, Pennsylvania, Rhode Island, and West Virginia.

Guards on Machinery.—Laws for the guarding of dangerous machinery, etc., usually provide that all vats, pans, saws, planers, cogs, gearing, belting, shafting, set-screws and machinery of every description shall be properly guarded. Such laws have been enacted in Connecticut, Indiana, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Missouri, Nevada, New Jersey, New York.

Mechanical Belt-gearing Shifters.—Where these provisions of law have been enacted it has usually been left to the discretion of the factory inspector to determine in what measure belt-shifters or other mechanical contrivances for the purpose of throwing on or off belts on pulleys should be installed. The states which have enacted such regulations are Indiana, Iowa, Kansas, Michigan, Minnesota, New Jersey, New York, Ohio, Pennsylvania, and Washington.

Guards on Elevators and Hoistways.—Laws concerning the guarding of elevators, hoisting shafts, well-holes, hatchways, etc., usually provide that these openings should be protected by sufficient trap-doors or self-closing hatches, and be enclosed. In some cases the installing of these safeguards is left to the discretion of the factory inspectors. The following states have provisions of this kind: Connecticut, Indiana, Kansas, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, Washington, West Virginia, and Wyoming.

Explosives.—Laws requiring certain precautions to be taken in establishments where explosives are made or handled, have been enacted in Iowa, Maryland, Massachusetts, Missouri, and New Jersey.

Doors.—Important provisions of law concerning factories and workshops are those requiring doors to swing outward, and requiring them to be unlocked while persons are employed in the rooms. Such laws have been enacted in Georgia, Indiana, Kansas, Maine, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, New Jersey, New York, North Dakota, South Dakota, and Wisconsin.

Fire-escapes.—Laws concerning the installation of fire-escapes on factories have been enacted in Connecticut, Delaware, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, New York, North Dakota, Ohio, Pennsylvania, Rhode Island, South Dakota, Vermont, Virginia, West Virginia, and Wisconsin.

Other provisions for the safety of employees enacted in some of the states are such as require the placing of hand-rails on stairways, and the marking of dangerous machinery, provide that a certain distance must be left between fixt structures and the traversing parts of machinery, prohibit the operation of dangerous machinery by children, etc., etc.

Hours of Labor

The limitation of hours of labor of adult males is confined to employees in certain specified industries, such as drug-stores, bakeries, mines, railways, and on public works. Thus, the hours of labor of drug clerks are limited to sixty per week in California, and to seventy per week in New York; the hours of labor of employees in bakeries to sixty per week in New Jersey, and to six days per week in Pennsylvania. A New York statute limiting the hours of labor of bakery employees to sixty per week was declared unconstitutional.

Mercantile Establishments

Laws concerning the regulation and inspection of mercantile establishments relate chiefly to the hours of labor and the conditions of employment of women and children, and include provisions prohibiting night work, requiring intervals of rest, fixing an age limit for the employment of children, requiring suitable and sufficient wash-rooms and water-closets, lunch-rooms, seats for females, etc. These laws are considered elsewhere. They are usually enforced by the factory inspectors.

Bakeries and confectioneries have likewise been made the objects of special regulation in a number of states.

Laws have been enacted, in twelve states, for the purpose of protecting the health of employees and of the public, by requiring cleanliness, proper plumbing and draining, and other sanitary arrangements, and regulating certain conditions of labor in establishments used for the manufacture of bread, cakes, biscuits, pies, pretzels, macaroni, confectionery, etc.

Tennessee has a law simply providing that whenever the

word "workshop" appears in the law relating to factories, etc., it should include bakeries, whether run by machinery or not. The laws of Connecticut, Massachusetts, New York, Ohio, and Washington relate only to bakeries; those of Minnesota, Missouri, New Jersey, and Wisconsin relate also to confectioneries. In Pennsylvania the law relates to bakeries, pretzel, and macaroni establishments, and in Indiana to bakeries, confectioneries, canning, packing, pickling, preserving, and all other establishments for the manufacture of food products. In all these states the laws require that the buildings occupied should be properly drained and plumbed, seven states requiring also that they be ventilated by air-shafts, windows, or ventilating pipes. In four of the states the rooms used for the manufacture of flour or meal foods are required to have impermeable floors, constructed of hard wood saturated with linseed oil, or of cement or tiles laid in cement. In three other states this requirement is made optional with the factory inspectors. Ten states require the walls to be plastered and either painted or whitewashed, and in some cases the ceilings must be ceiled with either wood or metal. When whitewashed, the wash must usually be renewed every three months, this requirement being in some cases optional with the inspector. In ten states it is required that furniture and utensils be so arranged that they and the floor may always be easily kept clean and in a sanitary condition.

In all the states having bake-shop regulations, wash-rooms and water-closets must be provided with ventilation separate and apart from rooms where food products are manufactured, and no water-closet, earth-closet, privy, or ash pit may be within or communicate directly with such rooms. In New Jersey and New York this applies also to bake shops in hotels and restaurants. Sleeping places must in all cases be separate and distinct from rooms where food products are manufactured or stored, and in four states if the sleeping rooms are on the same floor they are subject to inspection by the factory inspectors. In Minnesota and Wisconsin workmen in bakeries and confectioneries must be furnished with caps and slippers, or shoes, and an external suit of coarse linen, to be used only while at work, and these garments must be kept in a clean condition. For this change of clothes separate dressing-rooms must be provided.

In five states the use of cellars or basements for bake shops is prohibited unless they are put in the sanitary condition required by law. In four of these states the cellars must be at least eight feet high. In Connecticut and Washington no cellar or basement may be used as a bakery, and those used at the time of the passage of the act cannot be reopened for use as bakeries when once closed. A similar restriction exists in Minnesota in the case of any room the floor of which is more than two feet below, and in Wisconsin five feet below, the street or adjacent ground.

Six states prohibit the employment in bake shops of persons who are affected with consumption of the lungs or with scrofulous or venereal diseases or with any communicable skin affection, and employers are required to maintain themselves and their employees in a clean condition while manufacturing or handling food. In Indiana cuspidors must be provided, and no person is permitted to spit upon the floor or walls of any place where food products are manufactured. Notices to this effect must be posted in all such places.

In four states provision is made restricting the hours of labor of children or of adults in bake shops.

In Connecticut, Indiana, Missouri, New Jersey, New York, and Ohio the bake-shop laws are enforced and the bakery inspections made by the factory inspectors, and in Washington by the Commissioner of Labor. In Pennsylvania the provisions regarding employees affected with diseases are enforced by the health board, but all other provisions are enforced by the factory inspectors. In Minnesota and Wisconsin the state bureau of labor and the state and local health boards are charged with the enforcement of these laws. In Massachusetts this duty devolves upon the local boards of health only. In Connecticut, New Jersey, New York, and Ohio the inspectors, and in Washington the Commissioner of Labor, are required to inspect all bake shops and to issue certificates of inspection to all bakeries which have complied with the requirements of the bake-shop acts. In Minnesota and Wisconsin the common councils in cities of 5,000 population and over may by ordinance provide for licensing bakeries.

In nearly all the states that have enacted bake-shop laws a time limit of thirty or sixty days is fixt within which owners, lessees, etc., of such shops must make such alterations or installations as the factory inspectors or health boards may require in accordance with the provisions of the bake-shop acts. Failure to comply with these orders, or other violations of the bake-shop acts, are punishable by fines, usually from $20 to $50 for the first offense, and by higher fines or imprisonment for subsequent offenses.

Laundries

Eight states have statutes regulating work in laundries. New York and Hawaii have special legislation concerning labor in laundries. In the other six states laundries are simply included in the number of industries covered by the factory regulations.

The New York law, besides providing that the factory regulations should apply to laundries, prohibits sleeping in rooms used for public laundries, and requires all such laundries to be kept in a clean condition and free from vermin and all impurities of an infectious or contagious nature. The law does not apply to females engaged in doing custom laundry work at home for regular family trade.

The Hawaiian law provides for the erection of laundries and wash-houses by the government, to be rented to private persons, and prohibits any one from carrying on the business of laundry keeping or washing for hire within the limits of the city of Honolulu except in such buildings. Special permits may be granted for the erection of steam laundries by private persons.

Building Construction

A number of states have laws relating to the protection of employees on buildings, which may well be considered in this connection.

The states having such laws are California, Indiana, Kansas, Maryland, Massachusetts, Minnesota, Missouri, New York, Ohio, Pennsylvania, and Wisconsin. These laws are sometimes enforced by factory inspectors, but usually by building inspectors or other local authorities. The regulations relate to the safety of the scaffolding, ropes, blocks, or pulleys used, the provision of floors in unfinished buildings, etc.

Inspection of Factories

In twenty-seven states the laws provide for the appointment of inspectors of factories and workshops, whose duties consist of visiting and inspecting factories, workshops, mills, and, in some cases, mercantile establishments, sweat-shops, bakeries, laundries, and building construction work, and enforcing the laws concerning the same. In ten of these states the inspectors are required to prepare statistics of accidents, the owners of factories and workshops in these states being required to report all accidents occurring in their establishments.

Factory inspectors in some states have, in addition to the enforcement of factory laws, duties other than those indicated above. Thus, in some states they are entrusted with the duties of inspecting buildings, boilers, elevators, mines, etc., which functions are usually exercised by special officers appointed for those purposes.

In California, Iowa, Kansas, Kentucky, Maryland, Michigan, Minnesota, Missouri, Montana, Nebraska, New York, Oregon, Washington, West Virginia, and Wisconsin the duties of factory inspection are combined with those of the bureaus of labor statistics.

Great Britain

The first factories act in England and in all Europe was passed in 1802 (42 Geo. III., c. 72). It was entitled "An act for the preservation of the health and morals of apprentices and others," but was generally known as the elder Sir Robert Peel's act. Its principal provisions were that apprentices should not work more than twelve hours a day exclusive of meal time, nor at night; that they should receive instruction, the first four years of their apprenticeship, in reading, writing, and arithmetic, or either of them, and in the principles of the Christian religion; that they should be supplied with sufficient and suitable clothing by their masters; that factories should have two washings with quicklime each year and be ventilated by a sufficient number of windows.

In 1819 another step was taken for the protection of factory labor by the enactment of a law relating exclusively to cotton mills, and which fixt a minimum age limit of nine years for children employed in factories, restricted the hours of labor to twelve a day in the case of children from nine to sixteen years of age, and fixt an hour and a half as the minimum time to be allowed them for meals.

Supplementary acts were passed in 1820, 1829, 1831, and 1833. The act of 1833 (3 and 4 Will. IV., c. 103) replaced the previous acts, and for the first time made a distinction between "children" and "young persons," a distinction which is still maintained. It defined a child as a person under thirteen years of age, and a "young person" as one under eighteen years of age. It forbade night work for children and young persons. Daily attendance at school for children, and holidays and half-holidays were provided for. It also made provision for the appointment of four factory inspectors. While the preceding act related only to cotton and woolen mills, the present act applied to "any cotton, woolen, worsted, hemp, flax, tow, linen, or silk mill or factory wherein steam or water or any other mechanical power is, or shall be, used to propel or work the machinery."

Development

As a result of the report of a Royal Commission appointed in 1840 to inquire into the labor of children, a new factories act was passed in 1844 (7 and 8 Vict., c. 15), which likewise applied to the textile industries. This act lowered the minimum age limit from nine to eight years—a step backward. On the other hand, it reduced the hours of labor per day to six and a half, prescribed the period of employment of children between 5.30 A.M. and 8.30 P.M., and prohibited the employment after 1 P.M. of any child working during the morning. Where young persons were employed ten hours per day, children were allowed to work ten hours on alternate days. This act was the origin of what has since come to be known as the half-time system. For the first time adult women were placed under legal protection, the provisions concerning young persons being made to apply to all adult women. Another very important innovation was a provision requiring the fencing of dangerous machinery operated by children and young persons, and prohibiting their employment in the work of cleaning machinery while in motion. The system of factory inspection was made more efficient by the creation of a department of factory inspection, with a central office in London.

The next step of importance in factory regulation was the passage in 1847 of what was known as the Ten Hours Act (10 and 11 Vict., c. 29). This was the result of a twenty years' agitation of the advocates of the ten-hour movement. It limited the hours of all women and young persons in factories to ten per day and fifty-eight per week. Other acts of minor importance were passed in 1850, 1853, 1856, and 1860.

Up to the year 1864 the factory acts related only to the textile industries. In that year, however, an act (27 and 28 Vict., c. 48) extended the factory act to practically all kinds of industrial work, thus bringing under the factory regulations non-textile as well as textile industries and also certain other employments.

In 1867 two acts were passed which marked a decided advance in factory regulation. The one (30 and 31 Vict., c. 103) was known as the Factory Acts Extension Act, and the other (30 and 31 Vict., c. 106), the Workshops Regulation Act. The first act extended the principle of legal regulation by defining the word "factory," as regulated by the act, to any place where manufacturing was carried on and where fifty or more persons were employed. The second act extended the legal regulation of labor to smaller places of work where children, young persons, or women were employed, and to which or over which the employer of the persons working therein had the right of access and control. It limited the hours of labor in workshops, but allowed greater latitude as to periods of employment and overtime than was permitted in factories. As the enforcement of the provisions of the Workshops Act was left to the local authorities the act was largely disregarded.

In 1871 a Factory and Workshop Act (34 and 35 Vict., c. 104) was passed placing all factories and workshops under the control of the factory inspectors, and bringing government factories and workshops under the Factory and Workshops Act.

In 1874 an act (37 and 38 Vict., c. 44) was passed raising the minimum age limit of children in textile factories from eight to nine, and the next year to ten years, and further restricting the hours of their employment.

The multiplicity of the various factory and workshops acts induced the appointment of a royal commission, whose report resulted in the passage of the "Factory and Workshops Act, 1878" (41 Vict., c. 16). It not only consolidated the provisions of all previous factory acts, but brought together the two classes of factory and workshop regulations which had hitherto been kept separate. It classified the establishments as "factories" and "workshops" and the industries as "textile" and "non-textile." This act, with its subsequent amendments in 1883, 1889, 1891, 1895, and 1897, was in force when, in 1901, the present Factory and Workshops Act (1 Edw. VII., c. 22) was passed. The latter consolidated all these enactments and made many new and important provisions.

The Factory and Workshop Act of 1901 retained the classification of establishments into "factories" and "workshops." The factories are again divided into textile and non-textile factories, tenement factories, and domestic factories. Workshops are divided into men's workshops, women's workshops, and domestic workshops. To define these various terms would require more space than can be given in this article, but their names give a fair idea of their meaning.

Act of 1901

The main difference between a factory and workshop as defined in this act is that the former is a place where any article is made, altered, repaired, ornamented, finished, or adapted for sale, and where steam, water, or other mechanical power is used in aid of such process, except that for special reasons some non-textile work places are included, even tho mechanical power may not be used. Workshops include all other work places which come within the scope of the law.

The law first deals with the health and safety of employees in factories and workshops. The health provisions relate to cleanliness and sanitation, overcrowding, temperature, ventilation, drainage of floors, and sanitary conveniences. The health regulations, as far as they concern factories, are contained in the act itself; but as regards workshops, the act applies the provisions of the various public health acts. Hence the provisions as to health are enforced by factory inspectors in factories, and by local sanitary authorities in workshops.

Protection of Health of Employees

Sanitation.—The regulations regarding cleanliness provide that a factory must be kept in a cleanly state and free from effluvia arising from any drain, water-closet, earth-closet, privy, urinal, or other nuisance. For the purpose of securing cleanliness, all inside walls and the ceilings or tops of the rooms of a factory, and all passages and staircases of a factory, if they have not been painted with oil or varnish once at least within seven years, must be lime-washed once at least every fourteen months; and if they have been so painted or varnished, must be washed with hot water and soap once at least every fourteen months. In every factory or workshop in which a process is carried on which renders the floor liable to be wet, adequate means must be provided for draining off the wet.

Toilet Facilities.—Every factory and workshop must be provided with sufficient and suitable accommodations in the way of sanitary conveniences, regard being had to the number of persons employed, and proper separate accommodations must be provided for persons of each sex. The secretary of state determines by special order what should be considered as sufficient and suitable accommodation.

Temperature.—The provision regarding temperature requires that a reasonable temperature must be maintained in each room, in every factory and workshop in which any person is employed, without interfering with the purity of the air.

Ventilation.—Sufficient means of ventilation must be provided, and sufficient ventilation must be maintained in every factory and workshop. The standard of sufficient ventilation for any class of factories or workshops is prescribed by the secretary of state.

Overcrowding.—The act provides that the amount of air space in any room must be not less than 250 cubic feet for each person employed therein, or 400 cubic feet during a period of overtime. These requirements may be modified by special order of the secretary of state. The employer must affix in every factory and workshop a notice specifying the number of persons who may be employed in each room by virtue of this provision.

The provisions of the Factory and Workshops Act having for their purpose the safety of employees, are considered under six heads, namely, the fencing of machinery, steam boilers, the use of self-acting machines, the cleaning of machinery in motion, the provision of fire-escapes, and special regulations regarding dangerous machinery and unhealthy or dangerous buildings. These safety provisions apply not only to factories and workshops, but also to docks, wharves, quays, warehouses, to certain

Prevention of Accidents

buildings, and to any machinery used in the process of loading or unloading or coaling any ship in any dock, harbor, or canal.

Guards on Machinery.—The provisions for the fencing of machinery are as follows:

1. Every hoist or teagle, and every fly-wheel directly connected with steam, water, or other mechanical power, whether in the engine-house or not, and every part of any water-wheel or engine worked by such power shall be securely fenced.

2. Every wheel-race not otherwise secured shall be securely fenced close to the edge of the wheel-race.

3. All dangerous parts of the machinery and every part of the mill-gearing must be either securely fenced or be in such position or of such construction as to be equally safe to every person at work in the factory as if it were securely fenced.

4. All fencing must be constantly maintained in an efficient state while the parts required to be fenced are in motion or in use, except when they are under repair or examination or are necessarily exposed for the purpose of cleaning or lubricating, or for altering the gearing or arrangements of the parts of the machinery.

Steam-boilers.—The provisions of the act concerning steam-boilers are entirely new. They direct that:

1. Every steam-boiler used for generating steam in a factory or workshop or in any other place to which the act applies: (*a*) must have a proper safety-valve, steam-gage, and water-gage to show the pressure of steam and the height of water in the boiler; (*b*) must be examined thoroughly by a competent person at least once in every fourteen months.

2. Every such boiler, safety-valve, steam-gage, and water-gage must be maintained in proper condition.

3. A report of the result of every such examination in the prescribed form must within fourteen days be entered into or attached to the general register of the factory or workshop, signed by the person making the examination.

Self-acting Machines.—The provisions for the use of self-acting machines are as follows:

1. In a factory erected on or after the first day of January, 1896, the traversing carriage of any self-acting machine shall not be allowed to run out within a distance of eighteen inches from any fixt structure not being part of the machine, if the space over which it so runs out is a space over which any person is liable to pass, whether in the course of his employment or otherwise.

2. A person employed in a factory must not be allowed to be in the space between the fixt and the traversing parts of a self-acting machine unless the machine is stopt with the traversing parts on the outward run, but for the purpose of this provision the space in front of a self-acting machine shall not be included in the space aforesaid.

3. A woman, young person, or child shall not be allowed to work between the fixt and traversing part of any self-acting machine while the machine is in motion by the action of steam, water, or other mechanical power.

Cleaning Machinery.—The regulations with regard to the cleaning of machinery in motion are as follows:

1. A child must not be allowed to clean in any factory, (*a*) any part of any machinery; or (*b*) any place under any machinery other than overhead mill-gearing, while the machinery is in motion, by the aid of steam, water, or other mechanical power.

2. This provision also applies to young persons, so far as the dangerous parts of machinery are concerned. It is presumed, until the contrary is proved, that those parts of machinery are dangerous that are so notified by the inspector to the occupier.

3. A young person or woman must not be allowed to clean such part of the machinery of a factory as is mill-gearing (that is, the means by which power is transmitted as distinguished from the manufacturing operations) while the same is in motion for the purpose of propelling any part of the manufacturing machinery.

Fire-escapes.—In the provisions of the factory act requiring precautions to be taken against fire in factories and workshops, and the provision of means of escape, a distinction is made between old and new buildings. Following are the provisions:

1. Every factory of which the construction was not commenced on or before Jan. 1, 1892, and in which more than forty persons are employed, and every workshop of which the construction was not commenced before Jan. 1, 1896, and in which more than forty persons are employed, must be furnished with a certificate from the district council of the district in which the factory or workshop is situated, that the factory or workshop is provided with such means of escape in case of fire for the persons employed therein as can reasonably be required under the circumstances in each case; and it shall be the duty of the council to examine every such factory and workshop; and, on being satisfied that the factory or workshop is so provided, to give such certificate,

Fire-escapes

2. With respect to all factories and workshops to which the foregoing provisions do not apply and in which more than forty persons are employed, it shall be the duty of the district council of every district from time to time to ascertain whether all such factories and workshops within their district are provided with such means of escape as aforesaid, and, in the case of any factory or workshop which is not so provided, to serve on the owner of the factory or workshop a notice in writing specifying the measures necessary for providing such means of escape, and requiring him to carry them out before a specified date, and thereupon the owner shall, notwithstanding any agreement with the occupier, have power to take such steps as are necessary for complying with the requirements, and unless the requirements are complied with, the owner shall be liable to a fine not exceeding £1 ($4.87) for every day that the non-compliance continues. In case of a difference of opinion between the owner of the factory or workshop and the council this difference must, on the application of either party, within one month, be referred to arbitration, this arbitration to be had in conformity with a scheme provided in this act. The award on the arbitration is binding on the parties. If the owner alleges that the occupier of the factory or workshop ought to bear or contribute to the expenses of complying with the requirements, he may apply to the county court having jurisdiction; and this court, after hearing the occupier, may make such order as appears to the court just and equitable.

For the purpose of enforcing the provisions concerning means of escape in case of fire, an inspector may give the like notice and take like proceedings as in other provisions under this act with respect to matters punishable or remedial under the law relating to public health but not under this act, and those provisions shall apply accordingly.

The means of escape in case of fire provided in any factory or workshop must be maintained in good condition and free from obstruction.

3. While any person employed in a factory or workshop is within the factory or workshop for the purpose of employment or meals, the doors of the factory or workshop and of any room therein in which any such person is shall not be locked or bolted or fastened in such a manner that they cannot be easily and immediately opened from the inside.

4. In every factory or workshop, the construction of which was commenced after Jan. 1, 1896, the doors of each room in which more than ten persons are employed shall, except in the case of sliding doors, be constructed so as to open outward.

The regulations concerning the use of dangerous buildings or machinery provide that whenever an inspector believes that any place used as a factory or workshop is in such a condition that any manufacturing process or handicraft carried on therein cannot be so carried on without danger to health or to life or limb, or that any part of the ways, works, machinery, or plant used in a factory or workshop is in such a condition that it cannot be used without danger to life or limb, he can make complaint to a court of summary jurisdiction, and this court can, upon being satisfied of the justness of the complaint, prohibit the use of the place or machine until such works have been executed as, in the opinion of the court, are necessary to remove the danger. A fine of not exceeding 40s. ($9.73) a day may be imposed for failure to comply with this order.

When a complaint has been made as above, the court or a justice may, on application *ex parte* by the inspector, and on receiving evidence that the use of any machine involves imminent danger to life, make an interim order prohibiting, either absolutely or subject to conditions, the use of the machine until the earliest opportunity for hearing and determining the complaint.

Reporting and Investigation of Accidents

The British law makes careful provision for the investigation of all serious accidents and their recording, with a view of determining the responsibility and cause of their occurrence. Where there occurs in any factory or workshop any accident which either causes loss of life to a person employed in the factory or workshop, or causes to any person therein employed such bodily injury as to prevent him on any one of the three working days next after the occurrence of the accident from being employed for five hours on his ordinary work, written notice must be immediately sent to the inspector of the district.

If the accident causes loss of life, or is produced either by machinery moved by steam, water, or other mechanical power, or through a vat, pan, or other structure filled with hot liquid or molten metal or other substance, or by explosion or escape of gas, steam, or metal, then, unless notice thereof

is required by the Explosives Act of 1875 to be sent to a government inspector, notice must immediately be sent to the certifying surgeon of the district. The notice must state the residence of the person killed or injured, and the place to which he has been removed. If notice as above required is not sent, the occupier of the factory is liable to a fine not exceeding £5 ($24.33). If the accident occurs to a person employed in an iron mill or blast furnace, or other factory or workshop, where the occupier is not the actual employer of the person killed or injured, the actual employer must immediately report the same to the occupier, and in default shall be liable to a fine not exceeding £5 ($24.33).

When a certifying surgeon, as before mentioned, receives notice of an accident, he shall, with the least possible delay, proceed to the factory or workshop, and make a full examination as to the nature and cause of the death or injury caused by the accident, and make a report thereof to the inspector within the next twenty-four hours. In making this investigation he has the same powers as an inspector, and can enter any room in a building to which the person killed or injured has been removed.

Where a death has been caused by accident, the coroner must immediately advise the district inspector of the time and place of holding the inquest. Unless an inspector or some person on behalf of the secretary of state is present to watch the proceedings, the coroner must adjourn the inquest, and must in writing give the inspector at least four days' notice of the time and place of holding the adjourned inquest. At such inquest any relative of any person whose death may have been caused by the accident, and any inspector, and the occupier of the factory or workshop in which the accident occurred, and any person appointed by the order in writing of the majority of the work people employed in the factory or workshop shall be at liberty to attend and examine any witness, either in person or by counsel, solicitor, or agent, subject to the order of the coroner.

Employment

With regard to the conditions of employment in factories and workshops, adult male labor is subjected to no regulations except in the case of dangerous occupations, the theory being that this class is competent to look after its own welfare. In the case of women, young persons, and children, however, the conditions are different, their natural weakness being such that the intervention of the State in their behalf is held to be fully justified.

In the Factory Act, therefore, the numerous regulations concerning hours of labor, time of employment, Sunday and holiday labor, fitness for employment, education, etc., relate only to women, young persons, and children, and as they are considered elsewhere, they will not be treated in this place.

Dangerous Occupations

Altho the regulations for health and safety prescribed by the Factory Act are considered sufficient for factories and workshops generally, there are some industries that are unusually dangerous to life and health for which additional rules and regulations are provided.

Every medical practitioner attending on or called in to visit a patient whom he believes to be suffering from lead, phosphorus, arsenic, or mercurial poisoning, or anthrax, or any other disease designated in a special order by the secretary of state, contracted in any factory or workshop, must send to the Chief Inspector of Factories at the Home Office, London, a notice stating the name and full postal address of the patient and the disease from which he is suffering, for which he receives a fee of 2s. 6d. (61 cents) from the State. If he fails to send such a notice he is liable to a fine of 40s. ($9.73).

Written notice of every case of lead, phosphorus, or arsenic or mercurial poisoning, or anthrax, or other disease designated by special order by the secretary of state, occurring in a factory or workshop, must be sent to the inspector and to the certifying surgeon for the district, the same provisions applying in this case as in that of accidents.

If in any factory or workshop where grinding, glazing, or polishing on a wheel, or any process is carried on by which dust, gas, vapor, or other impurity is generated and inhaled to an injurious extent, the inspector may direct that a fan or other mechanical means of construction for preventing such inhalation be provided within a reasonable time.

In every factory where lead, arsenic, or any other poisonous substance is used, suitable washing conveniences must be provided; and in any such factory where dust or fumes are generated a person is not allowed to take a meal or remain during meal time. In such cases provision must be made for enabling persons to take their meals elsewhere.

Special provisions also exist concerning women, young persons, and children, restricting their employment in wet-spinning; prohibiting their employment in certain factories and workshops; and prohibiting their taking meals in certain parts of factories and workshops.

Where the secretary of state is satisfied that any manufacture, machinery, plant, process, or description of manual labor, used in factories or workshops, is dangerous or injurious to health, life, or limb, either generally or in the case of women, children, or any other class of persons, he may certify the same to be dangerous and make such regulations, under this act, as appear to him to be reasonably practicable and meet the necessities of the case. Before making such regulations he must publish a notice of the same and allow not less than twenty-one days for the receipt of objections from those affected. These regulations may, among other things:

1. Prohibit the employment of, or modify or limit the period of employment of all persons or any class of persons in any such manufacture, etc.
2. Prohibit, limit, or control the use of any material or process; and
3. Modify or extend any special regulations for any class of factories or workshops contained in the factory act.

A breach of the above-mentioned regulations incurs a fine not exceeding £10 ($48.66), and in case of a continuing offense, not exceeding £2 ($9.73) for every day during its continuance after conviction therefor. The act also prescribes the manner in which the regulations made by the secretary of state should be published.

In addition to the provisions of the Factory Act above described, there are many special modifications and extensions which apply to tenement factories, cotton-cloth and other humid factories, bakehouses, laundries, docks, buildings, and railways, and to home work, but which space will not permit us to consider here.

The administration of the factory laws and the enforcement of their provisions are entrusted to the Secretary of State for the Home Department.

Administration

The law, instead of creating an inspection service and specifying the number of officials, leaves to this officer the determination of the number of inspectors that may be required, their salaries, official designation, etc. The law reads that the secretary of state from time to time, with the approval of the treasury as to numbers and salaries, may appoint such inspectors under whatever title he may from time to time fix, and such clerks and servants as he may think necessary for the execution of this act, and may assign to them their duties and award them their salaries, and may constitute a principal inspector with an office in London, and may regulate the cases and manner in which the inspectors, or any of them, are to execute and perform the powers and duties of inspectors under this act, and may remove such inspectors, clerks, and servants.

Besides the enumerated general powers and duties, the inspectors have others of importance which are mentioned in connection with the statement of the special provisions of the acts. Such, for example, are those of taking action when the sanitary authorities are in default; of taking part in proceedings at inquests; of enforcing the truck acts, etc.

All offenses under the factory acts are prosecuted and all fines recorded before a court of summary jurisdiction in the manner provided by the summary jurisdiction acts. The attempt to reproduce the provisions of the acts regarding the methods of procedure, admissibility of evidence, etc., would necessitate the statement of details to a greater extent than is warranted by the scope of this article.

Prosecutions

Germany

The first important step in the direction of factory regulation in Germany was made by Prussia, through the act (*Regulativ*) of March 9, 1839, which prohibited the regular employment of children under nine years of age in mines, factories, stamping-mills, blast-furnaces, etc.; limited the maximum working day for young persons under sixteen years of age to ten hours, and prohibited their employment at night or on Sundays and holidays. There were also a number of provisions making it obligatory upon employers to take certain precautions for the maintenance of the health and morality of the employees. It thus contained many of the features of the modern factory act.

In 1845 a very decided advance was made in the enactment of a general labor law, bearing date of Jan. 17th of that year, which made further provisions for the benefit of employees. Feb. 9, 1849, other important changes were introduced by an order in council. This order declared that no person should be compelled to work on Sundays or holidays, provided for the establishment of industrial councils, and ordered that the hours of labor for journeymen, helpers, apprentices, and factory employees should be fixt by these councils. It also prohibited the truck system and required wages to be paid in cash.

A further advance was made by the law of May 16, 1853. The minimum age at which children could be employed in factories was raised to twelve years, and the hours of labor of children under fourteen years of age were limited to six per day. Other provisions of the law regulated the granting of periods of rest, the times of beginning and ending work, school attendance, etc. Finally, power was given to the authorities to appoint factory inspectors to enforce the law, if they deemed it advisable to do so.

In the following fifteen years but little or no change was made in the labor legislation of Prussia. After the founding of the North German Confederation, however, a general labor code, embodying, with some changes, the then existing Prussian legislation, was enacted June 21, 1869. Upon the creation of the German empire this law was gradually extended to the other states of the empire, and remains today, though with important amendments, the fundamental law regulating labor in Germany.

The first of these amendments introducing other than minor modifications was the law of July 17, 1878. This law made a number of radical changes, the most important of which were those in relation to the employment of women and the protection of the health and lives of factory employees. For the first time the labor of women was subjected to special conditions, through the provision that women could not be employed for the three weeks after their confinement, and through the large powers given to the Bundesrat to regulate or prohibit their employment in industries detrimental to their health, or at night in certain trades.

In 1884 a special law was passed to regulate match factories, and in the same year the duties of employers with regard to the provision of safety appliances and the prevention of accidents were further defined by the accident insurance law of that year.

In 1890 was held the famous International Congress in Relation to Labor Legislation, summoned at Berlin by the emperor for the purpose of considering the whole question of protective labor legislation. The work of this congress led to the enactment of the law of June 1, 1891. This law, which embodies most of the changes recommended by the German representatives at this congress, subjects the employment of women and children to a far more rigid regulation than ever before attempted; lays down in a definite manner the conditions under which Sunday labor is permissible; contains provisions concerning the framing of factory regulations, the making and breaking of the labor contract, and the payment of wages, and generally revises the whole labor code in the direction of subjecting labor to a more rigid legislative control.

Other important acts, apart from those relating to insurance, were those of July 29, 1890, and June 30, 1901, concerning the creation of tribunals for the arbitration of labor disputes; the Act of June 30, 1900, making certain changes in and additions to the industrial code; the Act of March 30, 1903, regulating the employment of children and the Act of May 10, 1903, prohibiting the use of yellow sulphur in the manufacture of matches or other inflammable materials.

The changes effected by the Act of June 30, 1900, affect the provisions of the industrial code governing establishments requiring special authorization; the fees charged by employment agencies; Sunday and holiday labor; workingmen's pass-books; labor contracts, and rest periods for young persons. An important addition to the industrial code consists of regulations governing employment in stores and shops for the sale of merchandise. They limit the hours when such establishments may be open for traffic; require employers to compel assistants and apprentices under eighteen years of age to attend continuation schools, and to establish working regulations to be approved by the authorities; regulate the infliction of fines upon employees, etc.

Before entering upon a statement of the provisions of the industrial code regarding particular subjects regulated, some explanation should be given of the general scope of that part of it now to be considered which constitutes factory legislation proper. The labor code, as a whole, relates to almost all kinds of industrial work with the exception of transportation, agriculture, the fisheries, and mining; and different parts of the code relate to different categories of work. The regulations concerning such subjects as the employment of women and children, the making of shop regulations, etc., are restricted to a definite class of factories (*Fabriken*). Whether a particular establishment will be deemed to be a factory must be determined in each case according to the particular circumstances, such as the number of persons employed, the importance of the work carried on, the use of machinery, etc. In case of dispute the matter is decided by the courts.

Factories and Workshops

The term factory, moreover, is used with a different signification in different parts of the code treating of factory regulations. Thus the provisions concerning the framing and posting of shop rules apply only to factories employing at least twenty persons. On the other hand, the provisions regarding the employment of women and children are made to apply to "employers and employees in all work places (*Werkstätten*) in which mechanical power (steam, wind, water, gas, electricity, etc.) is employed otherwise than temporarily," subject to the power of the Bundesrat to make exceptions in certain cases. It is also expressly provided that an imperial decree can extend these provisions to classes of work which are not carried on in places which can be called factories, as well as to building operations, with the exception that they cannot be made to relate to a person employing only members of his or her own family. In point of fact, this power has been exercised but once, when the industry of clothing and underwear making was subjected to these provisions of the code.

An exceedingly broad application has been ordered of those sections relating to the protection of the lives and health of employees. They are made to relate to practically all kinds of industrial work, whether carried on in factories or not, and

thus embrace places in which the handicraft trades are prosecuted. They do not refer, however, to such industries as mining and transportation, for which special regulations are provided by other laws.

Each factory law enacted has required the taking of more stringent precautions for the prevention of accidents and the protection of the health of employees than its predecessors. Prior to 1891 these requirements were for the most part exprest in general terms, that all needful precautions should be taken. The law of 1891 reproduces these provisions, but also mentions more specifically the measures that must be observed.

Employers must so install and maintain their machinery and appliances that the lives and health of employees are protected as far as possible. They must in particular see that there are provided sufficient light and air; that injurious dust and gases are removed; that dangerous machinery is properly guarded; that precautions are taken against fire, and that regulations to this effect are prepared and enforced.

Employers must also see that all needful precautions are taken, when both men and women are employed, to protect the morality and good conduct of employees. They must, as far as possible, separate the two sexes; provide separate lavatories and dressing-rooms for the two sexes when the nature of the work requires the employees to change their clothes after finishing their work, and provide a sufficient number of water-closets, so arranged that they can in no way lead to improper conduct on the part of the employees.

Prevention of Accidents and Protection of Health of Employees

Where persons under eighteen years of age are employed, special precautions must be taken for their protection. In the case of industries presenting unusual danger to life or health, or of such a nature as to make them nuisances to their neighbors, special permission for their operation must be obtained from the authorities, and these officers can make such regulations regarding their location and methods of work as they deem proper.

To insure compliance with these provisions, the police authorities have the power to order such changes in the methods of work in individual establishments as they deem proper. An appeal from these orders can be made, first, to the superior administrative authorities, and then to the central government. The police authorities can also require employers to provide, without expense to the employees, suitable places, properly heated during cold weather, and apart from the workrooms, where the latter can eat their meals.

Unless the orders issued refer to some imminent danger to life or health, time must be allowed to employers in which to comply with the orders. In the case of establishments existing at the time of the passage of this law, orders for considerable alterations cannot be issued, unless they are necessary for the removal of a serious menace to life, health, or morality, except in the case of rebuilding or the making of extensive additions to the establishment.

Finally, and most important of all, the Bundesrat is given the power to draw up detailed regulations, setting forth the manner in which particular industries must be carried on. In the case of those industries where the Bundesrat does not make use of this power, the central authorities of each state (*Landes-Centralbehörde*) can take action, and in case of non-action by them the police authorities can prepare such regulations. Before doing so, however, they must give the trade associations (*Berufsgenossenschaften*) interested an opportunity to express their opinion regarding the proposed action.

The Bundesrat has also the power of prescribing the duration and time of beginning and ending work in establishments where the working of long hours is believed to be injurious to the health of the employees.

At the present time orders have been issued by the Bundesrat in respect to the following industries: Match factories, July 8, 1893; lead-paint and sugar-of-lead works, July 8, 1893, May 26, 1903, August 24, 1903; cigar factories, July 8, 1893, August 24, 1903, April 9, 1905; alkali chrome works, Feb. 2, 1897; printing-offices and type-foundries, July 31, 1897; establishments for the manufacture of electrical accumulators by means of lead or lead compounds, May 11, 1898; the hair-goods industry, Jan. 28, 1899, and Oct. 22, 1902; slag-crushing establishments, April 25, 1899, and Nov. 15, 1903; zinc-smelting works, Feb. 13, 1900, and July 5, 1901; establishments for vulcanizing india-rubber, March 1, 1902; quarries and stone-cutting establishments, March 20, 1902; lead-smelting works, June 16, 1905; manufacture of paints, varnishes, etc., June 27, 1905.

The number of hours per day that an adult may work is not limited by law, but the Bundesrat has power to fix the time that work shall begin and end and the maximum duration of a day's labor in industries in which long hours are deemed especially injurious to the health of employees. Orders fixing hours of labor for adult labor by virtue of this power have been issued by the Bundesrat in respect to bakeries and confectioneries, lead paint and sugar-of-lead works, the manufacture of electrical accumulators, slag-crushing establishments, establishments for vulcanizing india-rubber, and lead-smelting works.

The hours of labor of women and children are considered elsewhere.

The question of shop rules or regulations received considerable attention by those having charge of the framing of the Law of 1891, and important provisions concerning it were incorporated in the law. Prior to the passage of this act great complaint was made by the employees that not only were the regulations governing the conduct of work in each establishment framed by the employer in an arbitrary manner, but that, owing to the fact that they were often not reduced to writing, the employees had no way of knowing exactly what the regulations were, nor when they would be changed.

Factory and Workshop Rules

To remedy this the Law of June 1, 1891, provided that in every industrial establishment in which twenty or more persons were employed a set of shop rules or regulations should be prepared, and that these regulations, as far as they were not contrary to law, should constitute an integral part of the labor contract. These regulations must be dated, signed, and posted where they can easily be seen by the employees, and a copy must be given to each employee upon his entering the service of the establishment. Special regulations can be prepared for particular branches of the work. The regulations do not enter into force until two weeks after they are posted.

Tho the main purpose of this law is to make the conditions of labor certain and generally known, the law also specifies the essential points that must be covered by the regulations. They must contain provisions concerning the hours of

beginning and stopping work and the intervals allowed adult employees for rest; the manner of fixing wages and the times of their payment; the notice required in terminating the labor contract and the grounds upon which it can be dispensed with; the kinds and amount of fines, the manner in which they are levied, and when they are money fines, the method of their collection and the purpose for which they are employed; and the disposition that will be made of money retained on account of the improper breaking of the labor contract.

The law limits the amount of fines that can be levied to not more than one half the average daily earnings of the employee, except that, in cases relating to the punishment of acts of violence toward fellow-workers, serious transgressions against good morals, or against the orders of the establishment for insuring the safety of the establishment or for the enforcement of the regulations enacted for the carrying out of the provisions of the industrial code, the fines may equal the full amount of the average daily earnings. No fines or penalties can be imposed which are hurtful to the sense of honor or good morals of the employees. In all cases the proceeds from fines must be expended for the benefit of the employees of the establishment in which they are levied. This provision of course does not refer to compensation obtained by employers on account of damages sustained.

The fines levied must be entered in a register kept for that purpose. The entry must show the name of the person fined, the date, cause, and amount of the fine, and the register must be open at all times to the inspection of the proper authorities. The penalties must be fixt without delay and must be made known to the employee.

Causes for dismissal or giving up of work other than those specified in the factory regulations or in the law cannot be agreed upon in the labor contract, nor can penalties other than those provided for in those regulations be imposed.

It will be observed from the foregoing that, with the exception of the matter of fines, the law merely fixes the points to be covered, but leaves the parties quite free in determining their exact nature. The Law of 1891, however, contains a very important provision in its requirement that the working men shall be given an opportunity to be heard in the framing of the regulations or of supplements thereto. The law thus provides that before the regulations are promulgated the adult working men of the establishment shall be given an opportunity to make known their wishes regarding them.

In a considerable number of the more important industrial establishments permanent working men's committees (*ständige Arbeiterausschüsse*) had been voluntarily created by the employers for the purpose of having a body which could represent the collective interests of employees. The law recognized the utility of these institutions, and provided that where they were in existence their advice should be taken in the formulation of the regulations. In their absence certain other working men's organizations, such as the committees for the management of the sick funds, when the majority of their members were elected from among the working men, could act in this capacity as the representatives of the employees.

Working men's Committees

If there is a permanent working-men's committee, and its consent is obtained, provisions can be introduced in the regulations concerning the operation of factory institutions created for the benefit of the employees and the conduct of minors outside of the establishment.

Though the employers must thus afford their employees an opportunity to be heard in regard to the framing of the factory rules, they are not bound to conform to their wishes in any respect. Experience, however, has demonstrated that the opportunity to be heard is nevertheless a valuable one for both parties. Conditions that would lead to trouble are often foreseen and modified, and points of little moment to the employers, and yet objectionable to the employees, are frequently eliminated.

Inspection of Factories

The duty of creating a service for the inspection of factories and the enforcement of the law in relation to them is left to the individual states. Formerly each state was left free to determine whether the execution of the factory laws should be left to the ordinary police or local administrative authorities, or special officials should be appointed for that purpose. The Law of 1891 changed this and made it obligatory upon the states to appoint special industrial councilors and inspectors (*Gewerbeaufsichtsbeamten*). Each state thus possesses its own particular service, and fixes the powers and duties of its inspectors and their relation to the local police authorities. The general law of the empire, however, provides that these officials shall have the right to enter and inspect all industrial establishments at any time, and the employers are bound to furnish them such statistical information as the Bundesrat or provincial authorities may require.

The inspectors must furnish annually to their governments reports setting forth the manner in which they have performed their duties. These reports must be transmitted in their entirety or in abstract to the Bundesrat and Reichstag. From the information contained in them the central government prepares and publishes an annual report under the title of "Amtliche Mittheilungen aus den Jahresberichten der Gewerbeaufsichtsbeamten." A number of the individual states also publish the reports of their inspectors independently.

In addition to this regular service for the inspection of factories the accident insurance institutions can appoint special officers to oversee the observance of those provisions having for their object the prevention of accidents.

France

If exception be made to certain decrees and ordinances concerning dangerous and unhealthy establishments, made in the interest of the public health, the first act passed by France in relation to the conditions of labor in factories was that of March 22, 1841. This law, entitled "An act in relation to the employment of children in factories, mills, and workshops," was an advanced measure for that period. In it were embraced, at least in principle, most of the features contained in modern factory legislation. It, however, was never enforced except in the feeblest manner. With the exception of one or two departments, its provisions were almost wholly disregarded.

The Republic of 1848 was marked by renewed activity in the enactment of social legislation. Its most important action in the direction of the regulation of industrial work was the decree of March 2, 1848, by which the radical step was taken of limiting the hours of labor of adult males. By it the maximum duration of a day's labor was fixt at ten hours for Paris and eleven hours elsewhere in France. This decree was succeeded by the Law of Sept. 9, 1848, which is still in force. By it, tho the principle of the regulation of adult labor was left untouched, its application was limited to factories and workshops, as regulated by the Factory Act of 1841. The maximum hours of labor that could be worked by employees in these establishments was changed to twelve for all France. This law, like that of 1841, remained practically a dead letter for want of offi-

cials to supervise its execution until 1883, when a law, passed Feb. 16th of that year, made its enforcement a part of the duties of the factory inspectors.

In the meantime the Factory Act of 1841 remained unchanged, and was seldom enforced during a period of over thirty years. The Third Republic, however, as one of its first measures of labor legislation, enacted the Law of May 19, 1874, by which the system of factory legislation was thoroughly reorganized, and means, tho inadequate, provided for its enforcement.

Altho this law constituted a great advance over the one it replaced, it presented defects and omissions that became more prominent as production upon a large scale developed. The constantly growing demand for the further restriction of the employment of women and children, the maintenance of better hygienic conditions in factories, and the provision of more effective means for preventing accidents, led finally to its repeal and the enactment in its place of the Law of Nov. 2, 1892, which, as amended by the Law of July 11, 1903, is now in force. The Law of Nov. 2, 1892, was supplemented in the following year by the Act of June 12, 1893, which relates to the hygiene and security of workers in industrial establishments.

This act was also amended by the Act of July 11, 1903, which added a number of other classes of establishments, which now come within the scope of the law.

The Act of Nov. 2, 1892, with its amendment, relates to the employment of women and children and to the inspection of factories. As the employment of women and children is treated elsewhere, it will not be considered here. The paragraphs which follow will deal, therefore, with the Law of 1848 as amended by the Act of March 30, 1900, concerning the hours of labor of adult males; the Act of Nov. 2, 1892, as amended by the Act of July 11, 1903, as far as it relates to the inspection of factories, etc.; and the Act of June 12, 1893, as amended by the Act of July 11, 1903, relating to hygiene and security.

Factories and Workshops

The Act of Sept. 9, 1848, as amended by the Act of March 30, 1900, provides that the hours of labor of male adults must not exceed twelve per day in establishments employing male adults only. In factories and workshops employing also women and children the hours of labor at present must not exceed ten per day. The administration has power to designate by order these industries which by reason of the nature of the industry, or causes beyond control, should be exempt from the provisions of this act. The penalty for violating the act is a fine of from 5 to 100 francs ($0.97 to $19.30). By virtue of the power given to it as above indicated, the government has issued various decrees from time to time enumerating industries and kinds of work which are exempt from the provisions of this law. These orders have all been replaced by a decree issued March 28, 1902, which is now in force, which indicates the industries in which exceptions may be made and the extent to which the daily hours of labor may be increased.

Hours of Labor

The Act of June 12, 1893, as amended by the Act of July 11, 1903, for the protection of the health and the safety of employees applies to mills, factories, and workshops of all kinds, laboratories, kitchens, wine-cellars, warehouses, mercantile establishments, offices, and enterprises for the loading and unloading of merchandise, and their dependencies, both public and private, religious or secular, including educational and benevolent institutions. The single exception is that of establishments where only members of the same family work under the direction of the father, mother, or guardian. If, however, any such domestic workshop makes use of a steam-engine or mechanical motor, or the work there carried on is classed among the list of dangerous and unhealthy industries, the inspectors of factories can prescribe the measures of health and security that must be observed in conformity with the provisions of this act. A statement of the main provisions of the act follows:

Prevention of Accidents and Protection of Health

All establishments comprehended under the act must be maintained in a constant state of cleanliness, be properly lighted and ventilated, and present all the conditions of safety and salubrity necessary for the health of the employees.

In all establishments containing mechanical apparatus the wheels, belts, gearing, or other machinery that may be a source of danger must be guarded in such a manner that access to them by the employees shall be impossible except for the needs of the service. Shafts, trap-doors, and openings must be railed in. Machines, engines, tools, and means for transmitting power must be installed and maintained in such a way as to afford every possible protection against accidents. All of these foregoing provisions are applicable to theaters and other similar establishments where use is made of mechanical apparatus.

The government shall, upon the advice of the consulting committee of arts and manufactures, determine by special orders (1) the general measures of hygiene and protection that must be taken by all establishments, and notably in regard to lighting, ventilation, drinking water, privies, removal of dust and vapors, precautions against fire, etc.; (2) special provisions that may be necessary regarding certain industries or certain methods of work.

The consulting committee of public hygiene must be called upon for its advice in regard to all orders respecting establishments generally.

The inspectors of factories are given the same power for enforcing this act as they have in regard to the Act of 1892. In all cases, however, where they find that the provisions of the law or government orders are not complied with, they must first notify the proprietor of this non-observance of law by entering the fact upon the register of the establishment, make such order as is required, and fix the time, not less than one month, within which it must be complied with. The proprietor can appeal against this order to the minister of commerce during the next fifteen days after the receipt of the notice. If the change necessitates important modifications, the latter can, after having taken the advice of the committee of arts and manufactures, permit a delay in making the change, which, however, can in no case exceed eighteen months. When this is done the inspector must be duly notified.

The method of enforcing this law is much the same as that of the Law of 1892. Infractions of the law are prosecuted before the police court and are punished by fines of from 5 to 15 francs ($0.97 to $2.90). The judgment must also indicate the time within which its order must be complied with. In case the judgment is not obeyed, the correctional tribunal can order the closing of the establishments. For a second offense fines of from 50 to 500 francs ($9.65 to $96.50) can be imposed for each infraction of the law, or a total of 2,000 francs ($386).

The above provisions for the inspection of establishments do not apply to establishments conducted by the State, for which special regulations are made by the Government.

The inspectors are required to make detailed annual reports concerning the application of the law in their districts. The reports must make mention of all accidents to working men and their causes, and contain recommendations for such new regulations as they deem to be desirable. The minister of commerce and industry is directed to make an annual general report, giving a summary of their contents.

Every accident occurring in an establishment subject to the Law of 1893 which results in an injury to one or more working men must be reported by the employer within the next forty-eight hours to the mayor of the commune. This notice must contain the names and addresses of the witnesses to the accident, and have attached to it a certificate of a physician, to be procured

by the employer, showing the nature and probable effects of the injury and the time when it will be possible to know the definite results.

Reporting and Investigation of Accidents

Upon the receipt of this notice the mayor must make an investigation of the accident in a manner to be determined by an order of the government. The mayor must also acknowledge the receipt of the notice, and likewise inform the divisional or departmental inspector of the occurrence of the accident.

Undoubtedly one of the most important features of the Act of 1893 was that whereby provision was made for the first time for an effective system of factory and workshop inspection. Under the Law of 1874 the division inspectors were appointed by the central government, the selection of the departmental inspectors being left to the departments, which might or might not make such provision as they deemed desirable. This defective system was radically changed by the Law of 1893. Provision is there made for a corps of factory inspectors, wholly dependent upon the central government, consisting of division and departmental inspectors appointed by the minister of commerce and industry. Their number, salaries, and districts are determined by decrees issued upon the recommendation of the committee of arts and manufactures and the superior council of labor—a body created by this act.

The departmental inspectors are under the authority of the division inspectors and can be either male or female. All inspectors must make oath that they will not reveal any secrets of manufacture or, in general, any operations that may come to their notice in the exercise of their functions.

No person can be appointed an inspector until he has successfully passed the competitive examination held for that purpose by the superior council of labor. Definite appointment is not made until after a probationary period of one year has been served.

Inspection of Factories

The inspectors are specifically given the duty of enforcing not only the Act of 1892, providing for their appointment, but also the Act of Sept. 9, 1848, in relation to the hours of labor of adults, and the Act of Dec. 7, 1874, in relation to the employment of children in traveling shows. When the Act of June 12, 1893, was passed in relation to the hygiene and security of working men, its enforcement was likewise entrusted to these officials. In all matters, however, that concern mines and quarries the execution of the laws is entrusted exclusively to the corps of mining engineers, who for this service are placed under the authority of the minister of commerce and industry.

In the performance of their duties inspectors have the right to enter all establishments coming under the provisions of the Law of 1892, and to inspect the different registers, shop regulations, and employees' pass-books and certificates of physical fitness. All contraventions of the law reported by the inspectors shall be considered as proved until the contrary is shown. These reports of infractions of the law must be made in duplicate, one copy being sent to the prefect of the department and the other filed in the office of the public prosecutor. The above provisions do not modify in any way the common law regarding accusations and prosecutions for violations of the law.

The inspectors are also given the duty of preparing statistics showing the condition of industrial labor in their districts. A general report giving a summary of the reports of inspectors must be published annually under the direction of the minister of commerce and industry.

FACTORY SYSTEM, THE: Altho what is called "the factory system" is a product mainly of the close of the eighteenth century, and of the application of machinery and steam-power to industry, factories existed in Greece and Rome and in the older civilizations of Egypt, Assyria, India, and China. In the later Middle Ages they developed in all the industrial cities in connection with the Gilds. In the Elizabethan Age they are said to have multiplied in England. But these establishments were not factories in the modern sense. In ancient civilizations they were slave shops, where the slaves worked under a taskmaster; in medieval days they were shops where the master workman labored with his apprentices and his journeymen.

The first factory in the modern sense seems to have been a silk factory, built by Sir Thomas Lombe, in Derbyshire, in 1719. Through all the eighteenth century factories multiplied in England as industries became localized in certain localities or sections. The main cause, however, of the development of the present factory system was the invention of machines and the application of steam-power in production, necessitating the carrying on of industry in buildings especially adapted to the purpose and in connection with an ever-increasing plant. A realization of what a change this meant in production can be seen by the following picture of the woolen trade before the development of the factory system:

> The work was entirely domestic, and its different branches widely scattered over the country. First, the manufacturer had to travel on horseback to purchase his raw material among the farmers, or at the great fairs held in those old towns that had formerly been the exclusive markets, or, as they were called, "staples" of wool. The wool, safely received, was handed over to the sorters, who rigorously applied their gage of required length of staple and mercilessly chopped off by shears or hatchet what did not reach the standard as wool fit for the clothing trade. The long wool thus passed into the hands of the combers, and, having been brought back to them into the combed state, was again carefully packed and strapped on the back of the sturdy horse, to be taken into the country to be spun. . . . Here, in each village, he had his agents, who received the wool, distributed it among the peasantry, and received it back as yarn. The machine employed was still the old one-thread wheel, and in summer weather on many a village green might be seen the housewives plying their busy trade, and furnishing to the poet the vision of contentment spinning at the cottage-door. Returning in safety with his yarn, the manufacturer had now to seek out his

weavers, who ultimately delivered to him his cambiets or russels, or serges, or tammies, or calimancoes (such were the leading names of the fibers) ready for sale to the merchant or delivery to the dyer (James, "History of the Worsted Manufacture," p. 323; quoted by R. Whately Cooke Taylor, "The Modern Factory System," pp. 61, 62).

With the use of machinery this was all changed. All the processes were gradually brought together in factories, and men, women, and very soon children were gathered together to tend the machines. The first factories were of the rudest description, and the employees were worked the longest hours and without the least regard to health or morality. It was the day of absolute *laissez faire*. There were no factory laws and experience had not taught that it pays the employer to consider the needs and health of his employees. Men and women were worked like cattle and housed worse than the cattle. Women, since they would work cheaper, displaced men, and children soon displaced women. The horrors of the early factory system to-day can scarcely be credited. Yet the facts are proved by the unquestioned evidence of parliamentary commissions and English Blue-Books. See FACTORY LEGISLATION.

In the United States the factory system was not developed till the nineteenth century. It was the policy of England to prevent her American colonies from having machinery, in order to keep them dependent upon the trade of the mother country. The first spinning-jenny seen in America was exhibited in Philadelphia in 1775. Efforts at a factory were made at Worcester, Mass., in 1780. Parliament, however, enacted strict laws, forbidding, under severe penalties, the export of machinery from England. After the War of Independence machinery was rapidly developed. The first textile factory was erected at Beverly, Mass., in 1787. Samuel Slater, whom President Jackson called "the father of American manufactures," erected the first factory with power machinery at all adequate in Pawtucket, R. I., in 1790. In 1794 Eli Whitney, of Massachusetts, invented in Georgia the cotton-gin. Only gradually, however, did the factory system replace home industries. Women preferred to work in their homes, and reluctantly entered the factories. The early factory employees were drawn from the American families in the neighborhood, and from the most intelligent homes. The spirit and intelligence of the factory girls of Lowell and other New England towns are well known. But gradually conditions changed. Factories grew larger and larger. The duties of the employees grew more and more merely technical. Immigration set in. Factory populations developed. The moral tone of the factory was lowered. Uneducated girls and families, being able to do the merely manual work of tending the machines, were employed. Gradually the factory system, as we know it to-day, was developed.

United States

Whether the factory system has been a step forward or backward is hotly argued. To many earnest reformers the factory is "the factory hell." Says Robert Blatchford, the socialistic author of "Merrye Englande":

> What are the invariable accompaniments of the factory system?
>
> Foul air, foul water, adulterated foods, dirt, long hours of sedentary labor, and continual anxiety as to wages and employment in the present, added to a terrible uncertainty as to existence in the future.
>
> Look through any great industrial town in the colliery, the iron, the silk, the cotton, or the woolen industries, and you will find hard work, unhealthy work, vile air, overcrowding, disease, ugliness, drunkenness, and a high death-rate.

Even Mr. Hobson ("Evolution of Modern Capitalism") argues that the factory system breaks up family life. He says (pp. 319, 320):

> Before the industrial revolution women were quite as busily and numerously engaged in industry as now, and the children employed in textile and other work were often worked in their own homes with more cruel disregard to health and happiness than is now the case. Even now the longest hours, the worst sanitary conditions, the lowest pay, are in the domestic industries of towns which still survive under modern industry. But tho the regular factory women and the half-timers are generally better off in all the terms of their industry than the uninspected women and children who still slave in such domestic industries as the trimmings and match-box trades, the growing tendency of modern industry to engage women and children away from their homes is fraught with certain indirect important consequences. Home work is consciously slighted as secondary in importance and inferior because it brings no wages, and if not neglected, is performed in a perfunctory manner, which robs it of its grace and value. This narrowing of the home into a place of hurried meals and sleep is, on the whole, the worst injury modern industry has inflicted on our lives, and it is difficult to see how it can be compensated by any increase of material products.

Evils of the System

There is, however, another view, the contrary of this. Mr. Carroll D. Wright argues in the American supplement to the "Encyclopædia Britannica" (article "Factory") that the system, tho by no means perfect, is far in advance of previous methods of production. He says:

> As to the assumption that the factory tends to destroy domestic ties and habits, it may be said that this charge against the factory grows out of another assumption: that the cottage of the domestic worker was the ideal home. It is poetry which calls such home a cottage; history rather calls it a hut. The home of the worker of old was the workshop also, and the wheels or looms disputed with the inmates for the room. Small, close, crowded, with bad air and bad surroundings, the hut was occupied day and night by a class which cannot find its kin under the factory system, for the operative of to-day, as a rule, occupies a home, even in the factory, tenement, or boarding-house, superior in every sense to the home of the domestic worker. The morals in all respects under the individual system were greatly below those of the factory operatives of to-day. The evils which became apparent during the early days of the factory system were simply the results of bringing together the labor which had become pauperized under the domestic system, and in agricultural districts. The employment of young children is now forbidden by law wherever the factory has gained a strong foothold. The factory has not so much destroyed the home as it has enabled members of broken families to earn a livelihood. If it has at times taken the mother from the care of her young children—the worst feature of the employment of married women—it has enabled more who had no home to become self-supporting. . . . If it could be shown that the factory leads to intemperate habits, it would follow conclusively that it is productive of unthrift and poverty—the sure conditions resulting from intemperance. It is true that a great deal of drunkenness exists in factory towns and among factory operatives; it is not true that the factory is the creator of this.
>
> The charge that the factory feeds prostitution and swells the criminal lists is absolutely unfounded. This impression first grew from the condition of Manchester, England, where a large cellarage population, which has entirely disappeared, was attributed to the factory. It has been shown by the returns from the penitentiary of Manchester that the ranks of prostitution were not fed from the factory, eight only out of fifty coming from the factory, and twenty-nine out of fifty from domestic service.
>
> The impression that the factory tends to intellectual degeneracy is a greater fallacy than the preceding. Through the simplification of mechanical processes ignorant labor is congregated in factory centers, but, as we have said, it is not created nor induced by the factory. The fact that ignorant masses are enabled by the factory to engage in what it once took skilled labor to perform has given the wide-spread impression that the factory has degraded the skilled, when the truth is, it has lifted the unskilled; and this is the inevitable result of the factory everywhere. Certainly it is better for the persons engaged than the filthy little shop, occupied by a few foul-talking people, which characterized the domestic system. Instead of dwarfing the minds and the skill of the skilful, as is often alleged, the factory enlarges the minds and increases the power of the unskilful. That some factory employments are injurious to health is true, but it is not true

The Favorable View

that factory employment as such, in comparison with any other mechanical employment, is unhealthy. The first requisites of a watch-factory are neatness and abundance of light. It is now recognized that no man can do his best work unless he is physically comfortable.

Modern Tendencies

In truth, a very widely extended movement has set in, wholly apart from legislation, for the improvement of the factory system (see INDUSTRIAL BETTERMENT). A few wise, far-seeing successful employers have seen that the dictates both of humanity and of practical business enterprise call for healthful, convenient, and agreeable conditions for the workers if they are to do their best work; and they have therefore undertaken to create such conditions. Such a factory as Mr. Cadbury's at Bourneville, near Birmingham, England, may be said to be a home in a park. The factory of the Natural Food Company at Niagara, N. Y., is almost an industrial palace. The work in this line of the National Cash Register Company at Dayton, Ohio, is well known. Improvements are being introduced by leading manufacturers in all countries, and a large number, tho by no means all, of the lesser manufacturers are being compelled more or less to follow their example. Many manufacturers are moving their works into the country or into model villages more or less surrounded by a park and model workmen's homes and gardens. (See GARDEN CITY MOVEMENT.) The factories themselves are being made safe, hygienic, convenient, and attractive. Bare workrooms are being decorated and made homelike. Rooms for rest and recreation are frequently provided. All sorts of cooperative, educational, and recreative clubs are organized for the benefit of the employees. Cheap, warm, and wholesome lunches are frequently provided in attractive eating-rooms. Nevertheless it must not be forgotten that these improvements are yet the exception and confined to a few trades. The sweated trades, driven out from sweating dens, are still for the most part in sweated factories. The result is that the factory, like all else, in all countries is in a state of evolution, while examples can still be found of almost every stage. Generally speaking, the smaller the factory the worse the conditions, tho the worst of all are the large factories which are bad. (See also CHILD LABOR; EMPLOYER'S LIABILITY; FACTORY LEGISLATION; HOURS OF LABOR; LABOR LAWS; MANUFACTURES; WAGES; WOMAN'S WORK, etc.)

FAIRHOPE COLONY: A colony founded in 1895 on the eastern shore of Mobile Bay, in Baldwin County, Ala., by believers in the theories of Henry George, and therefore known as "The Single Tax Colony"—the only colony of the kind in the world.

It is founded on the belief that land (which as here used means all natural resources) is of right common property; and that all men have an equal right to its use. Hence, the land and the ground rent, that which one pays for the privilege to use land, are treated as common property and used for the common good. All the public utilities are also owned and operated by the public, because they are, in the last analysis, founded upon land grants.

The colony had its inception at Des Moines, Ia., in 1894. Prominent in perfecting its constitution were E. B. Gaston, then on the staff of the *Farmers' Tribune*, and James Bellangee, a leader in reform politics.

The location was selected after much investigation, the deciding considerations being its healthfulness, mild climate, pleasantness of situation, opportunities for water transportation, and cheapness of land.

Funds for meeting initial expenses and the purchase of land were raised by a membership fee of $200 (reduced after the colony was located to $100), and mostly paid in installments of $5 monthly.

The handful of first settlers included only ten adults who actually took up their residence upon the land. The first purchase of land was 140 acres, costing about $800 and exhausting the treasury. For several years practically all of the small salary of the secretary was paid in corporation certificates, redeemable in rent and membership fees, and colonists working on roads or other public work were paid in the same way.

Starting in this humble way and overcoming many difficulties, the colony has grown steadily, attracting many sympathizers as residents and others as contributors to its progress. There are to-day about 160 residences and business buildings on the ground, with a population of about 500.

There are four general merchandise stores, drug store, millinery and ladies' furnishing store, butcher shop, two restaurants and bakeries, café and amusement pavilion, two resident practising physicians, sawmill, blacksmith shop, merchant tailor, four hotels, free public library of about 3,000 volumes, etc. An excellent free school is maintained for eight months, with an enrollment last year of over 100.

The Corporation now owns absolutely unencumbered nearly 4,000 acres of land. It has a frontage on Mobile Bay of about three fourths of a mile, and extends back about four miles. It owns an excellent school building, telephone system with twenty-two subscribers, waterworks with steam pumping plant, and a mile and a half of mains. It did own a wharf 1,800 feet long, with commodious warehouses at either end, and a large public hall; but the hall was blown down and the wharf demolished in a great storm in Sept., 1906. Most of the money to build a much better hall and library building combined has been subscribed, and the wharf has been rebuilt in much better shape than ever by a company of citizens, who will return it to the colony when paid for out of its earnings, which is expected to take from three to four years.

The city of Mobile is about fifteen miles distant across the bay. Communication with the city is by water. A fine iron-hulled steamer, the *Fairhope*, owned by the Fairhope Improvement Co., organized separate from the colony company, but whose stockholders are all members or friends, makes the trip daily in an hour and a quarter, and two other steamers at present give daily service between Fairhope and other nearby points and Mobile. The fare on the *Fairhope* is only 25 cents, and rates on freight are very low.

The land back from the bay lays exceedingly well, with a bluff about 40 feet high, and a half mile back reaches a height of 120 feet. It is said to be the highest land immediately on salt water between New Jersey and the Rio Grande. It is particularly adapted to trucking, as well as general farming and stock-raising. The agricultural development has been somewhat backward, but encouraging results are now being achieved, and agriculture is expected to become the main resource of the people.

The affairs of the colony are managed ordinarily by an executive council of five members, elected by majority vote, women having an equal vote with the men. Under the provisions of the constitution, however, on petition of 10 per cent of the members on the ground, any act of the council or any measure proposed by the petitioners must be submitted to vote of the members, and a majority governs. The rents are determined annually by the executive council subject to the provision just cited.

The colony has had dissensions—at times acute and threatening. Friction has been largely due to the fact that non-members are allowed to lease land on exactly the same terms as to rents and enjoyment of colony benefits as members, but without a vote on the election of officers, fixing of rents, or expending of revenues. A very considerable portion of the lessees are non-members. Many of these have a more or less imperfect understanding of the single-tax philosophy. Strenuous objection has been made to increase of rents, with increasing population and land values, and the corporation has been forced to sue some of its tenants—winning its cases in the courts. Some friends have severely criticized the withholding of the voting privilege from any as "undemocratic," and have charged the colony with imposing "taxation without representation" upon non-member lessees who were not given a voice in determining the rents.

The answer is that the colony is not a civil government at all, but a purely voluntary association —The Fairhope Single-Tax Corporation; that it has a perfect moral as well as legal right to fix the terms upon which others will be permitted to share in its benefits; that in contracting with non-members that they shall pay exactly the same rents as members for land of equal value, and share exactly the same in the benefits secured by the expenditure of the rent funds, it makes a proposition of unexampled liberality; and finally, that it is absolutely necessary to the existence of Fairhope as a "single-tax colony," that its final authority shall be kept in the hands of single-taxers and single-taxers who are interested enough to comply with the easy conditions of membership. Despite its differences of opinion the community is an unusually homogeneous one, displaying an ability to work together and hang together upon occasions, which is the admiration of all neighboring communities. The av-

erage of intelligence is unusual, and the reputation of the community for culture and enterprise is very high. The revenue from rents for 1906 amounted to $2,142.16, of which $937.72 was paid out for taxes, leaving the balance for local expenses. Rent of land for the current year ranges from thirty-five cents an acre per annum for much of the farm land to a little over $50 for business lots in the center of town. Fairhope is distancing all neighboring towns in rate of growth, and is generally recognized as one of the brightest, cleanest, and most prosperous towns in the South. It is thought to be the only village in the world that provides a public water supply and a public telephone system free of charge, the telephone service reaching throughout the county, which is nearly as large as the State of Delaware.

Many and varied are the effects that this policy is having upon the people and especially upon so-called well-established ideas and institutions. To illustrate: No law or rule has been adopted prohibiting the manufacture or sale of liquor, or any other objectionable business except a clause in the lease contracts which provides "that no business shall be conducted upon the premises herein leased that is objectionable to a majority of the residents on colony lands." But no one has ever even proposed to establish a saloon. No rule or law has been promulgated to the effect that men shall not buy and sell lands, but the fact that all colony lands are offered free of charge to any one who wishes to settle upon them, and the agreement in the lease which provides that all the rent shall be used for public purposes, make it next to impossible for any one to sell lands alongside colony lands at any price. This village levies no taxes and has no public debts, and yet has more public improvements and public utilities than can be found in any similar village in the whole country.

FAIR TRADE: During the period of industrial and commercial depression that prevailed in England as well as the United States from 1873–79, the idea became somewhat popular in England that the cause in the case of that country was the *unfair* condition which characterized British international exchanges; Great Britain admitting into her own ports without duty nearly all the products of foreign nations, while these same nations at the same time not only imposed heavy and often prohibitory duties on the importation into their territory of British products, but also in some instances, as in the case of the beet-root sugar of France, subsidized competition to make it possible to undersell British products in England's own market by the granting of bounties on exports.

It was therefore proposed to institute a system of *fair* trade by having England affix to each country a tariff as nearly as possible corresponding to the tariff which such country enforced against English products. The proposition gained some passing favor, but made no serious impression on England's settled policy and conviction that free trade is best. (See, however, TARIFF REFORM OF GREAT BRITAIN.) The same idea has to some extent been agitated in this country under the name of RECIPROCITY.

FALKNER, ROLAND POST: American educator; born in 1860 at Bridgeport, Conn; graduated at the Philadelphia Central High School (A.B., 1879). Entering the Wharton School of Finance and Economy of the University of Pennsylvania, he received the degree of Ph.B. in 1885. Later he studied at Paris, Berlin, Leipzig, and Halle, receiving, in 1888, the degree of Ph.D. at Halle. Becoming an instructor in the Wharton School of Finance and Economy, he was elected to the associate professorship of statistics in the same institution in 1891. The same year he was chosen statistician of the Senate subcommittee on the tariff. He was the first corresponding secretary, and is now vice-president of the American Academy of Political and Social Science, and from 1890 to 1900 he was editor of the *Annals* of the academy. He is a member of various learned societies, among them the American Economic Association and the American Statistical Association. From 1900 to 1904 he was chief of the division of documents in the congressional library; and in the latter year was appointed Commissioner of Education for Porto Rico, which position he still holds (1907). His writings are, besides numerous monographs: "Prison Statistics of the United States" (1889); "Statistics of Prisoners" (1890, 1892); a translation of Meitzen's "Geschichte, Theorie und Technique der Statistik" (1891); "The Theory and Practice of Price Statistics" (1892), etc.

FAMILISTÈRE: See GUISE; also, FOURIER.

FAMILY: By the word *family*, in sociology, is usually meant the small community formed by the permanent union of one man and one woman, or of one or more men with one or more women, together with the children born to such unions, either living in one house or forming one domestic group. This word is sometimes, however, used to include the servants or slaves belonging to the family proper, and living immediately with the family proper. Again, going to the opposite extreme, and putting the emphasis, not upon the living together, but upon the legal or the blood relation, the word is used to denote the unity of those related by legal blood relation, primarily parents and their children alone, no matter where they reside, but sometimes made to include parents, children, uncles, aunts, cousins, sons-in-law, daughters-in-law, and even still more remote connections.

Etymologically, the word, by most authorities, is derived through the Latin *familia*, from the Oscan *famel* (servus), originally signifying the servile property, the thrall of a master, and later used for all domestic property, things as well as persons, bearing only too plain impress of what we shall find to be the Roman conception of the family relation.

I.—The Origin of the Family

All sociologists find the origin of the family in general in the sexual relation, but as to the more exact form of its origin there is diversity of opinion, and we trace a development of view. Before the discussion of the question in the scientific spirit, it was generally held by orthodox tradition that the family arose by the ordering of God in the union of the first man and the first woman. When science began to study the question, and the hypothesis of evolution became prevalent, the earlier writers—McLennan, L. H. Morgan, Bachofen, Lubbock—generally taught that the sexual relation of men and women was at first one of promiscuous union, from whence the family

was a comparatively late evolution in the process of civilization, through the survival of the fittest—that is, in this case the institution or custom best fitted to preserve life. Later and more careful study by such men as Sir Henry Maine, Herbert Spencer, Charles Darwin, Peschel, Starcke, Letourneau, and Westermarck, finds that the theory of promiscuity is, to say the least, not proved, tho these writers disagree as to what to put in its place. Sir Henry Maine holds that the original communities of men may have taken "all sorts of forms" ("Dissertations on Early Law and Custom," p. 281). Darwin says:

If we look far enough back on the stream of time, it is exceedingly improbable that primeval men and women lived promiscuously together. Judging from the social habits of man as he now exists, and from most savages being polygamists, the most probable view is that primeval man aboriginally lived in communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men ("Descent of Man," ii., p. 346).

Spencer holds that the family relation evolved itself through being the relation best fitted to produce and rear children ("Principles of Sociology," vol. i., part 3, chap. 9). Starcke finds the evolution of the family the best means of enjoying property. De Coulanges finds the family, at least in Aryan races, forming around the religious worship of ancestors. The theories of Westermarck and Letourneau we shall consider later. Yet, however the authorities differ, in much they are agreed. They all hold that out of very various beginnings, more or less loose, the monogamic family has been evolved as, for one reason or another, the best (altho that this is a finality they are not agreed). They all hold that monogamy was not, as a rule, the first form. Among animals different forms of the family exist, yet the family has certainly been evolved on the plane of evolution that they have reached; why not, then, among the earliest and lowest men? Among only a few wild animals does promiscuity prevail. Strict pairing is the rule among some monkeys, ruminants, ungulates, and predatory animals; other monkeys are polygamous, but still in families. Moreover, the male animals are jealous over the possession of females. It is also well known that promiscuity tends to infecundity. Yet a study of all the facts will warn one from dogmatism as to the origin of the family, and show the variety of forms which the family relation has taken among men.

Various Theories

Of the arguments for the origin of the family in promiscuous union, Mr. Andrew Lang has made, perhaps, the best summary in his article in the "Encyclopædia Britannica." He says in brief:

At whatever epoch civilized travelers have visited peoples of less cultivation, they have noted, with unconcealed surprize, not the family, but promiscuity and polyandry. They have found men and women living together in what seemed unregulated community, or they have found that the woman had several husbands, and often that these husbands were brothers. . . . If we can trust the traditions of Indo-European and other polite peoples, they, too, once lived in a stage which can hardly be discerned from promiscuity. . . . If the practises which make kindred through males difficult or impossible to recognize were ever universally prevalent, they will have left vestiges of their existence in the custom of tracing descent through females. (Mr. Lang goes on to show such vestiges.) . . . It has been shown that the actual practises of many barbarous races make the existence of the patriarchal, and still more of the monogamous family impossible, and that the traditions of the races called Aryan, with many fragments of their customs, testify to a similar state of things in the past experiences of nations now organized on the basis of the family. . . . The Australian black fellows and the red men of North America are grouped in *local tribes*. . . . Within these local tribes there are smaller associations, variously called "clans," "families," "septs," "tribes," by travelers. They are, as a rule, governed on this principle in Australia—"All the children take after the clan of their mother, and no man can marry a woman of the same clan, altho the parties be born of parents in no way related, according to our ideas." These smaller associations which may not intermarry are named after some animal, vegetable, or other natural object. . . . The animal or plant from which each association takes its name is sacred; in America it is called the totem. . . . The question now rises, Do we meet similar associations among civilized peoples who now possess the family? (and Mr. Lang answers that we do).

Evidences of Promiscuity

For the argument for the origin of the family in other than promiscuous union we may turn to many authors, but best to Westermarck, who, in his "History of Human Marriage," has treated this portion of the subject the most fully.

He argues that the family has probably existed from the beginning of the human race, because (1), accepting the evolutionary hypothesis of the ascent of man from the lower animals, the family is found among many of the higher animals. It is here evidently an evolution; among the lower animals it has not been found. Marriage is thus rooted in family, and not the family in marriage (p. 22). Coming now to man, he finds the family existing from the start, as among the higher animals, tho more developed. He says that the asserted promiscuity of certain tribes is a mistake, and does not exist, while among the lowest tribes we find abundant proof of rude family life. If the father does nothing else, he builds the hut. The development of separate families among man and the higher animals is said to be due in part to the difficulty in getting food. They must separate to range and get food, just as later they come together in tribes for defense. Westermarck believes that the theory of promiscuity has arisen from mistakes of travelers not understanding family customs, and says that sometimes unchastity has been increased by contact with civilization. Westermarck says: "We may perhaps say that irregular connections between the sexes have, on the whole, exhibited a tendency to increase along with the progress of civilization" (p. 69). Among many savage tribes intercourse is very free among the young, but after pregnancy there is great strictness. Even in Scotland, before the Reformation, the practise of "hand-fastening" was common, whereby at the public fairs men selected female companions with whom to cohabit for a year, at the end of which period they could either leave or marry. The very extended if not almost universal custom of lending wives and sometimes children and servants among savages, Westermarck refers not to primitive promiscuous customs, but to conceptions of hospitality, the father looking upon his wife and children as property at his disposal. So too with the *jus primæ noctes*, which has so generally existed in fact if not in law; it was held as a property right belonging to the strong. The weaker families felt honored if their kings, priests, or rulers made use of their wives. This custom is very common, and has existed very recently in Russia.

Arguments against Promiscuity

Separate Families

As for the fact that relationship is usually traced through the females, Westermarck gives a long list of tribes where it is traced through the males, and says that even where it is traced through the females, there are a good many reasons that may be given for it other than that of uncertainty of the paternity. He says, for one reason, that in polygamous families, tho paternity be certain, the relation is naturally traced through the mother, to distinguish the one wife's offspring from another's. Woman has usually been considered man's property by capture or purchase. The price is often one of service, as with Jacob. Sometimes a kinswoman is given in exchange. The most common compensation is property. Among the Californian Karoks a wife was bought, unless unusually pretty and aristocratic, for half a string of dentalium shell. In British Columbia and Vancouver Island the prices range from £20 to £40; among the Kafirs, from five to thirty cows. The Damaras will give a girl for one cow. In Uganda a wife can be bought for three bullocks, or six sewing needles, or a pair of shoes. Among the Fijians the usual price is a whale's tooth or a musket. In Japan and China the bridegroom gives presents to the bride, and this is sometimes stipulated for. Among early Aryan races the bride was usually bought. In the Homeric age a maid was called ἀλφεσίβοια, one "who yields her parents many oxen." Aristotle says that the ancient Greeks bought their wives. In Germany, the expression "to buy a wife" was in use till the end of the Middle Ages. The giving of the ring in the English wedding service is said to be a relic of the same custom. In Servia, in the beginning of the present century, Black George limited the price of a girl to one ducat. Presents to the bride during courtship are said to come from the same custom. In many tribes the adulterer simply pays the husband a fine for stolen

property. Women are bought for what they can do. The Fuegians buy as many wives as possible to row their canoes.

Wives by Purchase

The purchase, by marriage, however, among all peoples has more or less disappeared. In many the price paid for the bride came to be given by the father, after he had received it, to the bride, and hence rose the custom of the dower, or settling of a "portion" by the father upon the bride. With this conception of marriage as a purchase of the wife, it is easy to see how those who could afford it should buy many wives, and polygamy became common tho not universal among savage tribes. Many North American tribes are strictly monogamic. Many Asiatic and African tribes are the same, including some of the lowest, as the Veddahs of Ceylon. But in almost all tribes it seems to be mainly a matter of money and power, since most princes have many wives. In China and most Mohammedan countries, while there may be only one wife, the law allows concubines. Polyandry is much rarer, but exists among the Aleuts, sometimes among the Eskimos. Polyandry is not unknown to the *Rig Vedas*. It seems to have existed among the Picts, and to have developed mainly in mountainous or rude climates, where women were few, and men would combine to own a wife, the one staying with her, while others would be away on excursions of chase or war. Divorce seems almost tho not quite universal. A wife that is bought can be sold, exchanged, or discarded. Such, then, according to one of the best modern authorities, is the origin of the family: *First*, the union of male and female, animal or man, to care for and defend the young—a union easily broken, where the woman, however, has considerable freedom; *second*, a union where the man rules the wife, and she is considered his property, with her children, he having obtained her, at first by capture, and later by service, exchange, or purchase, and where she is his servant, he going on to buy as many wives as he can afford to maintain; and, *thirdly*, a union rising from this into monogany, and with more liberty for woman.

M. Letourneau, in his "Evolution of Marriage," takes substantially the same ground as Westermarck in his view of the origin of the family. In the system of *totems* found in Australia, and essentially, tho under other forms, in most uncivilized communities, he sees no remnant of a time of promiscuous intercourse, or trace of descent through the mother, but rather a property institution, which in general he believes marriage to be, marrying together in general, a large number of men and women connected by one *totem*. M. Letourneau believes that evolution has proved the enduring monogamic marriage to have been thus far the most fitted to survive, but holds all evidence to-day to indicate that the marital relation is now evolving still further into one of monogamic marriage; not of enduring monogamy, but rather of easy divorce and "free-love."

II.—The Prehistoric Family

Passing, then, from the question of the origin of the family, we come next upon the question of its form in civilized society as it exists when fully developed, tho not yet in the clear light of certain history. Here we are met with two clear types, the Semitic and the Aryan.

Semitic and Aryan

The Semitic family is patriarchal and polygamous. Semitic races know little of individual liberty. They have given the world its religion; above all, its conception of a one supreme and all-powerful ruler. The family has partaken of this conception. It is founded upon obedience to one head. The wives and children are slaves; their duty is to serve and obey. Love has not been wanting, yet obedience is the fundamental relation. Yet the family is strongly developed. It is the social unit. Family relationship and descent is carefully maintained. When a man dies childless it is his brother's duty to raise children for him. (See the Levirate in Bible customs.) Land is held by families.

The Aryan family is monogamic. It is also the social unit. The family lives separately. It possesses rights and never dies. The principle and purpose for which the family is founded is the performance of the *sacra* or worship of ancestry. Personal immortality is the common faith. Ancestor worship they put first. In India Agni, in Italy Vesta meant the sacred fire burned to ancestors. Prayers to Agni and to Vesta came always *first*. There was in every home the sacred fire, never allowed to go out, always kept pure, and burning only certain woods. Near the home of the living was the home of the ancestral dead. It was one home; in one part lived the living, and in one part "lived" the dead. Around this center grew the family. Only relatives could be buried in the ancestral home. When a woman married, she left her home and her gods and joined the home and gods of her husband. Generation was not the center of the family, but the fire. The daughter was not equal to the son. The object of marriage was to bear a son who could keep up the family fire. If sterile, a man could divorce his wife and marry again; or, in Sparta and other places, introduce some one else to give conception to the wife. No woman could perform the *sacra*.

Such is the Aryan conception of the family, perhaps best given in Fustel de Coulanges's "Ancient City." This ancestral worship seems to have existed with more or less distinctness among the Hindus, Iranians, Slavonians, Greeks, and Romans.

III.—The Family in Classic Times

In classic times the family is still a religious institution, but this is not made so prominent. In the Homeric type there is great delicacy, dignity, tenderness, simplicity, love. No trace of polygamy appears. Concubinage is practised only by a few. Of domestic concubinage there is no trace. The essence of marriage lies in cohabitation, with a solemn public acknowledgment. Death alone dissolves the conjugal relation. The love of Penelope for Ulysses, the tenderness of Hector and Andromache, the heroic love of Alcester, the filial piety of Antigone, the majestic grandeur of Polyxena, the resignation of Iphigenia, the joyous, modest, and loving Nausicaa—these, says Lecky, are "pictures of perennial beauty, which Rome and Christendom, chivalry and modern civilization have neither eclipsed nor surpassed" ("History of European Morals," Am. ed., ii., p. 296). Women, however, are servants. They perform indoor work, fetch water, and grind flour. Telemachus bids his mother mind her spindle and loom and not interfere in the debates of men.

The family of the classical period proper of Greece is more religious in form and less pure in fact. Concubinage and intercourse with *hetæræ* are not only allowed by the State, but publicly favored. The wife is kept well at home. She is married by her parents. Sophocles makes a woman describe the lot of her sex by saying: "When we are grown up we are driven away from our parents and paternal gods" (*Frag. Terms*). Athenians marry Athenians. The wife cares for the house and does not share the intellectual life of her husband. For this the husband goes to *hetæræ*. Demosthenes says frankly: "We have *hetæræ* for our pleasure, wives to bear us children and to care for our households" (*κατα Νεαιρας*). Socrates asks: "Is there a human being with whom you talk less than with your wife?" (Xenophon, "Economics," iii., 12). Fidelity is required of the wife. Still the wife has some rights. She can bring action against her husband.

Greece

The Roman family was at first like the Homeric. Marriage was of three kinds: *Confarreatio*, the religious; *coemptio*, the civil; *usus*, effected by a man and woman living together for one year. The husband is the priest of the domestic altar. He is responsible for the perpetuity of the family. If his wife is sterile he can divorce her. He has the right to reject or accept the child at birth. He has the right to join his daughter in wedlock and to compel the wedlock of his son. He has the right to exclude the son from the family hearth and to introduce a stranger. He is the

Rome

judicial authority in the household, the judge of his wife. If she commit adultery he can put her to death. Over his children his power is the same. In the laws of Manu we read:

> Woman during her infancy depends upon her father; during her youth upon her husband; when her husband is dead, upon her sons; if she has no son, on the nearest relative of her husband, for a woman ought never to govern herself according to her own will (v., 147, 148).

This was true in Rome as well as India. A mother need not be asked to consent to the marriage of her only daughter. This position was true only of marriage by *confarreatio*. In *usus* and *coemptio* she had more rights; it was more of a bargain. The Roman matron, however, had dignity if not power. She was addressed as *materfamilias*, as her husband *paterfamilias*. She pronounced to her husband on entering his household "*Ubi tu Caius, ego Caia*," implying equality in dignity. She was the object of veneration. She had her place near the sacred fire. It was said to be 500 years after the foundation of the city before the first divorce occurred. The disintegration and immorality that set in under the empire are well known. Seneca says that marriage was contracted to give piquancy to adultery (*De Benef.*, iii., 16, 2, 3).

IV.—The Family in Early Christianity

The conception of marriage as a lifelong union of one man with one woman, and that outside of this any sexual relation is sinful, came in with Christianity. Christianity knows but one wife for one husband, and that while life lasts, save for the one cause of fornication. Purity is to be of the heart. He "who looketh on a woman to lust after her hath committed adultery with her already in his heart" (Mt. v. 28). Christianity does not give detailed enactment. It elevates the whole conception of woman and of marriage to a spiritual plane. Christ gives the same authority and power to the mother as the father. The two are equal and the two are one. St. Paul seems to have had a lower idea of woman. He says more than once, "For the husband is the head of the wife, even as Christ is the head of the Church" (Eph. v. 23). He commands wives to be subject "to their own husbands in everything" (Eph. v. 24). Celibacy is held to be better than marriage, tho marriage may be allowed to prevent fornication (1 Cor. vii. 2). Yet he and all the writers of the Epistles and Revelation elevate marriage by making it the symbol of the relation of Christ to the Church. Celibacy is held very high through all the early Christian centuries. (See CHURCH AND SOCIAL REFORM.) Bishops, presbyters, and deacons are forbidden marriage. They need not repudiate wives, but they must not marry. Deaconesses are to be virgins or widows. The reason for this is plain—licentiousness was the prevailing sin of the times.

The New Testament

In one respect only was woman's liberty narrowed by early Christianity. Under Rome woman had gained some freedom by relinquishing religious marriage and bargaining for freedom in the civil marriage. Christianity, by making marriage again religious and not civil, brought her legal position back to being under her husband again. The old law proclaimed liberty of divorce; the Christian declared marriage indissoluble. The Christian idea of the family pervaded later legislation. (See CHRISTIANITY AND SOCIAL REFORM.) It restrained the power of the parent, putting love in place of law. The freedom of the Roman matron was bought by her disgrace. If Christianity took away some of this freedom, it was by taking away her disgrace.

V.—The Medieval Family

The barbarians who invaded the empire honored woman. The family was pure. Domestic virtues prevailed. Salvian wrote in the fifth century (*De Gubernatione Dei*) of the Romans and the Christians, at this time largely infected by Roman impurity:

> You, Romans and Christians and Catholics, are defrauding your brethren, are grinding the faces of the poor, are frittering away your lives over the impure and heathenish spectacles of the amphitheater; you are wallowing in licentiousness and inebriety. The barbarians, meanwhile, heathens and heretics tho they may be, and however fierce toward us, are just and fair in their dealings with one another. The men of the same clan and following the same king love one another with true affection. The impurities of the theater are unknown among them. Many of their tribes are free from the taint of drunkenness, and among all, except the Slavs and the Huns, chastity is the rule.

Monogamy was universal save among the princes. Divorce was uncommon. Adultery was punished with great severity. Women accompanied their husbands on campaigns. The great invasions were migrations of families. The German family was a republic. Legally the position of woman, in the Germanic states, as they began to crystallize, was a mass of contradictions. One code grants her the right of inheritance; another denies it. One causes the wife practically to be sold to the husband; another causes her to come to him bringing a dowry. But however it was legally, morally woman was ever regarded as man's equal or superior. She was not confined to household cares. In battle she stood in the rear to inspire the warriors. In worship she stood near the priest, examined the entrails, and pronounced the verdict. In Iceland, which was never touched by Roman influence, a kiss forced upon woman was, in the twelfth century, punished with exile. Yet in other Germanic races woman was virtually a slave. In some she was immolated on the pyre of her husband.

As royal power arose and civilization became a war between robber barons, woman needed a protector. She was more and more placed under tutelage. Yet as feudalism became settled it tended to develop the family. The lord, marked off from his dependents, was more forced to seek equal comradeship with the few who were his feudal equals—his family. It tended to develop the individual family. The children, and especially the eldest son, were more honored. This developed pride of family, but lowered the condition of the dependent family. The lord often lorded it over the family of his serf. The legal recognition of the *jus primæ noctis* has been denied; but in practise the lord undoubtedly, by might, if not by right, claimed the body of the female serf. His serfs could not marry without his will.

Feudalism

When feudalism gradually disappeared the tutelage of woman was continued by habit and legal custom. Chivalry, however, honored the woman as a jewel to be guarded, and a queen to be served. Knights swore "to fear, revere, and serve God religiously; to forward the faith with all their strength, and to die a thousand deaths rather than renounce Christianity; to maintain the just cause of the weak, such as of widows,

orphans, and maidens, in a good quarrel; to expose themselves for them according as necessity required, provided it was not against their own honor, or against their king, or natural prince; that avarice, recompense, gain, or profit should never oblige them to do any action, but only glory and virtue; that they would hold themselves bound to conduct a lady or maiden; that they would serve her, protect her, and save her from all danger and all insult, or die in the attempt; that they would never do violence to ladies or maidens, altho they had gained them by arms, without their will or consent; that, above all things, they would be faithful, humble, and would never fail in their word, for any ill or loss that might thence happen to them" (Guizot's "History of Civilization," iv., 22–24). In Southern Europe the vices of the Roman Empire had more endurance. The home was degraded; woman an inferior. This was encouraged and woman corrupted by the growing licentiousness of the priests with their enforced celibacy. The Church praised first purity, then virginity, then celibacy. Marriage was a concession to the flesh. The Manichean doctrine spread that the body was evil. Eustathius, before the close of the fourth century, asserted that the married cannot be saved, and that prayers must not be offered in their houses (Lea's "Historical Sketch of Sacerdotal Celibacy," p. 61). About the year 385 the first definite rule was issued commanding perpetual celibacy for the clergy. Down to the Protestant Reformation the monk and the nun were held up as "the religious." Every kind of concubinage was practised, tho the councils thundered against it. Occasionally the Church in despair seemed to surrender and allow concubinage. Convents became brothels. The love of Abelard and Heloise is indicative:

Asceticism

> In a worldly point of view, it was better for him, as a churchman, to have the reputation of shameless immorality than that of a loving and pious husband; and this was so evidently a matter of course, that she willingly sacrificed everything, and practised every deceit, that he might be considered a reckless libertine, who had refused her the only reparation in his power (Lea, p. 283).

The Church, with exceptions, yet too few, became grossly corrupt. Cardinal Hugo said to the people of Lyons, on the occasion of the departure of Innocent IV. (1251), after a residence of eight years:

> Friends, since our arrival here we have done much for your city. When we came, we found here three or four brothels. We leave behind us but one. We must own, however, that it extends without interruption from the eastern to the western gate (Lea, p. 356).

Marriage was regarded as a sacrament, but the degradation of marriage as a carnal indulgence was more potent. The degradation of marriage led to a degraded sense of woman. This was voiced in the canon law. Woman was regarded as the means of man's fall. Man is above her, between her and God. In all respects relative to the condition of woman, the canon law copied Roman law.

VI.—The Family in Modern Times

It has been a favorite charge of Roman Catholics that the Protestant Church was founded upon lust: in England, upon the unholy passion of the king; on the Continent, upon the broken vows of a monk and nun. The truth is that one of the first blows struck by the Reformers was against the enforced celibacy of the clergy; a rule which Luther characterized as angelic in appearance, but devilish in reality. The importance of this step was enormous. The enthusiasm with which the common people greeted it was a proof of the evil of an unmarried clergy. The Romish Church, while not allowing divorce, reserved for itself the right of pronouncing marriages between relatives, within a marvelously ingenious and complicated system of prohibited decrees, as null and void from the beginning. Dispensations, too, were allowed princes and nobles. The mass of the people were left to endure the burden of evils growing out of the sacramental theory of marriage. In demanding impossible virtues, the Church opened wide the doors for all possible vices. Luther allowed divorce on the ground of adultery only; Zwingli and the Zurich ordinances for other grave reasons. Calvin took substantially the same position as Luther. Luther even allowed Philip the Magnanimous, of Hesse, for political reasons, to marry two women. The English Church, which had never been wholly under the control of Rome, was less changed, there being less to change. Enforced celibacy, however, was voted down in convocation by a vote of 53 to 22 in 1547, and marriage as a sacrament was rejected. The Puritans, revolting against the Established Church, denounced the right of the priest to marry, and declared marriage a civil contract. This was confirmed by the New England Puritans. John Robinson says: "We cannot assent to the received opinion and practise answerable in the reformed churches by which the pastors thereof do celebrate marriage publicly and by virtue of their office" ("Apology," 45). A law of Plymouth Colony (1633) required magistrates to legalize marriages. It was doubtful, however, how far the people approved of this. In 1692 the Massachusetts laws provided that marriage ceremonies might be performed by ministers, and this has become the rule in New England; but the minister performs the marriage as far as the State is concerned, not in his capacity as a minister, but as a civil officer. The Church of England, as well as that of Rome, is averse to this theory—that marriage is a civil contract—and has thus far successfully resisted the tendency to the complete secularization of marriage in England; but on the Continent it has grown rapidly with the waning power of Rome. All Protestant sects tend to look upon adultery as the only cause for divorce, while Rome allows separation, but holds that the bond, once formed, is dissoluble only by death.

Protestantism

Other influences have been at work in modern times upon the family. The Protestant Reformation, with its emphasis upon individualism, has tended to exalt the individual above the family. Says Sir Henry Maine ("Ancient Law," pp. 163, 165):

> The movement of the progressive societies has been uniform in one respect. Through all its course it has been distinguished by the gradual dissolution of family dependency and the growth of individual obligation in its place. The individual is steadily substituted for the family, as the unit of which civil laws take account. . . . We may say that the movement of the progressive societies has hitherto been a movement from status to contract.

Says President Thwing of the Western Reserve University, himself a Protestant: "The cause underlying, and in a sense all other causes [of the decay of the modern family] is that growth of in-

dividualism which is itself the direct product of the Reformation."

Such has been the legal effect of the Reformation upon the family. The family is less the social unit, and less and less so as liberalism prevails. In England the Conservative Party is said to be made up of those who have strong "family" affiliations. In regard to property, the old common law gave all property to the husband, and tho this has been steadily modified, great injustices are yet done to woman in the name of law. (See Woman's Rights.) Protestantism, however, while it has tended to exalt the individual over the family, and to give the woman a standing at least more equal with the man, cannot as yet be accused of having hurt the family life. Nowhere in the world has there been purer family life than in Protestant Germany, England, Scotland, and America. The Protestant home has been its proudest gem. Yet equally undoubtedly a change has come. The increase of Divorce is one of the best recognized,

Divorce

because most apparent of modern facts. And this is perhaps quite as much a symptom as the cause of the decay of the family. A publication of the National Divorce Reform League for 1893 says:

> We might spend much of our time on the evils that beset the family, for they are many and serious. But brief mention of a few is enough. Some destroy the very constitution of the family; others impair its environment. We name the enormous number and increase of divorces; the apparent decrease of marriages and the haste and ignorance that mark many unions; the prevalence of sexual vice, with the low ideals of sex that lead to it; and insensibility to the sacred obligations of paternity. Then there are the open or more subtle influences that make our civilization almost the direct foe of the home. We point to the methods of business involving absence from home, the system of commercial travelers and the operation of the industrial system as a whole, which tends to separate the household in both business and labor into its constituent individuals. These have greatly disturbed the relation of the centripetal and centrifugal forces of the home and society. Then, again, the solidarity of domestic interest is weakened by other competitions. There are the fascinations of "shopping," the waste of time over mere social "fads," and the increasing resort on the part of women to clubs and social frivolities among themselves, for which the neglect and absence of men are in great degree responsible; and even the noble desire for honest intellectual improvement and for charitable work have made inroads upon the home.

More open evidences of social corruption exist. (See Prostitution.) Evidence is not wanting of the increase of impurity in the sexual relation among factory populations. The development of the tenement population is itself an indication of the decay of the family. In New York City 80 per cent of the population are said to live in tenements. (See Tenements.)

The evidences exist on every hand that the preservation of the family is a most pressing, if not the most pressing, problem in modern practical sociology.

VII.—The Sociologic Function of the Family

Save for a few extreme radicals, who would abolish the family, and whose position we shall consider later, all sociologists find in the family the social unit, the keystone of society. Says Dr. S. W. Dike:

> I do not fear contradiction from any competent scholar in political science when I say that the study of the single family on its homestead would yield richer scientific knowledge and more practical results in the great social sciences than almost any other single object in the social world. Pursued historically the student would find himself at the roots of property, separate ownership of land, inheritance, rent, taxation, free trade, and tariff, and discover the germs of international law and the State. The great questions of the day, as we call them, are little more than incidents to the working of the great social institutions; and these, we have already seen, are the expansions and modified forms of the family, amid its unceasing support and activity. "Sociology," the late Dr. Mulford used to say, "is the coming science, and the family holds the key to it." "The family," he also wrote, "is the most important question that has come before the American people since the war."

Mr. Gladstone wrote in the *Nineteenth Century* for February, 1889:

> The greatest and deepest of all human controversies is the marriage controversy. It appears to be surging up on all sides around us. . . . It is in America that, from whatever cause, this controversy has reached a stage of development more advanced than elsewhere.

What, then, is definitely the sociologic function of the family which gives it such extreme importance?

1. It furnishes the two elements which undoubtedly contribute more than any other to the development of all human life—viz., heredity and environment during the formative period of life. The family controls or may control both. "The best way to become good," it has been well said, "is to be born good." Out of 5,511 convicts at Elmira Reformatory 38 per cent had parents known to be intemperate, and 13 per cent more of doubtful habits; 81 per cent had parents not possessing property; 44 per cent had parents of little or no education. The power of home in childhood is equally evident. Of these same 5,511 convicts, 54 per cent came from bad homes, 38 per cent more from homes only "fair"; not more than 6 per cent came from homes that were good; 42 per cent were homeless when committed;

The Home

97 per cent came from bad associations. "As the twig is bent the tree inclines." "A child's first teacher is the one who first loves it"; and usually this is the mother. It is, then, the first duty of the family to see that the child is well born, and, secondly, well nurtured. These conditions are largely personal and individual, moral and physiological, rather than sociological, and so do not fall within our province in this article. Who does not know that pure parents, pure generation, pure conception, pure pregnancy are of infinite importance to pure birth? So with mental, moral, and physical health in every form. To see that the child that is born has this is, then, the first sociological function of the family. This, however, implies and necessitates pure marriage: so that the marriage of those mentally, morally, or physically incapacitated to beget healthy children is a sociologic sin. Says Professor Jowett, in his introduction to Plato's "Republic" (1st ed., vol. ii., 130–132):

> The late Dr. Combe is said by his biographer to have resisted the temptation to marriage, because he knew that he was subject to hereditary consumption. This little fact suggests the reflection that one person in a thousand did from a sense of duty what the other nine hundred and ninety-nine ought to have done.

2. But purely and healthfully born, it is, second, the function of the family to see that the child is rightly reared. Its first duty in this line is undoubtedly to see that it is reared in an atmosphere of love. The first duty of parents is to love each other and their offspring. Here most literally love is life. Who can deny or doubt the infinite and irreparable loss of a childhood reared in an atmosphere without love? It is this loss which, as we shall say, is sociologically the unanswerable argument for all social schemes, that

would take away the child from the mother or father. Of the nurture of the child in health and in education, ethical and moral, as well as intellectual and physical, we cannot here speak, but it suggests itself. The truest education a child receives is in its home, whether that home be a palace or a city alley. Therefore, as for other reasons, the frightful significance of the disappearance of the real home in large sections of our cities and growing portions of our population.

3. But this is by no means the only function of the family. It is, thirdly, the function of the family to furnish all through life the necessary atmosphere of love and peace to the individual. It is not necessary that every one should be married. It is necessary to the highest life that every one should have at some portion at least of adult life, as well as in childhood, the joy and peace of life in the family. "It is not good that the man should be alone" is the voice of sociology as well as of God. Man is born sexed. Man is created male and female. This is the fact, whoever and whatever is the creator. And the law of sex runs through all the universe, mental and moral, as well as physical. For the development of this, see MARRIAGE; we simply state it here. It is the function of the family to furnish men and women with the opportunity for the carrying out of this sex life, mental and moral, even more than physical. Man without woman, or woman without man, is a biological and sociological abnormity. It indicates an abnormal condition in society when it is found that 20 per cent of the women of England and 44 per cent of the population of Belgium, with about 33 per cent in Europe, in 1875, are unwedded; and when we read the startling statistics of the decrease of marriages in modern civilization. (See MARRIAGE.) It is to the shame of modern science that thus far this subject has been left almost completely untreated from the standpoint of science, and that the careful literature of the subject is so meager.

Law of Sex

VIII.—Various Theories of the Family

The form of the family where marriage is between one man and one woman, and indissoluble until death, save for cause of adultery or similar aggravated causes, is by many considered the only form of the family really worthy of the name. It is declared to be the best form, for the following, among other reasons:

1. That history proves it to be that form of the family best productive of the highest character, individual and national. The supporters of this argument point to the Aryan civilization; to Greece in her pure days; to Rome when she had the monogamic family and rare divorce; to the early Christian centuries, before false theories of celibacy and virginity broke up the married life; to Germany, England, Scotland, Ireland, and America, and to the individuals produced by such civilizations as compared with the polygamic civilizations of Asia and Africa.

Permanent Monogamy

2. It is argued that monogamic marriage without easy divorce is far better for child nurture. Easy divorce, they say, leads to broken homes and changing, shifting relations that break up the peace and quiet and love necessary to child nurture.

3. It is argued that the possibility of easy divorce suggests its adoption; that the men or women who know they can easily obtain divorce and marry again are led to think of it, and then seek it on any occasion when fancy prompts, or when passing displeasure with their married partner causes a desire to change. In nine cases out of ten it is claimed that the trouble lies at least in part with both parties, and that to make a change in the marital relation would not afford relief, since one cannot obtain divorce from oneself, and that often at least one would thus seek change without finding relief; thus, to say the least, needlessly causing the breaking up of homes and perhaps the breaking of many hearts.

4. It is claimed that easy divorce makes marriage a light affair, hence lowering the sense of both its solemn responsibilities and its possibilities of unchanging and unequaled mutual confidence and joy and love. This, it is said, would make men and women enter the state of matrimony more carelessly than they do now, instead of "reverently, discreetly, advisedly, soberly, and in the fear of God."

5. It is claimed that, since sensual desire is more liable to change its object than is love, a system allowing of easy divorce and change would tend to elevate the lower elements in marriage and the family, making them matters of bodily sexual relations rather than of moral and spiritual relations.

6. It is claimed that easy divorce and change are repugnant and contrary to the highest ethical and moral sentiment, which demands love that does not end nor change, and that recognizes one supreme object of its love, a love which can brook no rival.

7. Lastly, but for Christians first, it is argued that any relation other than that of the union of one man with one woman, indissoluble until death save for cause of fornication, is directly contrary to the revealed will and law of God in Christ, who declares positively of the sexual relation that "for this cause shall a man leave father and mother and shall cleave to his wife, and they twain shall be one flesh"; and again, "Whosoever shall put away his wife, except it be for fornication, and shall marry another, committeth adultery, and whoso marrieth her which is put away doth commit adultery."

Orthodox View

Such are some, tho by no means all, of the main arguments for enduring monogamic marriage. It is summed up for Christians in the appeal to the Christian ideal and the stern testimony of fact; and to non-Christians in the testimony of fact alone, that easy divorce has always resulted in a corrupt, sensualized society; while enduring monogamy has given the world the highest civilization, the happiest home, the purest family the world has known.

The argument for easy divorce claims that it meets the above contention at every point. It says, admitting that thus far enduring monogamy has been best for the race, and has thus far produced the highest civilization on account of the lower elements in man's nature, which marriage laws and difficult divorce have done something to restrain, does it follow that it must always be so? Is love never to be trusted except under lock and key? Have we such reason to be satisfied with our present system? Defenders of easy divorce are never weary of calling attention to the heart-burnings, and quarrels, and dissensions of those who find themselves tied together for life, altho love may have turned to

hate. They say that what they argue against is not enduring monogamic love, but against an enduring monogamic *law* compelling men and women to live together after love has fled. They argue that in the very name of love this is an outrage upon love. They say that all marriage, except marriage for love, is an acted farce, and that when love ends, the pretense of love should end. Enforced pretense of love, they say, when love is really gone, is the fruitful parent of innumerable ills, quarrels, hatred, cruelty, refinements of mental and moral torture, desertion, unfaithfulness, adultery, prostitution, murder. They say that, instead of being good for childhood, *enforced* monogamy, compelling children to live where only the pretense of love exists, with a reality of hatred—a condition of affairs discovered by children only too easily—is really the worst atmosphere in which childhood can be reared. They argue that, in fact, if love be left free it would be much more likely to endure than when attempted to be enforced by law, so that easy divorce would really give us more enduring true love, and only break up those sham relations which do more harm than good. They argue that it is absurd that the most solemn relations of life should be irretrievably fixt, too often and perhaps usually, by the uneducated and inexperienced fancy of a young man for a young woman, sometimes of an irresponsible boy for an inexperienced girl. As for reference to facts, they argue that if corruption in Greece and Rome did accompany the development of divorce, it is not proved that divorce was the cause. They say that it is far more likely that the breaking up of faith in false gods, with no higher faith taking its place, at least till Christianity came, did, in a society resting on a material and slave basis, cause the outbreak of corruption, which to an extent made use of divorce, but which marriage was equally powerless to restrain. The evidence they claim is that corrupt marriage is worse than corrupt divorce. They say that in our own times the cause of growing profligacy is not growing divorce, but growing materialism and omnipresent commercialism. They point to such women as George Eliot and such men as Goethe to show that to break away from legalized relations to freer love does not weaken or debase character. Such is the main argument for easy divorce.

Theory of Easy Divorce

Free love, it must be stated at the outset, is by no means of necessity material and animal in its motives or its character. Free love has been defended by some of the most spiritual and noble of mankind. Plato and Campanella, St. Simon and Fourier, Shelley and William Morris cannot be set aside as in their ideals "material," "animal," or "low." Professor Jowett, of Oxford, says of Plato, in his introduction to Plato's "Republic" (1st ed., vol. ii., pp. 145–147):

Free Love

> First, we may observe that the relations of the sexes supposed by him are the reverse of licentious; they seem rather to aim at an impossible strictness. . . . We may allow that his conception of the relation of the sexes takes rank among the great original thoughts of mankind.

The ethical standing of free love depends on what you mean by free love. When the anarchist Spies, lecturing before the Chicago ministers, was asked if he believed in free love, he answered, "As opposed to bought love, I do." We must understand what is meant by free love before we can discuss it, and, as a matter of fact, very different and even opposing theories of the family relation have been classed indiscriminately under this phrase. Some of these are indeed ignoble and base; others may be mistaken, but are not intentionally ignoble. The first duty, then, is to distinguish between theories. Plato, Campanella, and some extreme State Socialists (tho by no means the majority of Socialists) have argued that the whole matter of the begetting and rearing of children should be left in the hands of the State. The large majority of Socialists do not, as we say, accept this form of free love, but it is proposed by a few extreme worshipers of the State; and by Plato first and foremost. In a sense it is not free love, but, as Dr. Jowett has pointed out, is its opposite. Its advocates, following Plato, would have the State or community allow or control the sexual intercourse of men and women, only within certain limits of age and certain mental, physical, and moral qualifications. They would have children thus generated, and reared by the State, no father or mother being allowed to know their own children, that thus children may be educated equally and wisely to live for the State and not for the disrupting ties of family. Horrible as this may seem to many, it is well at least to notice that grave thinkers have found some good in it. Professor Jowett says:

Plato's View

> No one can have observed the first rising flood of the passions of youth, the difficulty of regulating them, and the effects of the whole mind and nature which follow them, the stimulus which the mere imagination gives to them, without feeling that there is something unsatisfactory in our method of treating them. That the most important influences on human life should be wholly left to chance or shrouded in mystery, and instead of being disciplined or understood, should be required to conform only to an external standard of propriety, cannot be regarded by the philosopher as a safe or satisfactory condition of human things. Nor is Plato wrong in asserting that family attachments may interfere with higher aims. If there have been those who "to party gave up what was meant for mankind," there have been those who to family gave up what was meant for mankind, or for their country. The cares of children, the necessity of procuring money for their support, the flatteries of the rich by the poor, the exclusiveness of caste, the pride of birth or wealth, the tendency of family life to divert men from the pursuit of the ideal or the heroic, are as lowering in our own age as in that of Plato. And if we prefer to look at the gentle influences of home, the devotion of one member of a family for the good of others, which form one side of the picture, we must not quarrel with him, or perhaps ought rather to be grateful to him, for having presented to us the reverse.
>
> We start back horrified from this Platonic ideal in the belief, first, that the instincts of human nature are far too strong to be crushed out in this way; secondly, that if the plan could be carried out, we should be poorly recompensed by improvements in the breed for the loss of the best things in life. . . . There is no sentiment or imagination in the connections which they [Plato's men and women] are supposed to form; human nature is reduced as nearly as possible to the level of the animals, neither exalting to heaven nor yet abusing and overindulging the natural instincts. All that world of poetry and fancy which the passion of love has called forth in modern literature and romance would have been banished by Plato.

Another form of free love, adopted not by Socialists, but by some sects of so-called Christian communism, in place of the monogamic family, would have a family more or less polygamic, and with the sexual relations not left to promiscuous and thoughtless desire, but restrained, guided, and sanctified by religious precepts, instincts, and life. Such have been the proposals and attempts of some of the older Anabaptists in Germany, the Perfectionists of Noyes's Oneida Community, and the Mormons, with other kindred religious and semicommunistic sects. (See ANABAPTISTS; MORMONISM; ONEIDA COMMUNITY.) However opposed these may be in the moral sense, and however we may dissent from

"Perfectionists"

them, it is to be said that they are not at least outwardly moved by licentious notions. The Anabaptists of Germany certainly commenced with most religious feelings. The Oneida Community claimed to be one of spiritual perfectionists. They declared again and again that neither their notions nor their practises were licentious. Noyes, their leader, said:

> Free love with us does *not* mean freedom to love to-day and leave to-morrow. Our communities are families as distinctly founded and separated from promiscuous society as ordinary households. The tie that binds us together is as permanent and sacred, to say the least, as that of marriage, for it is our religion. . . . Every man's care and every man's dollar of the common property is pledged for the maintenance and protection of the women and the education of the children of the community. . . . Whoever will take the trouble to follow our track from the beginning will find no forsaken women or children by the way. In this respect we claim to be in advance of marriage and common civilization. . . . We are not free-lovers in any sense that makes love less binding or responsible than it is in marriage ("History of American Socialism," pp. 639, 640).

Their practise was to religiously marry all the men in their "families" or communities to all the women, and then to allow sexual intercourse between any, *but not without due consideration and consultation as to the wisdom and ethical character of the relation.* Ordinary marriage and the family led, they argued, to family selfishness, family quarrels, and hypocrisy. Love for one wife no more interferes, according to their argument, with love of another wife than love for one sister interferes with love of another.

To these religious forms of free love, perhaps, should be added the forms proposed by St. Simon and Fourier and other doctrinaires, which, altho, especially with Fourier, opposed to religion in the ordinary sense, and designed to be simply humanitarian, were advocated with a spirit virtually religious. Their theories will be found under the respective articles St. Simon and Fourier; but they must be at least mentioned here.

Elective Affinities

They would have society in some form regulate marriage, and within these restrictions have wives in common, and children reared together in the most approved way. The modern religious sense, when once it begins to wander into new ways, seems to be easily led, as among many spirtualists, to conceiving new marital relations of "elective affinities," "spiritual wives," "heavenly marriages," etc. How far their theories are put into practise cannot be said, but undoubtedly they are penetrating society very fast. Mormonism is not the only *ism* in America that has given up belief in strict monogamic marriage. Yet many claim that the result is good. A daughter of Brigham Young has recently, in a leading magazine, described the happy homes and happy childhood of polygamous Mormons. But this is exactly where the strongest argument arises against all forms of polygamous marriage. Admitting possible exceptions, the notorious fact remains that no polygamous country or polygamous sect has begun to develop the character produced in monogamic homes. It is to England and not to Turkey, to America and not to Asia, to Kansas and not to Utah, to Brook Farm and not to Oneida, to Christianity and not to Mormonism, that one looks for the leaders of the world.

We then come to the *third* form of free love, the free-love theory par excellence, which is held to-day by many Socialists, by more individualists, and by all anarchists, and an increasing number of radical men and women of various schools of thought. According to these, neither the State nor organized religion should have aught to do with control of the family or of the sexual relation. They would make love supreme. They would have it unfettered by any tie whatsoever. They argue that compulsory love is not love; that all marriage save from love is sin; that when love ends marriage ends. They would have (Socialists by collectivism, and anarchists by free competition or cooperation) each man and each woman free to support himself or herself without any dependence upon any other individual. Then, they say, when a woman gave herself in love, it would not be for reason of family, or position, or custom, or support, or help in any way, but simply because she loved. They hold that this would produce the purest, and highest, and the most enduring love. Some of these free-lovers would have the State guarantee to every woman during pregnancy an income to keep her independent, so that she should never have to sell herself in any form or be unable to care in the most hygienic way for her child. In this way they claim that every child would have at least the opportunity of careful nurture without the loss of parental love. Most parents, it is thought, when economic difficulties were out of the way, would *prefer* to rear their own children; only they would not be compelled to. Thus, without losing pure parental love, we should be rid of that monstrosity, compulsory love. Marriage, they claim, thus freed from control of either priest or town clerk, would be pure, and noble, and abiding. Prostitution would disappear.

Modern Free Love

That this system would work for the majority of the population under the present industrial system, the more thoughtful supporters of this view do not claim. They would have it only in connection with economic reforms that would give financial independence to every man and woman. They would also urge along with it such physical, mental, moral, and ethical education as would prevent humanity from sinking into material and animal misuse of its liberties. But they believe that humanity, once free from dependence upon priest and policeman, would rapidly prove itself capable of pure free love. At least this is the ideal toward which they believe that law and practise should tend; and for themselves and those sufficiently "advanced" they think it perfectly safe to try free love now. Whatever be their theory, the practise is certainly on the increase. The last law that they would take from love would be the law forbidding marriage below a proper age. Only when society can be trusted to prevent this without law would they remove this law. Such is the theory of free love that is to-day most rapidly spreading. A *fourth* form of free love should be possibly also mentioned which has nothing ethical or pure about it, which is simple libertinism and worse than animalism, since no brutes would fall so low. But this, tho too much in practise, has no defenders to whom any honest mind need listen, and therefore needs no discussion here. The only thing is the question whether other forms of free love, however differently they may mean and may aim, would not lead to this form of free love, a fear which is answered on the part of defenders of pure free love by the question whether

Animalism

our present monogamic system has not already led to it, by requiring an impossible and mistaken system, the parent of vice and secret corruption. (See PROSTITUTION.)

IX.—Recent Advance Steps

The last report of the National League for the Protection of the Family (1907) says in brief:

Within the last twenty-five years there has come to be recognized a problem of the family. Twenty-five years ago there was no study of the family in any of our educational institutions. Indeed, there was not then a single course of lectures given on the subject anywhere in the entire country. Now such courses of lectures or of study are frequent. Perhaps it may already be said that the higher educational institution that does nothing with the family has become the exception rather than the rule. The colleges for women have opened this important line of study to their students. And the study is taking on more practical form in what is now known as domestic science, but which, as pursued, is confined pretty closely to the study of housekeeping in its practical aspects, but along scientific lines. Domestic science has also become a department in some of our best secondary schools and is rapidly growing in public favor. There has been, too, a marked increase of attention to the home in the periodical press. Departments or pages for the home have taken the place of the old single column and are of a much more scientific character and more valuable as a whole.

Domestic Science

I am speaking of the United States. Perhaps more has been done in parts of Europe. Within the last twenty-five years attention has been given in new ways to the practical value of the home in a number of directions, that is full of promise for the future.

Interest has been awakened in the home as a factor in public school education. Under the lead of our national superintendent of education our people are beginning to see that there is more than one social institution at work in education; that, as he puts it, the great educational factors are the school, the church, the home, and the vocation; and the problem is to get each of these to do its share in the common task, and that in intelligent cooperation with each other. While the public school has as yet nothing like the home department of the Sunday-school, unless it be its required home study, it is having more aid than formerly in progressive communities from parental associations.

In philanthropy we may note a steadily growing recognition of the place of the home in social reform. In Massachusetts and perhaps elsewhere, the charitable institution where large numbers of children have been gathered for care has given place to the single home. Indeed, it is almost a first principle of all expert charitable work now to make respect for the home and all possible use of its resources a cardinal principle of all philanthropic effort. The vigorous attack on the tenement-house problem proceeds on the assumption that the single home is the goal of its efforts and is already doing much to demonstrate the social and moral value of the home. Those who are dealing with the criminal are more and more impressed with the need of a better home life as the greatest single aid to the relief of society from the burdens of crime, and the surest protection against the beginnings of a criminal career. And the students of the evils of intemperance and licentiousness have of late come to see that the home, in its moral training, its cooking, and social activities, is, after all, one of the most important objects of their concern. Some go as far as to say that it is the most important of all.

The Home in Social Reform

FARMERS' ALLIANCE AND KINDRED ORDERS, THE: Various orders of somewhat similar names and almost absolutely similar character have sprung up at various times among the farmers of the United States. The largest, best known, and politically the most active of these, tho often called The Farmers' Alliance, had as its exact title The National Farmers' Alliance and Industrial Union. In a sense, the parent of all these orders was the Grange, or Order of Patrons of Husbandry, founded in 1867; but as this is a much older organization, and has pursued a wholly different policy, we consider it separately. (See GRANGE.)

The first organization bearing the name Farmers' Alliance seems to have been organized by W. T. Baggett in Lampasas County, Texas, in 1876, for the purpose of opposing the spoliation of the public lands and the bringing to justice of land and cattle thieves. It did not endure, but the idea spread, and in 1879 a State Farmers' Alliance was effected. In 1887 a meeting was held at Waco for the purpose of effecting a union with the Farmers' Union, an association of Louisiana farmers. The union was accomplished, and the new organization bore the name of the Farmers' Alliance and Cooperative Union of America, with C. W. McCune at its head. This new order spread rapidly in the States of Missouri, Kentucky, Tennessee, North and South Carolina, Georgia, Alabama, and Mississippi.

At that time another famous organization was operating in the States of Arkansas, Missouri, Kentucky, and Tennessee, known as the Agricultural Wheel, which began under the leadership of W. W. Tedford, at Des Arc, Prairie County, Ark., 1882. At a meeting held at Shreveport, La., 1887, a union of the Wheel and Alliance was effected which was completed at Meridian, Miss., 1888, the organization being called the Farmers' and Laborers' Union of America.

Up to this time the Farmers' Alliance was almost exclusively a Southern institution, a secret order with grips and passwords, but it had taken no action whatever in politics except to impress its tenets in the minds of public men. In the spring of 1877 there had been organized by Milton George, at Chicago, an organization called the National Farmers' Alliance, which in a little while had extended into the States of Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, and Dakota. The objects of the National Farmers' Alliance were to unite farmers for the promotion of their interests, socially, politically, and financially; to secure a just representation of the agricultural interests of the country in Congress and state legislatures; to demand the prohibition of alien cattle and land syndicates; to oppose all forms of monopoly; to demand of representatives in Congress their votes and active influence in favor of the prompt passage of such laws as will protect live-stock interests from contagious diseases; and to demand that agricultural interests shall be represented by a cabinet officer.

This organization is sometimes called the Northern Alliance. Meanwhile, still another organization, the Farmers' Mutual Benefit Association, had been organized in southern Illinois in 1887, and had extended over Illinois, Kentucky, Missouri, and Kansas. Its chief object was to resist the encroachments of monopoly.

The problem now was to unite these movements The first meeting of the Farmers' and Laborers' Union of America was appointed for December, 1889, at St. Louis. The National Farmers' Alliance appointed the same time and place for its general session, and negotiations were undertaken for the still further strengthening of the movement by the blending of the two great orders now remaining. The net outcome of the conference was a failure to unite, and for this failure the question of secrecy was the sole cause. Kansas, North Dakota, and South Dakota, however, deserted the "Northern" alliance and went over to the Southern and secret order.

A union platform was, however, adopted, and in this the order of the KNIGHTS OF LABOR also united.

Organization, however, still went on. The Southern Farmers' Alliance was mainly made up of the middle class, composed of small farmers and mechanics. It claimed, in 1890, 3,000,000 members, men and women. The colored farmers were organized under the name of The Colored Farmers' National Alliance and Cooperative Union. The first colored alliance was founded in Houston County, Texas, in 1886. In January, 1891, the estimated membership was 1,250,000, of which number 700,000 were adult males, and 150,000 more were males between eighteen and twenty-one years of age. A national organization was effected in 1888, and as the organization owed its existence largely to one man —R. M. Humphrey, a white man, formerly a Baptist preacher —he was put at the head of the alliance.

All these various alliances met at Ocala, Fla., December, 1890, and adopted the so-called Ocala Platform, not materially different from the St. Louis platform. At this convention a strong effort was made to form a new political party. The alliance voted not to do so as an alliance, but

to allow its members who wished to do so as individuals. As the result a convention was called at Cincinnati, May 20, 1891, the People's Party formed, and a platform drawn and nominations made at St. Louis, July 4, 1892.

After the Ocala convention the Farmers' alliances became virtually identified with the People's Party, but kept up separate organizations, and different organizations among them voted to favor various cooperative educational and industrial schemes, such as cooperative railroads, etc. Little, however, was accomplished in this line; but an enormous amount of political agitation was carried on. Since the practical ending of the People's Party, the movement has nearly disappeared. It has passed into an as yet very vaguely organized cooperative and educational movement. (See COOPERATION.)

FARMERS' NATIONAL CONGRESS, THE: Organized in 1880. The congress is composed of delegates from the different states, appointed by governors or departments of agriculture. It confines itself to discussions and resolutions on broad national problems. Local issues are avoided, and speakers are expected to treat the subjects they discuss in a national manner. The congress is non-partizan, but is free to take up any politico-economic or other question of importance to agriculture.

The president is J. M. Stahl, of Chicago, editor of *The Farmers' Call*. Secretary, G. M. Whitaker, 1404 Harvard Street, N. W., Washington, D. C.

FARMS AND FARMERS: See AGRICULTURE; LAND; HOMES, OWNERSHIP OF; WAGES.

FAUCHET, CLAUDE: French Christian Socialist; born at Dornes, Nièvre, France, 1744. For a while court preacher for the Louis, he lost his position owing to his radical views. At the storming of the Bastille he took an active part, was requested to prepare a eulogy over those who fell in the attack, and produced his "Discourse upon French Liberty," in which the central idea was the union of the gospel of love with the program of the Revolution. In 1790 he was instrumental in establishing a society or circle of the Friends of Truth and, as an organ of the club, the *Bouche de Fer* (the Iron Mouth), a paper in which he developed his religious ideas in union with the theories of Rousseau's social contract. "Unite the Gospel of Christ with the spirit of freedom," was Fauchet's pregnant utterance, "and our joy shall be complete." In 1791 Fauchet was elected constitutional Bishop of Calvados, and sent as a representative to the Legislative Assembly of 1792. He voted against the guillotining of the king, and on account of taking this position, and because of his landed property, he was brought before the revolutionary tribunal and guillotined with the Girondists, Oct. 31, 1793. An account of his life and views can be found in Stegmann and Hugo's "Handbuch des Socialismus."

FAWCETT, HENRY: English political economist; born in 1833; educated at a school near Salisbury, at Queenwood College, at King's College School, London, and at Trinity Hall, Cambridge; was graduated at Cambridge in 1856, and chosen a fellow. He practised law in London, but soon left this for political activity. In 1858 an accident, while shooting, left him totally blind for life. He nevertheless lectured on finance at Oxford and Glasgow, and elicited general attention. In 1863 he published his chief work, "A Manual of Political Economy," which has been much used as a text-book of economics of the orthodox school. He was immediately elected to the chair of political economy at Cambridge. In 1865 he was elected M.P. for Brighton, which he continued to represent till 1874. He was a radical of the old school, but made his mark standing for woman suffrage, refusing on principle to pay any but the merest official expenses of his election, advocating the abolition of university tests, investigating the miseries of the agricultural laborer, etc. In 1874 he was defeated for Brighton, but returned for Hackney, and again in 1880. The same year he became postmaster-general in Mr. Gladstone's second administration, and would have been a member of the Cabinet but for a conscientious scruple. He introduced many reforms into the postal system. In 1883 he was elected Lord Rector of Glasgow University, and received the titles of D.C.L. and LL.D. A strong individualist with little originality or genius, he influenced men by the force of his personality. In addition to his "Manual" he wrote "The Economic Position of the London Laborer" (1865); "Free Trade and Protection" (1878); "Essays and Lectures" (1879). His life was written by Leslie Stephen (1885). Fawcett died in 1884.

FAWCETT, MILLICENT (née GARRETT): English political economist and author; born at Aldeburgh, Suffolk, 1847; married to Henry Fawcett in 1867. She assisted her husband in all his studies, and became a leader in the woman suffrage movement. She has written "Political Economy for Beginners" (1870); "Tales in Political Economy" (1875); "Life of Queen Victoria" (1895); etc. *Address*: 2 Gower Street, W. C., London, England.

FEDERAL GOVERNMENT: "Stated broadly," says John Fiske ("American Political Ideas," p. 133), "the principle of federalism is just this: That the people of a State shall have full and entire control of their own domestic affairs, which directly concern them only, and which they will naturally manage with more intelligence and with more zeal than any distinct governing body could possibly exercise; but that, as regards matters of common concern between a group of States, a decision shall in every case be reached, not by brutal warfare or by weary diplomacy, but by the systematic legislation of a central government which represents both States and people, and whose decisions can always be enforced, if necessary, by the combined physical forces of all the States."

Federalism has been practised from the earliest times among certain savage races, as among some of the North American Indians, in more developed form among the ancient German tribes, and for certain purposes among the Greek States, the English heptarchy, and other peoples. It reached a still fuller development in the old German Empire, but has been principally developed in modern republics.

Says Mr. E. V. Robinson ("Annals of the American Academy," vol. iii., p. 786):

There can be no security against despotism but limitations upon the government; and no effective limitations upon the government but such as are imposed by a higher power, the State, and enforced by separate and coordinate organs of government created by the State and participating in the action of the general government. But this is the Federal State, a form long considered a transition stage between the league of States and the simple State, but now recognized—in other countries at least—as the most interesting and significant product of institutional development.

History of Federalism

Its importance is proved by its success. In a century the new form has overspread the earth: 1787 in the United States; 1848 and 1874 in Switzerland; 1866 to 1870 in Germany; 1867 in Canada and Mexico; 1889 in Brazil; 1891 in Australasia—these dates record a progress unchecked by reverse, unparalleled in rapidity and extent. Federalism has succeeded in conditions the most diverse; here knitting scattered colonies of a kindred race into a nation equally strong and free; there forming hostile races, tongues, and creeds into compact and vigorous States. It is strong and flexible. No shock has severed its well-knit meshes, and nations the most unlike move with equal freedom in its enveloping folds. The whole drift of the political world is toward federalism to-day, as it was toward feudalism in the tenth century, and centralism in the fifteenth. The time may not be far distant when a centralized simple State will be as great an anachronism as a mail-clad knight in a modern army.

Of the nature and development of the chief modern federal governments; Mr. Robinson says (idem, pp. 787–790):

The Canadian Union was the work of one external sovereignty. A congress of delegates appointed by the provincial legislatures framed the desired constitution, which was then (1867) enacted *en bloc*, as an ordinary statute, by the British Parliament.

In Switzerland and the United States the ordaining sovereignty was one and internal. Previous to 1848 the cantons are said to have been separately sovereign. The only central authority was the Diet, consisting of one instructed vote from each canton. But unanimity was not required for decision, consequently a canton could be bound against its will, and coerced by arms if it resisted—as occurred in the Sonderbund war in 1847. Thus Laband's conception of the German Empire exactly fits the Switzerland of that date; sovereignty rested in the cantons not individually, but collectively. There were not as many sovereignties as cantons, but one sovereignty, of which the cantons were cobearers (*Mitträger*). To the cantons collectively the cantons individually were subject; just as each Roman senator was subject as an individual to the Senate as a whole. Following the Sonderbund war a committee of the Diet drafted the new constitution; the Diet itself then revised and passed it. When submitted to the cantons for approval, 15½ cantons accepted 6½ rejected it. The constitution thereupon went into effect for all alike. The sovereignty in the old confederation, therefore, decreed the new Federal organization. No absolutely new State was created, but a rudimentary exchanged for a well-developed form.

Modern Federalism

The same was true in America, but is not so easily seen. The traditional view regards the individual States as separately sovereign under the confederation. Article 2 declares: "Each State retains its sovereignty, freedom, and independence." . . . But words cannot obliterate facts. The States could not "retain" what they had never possest. They had always been subject to a political superior. First to England; secondly to the Continental Congress, a revolutionary body; hence *de facto* sovereign; and thirdly, under the Confederation each State individually was subject to the States collectively. In the American, as in the Swiss Confederation, sovereignty was one and the States were its cobearers; each as an individual was subject to the States collectively.

This, however, is a disputed point. See CONSTITUTION; STATE RIGHTS, etc. Mr. Robinson continues:

In Germany, the situation was different in that the contracting States had been and still were separately sovereign. Aug. 18, 1866, the North German States provided by treaty for the founding of a Federal State within one year, the constitution to be drafted by a conference of Envoys at Berlin, and passed upon by a Reichstag elected on the basis of the Frankfort election law. These provisions of the treaty were then enacted by the State legislatures as State law. State law they would have been without special enactment, since the August treaties rested upon State authority. State law they had to be, if law at all, since law requires a lawgiver, and only the States then legally existed. Both Reichstag and Conference therefore rested equally on State authority. The Conference sat Dec. 15, 1866, to Feb. 7, 1867. Its draft was submitted to the Reichstag February 24th by the King of Prussia, in the name of the associated governments. The Reichstag proposed amendments; these were accepted by the Conference. Both then dissolved and disappeared. The bodies created by State authorities had done their work, but the States were not legally bound by it, any more than the British Parliament was legally bound by the recommendations of the Canadian Constitutional Congress. The States did ratify the report of their agents, and fixt July 1, 1867, as the day for it to go into operation. But legally they could as well have rejected it. The lapse of the specified year would then have restored the *status quo ante* Aug. 18, 1866. If, therefore, the criterion of the existence of a new State be the existence of a new political authority, setting a limit to older authorities, then no new State existed prior to the ratification of the constitution by all the States.

It is indeed unquestionable that the German nation already existed, i. e., that the German people were conscious of common interests, feelings, and aspirations. It is equally unquestionable that such feelings could not but result in new political relations, and that in an historical and dynamical sense, the nation did, as a matter of fact, employ the States as instruments in the creation of a new State. But it is generally agreed that a nation is not a State politically organized, and a State cannot be said to give it political organization, because such organization is prerequisite to its being a State.

Mr. James Bryce ("The American Commonwealth," chaps. xxix., xxx.) sums up the faults generally charged against federal forms of government as:

(1) Weakness in the conduct of foreign affairs.
(2) Weakness in home government—that is to say, deficient authority over the component States and the individual citizens.
(3) Liability to dissolution by the secession or rebellion of States.
(4) Liability to division into groups and factions by the formation of separate combinations of the component States.
(5) Want of uniformity among the States in legislation and administration.
(6) Trouble, expense, and delay due to the complexity of a double system of legislation and administration.

Few of these dangers he thinks, however, have developed in the United States. He says:

All that can fairly be concluded from the history of the American Union is that federalism is obliged by the law of its nature to leave in the hands of States powers whose exercise may give to political controversy a peculiarly dangerous form, may impede the assertion of national authority, may even, when long-continued exasperation has suspended or destroyed the feeling of a common patriotism, threaten national unity itself. Against this danger is to be set the fact that the looser structure of a federal government and the scope it gives for diversities of legislation in different parts of a country may avert sources of discord, or prevent local discord from growing into a contest of national magnitude.

The merits of the federal form of government he considers to be: (1) That federalism can unite States into one government without extinguishing local governments, legislatures, and patriotism; (2) that it supplies the best means of developing a vast country; (3) it prevents the development of overcentralization; (4) it interests people in local self-government; (5) it secures the good administration of local affairs; (6) it allows of experiments in legislation; (7) it diminishes the risk which comes from size and diversity in the structure of a nation; (8) it relieves the national legislature of burdens which might prove too heavy. All these advantages Mr. Bryce holds true of the U. S. (But see DEMOCRACY.) For other countries, see under the different headings.

FEDERAL PARTY, THE: The name given, at the time of the adoption of the Constitution, to those who favored the Constitution as framed by the convention at Philadelphia in 1787. The name was later adopted by the party developed under the lead of Alexander HAMILTON,

which favored a strong central national government, friendly relations with Great Britain rather than with France, the fostering of commercial interests, the assumption of the State debts, and the chartering of a national bank, etc. It controlled the general government till 1801. Says Schouler ("History of the United States," vol. i., p. 54): "To speak logically, it was the anti-federal party that sustained a federal plan, while the Federalist contended for one more nearly national." (For a discussion of the views of the party, see CENTRALIZATION; CONSTITUTION; HAMILTON; STATE RIGHTS.)

FEDERATION OF CHURCHES, THE: A movement toward practical church unity and cooperation in the carrying on of church evangelical and social work, begun in New York City in 1905, largely through the efforts of the Rev. J. W. Hegeman, Ph.D., and having as its essential principle the federating of the various religious bodies, for practical work, while allowing each body perfect liberty to fashion its own life independently in its own way. The New York City Federation, of which the Rev. Walter Laidlaw, Ph.D., is secretary, has been by far the most active federation resulting from the movement, especially in social investigation and work (see below), but various state and city federations have been organized in New York state, Massachusetts, and elsewhere, and have led to considerable thought and to some united and social work, particularly in Providence, Toledo, Syracuse, and Utica. In 1900 a National Federation of Churches and Christian Workers was formed, with E. B. Sanford, D.D., as general secretary (90 Bible House, New York City). This has created some general thought and held an important interchurch conference in New York in 1905. Concerning the very active New York City Federation, its secretary contributes the following:

FEDERATION OF CHURCHES AND CHRISTIAN ORGANIZATIONS IN NEW YORK CITY, THE: Organized 1895, incorporated 1901. Purpose: To organize and assist the churches and Christian organizations of New York City for cooperative work in behalf of the spiritual, physical, educational, economic, and social interests of its family life, and to represent the Christian sentiment of the city in regard to moral issues. It began its work by a sociological investigation, including nationality, housing, wages, and public-school attendance with religious conditions in an upper West side district of New York. It found a district denser than the densest ward of London, England. It secured DeWitt Clinton Park by united petition of Catholic and Protestant churches; succeeded in having Episcopalian and Lutheran communions erect needed churches; located two settlement houses and several kindergartens, and brought churches of district into permanent cooperation. All succeeding investigations have been conducted on the same principles. It has instituted a model tenement for negroes to atone for racial injustice of charging blacks extra rent, has located a Moravian negro church to care for the West Indian immigration, and several churches for whites. It has discovered most populous blocks in New York City, and led the way to the formation of the Tenement House Department of the city. Its work of eleven years has resulted in over twenty-five institutions with aggregate value of over $3,000,000, and shaped the policies of sixty-five other institutions with value of over $10,000,000. Sub-federations have started cooperative work for neighborhood welfare. The first summer playground in New York, leading to the vacation playgrounds of the city, was conducted by a sub-federation. The organization of summer vacation Bible schools that include the first aid to the injured in their curriculum have led the city to include the same in the curriculum of their schools. The organization has also assisted the city in locating public baths. Federal and state statistics concerning population, overcrowding, etc., in New York City are interpreted, reedited, and reissued in *Federation*, the quarterly of the organization ($1 per annum). Here and here only the distribution of nationalities, the congestion of the city, and much kindred information can be obtained. The publications are used as text-books in sociological departments of many colleges and seminaries. The society has taken religious censuses of over one million people. It has lists of all institutions in each of the seventy-seven subdivisions of Greater New York; has in operation a cooperative church parish system covering 450,000 of the population; and has reduced, by the district plan, the churchless Protestants, in one neighborhood, from 48 to 28 per cent. It has the support of twenty-five religious communions, and was the cause of the formation of the National Federation of Churches. Studio 119 E. 119th St.

WALTER LAIDLAW.

FEDERATION OF LABOR. See AMERICAN FEDERATION OF LABOR.

FEEDING OF SCHOOL CHILDREN, THE: Owing to the fact that proof has been given by experts to the underfeeding of children among the poorer classes, and to the consequent retarding of their mental development, a number of communities have undertaken the feeding of school children. The practise is a development of a Swiss custom that newly married couples give a present of money to the school as a thanksgiving for their education. The mayor of Paris introduced this custom in 1849; in 1867 the Chamber of Deputies passed a law *permitting* any municipality to create a school fund, *caisse des Écoles*, by voluntary contributions and subventions of the city or the state. This was employed in buying shoes and clothes for poor children. In 1882 a law was passed *compelling* the creation of school funds in all parts of France. The district of Montmartre, Paris, was first in using its fund for the feeding of children. The idea soon spread over Paris, and other large cities of France, under the name *cantines scolaires*.

France

The plan as now practised in France usually involves: (1) Free meals, or meals provided at cost; (2) provision of shoes and clothing when necessary; (3) free medical attendance; and (4) in some localities the sending of weak and sick children to the seaside or the mountains, under the name of "school colonies." For the treatment of topics under (4) see article FRESH AIR WORK.

I. At first only poor children were fed, free of cost, later any child who was willing to pay. In 1882 there were fifteen *cantines scolaires* in Paris, which served in all 1,110,827 *portions*, as the lunches were called. One third of these "orders" were for meat, one third for bowls of soup; the remainder for vegetables; 374,301 orders were

given free; 736,526 paid for. The total cost of the lunches was 59,264 francs, of which the children paid 36,776 fr. Later experience proved the "orders" could be made larger, and the price reduced nearly 50 per cent. Nowadays the cost of a meal—consisting of a bowl of good soup, a plate of meat, two kinds of vegetables, and bread *ad libitum*—is fifteen centimes, or about three cents. The managers say that this small sum more than covers the cost. If all children paid, there might be some profit. Poorer children pay part, very poor ones nothing. In the district of Eppinette, a poor quarter, the children pay about 20 per cent of the total cost; in ordinary districts, e. g., Batignolles, from 45 to 50; in wealthy ones, 75 to 85. In order to make up the deficit the Municipal Council of Paris grants a subsidy. The total amount of this for the three years 1901–3 was 1,000,000 fr. The city is, however, largely compensated for this subsidy by the consequent reduction of the poor relief funds. Another item to be noticed is the falling off of private subscriptions to the *cantines scolaires* since the city has made the feeding of school children a municipal duty. Two features deserve special mention: (1) The prevention of fraud. When a child claims to be unable to pay even part of the 15 centimes, he or she is given a ticket at once; but within twenty-four hours an investigation is made at the home to find out the facts. If the statement is true, the child receives free meals as long as necessary; if not, the parents must pay the arrears. (2) The discretion maintained about poor children. Tickets of the same color are issued to all children, whether they pay or not; so that no child need exhibit its poverty by a special ticket. In order to prevent the overhearing of applications for free tickets, each child is compelled to go through a little box-office singly and receives his ticket for or without pay there. Thus the taint of pauperism is removed, and the self-respect of the children preserved. The teachers, too, generally take their meals at the *cantines*, pay the same price, and receive the same ticket. About 90 per cent of them take their lunches with the children, altho there is no compulsion about it. The meals are tasty, served neatly, and paper napkins are provided.

Elsewhere in Europe

In several German cities, particularly in Berlin, the plan for feeding school children is very similar to that of Paris, the *Schul-Kuche* is connected, as a rule, only with schools in poor districts. Brussels, Belgium, likewise follows the model of Paris; so do several cities in Switzerland. Italy has adopted the same system widely, but that of Vercelli, in the province of Piedmont, is unique in that it provides free meals to all children, and makes attendance at the meals as compulsory as that at school. Trondhjem, Norway, offers free meals to all school children who desire to avail themselves of the opportunity. Birmingham, England, feeds very poor or starving children with very scanty food as a matter of charity free of cost. About 2.5 per cent of all the city's children take these meals. The cost to the city is less than a half-penny a meal, including the managers and helpers' salaries of £100 in all a year.

In the U. S. the Oliver Goldsmith school in Chicago has for several years furnished free meals to a large number of children.

II. In nearly all European cities poor children are provided with shoes and clothing. District visitors look up the poorly dressed children's homes, and provide these articles at the expense of the municipality. Details differ, but the plan is, in the main, the same.

III. Free medical attendance is a feature of the scheme of many schools in Europe. Brussels has a compulsory system of free medical examination for all school children at least every ten days. The eyes, ears, teeth, general physical condition are overhauled. Tonics are given to weak or puny children; eye-glasses to those of defective sight; if need be, children are sent to the country or seaside. France, Switzerland, and Norway have less systematic medical examination.

Several cities in the U. S., e. g., New York, Chicago, have introduced medical inspection. But it is perfunctory. Yet even these examinations have revealed the alarming fact that in New York 17 per cent out of 10,000 children examined, suffered from serious defects of eyesight; and fully one third with less serious ones. An examination in Minnesota proved 70,000 children to have very defective eyesight, less than 10 per cent of whom were provided with glasses.

The result of the experiments in feeding and inspecting children have proved that poor scholarship is often due to underfeeding, or some defect of eye, ear, etc. Better physical, mental, and moral development has attended the efforts of looking after the needs of poor children systematically.

FELS, JOSEPH: Of the Fels Naphtha Soap Company of Philadelphia, Pa., mainly resident in England (Elmwood Bickley, Kent). Interested in the Vacant Lot Gardening in Pennsylvania, and in Labor colonies in England. (See Labor Colonies; Unemployment; Vacant Lot Gardening.)

FENWICK, C.: Member British Parliament, of Labor Party for Wansbeck, Northumberland. Born 1850, began work at age of nine in a mine. He has been prominent in all endeavors for improving the condition of miners, altho he is opposed to the Eight Hours Bill for miners. Is a member of the Royal Commissions on Mine Explosions and on Secondary Education; was Parliamentary Secretary of the Trades Union Congress from 1890–94. Has been a member of Parliament since 1885, elected chiefly by the votes of the Miners' Association, altho the Liberals assisted him. *Address*: 14, Tankerville Terrace, Newcastle-on-Tyne, England.

FERRARA, FRANCESCO: Italian economist; born in Palermo, Sicily, 1810. In 1834 he became chief of the statistical bureau of Sicily, and founded the *Giornale di Statistica*. In 1847 he was active in a movement aiming at the political independence of Sicily, and was imprisoned. Released in the following year, he was sent to Turin on a special mission, and during his sojourn there was offered the chair of national economy at the University of Turin, which he accepted. Later he held a similar chair at Pisa. In 1867 he was appointed minister of finance, and in 1868 became director of a mercantile school in Venice, where he remained until his death in 1900. He has written: "Importanza dell' Economia Politica" (1849); "Memorie di Statistica" (1890), etc.

FERRARIS, CARLO FRANCESCO: Italian scientist; born at Moncalvo, 1850; educated at the University of Turin (LL.D., 1870). He was a member of the Italian bureau of statistics from 1874 to 1876, and in 1878 became extraordinary professor at the University of Pavia, and in 1883 a director in the Italian ministry of agriculture, industry, and commerce. In 1885 he was called to the chair of administrative science and law and statistics in the University of Padua, which he still holds. He was a member of the Italian Chamber of Deputies during 1886–87, and since 1904. He is a member of many academies and institutes of art and science and statistics. He is also an honorary member of the Swiss statistical society and of the English royal statistical society. Among his works may be mentioned: "La Statistica e la Scienza dell' Amministrazione nelle Facultà Giuridiche" (1878); "Moneta e Corso Forzoso" (1879); "Principii di Scienza Bancaria"; "Socialismo e Reforma Sociale" (1900), etc. *Address*: University of Padua, Italy.

FERRI, ENRICO: Italian sociologist and politician; born at San Benedetto-Po, Mantua, 1856; studied at Mantua, Bologna, and Pisa. In 1880 he was appointed professor of criminal law at the University of Bologna; from 1882–85 he officiated in a similar capacity at Siena; and in 1892 he was called to Pisa. Since 1895 he has been an attorney at Rome. In 1886 Ferri became a member of the Chamber of Deputies as a Socialist, and he has become a leading member of the party. He is the founder and editor of the Socialist organ *Avanti*, and has written various works on sociological questions.

FEUDALISM: A social system prevalent in one form or another in northern and western Europe, through all the Middle Ages, according to which land was held by its owners as *feuds* or *feifs* on condition of paying service to a superior lord.

Origin

The origin of the system is uncertain. It seems, however, to have been first developed in Germany. Some find its origin in the Roman custom of making grants of land to tribes on condition of paying certain tribute or military service. It is certainly not very different from certain Roman forms of land ownership. (See LAND.) Most authorities, however, trace it to older and more fully Germanic and perhaps Asiatic origin—a development, it may be, of the early forms of land tenure. (See PRIMITIVE PROPERTY.) German chiefs had their *comitatus* or retinue of "freemen" surrounding and serving them in peace, and especially in war. Beneath these were the serfs or tillers of the soil, dependent on the freemen. It was a system of society partly separate from and eventually largely replacing the relation of the individual to the State. Under feudalism the individual placed himself or was placed as a vassal (a word probably of Celtic origin, at first meaning servant) under a superior. He was said to be under *commendation* to him, and for the protection given by the lord he owed him *obsequium*, or willingness to serve. Feudalism was connected with the older Roman system of *beneficia*, or the giving of property for use, but with responsibility to the donor or heirs. From this system grew up the ecclesiastical benefices. Feudalism changed the *beneficia* into *feuda*—property held under personal allegiance, *allodia* being property held in fee simple. The service paid by the vassal was service in war (*service d'hoste*), the obligation to appear at his lord's courts (*justitia*), money payments (*auxilia*), and homage. The "Treatise of Tenures" says: "Homage is the most honorable service and most humble service of reverence that a frank tenant may do to his lord, for when the tenant shall make homage to his lord, he shall be ungirt and his head uncovered, and his lord shall sit and the tenant shall kneel before him on both his knees and hold his hands jointly together between the hands of his lord, and shall say this: 'I become your man from this day forward, of life and limb, and of earthly worship, and unto you shall be true and faithful, and bear you faith for the tenements that I claim to hold of you, saving the faith that I owe to our sovereign lord, the king'; and then the lord, so sitting, shall kiss him." The tie of feudalism was thus essentially a personal tie for the use of land.

Feudalism grew up from the fifth to the ninth century, when it is found somewhat fully developed in Germany, and developing in the adjacent countries. In Germany, however, the different chiefs were so independent that a centralized feudalism never appeared. It is among the Normans, in Gaul, in Aragon, through large portions of Italy, and, after the Conquest, in England, that we find its fully developed and centralized form.

Here all land is held as belonging to the king, representing the whole people. He divides the realm among his barons, to rule over and defend.

The Feudal Principle

For this they pay tribute to the king and receive tribute from their retainers or vassals—the tribute in time of war being military service. They in turn divide their baronies among the lesser nobility, and they among the freemen, each paying tribute to his superior. The serfs, finally, live on the domain of the lord of the manor (the freeman), cultivate it, and have certain rights of domicile and pasturage, for receipt of which they pay service to the lord. The serf pays no tribute to the king, only to his liege lord; the liege lord pays to his superior, and so on up to the king. This is the feudal *idea* modified in history in a thousand ways and by a thousand special grants and privileges. The basis of the whole system is the land tenure, which is "the sacramental tie of all public relations."

Once developed, however, the system immediately began to change. When the English kings began to fight in France it became more convenient for the northern barons to give payments of money instead of military service; and the king preferred this, since it enabled him to hire troops who would serve him more unquestioningly. Gradually the system of paying money instead of service developed into the rule. Out of this came PARLIAMENTS, first called together to vote supplies for the king. But out of this came also other institutions. Under feudalism proper the serf paid nothing to the king directly, but only to his superior lord. When the king wanted money it occurred to his councilors that he might get money by taxing the serf as well as the lords. The early poll taxes were resisted (see PEASANTS' REVOLT), but they were collected. It was forgotten or ignored that the serf already paid the king *through the lord*; that the serf only paid the lord because the lord paid the king.

Developments

The lords were quite willing to have the serfs pay the king because then they could claim that the king was paid, and keep what they received *as their own*. This developed the landlord system of England. Hitherto the lords had ruled their lands, not as owners, but as representatives of the king, and what they received from their vassals they paid over to the king, at least in part. They now claimed to own the land, and kept the tribute as *rent*. The king, they said, was paid through *taxes*. Out of this has developed modern England.

It is not claimed that the development took this simple and conscious form; but it explains a large portion of what actually occurred. Under feudalism the vassal did not pay both tax and rent. His rent or service was his tax. Says Rogers ("Six Centuries of Work and Wages," p. 56): "There was in the thirteenth century no rent paid in the ordinary sense of that word." Such conditions have led to two extreme views

of feudalism: the one too favorable, the other too severe. According to one view, to which conservatives and some Socialists are inclined, the laborer under feudalism was better off than to-day. Every man was entitled to the use of a little land, with perhaps a cottage and the right of pasturage and of getting fuel in the manorial woods, all on the one condition of paying a little service or work to his lord. Each man had a place, a lowly place indeed—a cottage, rough and dark, with few comforts. But then the lord did not have modern comforts, and at least the serf was sure of his living and related by ties often of personal regard to the lord on whose estate he lived, and whom he could occasionally see and know. There was no landless class, and there was not the modern impersonal "cash nexus" and freedom, which is often a freedom to starve.

The other view to which liberals and individualists are inclined, goes to the other extreme. It dwells upon the rough home and food of the medieval serf, above all upon his oppression by his lord. He had a place, it is true, but a dog's place and a dog's life. How vastly better off, it is said, is the workingman of to-day. Feudalism has gone. Serfdom disappears in England after the PEASANTS' REVOLT. Feudal tenures were abolished by act of Parliament in England in 1660; in Scotland in 1747. In France they disappeared in the Revolution of 1789; in Germany and Austria, in the Revolution of 1848–50. In each country, however, the system had long been modified by political and social changes. A feudal system is said to have early developed in China and Japan, but to have disappeared in the former country as early as 220 B.C., on the conquest of the country by Siang Wang, of Tsin, or Tsin-shi-Hwang-ti. In Japan, it endured till 1871, when the *daimios* or barons surrendered their lands to the Mikado.

FICHTE, JOHANN GOTTLIEB: German philosopher; born at Rammenau, Lusatia, 1762; studied theology and philosophy at the University of Jena. On leaving college he earned a precarious support as an itinerant tutor. In 1791 he became a zealous follower of Kant, and in the following year wrote his "Critique of All Revelation," which Kant highly commended. For a time he lived under pecuniary difficulties, but in 1794 was appointed to the chair of philosophy at Jena. He soon broke loose from Kant, whose philosophy was not sufficiently idealistic. He said to a friend, "Kant has only *indicated* the truth, but neither unfolded nor proved it." In 1799 a groundless charge of atheism removed him from the college; and he took up his residence in Berlin. Six years later he was called to the chair of philosophy at Erlangen. It was here that his famous lectures on "The Nature of the Scholar" were delivered. Later he was elected rector of the University of Berlin, where he remained until his death in 1814.

Fichte united the qualities of the philosopher, the prophet, the patriot, and the saint. The fundamental notion of his philosophy is the reality of the ego, which posits both itself and the non-ego. As to his social views, the following quotations speak for themselves:

In his "Materials for the Justification of the French Revolution," he writes: "Property can have no other origin than labor. Whosoever does not work has no right to obtain the means of existence from society." In 1796 he proclaimed "the right to property." He says in his "Principles of Natural Right": "Whoso has not the means of living is not bound to recognize or respect the property of others, seeing that, as regards him, the principles of the social contract have been violated. Every one should have some property; society owes to all the means of work, and all should work in order to live." In his book on "The State in Accordance with Right" ("Rechtstaat") he foreshadows a collective organization which would realize what he understands by right: "Labor and distribution should be collectively organized; every one should receive for a fixt amount of labor a fixt amount of capital which would constitute his property, according to right. Property will thus be made universal. No person should enjoy superfluities as long as anybody lacks necessaries; for the right of property in objects of luxury can have no foundation until each citizen has his share in the necessaries of life. Farmers and laborers should form partnerships, so as to produce the most with the least possible exertion." The essential ideas of the socialism of to-day, as regards both the notion of right and its realization, are contained in embryo in the foregoing lines, which were manifestly occasioned by Rousseau and the eighteenth-century philosophers, tho modified by his deep and pietistic Christianity. Among Fichte's works may be mentioned: "The Destination of Man"; "The Vocation of the Scholar"; "The Nature of the Scholar"; "The Way to the Blessed Life"; and "The Characteristics of the Present Age." His "Rechtstaat" was translated by A. E. Kroeger.

FINANCE, THE SCIENCE OF: (from medieval Latin, *finis*, an end, or payment in settlement), is correctly used in economics for the science of the raising, administration, and expenditure of the revenues of a nation, state, or city. The word finance is popularly but incorrectly used for the discussion of the subject of money; perhaps because, in the United States, especially, questions of revenue have been so intimately connected with those of money.

In classic times, while there was often wise management of the public finances, there was little development of theory or principles of finance. The work of Xenophon on the revenues of Athens was simply a discussion as to how the city might derive sufficient revenue from its own territory. He recommends a state monopoly of silver mining. The Romans developed still less theory.

Development

The first modern development of the science was by the German cameralists (q. v.). These often gave good, practical advice, but still with little system or theory. From the seventeenth century the school of the mercantilists (q. v.) began to have weight, and in the eighteenth century the school of the physiocrats (q. v.). The German cameralists discust finance largely as a matter of the management of domains and monopolies. The mercantilists were more for duties, customs, and bounties. Under the influence of the physiocrats we have the development of the idea of the *impôt unique*, the single tax on land. Under Adam Smith and his followers we have the development of the ideas of free trade and the substitution of other taxes for customs duties. In the development of the modern science of finance the Germans lead. They divide the science into

Content

three parts: 1. The organization of the financial economy; 2. public expenditure and the purposes for which it may be made; 3. public revenue and the sources from which it may be derived. The ordinary sources of revenues are divided into three kinds. (1) From agricultural, industrial, or commercial enterprises (see NATIONALISM; MUNICIPALISM; RAILROADS; POSTAL SYSTEM; TELEGRAPH); (2) from fees; (3) from taxation (q. v.).

In the conduct of a State's financial system, Prof. E. J. James (article "Finance," "Lalor's Cyclopedia of Political Science") finds four main systems: 1. The German, where all public offices are filled from the ranks of persons who have shown their fitness by prescribed tests, and after a period of probation are appointed with a right to the office and a salary as long as its duties are properly performed. 2. The French system, where the salaried officer, tho professionally educated, may be removed at pleasure. 3. The American system, in which the salaried officer may be removed for political reasons without any question of fitness. 4. The voluntary system, where offices are filled by those able and willing to act without salary. Professor James considers the German system, tho nominally the most expensive, in reality the cheapest and the best. (See TAXATION.)

* For latest figures, see under the principal countries.
[a] Actual receipts and expenditures.
[b] Budget estimate.
[c] From and on account of the consolidated fund.
[d] Local budget only, exclusive of subsidies and other expenditures of home government in interests of colony.
[e] Estimated.
[f] Exclusive of transfers from the imperial treasury, appearing in the budget of the empire.
[g] Exclusive of contributions to imperial treasury, appearing in budget of Empire.
[h] Exclusive of subventions paid by the imperial government to the extent of $6,443,000.
[i] Largely in depreciated paper.
[j] Of which $54,347,834 constituted the internal debt.
[k] External debt.
[l] Exclusive of the East Rumelian tribute of 2,951,000 francs per year, for which no capital value has yet been fixt.
[m] Net gross debt June 30, 1902, $366,358,477, of which $129,392,026 was not funded. Against gross debt there were $94,529,387 of assets, $50,874,000 constituting sinking-fund.
[n] Including arrears of interest amounting to £14,289,783.
[o] Converted into securities of the Salvador Railway Company in consideration of an annual subsidy of £24,000.
[p] Total gross debt, against which assets amounting to $27,962,901 were held by the treasury.
[q] Against which reserve funds amounting to $40,221,000 were held in beginning of 1903.
[r] Of this total, 1,161,913,883 rupees represent the permanent debt in India, and £130,307,090 the permanent debt in England.
[s] Against this total the treasury held bonds and securities valued at 166,039,000 lire, making the net debt = $2,528,559,000.
[u] Of which £1,116,686 were arrears guaranty payments due Paraguayan Central Railway.
[v] There are besides outstanding the debts due to Brazil, 9,876,500 pesos, and to Argentina, 12,393,600 pesos.
[w] The foreign debt, amounting to £31,579,080, exclusive of arrears of interest of £22,998,651, was assumed in 1890 by the Grace-Donohue Company on concession of the railways, and certain rights over guano deposits, mines, and lands in Peru for sixty-six years.
[x] Of which £41,568,645 are reported to be in the hands of the government.
[y] Of which 3,049,522,636 was in gold rubles or in terms of foreign currency, and 3,579,723,450 rubles in terms of Russian currency. This total does not include about 550,000,000 rubles of credit notes in circulation, more than fully covered by the metallic reserve of the Bank of Russia.
[z] Secured by customs duties and specially assigned revenues, the collection of which is controlled by the Santo Domingo Improvement Company, of New York.
[aa] Of which 9,664,484,956 pesetas were classed as "internal" debt.
[bb] Practically all contracted for the purpose of construction of railways.
[cc] Total liabilities of the Federation, exclusive of the railway debt.
[dd] Represents the funded debt proper and the estimated capital liability in respect to terminable annuities.
[ee] The item in the column "Funded debt" is total interest-bearing debt of United States.
[ff] External debt, including arrears.

FIRE DEPARTMENTS: The earliest fire companies were composed of volunteers, tho sometimes inducements to join were held out by exempting them from jury duty. They were sometimes like social and sometimes political clubs.

FIRE DEPARTMENTS OF TEN LARGEST CITIES, U. S. (1903)

CITY	Paid Firemen	Engines	Property Loss from Fires	Expenditure 1904
New York, N. Y.	3,359	170	$7,082,439	$6,438,426
Chicago, Ill.	1,297	123	3,062,931	1,878,308
Philadelphia, Pa.	854	66	2,326,528	1,377,247
St. Louis, Mo.	510	52	1,203,929	882,508
Boston, Mass.	891	65	1,674,333	1,333,087
Baltimore, Md.	444	34	670,615	548,550
Cleveland, Ohio	424	33	824,062	606,071
Buffalo, N. Y.	570	38	932,240	751,200
San Francisco, Cal.	647	60	1,211,816	743,603
Pittsburg, Pa.	451	36	553,324	599,802

In New York, the firemen became a power in ward politics. The paid fire department of New York City was organized May 4, 1865. Since then the system has spread to all the large cities and attained remarkable efficiency, organized usually under fire commissioners. Fires are much more frequent in America than in Europe, because of poorly constructed houses and lack of construction laws in America. This, however, is being changed. Partly as a result, the American fire departments are generally thought to be much more efficiently developed.

In London, the force of the fire-brigade is 1,313 men and officers; land-engines, 82; fire-floats, tugs, etc., 15; expenditure (1904–5), £247,974. The fire-brigade of Berlin had a total strength of 847 men and officers in 1900; 10 steam-engines, 18 hand-engines, etc.; expenditure, 1,661,611 marks. That of Hamburg, 551 men and officers, 32 steam-engines, 8 gas-engines, 11 hand-engines; expenditure, 1,264,830 mks. The force of Vienna amounted

to 461 men and officers, 7 steam-engines, 30 gas-engines. Besides the professionals Vienna has a voluntary force of 1,028 men, with engines and apparatus of their own; expenditure for both, 1,226,323 kronen. Germany has 50 professional fire-brigades. The fire-fighting forces of Germany have formed a union which consisted in 1898 of over 26,061 brigades with 1,451,123 men. Austria has a similar union numbering in 1901 9,849 brigades, mostly voluntary, with 441,925 men. The fire-brigade of Paris consisted in 1900 of 1,753 men and officers; it had 25 steam-engines, etc.; expenditure, 2,620,727 francs.

FIRE-DRILLS: It is usually assumed that where fire-extinguishing apparatus has been installed in a building and fire-escapes provided, everything necessary for a fire emergency has been arranged for.

Experience does not bear out this assumption. People not being accustomed to them, are afraid to use them at the critical time, or if many try to use them at the same time, get jammed on them and injured.

The only way that these results can be obtained in the case of fire appurtenances is through an occasional fire-drill. The effectiveness of this institution has long been proven in the public schools. Boys drilled in it are now men, and, appreciating the soundness of its principles, are putting it into effect in factories and in other places where people congregate for any length of time.

A fire-drill is now considered an essential part of every up-to-date, well-organized business enterprise. It is recommended by the city fire departments in order that the firemen on their arrival may give their immediate attention to putting out fire and preserving property instead of to saving lives.

For the working of Fire-drills, address H. F. J. Porter, Industrial Engineer, 1 Madison Avenue, New York.

FIRE INSURANCE. See Insurance.

FISHERIES: A system of profit-sharing was introduced into the cod and mackerel fisheries of the United States about 1730.

When a ship was built the builders would take shares in it—painter, sail-maker, rigger, captain, and all who were to man it. The ship was divided into sixty-four shares. The builder would take a large part, the captain and mate each one share or one half share, and so on down through the entire crew. The chief owner was known as "the ship's husband." He determined the plans of the voyage. In fisheries, a ship would be held in five shares. The owner held two fifths and the crew (captain, mates, and men) held three fifths. Profits were divided among these conjoint owners according to the shares held. The owner kept the ship in repairs and the whole company paid the expenses. This custom has only in small part been kept up—longest in the Maine fishing smacks. To-day the fishers are poorly paid, and for the most part work for wholesale dealers.

This change in fisheries has destroyed its romance. That is bad enough, but the indirect loss of having a considerably smaller number of competent seamen to recruit our navy from, is more serious, and affects the whole country.

United States

(Compiled by the U. S. Bureau of Fisheries.)

Sections	Vessels employed	Persons employed	Value of products
South Atlantic States (1902)	526	23,452	$2,839,633
Gulf States (1902)	714	18,029	3,494,196
Middle Atlantic States (1904)	3,583	83,103	18,963,976
New England States (1902)	1,479	39,250	12,406,284
Great Lakes (1903)	206	9,333	2,745,501
Mississippi River and Tributaries (1903)	5	13,377	1,841,168
Minor Interior Waters (chiefly for 1900, 1902, and 1903)	1	2,491	425,929
Pacific Coast States (1904)	226	19,658	6,680,866
Alaska Territory (1905)	170	10,866	7,330,224
Total	6,910	219,559	$56,727,777

The total capital invested is $88,349,563.

Great Britain

(Board of Agriculture and Fisheries, 1905.)

	Regular fishermen employed	Fishermen occasionally employed	Fishing boats	Value of products
England and Wales	34,318	8,132	9,131	£7,502,768
Scotland	29,064	10,487	10,581	2,719,810
Ireland	8,744	17,079	6,221	393,630

Channel Islands	530	193	.....	.....
Total	73,293	36,131	25,933	£10,616,208

Fish imported were valued at £3,224,402.

Other Countries

In Germany (1895), 32,199 persons were employed in fisheries; in France (1905), 20,272 men (in cod and herring fisheries); Italy (1905) 94,684 men in 24,264 boats; Spain, 14,700 men; Norway, 93,169 men; Holland, 20,141 men.

FLOWER, BENJAMIN ORANGE: American editor and author; born at Albion, Ill., 1858; educated in public schools and Kentucky University. Until 1880 he edited *The American Sentinel* at Albion, Ill., and then went to Boston, where he established *The American Spectator*. In 1889 he founded *The Arena*, of which he was editor until 1896. For a short time he edited *The New Time* in Chicago, and later *The Coming Age* until that magazine was merged into *The Arena*, of which he (1904) became sole editor. A firm believer in pure democracy, he holds that the most important immediate step is the introduction of the initiative, referendum, and right of recall. He also favors proportional representation and direct primaries, believes in public ownership of all natural monopolies, and holds that the single tax would do much toward establishing equality of rights and opportunities. In view of the great inequalities of wealth he believes that a graduated income tax and an inheritance tax should be introduced for a term of years, as an equalizing factor. He is the author of: "Lessons Learned from Other Lives" (1891); "Civilization's Inferno" (1893); "The New Time, Essays on Social Problems" (1894); "Whittier, Prophet, Seer, and Man" (1895); "The Century of Sir Thomas

More" (1896); "Persons, Places, and Ideas" (1896); and "How England Averted a Revolution of Force" (1901), etc. *Address*: 5 Park Square, Boston, Mass.

FLÜRSCHEIM, MICHAEL: German social reformer; born in Frankfort-on-the-Main, 1844. From 1860 to 1867 he worked in banks in Frankfort, Berlin, and Paris. In 1867 he went to the United States, where he was an importer, manufacturer, and inventor—first in New York, and from 1870–72 in Virginia. In 1872 he returned to Germany, first engaged in a journalistic enterprise (*The American News*), and in 1873 purchased the Gaggenau Iron Works, which he conducted for fifteen years with great success. He introduced new industries into Germany, and at one time he had taken out over one hundred patents. In 1883 he began to devote a part of his time to social reform. In 1884 his first book, "Auf Friedlichem Wege," appeared. In 1886 he published "Deutschland in 100 Jahren," a precursor of Bellamy's "Looking Backward," and the flood of similar writings following in its wake. In 1889 he completed and soon published "Der Einzige Rettungsweg," and in 1890 he wrote in English, "Rent, Interest, and Wages," which appeared in London in 1891. In 1894 he published "Bausteine für Social Reform." In 1893 he went to the U. S. and Mexico, to assist in the foundation of a cooperative colony on land nationalization principles. Tho a follower of Henry George in the general idéa that common land ownership is the foundation-stone of social reform, Flürscheim differs from him in most other theories, and also in regard to George's proposal of the single tax, which he calls confiscation. He prefers full land nationalization, with compensation of landowners. He considers his most important discovery is his crisis theory. It was in 1888 that he completed this theory. He holds that the cause of commercial depression, of scarcity of work—in fact, of the modern social problem—is that the very rich neither consume the total of their incomes nor do they invest a great part of their savings in products of work (machines, houses, steamers, etc.). They mostly invest in spurious capital, consisting of nothing but tribute claims that give no opportunity for work, but, on the contrary, by increasing the debts of the people, keep back their purchasing power, and thus prevent this power from keeping pace with the increasing productive power of the world, without which it must be impossible to keep at work all producers, for we cannot produce if we do not consume.

This spurious capital, these tribute claims, have their foundation mainly in private land ownership; for rent is the mother of interest and compound interest. As long as capital can invest in land and thus obtain rent, it will claim interest, wherever otherwise invested. When capital can no more purchase rent, it will be offered free of interest (of interest proper—i. e., of interest less risk premium) to labor, as the production of capital, when unhampered by the effects of private land ownership, will exceed the demand, and all who save for a rainy day and for old age will be glad to obtain the advantage of having their savings preserved intact for the day when they need them.

One other reform he proposed lately, which, tho he does not think it a fundamental one, he judges of great importance. This is the nationalization of commerce, the doing away with all middlemen, and effecting direct exchange of products through a State department, that monopolizes it just as letter delivery is monopolized by another department. He desires to restrict individualism to production where competition is a stimulating element, whereas it only produces waste in distribution. This system would allow the introduction of another reform which is possible in this way—a money reform. Exchange could take place through warrants issued by the commercial department, or checks drawn on the same, which warrants are redeemable only in goods or services. Metal money would become unnecessary or could be restricted to small coins.

He has introduced the above three reform principles into the by-laws of the Mexican colony, Freeland—i. e., common land ownership, monopolization of commerce (distribution) by the community, and warrant money.

FOLKS, HOMER: Secretary of the State Charities Aid Association, New York. Was born Feb. 18, 1867, at Hanover, Mich. Graduated from Albion College in 1889, from Harvard in 1890. He was secretary of the Children's Aid Society of Pennsylvania from 1890–93, and was appointed secretary of the State Charities Aid Association of New York in Feb., 1893, which position he has held continuously since with the exception of three years—1901–4—when he was Commissioner of Public Charities of New York City. He has been on numerous committees, both for the state, city, and the U. S. Government. Author: "A History of the Care of Destitute, Neglected, and Delinquent Children in the U. S." (1902); "Family Life for Delinquent Children" (1893); "Reform and Public Charities" (1895); "Problems in the Administration of Municipal Charities" (1901); and other papers on similar topics. *Address*: 105 East Twenty-second Street, New York, N. Y.

FOOD VALUES: The science of nutrition, tho a comparatively new science, has recently made rapid progress. The chemical standards of nutrition have been mainly investigated by Professor Voit and others in Germany, by Sir Lyon Playfair in England, by Prof. W. O. Atwater, Mrs. Ellen H. Richards, Edward Atkinson, and now to a large extent and very effectually by the Department of Agriculture in the United States. Statistics of the nutritive values of food have been clearly presented by Professor Atwater and others.

The animal body is a living machine, and, like any machine, needs fuel—i. e., food—to enable it to work, and also, as a machine does not, it needs fuel to keep it alive even without work. About one third of the food eaten goes to maintain life. The main nutriments of the body are protein, fats, and carbohydrates, mineral matter and water. What is called protein forms tissue (muscles, tendon, fat, etc.), and serves as fuel. Fats form fatty tissue and serve as fuel. Carbohydrates are transformed into fat, and serve as fuel. Water forms 60 per cent of the weight of the body and is an important constituent of food. Mineral matters form only 5 or 6 per cent of the body by weight, but are important. The standard of nutrition for a man at active but not excessive work is 700 grams of actual nutritive and digestible material free of water, 450 of carbohydrates or starch, 150 of fats, 150 of

protein, with such mineral ingredients as will be found in any miscellaneous dietary in sufficient measure. These elements will yield 3,520 calories, the calory being the amount of heat necessary to raise one kilo or 1,000 grams of water 1° C. In order to make allowances for inevitable waste, we may safely adopt 4,000 calories as the average units of nutrition for a man at active but not excessive work for one day; 2,700 calories is, however, perhaps enough to nourish a man at sedentary employment. The U. S. Department of Agriculture, "Farmers' Bulletin 142" (1902), publishes the following table of food values:

Kind of Food	Protein		Fat		Carbohydrates	
	Digestibility	Fuel value per pound	Digestibility	Fuel value per pound	Digestibility	Fuel value per pound
	Per ct.	Calories	Per ct.	Calories	Per ct.	Calories
Meats and fish	97	1,940	95	4,040	98	1,730
Eggs	97	1,980	95	4,090	98	1,730
Dairy products	97	1,940	95	3,990	98	1,730
Animal food (of mixed diet)	97	1,940	95	4,050	98	1,730
Cereals	85	1,750	90	3,800	98	1,860
Legumes (dried)	78	1,570	90	3,800	97	1,840
Sugars	....	.....	....	.....	98	1,750
Starches	....	.....	....	.....	98	1,860
Vegetables	83	1,410	90	3,800	95	1,800
Fruits	85	1,520	90	3,800	90	1,630
Vegetable foods (of mixed diet)	84	1,840	90	3,800	97	1,820
Total food (of mixed diet)	92	1,820	95	4,050	97	1,820

The department also makes the following statements of food values. ("Year Book, 1902"):

FOODS GROUPED ACCORDING TO THEIR VALUE AS A SOURCE OF ENERGY OR FUEL

Cheap.—Furnishing more than 1,900 calories energy for ten cents at ordinary prices: All cereal products; sugars, starches, etc.; lard; dried beans and peas; cheap fat cuts of meat, such as beef, plate and brisket, and mutton neck, fat salt pork and bacon; potatoes and sweet potatoes.

Medium.—Furnishing 800 to 1,900 calories energy for ten cents at ordinary prices: Such cuts of meat as beef flank, neck, shank, and shoulder, veal flank and knuckle, mutton chuck, rib, and loin, and the cuts of pork with the exception of bacon and fat salt pork; such vegetables as green peas and beans, parsnips, beets, and turnips; dried fruits; butter, cream, condensed milk, whole and skimmed milk; salt mackerel; a few fruits, such as apples, pears, and grapes.

Expensive.—Furnishing less than 800 calories energy for ten cents at ordinary prices: The leaner and the more expensive cuts of meat, such as beef chuck, rib, round, and loin, mutton leg and most cuts of veal; chicken and turkey; eggs, when costing over twenty-five cents a dozen; fresh and preserved fish and shellfish; green vegetables, such as cabbage, lettuce, cucumbers, tomatoes, celery, greens, etc.; fresh fruits, except those enumerated above; canned vegetables and fruits.

Concerning the food eaten by different nationalities, Mulhall ("Dictionary of Statistics") gives the following table, except that the figures for Australasia are taken from Coglan's "Year Book":

Country	Lb. per Inhabitant					Tea and coffee, ounces
	Grain	Meat	Sugar	Butter and cheese	Potatoes	
United Kingdom	378	109	75	19	380	91
France	540	77	20	8	570	66
Germany	550	64	18	8	1,020	78
Russia	635	51	11	5	180	6
Austria	460	61	18	7	560	28
Italy	400	26	8	4	50	20
Spain	480	71	6	3	20	6
Portugal	500	49	12	3	40	18
Sweden	560	62	22	11	500	112
Norway	440	78	13	14	500	144
Denmark	560	64	22	22	410	140
Holland	560	57	35	15	820	240
Belgium	590	65	27	15	1,050	142
Switzerland	440	62	26	11	140	110
Rumania	400	82	4	9	80	8
Servia	400	84	4	9	80	8
United States	370	150	53	20	170	162
Canada	400	90	45	22	600	72
Australasia	377	233	105	21	268	123

This question of food has a very direct and practical bearing on wages and productivity. Workmen ill paid are ill fed, and workmen ill fed cannot do work equally valuable to the work of well-fed men. European manufacturers continually marvel that American producers (e. g., in the steel mills) can sell their produce so cheaply and yet pay such high wages. But as proven in Schoenhof's "Economy of High Wages," high wages are really cheap wages, because the high-grade workman produces so much more. And a large part of the reason for this is that he is better fed. The well-fed workman has in the first place more vital power and endurance; and secondly, he has better quality of brawn and mind; he works less on a strain and nervous stimulus. His hand is steadier, his eye clearer, his brain more alert. He needs less minute direction and overseeing, which is expensive and rarely satisfactory. He needs also less stimulants, so much so that many temperance experts declare that good food is one of the best cures for the liquor habit. That American skilled workmen drink less beer and any alcoholic drink than their English or European competitors is probably one of the reasons for their higher productivity. All this is, in fact, a matter of food. A few English manufacturers (among them Chamberlain of Birmingham) have within recent years voluntarily raised their wages, being convinced that they would be more than repaid in increase of production. (See Production; Prices; Wages.)

FOREIGN BORN. See Population.

FORESTRY: Practical forestry, tho comparatively new to America, is, historically, quite old. In earliest times the forest was reserved for the game it contained, and was closed to the poorer people. In this era, when a man's life was worth less than that of the hare which he attempted to trap, forest reservation was exceedingly unpopular, and the feeling is even now not altogether outgrown.

China, of all the great nations, has wholly neglected its forests, and as a consequence suffers more from the effects of deforestation than any other country. The great floods which annually roll down the Yang-tse carry destruction in their path and cause the loss of thousands of lives. These floods are due wholly to the fact that the watersheds are absolutely treeless. Germany, France, and Switzerland have brought forestry to its highest development, and these three countries derive a large revenue from the administration of their forest estates. Forestry was practised in Italy long before Milton's time, because his famous line "thick as leaves in Vallambrosa," referred to a planted forest—the work of Italian monks.

Forestry in the United States, in spite of the great strides which it has made in the last few years, is still very much in its infancy. In the early days of the colonies the value of the forests was at first recognized, and the colonial governors promulgated laws for forest preservation. But the forest had to be cleared to make way for fields and gardens. It was a place where Indians and wild animals lurked, and as such was to be got rid of. This feeling grew, and the "westward course of empire" meant the downfall of the trees before the settler's ax. There was inaugurated a period of waste, which was kept up until the present time. Lumbermen now say that the best part of the forest was thrown away.

Recent investigations have shown that, at the present rate of cutting, the timber supply of the U. S. will not last out the first half of the twentieth century. It became imperative that steps should be taken to preserve those forests which were not yet taken up, and out of this need grew the National Forest Service and the present system of national forests.

United States

Altho American forestry is not confined to the government's activities, by far the most important work is that which is being done by the Forest Service of the Department of Agriculture. The principal business of the Forest Service is the administration of the national forests. These lie wholly within the West, where the only remaining forests on public lands were to be found. The present area of the national forests is about 160,000,000 acres, an area equal to the New England and Middle Atlantic States. The objects of the administration of this domain are three-fold: first, to preserve the forests to future generations; second, to give them the highest use in the present; and third, to make them self-sustaining. To accomplish these ends, the first care is to see that fire and waste are eliminated.

The national forests are used in several ways: as a source of timber supply, as grazing areas, and as conservers of water. In some places, particularly in connection with the development of irrigation under the Reclamation Service, their principal use is as a protection cover. In such places they will not be touched except where their chief purpose will be subserved by the cutting. In enclosing large areas of forest it is impossible not to include certain grazing or agricultural land. In the case of agricultural land it is as freely open for homestead entry as when a part of the open public domain. Moreover, there are certain advantages to be had in connection with settlements on the national forests, such as: the land can be selected by metes and bounds to include only good areas, instead of having to take all the land that falls within a rectangular quarter section, as is the usual case; the free use of timber and stone and of the range, where such use is for private purposes.

Timber is cut and sold from the national forests where the cutting means an improvement, or where the forest crop is ripe. In these cases the land is not skinned, proper precautionary measures are taken against the ravages of fire, which almost invariably follow lumbering operations, and seed trees are always left so that natural reproduction will follow. In most cases this is all that is necessary to secure a future stand of timber, but for the purpose of reforesting burned areas, or where natural reproduction is insufficient, planting operations are carried on in connection with the forests, and rangers' nurseries are fixed institutions.

National Forests

The two principal sources of revenue from the national forests are, therefore, the fees which are received for the grazing privileges, and the stumpage price obtained by the government for its lumber. The grazing privileges are eagerly sought for by stockmen throughout the West, because the forest administration insures to them an equitable allotment, makes the range permanent by preventing overgrazing, and obviates difficulties between the conflicting interests of sheep and cattle, by absolutely segregating different parts of the range for these two industries. Indeed, so highly is the grazing administration held that stockmen's associations have advocated that a similar plan be put in operation for all the public range in the West, whether it lies within or without the national forests.

The timber sales are conducted with the idea of giving the best service to the immediate locality served by any particular national forest. They are not conducted with the idea of keeping lumber prices down, or coming in competition with private commercial interests. The settler and small dealer are, if anything, favored above large interests, and the whole policy is summed up in the idea that the forests shall be for the use of the greatest number of people over the greatest possible period of time.

The national forests must be maintained to supply the future. If they did only this, there would be a sufficient excuse for their existence. But to be truly successful, they must be a help now and all the time, and must be so conducted that they will "pay as they go." The U. S. Government now controls approximately 148,000,000 acres of land in its national forests. Some of this area does not bear merchantable timber, yet the total stand is estimated to be approximately 425,000,000,000 feet, log scale. No one of the largest timberland owners in the country holds more than 4,000,000 acres, nor does any one control more than 50,000,000,000 feet. With the possible exception of Russia, the U. S. is by far the largest owner of stumpage in the world. From now on there will be no such extensive additions as those made by the proclamation of March 2, 1907, which added more than 15,000,000 acres to the national forests.

Statistics

Outside the western reserves the principal interest in national forest areas is in connection with the proposed White Mountains and Southern Appalachian forests. Bills for the creation of these forests have passed the U. S. Senate and

have received the approval of the proper committees in the House, and it is understood they had practically the unanimous sentiment of the House of Representatives back of them. At the last moment they failed to pass the House. It is very likely that the American Forestry Association and the other interests which are back of the bills will see that they are reintroduced at another session, when they will likely be passed.

The importance of government administration of the Appalachian forests cannot be overestimated. The slopes of these mountains contain a large proportion of the remaining supply of hardwoods, and this supply should be made to go as far as possible. The forests of the Appalachians are, however, more important as a protective cover than for any other purpose. The industrial development of the South will depend in a great measure on the sustained water power of the streams which flow from the Appalachian Mountains. These rivers will be intermittent in character and will go from extremes of flood in one season to drouth in another and become sources of damage and danger if the mountain sides are denuded. Through the forests the perpetual flow of the streams will be maintained, and a specific amount of water power can be depended upon. The southern rivers and harbors will not be silted up, nor will fertile fields and valleys be washed away by the action of floods.

Two names will go down in history in connection with the preservation of the forest resources of the U. S. One of them is that of Theodore Roosevelt, the president under whom the forest policy of the nation has received its greatest impetus. In spite of the fact that his greatest popularity lies in the West, he has deliberately espoused a policy contrary to many powerful influences there in order to keep the people's property in the people's hands. At a time when the most determined opposition was being made to his policy, and when legislation was pending that would make it almost impossible for him to further enlarge the national forests, he had the courage to make large additions to the existing reserves.

Mr. Gifford Pinchot, the U. S. Forester, is the one other man whose name will shine with equal splendor in connection with the cause of forestry. He is an example of the best in American citizenship. Rich by inheritance, and with no other incentive to the work than his love for it, he has thrown himself into the cause of furthering forestry in the U. S. with a zeal and industry that are stupendous. Every other interest in his life has been made subservient to this, his one great purpose. He and President Roosevelt have worked hand in hand, and to neither of them will future years bring any greater monument than that which they themselves have created in the national forests and the forest policy of this government.

State	Number of national forests	Total area
Arizona	13	9,463,725

In Great Britain, according to report in 1903 of a departmental committee the area of waste, heather, and rough pasture or land out of cultivation in the United Kingdom on which afforestation could be profitably undertaken is 21,000,000 acres, and that afforestation would furnish remunerative labor to an increased rural population, land under forests requiring more labor than the same area under sheep. The world is approaching a dearth in its supply of coniferous timber, which constitutes between 80 and 90 per cent of the total British timber imports, and which can be grown in these islands, and the question is therefore a matter of grave national concern.

The figures for woodlands, as given in "Agricultural Statistics, 1905," are:

	England	Scotland	Wales	Great Britain
	Acres	*Acres*	*Acres*	*Acres*
Coppice	538,123	23,015	15,733	576,871
Plantations (since 1895)	59,647	35,407	8,629	103,683
Other woods	1,117,703	809,987	159,999	2,087,689
Total woodlands	1,715,473	868,409	184,361	2,768,243

In the German Empire some 13,995,859 acres were estimated to be in forests, or 25 per cent of the empire. They are cared for by the State on scientific methods. Prussia alone receives from forests and domains a revenue of some $20,000,000. In France about 15 per cent is under forests; in Norway, 22 per cent; in Russia, 64 per cent of the forests (in European Russia) belong to the State. The revenue from the State forests in 1904 was 50,452,000 rubles, and the expenses 11,142,000. BRISTOW ADAMS.

FOUNDLING HOSPITALS: In ancient times infanticide, at least by exposure, was frequent. Aristotle and Pliny the Elder defended it. Institutions for the rescuing of exposed children do not seem to have been wholly unknown, and the Christian Church early condemned such exposure and rescued infants; but the first foundling hospital for the receipt of infants abandoned by their parents appears to have been established by the Bishop of Treves in the sixth century. The first authenticated one is that at Milan. This was copied elsewhere, the usual way being to receive the infants in a marble basin in front of the cathedral. In the Middle Ages, foundling hospitals existed in all the large Continental cities, tho the system was early abolished in Germany. In France it was early condemned as leading to vice, but defended as preventing infanticide, and continued. The revolutionary government of France in 1790 called such children *enfants de la patrie*, and decreed that every pregnant girl should receive a premium of $24. This was abolished in 1811, but foundling hospitals were maintained. They exist still in large numbers in France and Spain, and to a less extent in other countries. Those in Russia are the largest. The medieval device long used in France, and perhaps still used there in some parts of the country, consists of a double cradle. When the child has been placed in the cradle on the outside of the building, the contrivance is revolved, ringing a bell as it turns. The purpose of these "*tours*" is to make it easy to get rid of babies, that there may be no temptation to infanticide. The agitation for the abolition of this system was bitterly resisted. When the *tours* had been suppressed in some places attention was called to the fact that infanticide increased thereafter. But further examination of the statistics showed that infanticide had also increased in those departments where the *tours* were still in operation; in fact, it had increased faster in the latter than in the former. From 1869–73 there were received in France 5,076 infants, of whom 2,037 died.

At present in France the foundling hospitals are merely for the temporary care of infants. In Vienna mothers who bring infants to the foundling hospitals must nurse them three months. In London foundlings and illegitimate infants are received only after careful investigation. In the United States foundlings are usually received in poorhouses; the foundling hospitals exist in all the larger cities. Infants, however, are now increasingly boarded out under the supervision of the State, the result being that the death-rate of foundlings, which in hospitals is very high, has been much reduced. Massachusetts has abolished foundling hospitals by law, and the tendency everywhere is in that direction. (See CHILD-HELPING.)

FOURIER AND FOURIERISM: François Charles Marie Fourier was born at Besançon in 1772. Well educated and much traveled, but losing his property in the Revolution, he served two years in the army, and later entered business in Lyons. In 1803 he published an article on European politics. Becoming interested in social questions, he published anonymously his "Théorie des Quatre Mouvements" (2 vols., 1808). He believed that the full indulgence of human nature, with all its passions, would produce happiness and virtue. Society he would harmoniously organize in groups (phalanxes) of 1,600 persons, to inhabit a phalanstery, a certain proportion to do one kind of work, others other kinds, and to regulate their time so as to harmoniously develop all sides of life. In 1812 the death of his mother put him in possession of a small sum of money, with which he retired to Bellay in order to perfect his second work. The "Traité de l'Association Agricole Domestique" was published in two volumes at Paris in 1822, and a summary appeared in the following year. After its publication, the author proceeded to Paris in the hope that some wealthy capitalist might be induced to attempt the realization of the projected scheme. Later he became a clerk in an American firm in Paris. In 1829 he published "Le Nouveau Monde Industriel." In 1831 he attacked the school of ST. SIMON. He now began to gain followers, particularly Victor CONSIDÉRANT, who in 1834 published his "Destinée Sociale," the most important work of this school. In 1832 a newspaper was attempted, and, with many interruptions, published, till it was suppresst in 1850. In 1832 Baudet Dulary became a convert, and proceeded to establish a phalanstery at Condé sur Vesgre, but it soon failed.

Not discouraged, Fourier lived in the expectation that some rich man would appear and carry out his ideas. He announced that he would be at home every day at a certain hour to receive the rich man, and is said to have done so each day till his death in 1837.

Fourierism has been frequently described, sometimes in ridicule, sometimes in admiration. Henry James, Sr., says of Fourier's writings:

> Every one who trusts in a living and therefore active God, in that God who is quite as active and original in our day as He was 6,000 years ago—in short, every one whose hope for humanity is alert, behooves to acquaint himself forthwith with the marvelous literature of socialism. You will doubtless find things of an apostolic hardness to the understanding; you will find many things to startle, many things perhaps to disgust you; but you will find vastly more, both in the way of criticism and of constructive science, to satisfy and invigorate your understanding, while such glimpses will open on every hand of God's ravishing harmonies yet to ensue on earth, that your imagination will fairly ache with contentment and plead to be let off.

John Stuart Mill says ("Political Economy," Book II., chap. i., sec. 4):

> The most skilfully combined, and with the greatest foresight of objections, of all the forms of socialism, is that commonly known as Fourierism. This system does not contemplate the abolition of private property, nor even of inheritance;

on the contrary, it avowedly takes into consideration, as an element in the distribution of the produce, capital as well as labor. It proposes that the operations of industry should be carried on by associations of about 2,000 members, combining their labor on a district of about a square league in extent, under the guidance of chiefs selected by themselves. In the distribution, a certain minimum is first assigned for the subsistence of every member of the community, whether capable or not of labor. The remainder of the produce is shared in certain proportions, to be determined beforehand among the three elements, labor, capital, and talent. The capital of the community may be owned in unequal shares by different members, who would in that case receive, as in any other joint-stock company, the proportional dividends. The claim of each person on the share of the produce apportioned to talent is estimated by the grade or rank which the individual occupies in the several groups of laborers to which he or she belongs, these grades being in all cases conferred by the choice of his or her companions. The remuneration, when received, would not of necessity be expended or enjoyed in common; there would be separate *ménages* for all who preferred them, and no other community of living is contemplated than that all the members of the association should reside in the same pile of buildings for saving of labor and expense, not only in building, but in every branch of domestic economy; and in order that, the whole of the buying and selling operations of the community being performed by a single agent, the enormous portion of the produce of industry now carried off by the profits of mere distributers might be reduced to the smallest amount possible. . . .

Fourierism

According to the Fourierists, scarcely any kind of useful labor is naturally and necessarily disagreeable, unless it is either regarded as dishonorable, or is immoderate in degree, or destitute of the stimulus of sympathy and emulation. Excessive toil need not, they contend, be undergone by any one, in a society in which there would be no idle class and no labor wasted, as so enormous an amount of labor is now wasted in useless things, and where full advantage would be taken of the power of association, both in increasing the efficiency of production and in economizing consumption. The other requisites for rendering labor attractive would, they think, be found in the execution of all labor by social groups, to any number of which the same individual might simultaneously belong, at his or her own choice; their grade in each being determined by the degree of service which they were found capable of rendering, as appreciated by the suffrages of their comrades. It is inferred, from the diversity of tastes and talents, that every member of the community would be attached to several groups, employing themselves in various kinds of occupation, some bodily, others mental, and would be capable of occupying a high place in some one or more; so that a real equality, or something more nearly approaching to it than might at first be supposed, would practically result; not from the compression, but, on the contrary, from the largest possible development, of the various natural superiorities residing in each individual.

Even from so brief an outline, it must be evident that this system does no violence to any of the general laws by which human action even in the present imperfect state of moral and intellectual cultivation, is influenced, and that it would be extremely rash to pronounce it incapable of success, or unfitted to realize a great part of the hopes founded on it by its partizans.

Says Prof. R. T. Ely ("French and German Socialism," pp. 91–94):

The central idea of Fourier's social scheme is association. The all-pervading attraction which he discovered draws man to man and reveals the will of God. It is passionate attraction—*attraction passionnelle*. It urges men to union. This law of attraction is universal and eternal, but men have thrown obstacles in its way so that it has not had free course. Consequently, we have been driven into wrong and abnormal paths. When we return to right ways—when we follow the direction, given us by attraction, as indicated in our twelve passions or desires—universal harmony will again reign. Economic goods—an indispensable condition of human development—will be obtained in abundance. Products will be increased manifold, owing, first, to the operation of the passion to labor and to benefit society; secondly, to the economy of associated effort. . . .

His System

A social organization must be formed which will allow free play to our passions, so that they may combine harmoniously. Our present society, called civilization, does not, and cannot, do this. It is a system of oppression and repression, and is necessarily a frightful discord. Harmony can only be found in combinations of suitable numbers in communities known as phalanxes, and occupying buildings called phalansteries. Each phalanx is a unit, a great family, and dwells in a single building, a phalanstery. What is it that determines the proper number for a single phalanx? It is again the twelve passions of man. These can be combined in 820 different ways in as many individuals, and no possible combination ought to be unrepresented in the workers of any phalanx, or there will be a lack of perfect harmony. But in every community there will be found old men, infants, and those disabled on account of illness or accident. Provision must also be made for absences. There ought not, then, to be less than 1,500 or 1,600 members in a phalanx, tho 400 is mentioned as a possible but undesirable minimum; 1,800 to 2,000 members are recommended. A larger number would produce discord, and is, therefore, inadmissible. But a further arrangement is necessary. These different characters thrown together helter-skelter would no more produce harmony than it would for one blindfolded to draw from a bag 2,000 combinations of notes for the piano and play them in the order in which they were drawn. On the contrary, they must be ordered intelligently in series, the series combined into groups, and the groups into the phalanx.

But when Fourier fell to arranging his phalanx he let his ideas run away with him into amusing absurdities. He maintained that if England would introduce his phalanxes her labor would become so productive that she could pay off her national debt in six months by the sale of hens' eggs. He would divide the time in his phalanxes into fixt mathematical divisions, allotting certain periods for study, for work, for amusements, for love-making, etc. He thought that his mathematical harmonies enabled him to understand the world and the universe. The chief of a phalanx is a unarch. The next highest officer is at the head of three or four phalanxes, and is called a duarch. Triarchs, tetrarchs, pentarchs, etc., follow; while the highest officer of the world is the omniarch, who dwells at Constantinople, the capital of the world.

The duration of the human race on earth, he held, would be 80,000 years, divided into two periods of ascending and two of descending vibrations. Lions would be taught to draw wagons, as a symbol of the victory of man over nature. His conception of the relation of the sexes, altho giving vent to some noble thoughts about the freedom of woman, was, to say the least, contrary to conventional views, and, according to some, utterly gross and immoral. Such are some of the fantasies that mingled with Fourier's profound thoughts. On his tombstone were inscribed words which were considered to give the key to his whole system:

Les attractions sont proportionelles aux destinées,
La série distribue les harmonies.

Fourierism had little practical application in France. Only two French phalanxes were ever started and both soon failed. For the efforts of Fourier's leading disciple, see CONSIDERANT. The most permanent result of Fourierism in France is the Familistère at Guise which Godet began as a Fourierite colony, tho it only finally followed Fourier's thought in a very general way. (See GUISE.)

In the United States, however, Fourierism swept in a wave from 1840 to 1850. Brisbane (q. v.) presented its ideas in his "Social Destiny of Man." Horace Greeley opened the columns of the New York *Tribune* to its teachings. Prominent men took it up. Brook Farm (*q. v.*) in 1844 became a Fourierite phalanx, and its paper, the *Dial*, was converted into the *Harbinger*, a weekly Fourierite organ, which endured four years (1844–1848). In 1843 Brisbane had started a monthly organ, the *Phalanx*, which was discontinued when the *Harbinger* began. The largest Fourierite colony was, however, the North American Phalanx, established in 1843 at Red Bank, Monmouth County, N. J., with a capital of $8,000. It endured over twelve years. In all Noyes tells us of forty-one Fourierite phalanxes, and there were doubtless more, tho many of them were very small and weak, and most of them started

prematurely with insufficient capital against the judgment of prominent Fourieirtes.

FOXWELL, HERBERT SOMERTON: English professor of political economy; born at Shepton Mallet, Somersetshire, 1849; educated at Queen's College, Taunton, and at St. John's College, Cambridge (M.A., 1872). In 1881 he was elected professor of political economy at University College, London, which chair he still occupies. Mr. Foxwell is a fellow of, St. John's College, Cambridge. He early devoted himself to the collection of works on social and political economy, and succeeded in gathering together a library of more than 30,000 books and tracts, some of them very rare. It was bought in 1901 by the Goldsmith's Company, and presented to the University of London. Professor Foxwell was editor of "Jevons's Investigations in Currency and Finance," and of Menger's "Right to the Produce of Labor." He has himself written various papers, chiefly upon monetary questions. *Address*: 1 Harvey Road, Cambridge, England.

FRANCE: A republic since 1870. The constitution of 1871 has been revised in 1875, 1884, 1885, and 1889.

I. Statistics

Area, 207,218 sq. m. Population (1906, almost stationary for a number of years), 39,252,267. The census is taken every five years. In 1901 there were 18,916,889 males and 19,533,899 females. The population per sq. m. was 190.9. Foreign population (1901), 1,033,871, of which the most numerous were 193,178 Italians and 168,539 Belgians.

VITAL STATISTICS

(From the "Annuaire Statistique de la France, 1904," per 1,000 inhabitants.)

	1873 to 1877	1878 to 1882	1883 to 1887	1888 to 1892	1893 to 1897	1898 to 1902	1901[1] to 1905

[1] Compiled from the "Annuaire."

Principal Cities (1901 census).—Paris, 2,714,068 inhabitants; Marseilles, 491,161; Lyons, 459,099; Bordeaux, 257,638; Lille, 210,696; Toulouse, 149,841; St. Étienne, 146,559; Roubaix, 142,365; Nantes, 132,990; Le Havre, 130,196.

Religious Statistics.—Nominally, the vast majority of Frenchmen are Roman Catholics; practically, there are many unbelievers. Up to Jan. 1, 1906, the Roman Catholic Church, the Reformed Church, the Augsburg Confession, and the Jewish Religious Community were recognized by the State, altho the Roman Catholic Church was considered the State church, according to the Concordat of 1801 and the Organic Articles of 1802. The ministers of these creeds also received their salaries from the State. In 1892, when the last religious census was taken, there were: Roman Catholics, 35,387,000; Protestants, 580,000; Jews, 49,000; other religions, 2,995,995. In 1905 the recognized creeds received from the State 37,528,800 francs, and from departments and communes, 7,555,042 fr.; making 47,083,842 fr. By the law of separation of Church and State, which went into effect Jan. 1, 1906 (the government claiming that the Church of Rome had already violated the Concordat), ecclesiastics over 60 years of age and 30 years of service, formerly recognized by the State, are entitled to a pension of three fourths of their salary, and those over 45 years and 25 of service to one half of their salary. Other ecclesiastics formerly recognized by the State were to receive grants for four years, and in very small communes for eight years. The total amount of pensions and grants in the first year is 29,563,871 francs descending to 20,018,326 in the fourth year. This is for 38,093 Roman Catholic ecclesiastics (including 17 archbishops and 67 bishops), 686 Protestants and 54 Jews. Church buildings and dwellings in actual use were to be made over to associations of citizens, for public worship (*associations cultuelles*) under civil law. This law was bitterly opposed by the Church of Rome as taking away its power of ecclesiastical rule, and very few associations have been formed. The State has granted minor concessions, but the main law is maintained with the general support of the country. A law of 1901 required all religious associations and establishments to be authorized by the State, but many declining to apply for authorization dissolved themselves, and the Chambers refusing to authorize the great majority of the others, they were closed in 1902.

Church and State

Education is absolutely free and obligatory from six to thirteen years. Teachers must be lay, and all teaching by monks and nuns is suppressed, tho Catholics may have their parochial schools. The number of pupils in "Infant Schools" in 1904–5 was 670,687, that of teachers 8,838; in "Primary and Higher" schools there were 5,568,030 pupils—2,802,599 boys and 2,765,431 girls—and 150,867 teachers. The *public* schools had 4,513,214 pupils of the primary and higher grades; and the private *lay* schools had 1,054,816 pupils. The maximum of pupils in primary and higher schools was reached in 1888–89, with the number of 5,623,401; since that time there has been a decrease. (See article EDUCATION.)

Education

In 1905 there were 24,743 miles of first-class railways in operation, and 3,345 miles of local lines. The State has made large advances to the railroads, which will eventually revert to the State without compensation (1950–60). (See RAILROADS.) There are 3,012 miles of canals and 4,665 miles of river used for internal navigation. The French mercantile fleet consisted—Dec. 31, 1904—of 15,057 sailing vessels of 653,268 tons, with crews 74,348; and 1,457 steamers of 696,059 tons, with crews numbering 16,133. The State granted subsidies to the extent of 40,770,000 francs.

Communication

In 1904 France had 11,869 post-offices with total postal receipts of 246,238,651 fr. and expenditures—for both posts and telegraphs—of 245,862,911 fr. The length of telegraphic lines was

98,890 miles with 369,630 miles of wire. The telegraph receipts were 43,932,706 fr. The telephone had 3,999 urban systems with 15,580 miles of line and 300,800 miles of wire; also 6,882 interurban circuits with 35,300 miles of line and 160,200 miles of wire.

The commerce of France consisted (1906) of 5,229,400,000 francs imports and 5,043,600,000 exports. The latter were made up chiefly of textiles, wines, silks, wool, leather, furs, perfumeries.

Commerce

The principal countries for exports were, in francs (1905): United Kingdom, 1,256,000,000; Belgium, 764,000,000; Germany, 629,000,000; United States, 295,000,000; Switzerland, 303,000,000; Italy, 213,000,000; Algeria, 327,000,000; Spain, 111,000,000; Russia, 58,000,000. Imports were from: United Kingdom, 593,000,000; Belgium, 313,000,000; Spain, 180,000,000; U. S., 512,000,000; Germany, 477,000,000; Italy, 154,000,000; British India, 246,000,000; Argentine Republic, 260,000,000; Russia, 275,000,000; Algeria, 216,000,000. Marseilles is the chief port with a total of imports and exports of 2,220,000,000 fr.

Agriculture is the chief occupation, employing 6,000,000 people; 84 per cent of the land is productive. The holdings are mainly small. In 1892 more than 85 per cent of the farms were of less than 25 acres, tho farms of over 100 acres had 45 per cent of the farm area. Less than 15 per cent of the owners possess 74 per cent of the land. Much is done to benefit agriculture; 57 per cent of the land under cultivation is devoted to cereals, mainly wheat. There are 36,637,517 acres, surpassed in Europe only by Russia; 4,324,250 acres are directed to grape culture, producing (1900) 1,784,854,500 gallons of wine.

In manufactures France suffers through lack of cheap natural resources, but excels in artistic finish. Textile industries are the most important, wool employing about 160,000 people; cotton, 150,000; silk, 123,761 (1905). The metal industry is next. In mining, the coal-fields are the most important national resource.

Fisheries employ 155,000 persons.

The mines employed 193,365 workers, producing minerals worth 528,673,362 fr.; the output of the quarries was valued at 228,029,712 fr. Manufactures employed (1901) 5,819,855 people; agriculture and forestry, 8,176,569; commerce, 1,822,620; transport, etc., 830,643; liberal professions, 399,839; personal service, 1,015,037; public service, 1,297,569; extractive industries, 266,351. Including other occupations not mentioned, the total number of people engaged in various kinds of profitable work was 19,715,075—12,910,565 males, and 6,804,510 females.

II. Constitution and Government

France is governed by a president elected for seven years, and a ministry selected by him from the Senate or the Chamber of Deputies. He promulgates the laws voted by both Chambers, and insures their execution. He appoints to all civil and military posts, has the prerogative of pardon, and is amenable to punishment only in case of high treason. The president has the right to convoke special sessions of the two chambers, and to conclude treaties with foreign powers; but cannot declare war without the consent of both chambers. Every act of the president has to be countersigned by a minister or secretary of state. M. Armand Fallières was elected president Jan. 17, 1906.

The ministry consists of twelve portfolios, viz.: president of the council and minister of the interior; ministers of finance, war, justice, marine, colonies, public instruction, foreign affairs, commerce, agriculture, public works, labor.

The *Conseil d'État* is a special body composed of councilors, maîtres de requêtes, and auditors —all appointed by the president. Its function is to advise the government in legal aspects and on new bills.

The present ministry, with M. Georges Clemenceau (Radical) as Premier, consists of a *bloc* of Radicals, Progressists, and Independent Socialists. The legislative power is vested in two Chambers, Deputies and Senate. The Chamber of Deputies is elected for four years by universal (male) suffrage. Each citizen of twenty-one years, who can prove six months' residence in a town or *commune*, and not actually in military or naval service, has the right to vote—if not otherwise disqualified. *Deputies* must be citizens and at least twenty-five years old. A candidate must declare his intention of seeking election in a given district at least two weeks preceding election day. The Chamber is composed at present (1907) of 584 deputies. Each *arrondissement*—a district containing not over 100,000 inhabitants—elects one deputy. In 1901 there were 10,863,421 inscribed voters. The Chamber is divided into parties: Socialist Radicals, 246; Republicans of the Left, 77; Dissident Radicals, 7; Independent Socialists, 22; Unified Socialists, 53; Progressists, 64. These parties form the working or government majority. The "opposition" numbers 117 members of the Royalist, Bonapartist, Liberal, and Nationalist parties.

Legislature

The *Senate* is composed of 300 members who must be forty years old, elected by Senatorial Colleges throughout the country, which are elected by the inscribed voters according to municipalities and departments. The function of the Senate is to steady, not to oppose the deputies.

The Senate and Chamber of Deputies assemble every year in January, and remain in session at least five months out of the twelve. They can compel the president to convoke them if the demand is made by one half the number of members of each chamber. The two Chambers, sitting as one body (National Assembly), elect the president. The Chamber of Deputies may impeach the president and the ministers for high treason, and the Senate acts as High Court of Justice in such a case.

Senators and Deputies receive an honorarium of 15,000 francs a year; they travel practically free on all railroads. The presidents of the two Chambers receive 72,000 fr. in addition for entertaining. The president of the Republic receives 600,000 fr., and an allowance of 600,000 fr. for entertainment.

In all cases the preliminary inquiry is made in secresy, tho the accused may have counsel and witnesses, by an examining magistrate (*juge d'instruction*) who, with the consent of the *Procureur*—State or public attorney—may dismiss the case or send it up for trial. The *Court of Assizes* is assisted by twelve jurors, who decide by a simple majority. There are twenty-six courts of appeal, composed each of a president and four councilors, for all criminal cases which have been tried without a jury. The *Court of Cassation* is the highest judiciary body in France. It consists of a first president, three presidents of sections,

Judiciary

and forty-five councilors. It sits in Paris, and deals with all criminal cases tried by jury.

All judges are appointed by the president for life, and can be removed only by the Court of Cassation.

France is divided into eighty-six departments for administrative purposes. Each department is placed under a prefect who has wide and undefined functions. He is appointed by the government, and is assisted by representatives of each one of the ministries and by a *prefectorial council*. He is the representative of the president, and sees to the execution of all laws, the supervision of government officials, supplies the central government with information, etc. He, in turn, is represented in every *arrondissement* by a subprefect.

The *unit of local* government is the *commune*, varying in size and population. There are 36,210 of them; the majority (31,690) have less than 1,500 inhabitants. The affairs of the communes are under a municipal council, composed of from ten to thirty-six members, elected by all legal voters within the commune, tho the prefect, sometimes even the president of the Republic, has the right of vote over the commune. The head of the commune is the *maire*, who is both representative of his commune and of the central government, and directs the police, etc.

The next division is the *canton*, consisting on an average of twelve *communes*. It is not an administrative unit, but a judicial one with a justice of the peace.

The *arrondissements*, or districts (362 in France), have a subprefect as a representative of the central government, and an elected *conseil d'arrondissement* as an advisory body. It is composed of one representative from each *canton*, and is concerned chiefly with the allotting of the quota of direct taxes among the *communes*, assigned by general council to each *arrondissement*. Members of the Chamber of Deputies are elected from the *arrondissements*.

A varying number of *arrondissements* form a *department* which—headed by a prefect—has a *conseil général*. This general council is renewed to the extent of one half every three years, and consists of one member for each *canton*. The council direct all economical affairs of the department, partition taxes, look after roads, schools, poor relief, etc. Their decisions are controlled by the prefect, and may be, but very rarely are, annulled by the president of the Republic.

Large cities like Paris form both *communes*, *arrondissements*, and a *department*. Paris has a municipal council of eighty members; is divided into twenty *arrondissements*, each with its own mayor. Over the council, however, is the prefect of the department of the Seine, appointed by the president.

The French army is administered by the Minister of War, assisted by a *Military Cabinet* and the *General Staff*.

Army and Navy

The army, including Algiers and Tunis, and combining the various arms, numbers 576,000 men and 129,511 horses on a peace footing. The colonial army numbers 86,000 men—making a total 662,000 (1906).

The navy is under the Minister of Marine, who has different staffs and councilors. The number of officers and men on the active list of the French navy was (1906) 53,247, and that of the reserve 49,340. There are 31 battle-ships of the first class, 9 of the second; 19 armored cruisers, 255 torpedo boats, etc.

Finance

The revenues of France are raised chiefly from direct and indirect taxes, and from State factories and monopolies. The total budget for 1906 was 3,709,241,503 francs; for 1907 (estimated), 3,831,222,273. The expenditure for the two years respectively is in francs: (1906) 3,709,192,067; (1907) 3,833,825,305.

Colonies

The colonies and dependencies of France include 4,089,076 sq. m., with 56,826,410 people; in Asia, 256,096 sq. m., and 21,471,300 population; Africa, 3,702,150 sq. m., and 34,849,380 population; America, 31,660 sq. m., and 425,050 population; Oceanica, 9,170 sq. m., and 80,410 population. The estimated colonial revenue (1905) was 17,937,500 francs, and the expenditures 111,292,700 fr.

The Minister of Colonies controls their administration with the assistance of the *Conseil Supérieur des Colonies*. The trade of France with her colonies, except Algiers and Tunis, was in 1904: Imports, 487,857,000 francs; exports, 557,872,000. 1905: Imports, 452,861,000; exports, 585,628,000.

III. Social Reform

Social reform in France, as elsewhere, rests upon the past.

History

Ancient Gaul, more thoroughly Latinized than any other Roman province outside of Italy, fell a rich prize to the Gothic invaders, and they here developed some of their richest cities and strongest states. Only gradually did Paris raise herself above other cities and develop in France a strongly centralized government, a process largely necessary to rescue France from the weakness in which she was left by the long English wars. Yet all through the country lay the traditions of much independence for the communes or townships and local divisions. These communes, especially those of the larger cities, stood repeatedly for their rights, and treated with the king sometimes as all but equals. But the process of centralization went on apace. When, in 1358, the Jacquerie rose, under Étienne Marcel, to battle for constitutional liberty, they were mercilessly put down. The Reformation was suppress in France for political reasons, and the suppression aided the central government. The court of the Louis became more brilliant, more despotic, more corrupt than any other court in Europe. The result could be but a revolution. The French Revolution (*q. v.*) did only what has been done in all other Western countries—it freed the bourgeoisie. The French Revolution was largely produced by English ideas. The philosophy of Rousseau and still more of the Encyclopedists came from the school of Locke. But it took in France, perhaps because of the logical French mind, a more revolutionary and more radical form. The genius of Rousseau, the writings of Mably, of Morelly, of Boissel, of Brissot de Warville, even the land views of the Physiocrats, filled France with new ideals of the rights of man, and with the conception of government as only just when resting upon the consent of the governed. It is doubtful if the French masses at the time of the Revolution were suffering more than the dwellers in England's manufacturing centers and in her agricul-

tural hamlets during the same period. But the despotism of the Louis gave to the Revolution a violent form. Nowhere else could a Louis say, "I am the State"; nowhere else did absolute monarchy go down in such a whirlpool of passion. The suppression, too, of the French Reformation, the infidelity of the Encyclopedists, the wit of Voltaire, had deprived France of faith. The Revolution came "a truth clad in hell fire," yet a truth, and a necessary one. Napoleon's cannon put down the Revolution, but could not put down ideas. It could only make France long the scene of constant revolution and insurrection.

With Louis XVI. guillotined in 1793, the house of Bourbon, which had ruled since 1589, met its fall, and we have the First Republic. From 1793–1795 the Convention ruled; from 1795–99 the Directory; from 1799–1804 Napoleon as Consul. Then came the First Empire, from 1804–14, under Napoleon I. (died 1821). In 1814 the house of Bourbon was restored, with Louis XVIII., 1814–24, and Charles X., 1824–30. After the Revolution of 1830 we have the rule of the house of Bourbon-Orleans under Louis Philippe (1830–48). Then comes the Revolution of 1848, and the Second Republic, from Feb. to Dec., 1848, under the Provisional Government; from 1848–52 under Louis Napoleon. In 1852 the Empire was restored under Napoleon III., who died in 1873. In 1870 we have the declaration of the Third Republic and the Government of National Defense, in 1871 the uprising of the COMMUNE, and the presidents Louis A. Thiers (1871–73), Marshal MacMahon (1873–79), F. J. P. Jules Grévy (1879–87), M. F. Sadi Carnot (assassinated June 24, 1894), Casimir Périer (1893–95, resigned), Felix F. Faure (1895, died 1899); Émile Loubet (1899–1906); Armand Fallières elected Jan. 17, 1906.

Constitutional Changes

Such is the bare chronicle of the constitutional changes that have swept over France. There have been continual smaller changes and uprisings and ministerial crises. Through them all has gone the struggle for a republicanism more or less modified by the communal ideas connected with the old communes.

Sixty years before Proudhon, Brissot de Warville, in 1776, the year of Adam Smith's "Wealth of Nations," the year of American independence, had declared that property (as ordinarily understood) was theft. Babœuf was the first to battle for communism, in his attempted insurrection of 1797, but held as his ideal an utterly artificial dead equality to be rigidly enforced by the State. Insurrection crusht, thought was the only outlet. We come, therefore, to a long period of utopian socialism. Details of each author and school will be found under their separate names; we chronicle them here, to bring out the continuity. Fourier in 1808 published his "Théorie des Quatre Mouvements," with its strange blending of mathematical formulas, far-reaching thought, and impractical suggestions for artificial association and forced harmonies. It produced in 1834 Considérant's "Destinée Sociale," and his attempted phalansteries in France and far away in Texas; besides this, it led to Godin's famous Familistère at Guise (1859). Meanwhile Saint-Simon, an aristocrat, became revolutionary, dreamed in 1817 of an industrial scientific collectivist State, and in 1825 of a Neo-Christianity, a church which should introduce social reform. Calling upon the pope to lead in this, on his refusal Saint-Simon attempted a "religion" of his own, which Bazard and Enfantin developed into brief popularity and still briefer experiment from 1830–33. In 1840 Cabet published his "Voyage en Icarie," and the colony to Icaria in America was started in 1848. Meanwhile, Colins, Huet, and others were writing, while from England came the theories of Owen and the reports of Chartism. This long period of utopian socialism was broken by the July Revolution of 1830, and the almost constant attempts of radicals and revolutionists like Blanqui (*q. v.*) to rouse the Paris Commune.

In 1848 the Revolution of that year and the declaration of the Republic gave great hopes to the radicals, and the Socialists, mainly under the lead of Louis Blanc, demanded government shops for the unemployed. The provisional government nominally yielded, but appointed a committee constructed to procure the mismanagement of the plan. (See ATELIERS NATIONAUX.) The election of Louis Napoleon to the presidency and the *coup d'état* of Dec. 2, 1851, whereby the Empire was declared, put an end to the hopes of the Socialists till the overthrow of the emperor in 1870, the declaration of the third and present Republic. Conceiving it but a sham bourgeois republic, the Commune of Paris rose March 18, 1871, but were eventually defeated by the armies of the national government. (See PARIS COMMUNE.) Meanwhile the International had been planted in France, and under the influence of Bakounin, and influenced by the traditions of the old communes, had developed an anarchistic communism. The communards of Paris, scattered after the Commune, declared mainly for anarchism. But after a season some of the leaders became convinced of the impracticability of anarchism, and advocated socialism of the Marxist types. In 1879 amnesty was granted to communards, and Guesde, Brousse, Malon, and others returned Marxist Socialists. A storng party was developed for collectivism. The *Égalité*, the *Prolétaire*, the *Droits de l'Homme*, more or less formally committed to collectivism, spread the thought. The *Cri du Peuple*, founded and edited by Jules Vallès, had, since 1876, favored socialism. Collectivist ideas began to dominate the trade-unions. General congresses of working men were held at Paris in 1876 and Lyons in 1878, and were largely socialistic. The Congress of 1879 at Marseilles was Socialist in everything except name.

Revolution of 1848

But collectivism was not easily to triumph. French communist anarchism was still strong, and represented by men of ability and standing, like Kropotkin and Reclus, and still more by an intense and fanatic devotion, such as has furnished the modern dynamiters, a Vaillant and a Henry. It had an organ of marked literary ability, *La Révolte*, founded by Kropotkin in Geneva and transferred to Paris; it had a paper, *Le Père Péinard*, written in Parisian *argot*, and appealing to the workmen of the streets. The Socialist movement became divided. The right wing was for bargaining with the political radicals and for practising cooperation, and was hence called Opportunist or Cooperatist; the left wing worked with the anarchists; only the center was for Marxist collectivism. In 1880, at the Congress at Havre, division became open. The majority favoring independent political collectivist agitation, the right wing, which desired to work

Socialism

through existing political groups, defected, and formed the Alliance Socialiste Républicaine, and held congresses of its own at Paris in 1881 and Bordeaux in 1882. The anarchist wing renounced socialism altogether. The great majority, the center, declared for Marxist socialism, and formed the Parti Ouvrier Socialiste Révolutionnaire de France. This organization held a congress at Rheims, 1881, and declared *Le Prolétaire* its organ.

But even this organization divided. The question was whether to agitate for a complete Socialist program at once, or for portions of it, as might seem at the time possible. Those accepting the latter policy were called Possibilists, the former Guesdists, from their leader, Jules Guesde. Still another division took place. M. Brousse split the Congress of 1882, at St. Étienne, on a vote indorsing, instead of a centralized collectivism, a decentralized one based on the communes. He carried his point, 36 to 27, and formed the Broussist group, which soon became one of the largest, and in 1889 elected M. Joffrin to the Chamber of Deputies, while it frequently had nine members in the Municipal Council of Paris. Besides these groups there was in the Chamber of Deputies still another group, founded by followers of the old communist Blanqui, and hence called Blanquists.

Too much emphasis, however, must not be put upon French political groups. They continually change, and the French system of the second ballot (see Elections) allows its various groups to vote for their respective group candidates separately and then unite at the second ballot on the candidate of that particular Socialist group there seems the most chance of electing. Thus, in spite of divisions they have already increased the French Socialist vote from 47,000 in 1887 to 120,000 in 1889; 305,000 in 1892; 440,000 in 1893; 790,000 in 1898; 863,159 in 1902, and 1,120,000 in 1906. The main endeavor, indeed, of the French Socialists of recent years has been to develop a party unity. In 1899 M. Millerand, as leader of the French Opportunist Socialist deputies, accepted the portfolio of commerce in the Waldeck-Rousseau ministry, and the French Socialists became largely split on the question of indorsing this or not, the leaders of the government Socialists being M. Jaurés and M. Millerand and the leader of the revolutionary and irreconcilable party being M. Jules Guesde.

A motion to expel M. Millerand from the party was hotly debated in 1903, but finally defeated by a vote of 100 to 89. A new division and grouping, however, followed. M. Millerand was expelled from one party; and dissension was continued till 1906, when, under the influence of the International Socialist Congress at Amsterdam, and largely led by M. Jaurés, unity was at last attained and all the prominent Socialist groups united under the name of *Le Parti Socialiste*. This strengthens a political position already strong: for outside of the Chamber the French Socialists have elected sixty-eight mayors, and a representation in 111 communal councils, with the majority in sixty-eight.

The party has some forty-five journals, including three dailies. Leading papers are *L'Humanité*, the organ of M. Jaurés, and *Le Socialiste*, tho other papers like the *Petit République* are out and out in their socialism. Besides, too, the fifty-five party Socialists in the Chamber there are twenty-two independent Socialists and 246 so-called Socialist Radicals, largely favorable to many Socialist measures. In the cabinet are two Independent Socialists, M. Viviani, Minister of Labor and Hygiene, and M. Briand, Minister of Public Instruction, the able leader of the government in the matter of the separation of Church and State. Roman Catholic Christian Socialism, largely led by the Count de Mun (*q. v.*), has played a considerable part in France, but to a less extent now with the decrease of the influence of the Church. (See Christian Socialism.)

Socialist Influence

This Socialist influence in recent years is largely responsible for the fact that the government has increasingly introduced and enacted legislation favorable to the interests of labor. In 1887 there was founded in Paris a Bourse du Travail (Labor Exchange) with an annual subsidy (later) of 3,000,000 francs and in 1892 a fine building provided in the Rue Château d'Eau. This became the headquarters of some 200 trade-unions and a center of the labor movement. In 1894 it was closed for a while as having become too much of a Socialist headquarters, but was again opened and has since been copied by 111 other French municipalities which have provided Bourses du Travail. Connected with this was begun a public employment bureau, which has now sixteen branches in Paris, and finds places for thousands of operatives and others. This, too, has been copied and there were in 1904 twelve municipal employment bureaus. These French Bourses du Travail received in 1904 215,030 francs in subventions from the municipalities and 45,600 from the departments. There were affiliated in them 2,121 unions with a membership of 335,201. Through these employment agencies, 122,065 situations were sought. (See Public Employment Bureaus.) The government has also enacted much labor legislation. (See Factory Legislation, Digest of, section France; Railroad Laws; Sunday Rest.) An Old Age Pensions Bill has been enacted. (See Old Age Pensions.)

Trade-Unions

The trade-union movement of France, tho largely identified with the political movement, is not wholly so. The old gild system was overthrown in 1791, and working men's organizations placed under a ban. Napoleon I. undertook to establish compulsory organizations of employers and employees, with the employers in control, but with little success. Gradually, however, working men's unions developed. They won partially legal recognition in 1864, and complete freedom of organization in 1884. Strikes have been of late years somewhat numerous and often bitterly waged, especially in the mining districts. (For statistics, see Strikes.)

In 1905 there were reported 3,102 employees' unions with 252,036 members; 4,625 labor-unions with 781,344 members; 144 employees' and workmen's unions with 25,863 members; 3,116 agricultural unions with 657,953 members.

These agricultural unions have largely lent themselves to the French cooperative movement. This began in 1848 when the government appropriated 3,000,000 francs as a loan to cooperators. Two hundred societies were started, but soon failed, and by 1852 the movement was over. It began again, however, in 1863, in the formation of several working men's cooperative banking associations. These, however, mainly disappeared with the failure of the Crédit au Travail in 1868.

In 1879 a cooperative movement was restarted with new demand for government aid. M. Benjamin Ranopel made a bequest of 1,500,000 fr. to the city of Paris to aid cooperation. In 1883 the first instalment of 400,000 fr. was loaned out, but resulted in little. The movement, however, has recently grown and is now very strong. (For statistics, see COOPERATION, section FRANCE.)

More peculiar to France is the movement for profit-sharing, begun in France, 1842, by M. Leclaire (*q. v.*), and brilliantly carried out (1877) by M. Godin in his Familistère at Guise (*q. v.*) and (1876) at the Bon Marché (*q. v.*) in Paris. There are at present some ninety-three firms practising profit-sharing in France, sixteen of which began doing so before 1865. Some 100 cooperative societies also practise profit-sharing. In 1879 a *Société pour l'Étude Pratique de la Participation du Personnel dans les Bénéfices* was founded to guide the movement. (See PROFIT-SHARING.)

Philanthropies

There has been also much activity in France in the way of practical philanthropies. The *Musée Social* (*q. v.*) in Paris was founded in 1894 as a center for social studies. The same year there was organized the *Société Française des Habitations à Bon Marché*. This society was simply for education and propaganda, but largely as a result of its work there are to-day in France some sixty societies engaged in erecting cheap but good houses in some way for working men, whereas before 1889 there were only a few societies, tho the *Société Mulhousienne des cités ouvrières* dates from 1851. Of these earlier societies the important *Société Philanthropique*, founded in 1780, is wholly philanthropic and its works are numerous. The more modern building societies are partly commercial and partly philanthropic, like our American societies of philanthropy plus 5 per cent. The largest of these is at Lyons. A few more recent societies are working men's cooperative building societies, like *La Pierre du Foyer* (1891). A law has been passed by which any department can create a Superior Council on Working Men's Homes. (See HOUSING.) Some societies, like the *Société anonyme des Habitations ouvrières* of Passy-Auteuil, endeavor to create working men's model villages. The English Garden City movement has now a French representative in the *L'association des cités Jardins de France*, which is agitating for that ideal. Besides this the *Ligue du Coin de Terre et du Foyer*, founded in 1896 by M. L'abbé Lemire, agitates for working men's gardens (jardins ouvriers).

Many French employers, too, are active in industrial betterment (*q. v.*). (See also MODEL VILLAGES.)

Private charities have a large and varied development and cooperate with the State. The *Société Philanthropique* (1780) had, in 1900, 30 soup kitchens, 30 dispensaries, 4 for children; 1 hospital, 3 night refuges, homes for the aged, for mothers, for women enceinte, improved dwellings, etc. Twelve thousand children are cared for each year. At its refuges 12,000 women are admitted, and work found for about 25 per cent. Five thousand fr. a year are given in rewards to honest and industrious workers. The *Œuvre de Bienfaisance*, founded by Miss de Broen (1871), is notable. The *Œuvre de la Chaussée du Maine*, the *Société française de Bienfaisance de Tunis*, the *Hospitalité Universelle à Nantes et à Paris* are also important. Ecclesiastical charities are numerous, tho secular institutions are growing. Catholic societies relieved in 1901 107,400 persons, and numbered 4,000, according to abbé Gayraud. Protestant societies are proportionally strong, the *Institution des Diaconesses des Églises évangéliques de France* (1841) deserving especial mention. There is no charity organization society, but 15,827 *Bureaux de Bienfaisance*, in the communes, control private societies, and in a way unite them as well as administer outdoor relief. Indoor relief, only given when imperative, is well developed. There were in 1898 in France 1,708 hospitals, at a cost of 133,914,343 fr. Most of them have free dispensaries and many free clinics. There are in Paris 28 *Consultations de Nourrissons* and many in the country. Asylums and schools for the blind and deaf-mutes were developed in France earlier than in any other country, and in many similar ways France still leads. The national lunatic asylum at Charenton is a model, and Ainay is a colony for insane men, and at Dun-sur-Auron for insane women. Institutions for dependent children are various. The first crèche was opened at Paris, 1844. *La Maison Maternelle*, *L'Hôpital des Enfants Malades*, *la Ligue Fraternelle des Enfants de France*, *L'Œuvre laique du bon Pasteur*, are typical. The State has established State savings-banks, pawnshops. (See PAUPERISM AND RELIEF INSTITUTIONS; PAWN-SHOPS, SAVINGS-BANKS, LABOR COLONIES, etc.) For the temperance movement, women's movements, and activities for social purity, see articles TEMPERANCE; WOMAN'S ADVANCE, RESCUE WORK.

Charities

Important French social reform societies are:

Alliance d'Hygiène Sociale. 23 Rue Las Cases, Paris.
Bourse du Travail. Rue Château d'Eau.
Cercle Amicitia. (Women's Christian Society.) 12 Rue du Parc Royal, Paris.
Comité permanent du Congrés international des accidents du travail et des assurances sociales. 20 Rue Louis-le-Grand, Paris.
Confédération Générale du Travail, 10 Rue du Château d'Eau, Paris.
Conseil National des Femmes françaises. (1901.) 1 Avenue de Malakoff, Paris.
École des Hautes Études Sociales. (1900.) 16 Rue de la Sarbonne, Paris.
La Mutuelle-Habitation. 2 quai de Jemmapes, Paris.
La Croix-Bleu (Temperance). Rue Secrétan, Paris.
Ligue anti-alcoolique. (1896.) 107 Boulevard Magenta.
Ligue contre la Misère. (1894.) 22 Rue Orfila, Paris.
Ligue du Coin de Terre et du Foyer. (Homes and gardens for the working classes.) President and founder, l'abbé Lemire. 26 Rue Lhomond.
Ligue de Protection de l'Enfance. 122 Rue la Louvière, Lille.
Ligue Nationale contre l'Alcoolisme. 50 Rue des Écoles, Paris.
Ligue Nationale de la Prévoyance et de la Mutualité. (Savings-bank societies.) (1890.) Sec., Le Pasteur Arboux, 78 Rue Bonaparte.
Musée Social. 5 Rue Las Cases, Paris.
Office Central des Œuvres de Bienfaisance. 175 Boulevard, St. Germain, Paris.
Société des Crèches. (1846.) 15 Avenue d'Iena, Paris.
Société française des Habitations à bon Marché. Sec., Jules Challamel, 4 Rue Lavoisier, Paris.
Société française de Temperance. (1870.) Sec., Frederic Riemain, 50 Rue des Écoles, Paris.
Société pour l'Étude de la Participation aux Bénéfices. 20 Rue Bergère, Paris.
Société Philanthropique. (1780.) 15 Rue de Bellechasse, Paris.
Société de préservation contre la tuberculose par l'éducation populaire. 33 Rue Lafayette, Paris.
Société générale des Prisons. Sec., Albert Rivière, 14 Place Dauphine, Paris.
Union Chrétienne de jeunes gens. (Evangelical.) 14 Rue de Trevise, Paris.

L'Union française anti-alcoolique. (1896.) 5 Rue de Latran, Paris.

Union française pour le sauvetage de l'enfance. 108 Rue de Richelieu, Paris.

FRANCHISE. See SUFFRAGE; WOMAN'S SUFFRAGE.

FRANCHISES, in social science, means a privilege or grant of a public or semipublic nature conferred on individuals or corporations by governments (municipal, state, or national).

According to the common law, the franchise implies a mutual obligation between the government and the party holding the franchise. The government guarantees to strictly carry out the grant of the franchise (the franchise, however, always being strictly construed against the grantee), and the grantee agreeing to furnish the public all the facilities for which the nature of the franchise calls. The owner of a ferry franchise thus can be compelled to continue to run his boats, the failure to do this by common law forfeiting his grants. It is asserted that the government cannot repudiate or withdraw its franchise, once granted. (But see EMINENT DOMAIN.) Where the charter conferring the franchise, however, contains a clause reserving to the legislature the right to annul or vary the franchise granted, or where the charter is granted subject to a constitutional provision or general act reserving to the legislature such a power, it may constitutionally be exercised.

Franchises are not alienable by the owner or owners thereof without express legislative authority. They cannot, therefore, be conveyed or mortgaged of common right. They cannot be taken in execution and sold so as to convey any title to the purchaser.

The conditions upon which franchises are granted are among the subjects which need the most reform in the United States, and have produced the greatest scandals and corruptions, especially in our municipal governments. (See CORRUPTION.) Important and valuable franchises are again and again given away for a song to private corporations by corrupt aldermen, bought up by these corporations. European cities, on the other hand, rarely grant a franchise unless the corporation receiving the franchise gives the city high and adequate returns of various kinds. In Berlin, for example, a private company has the franchise to operate street-railways, but it only received the franchise on agreeing to pave the streets on which its tracks lie, from curb to curb; to pay a portion of its receipts to the city, amounting to some $250,000 annually, and in the year 1911 to turn its whole plant over to the city.

Professor Bemis, in a paper on "Some Essentials in the Way of Granting Municipal Franchises," read at the Minneapolis Conference for Good City Government, 1894 (see Proceedings, p. 123), makes the following points as requisites of a good franchise:

1. The mayor should have the right of absolute veto upon any proposed franchise.

2. Constitutional, or, if that is not possible, a legislative, limitation to the length of time for which future franchises can be given, such term not to exceed thirty years with elevated roads, twenty years with gas works or surface street-car lines, and a much less period for electric-light and telephone companies.

3. The prohibition of renewing franchises until within a year of its expiration, otherwise companies may secure a renewal from a corrupt council before the people are aware of it.

4. The expiration of all franchises for extensions to new streets with the expiration of the franchise on the main system; otherwise the city is prevented from entering on any broad policy.

5. Extensions on new streets made subject to order of the city, with appeal possibly to some court of arbitration.

6. Complete publicity of accounts, with the power and duty vested in the city auditor to prescribe methods of bookkeeping.

7. In case of transportation lines, the right of the city to require increase of cars to the capacity of the road when traffic demands it.

8. The express condition that the company receiving the franchise must, at its expiration, if not securing a renewal, sell out to the city or another company that may receive the franchise, at the cost of duplicating the physical plant, independent of any value based on earning power.

9. The sale of the franchise to the bidder offering the cheapest and best service or largest revenue to the city, emphasis being laid on cheap and good service.

10. Two years before the expiration of every franchise the citizens should have the opportunity to vote on city ownership, and if the latter is carried, the city to own and operate after the expiration of the franchise, with the provision for the merit system in the civil service, and with the further provision that every five years thereafter for ten or fifteen years, on petition of a certain number of citizens, another popular vote should be had on the question of continuing city management. (See MUNICIPALISM.)

FRANCKE, ERNST: Editor of *Soziale Praxis*; director of the *Bureau für Sozialpolitik*, Berlin; general secretary of the *Gesellschaft für Soziale Reform*. Born Nov. 10, 1852, in Coburg; studied in the Gymnasium of his native city, and several universities. Received the degree of Ph.D., and later the title of professor. He was editor of newspapers in Nürnberg, 1877–81; Münich, 1881–1892; Hamburg, 1893–97, when he was called to Berlin. He considers the necessity of elevating the working classes by means of legal reforms and by the organization of self-help as imperative, so as to avoid both socialism and the pauperization of the working men. Author of numerous papers and essays on social reform and the best industrial policy. *Address*: Nollendorf Strasse, 29 and 30, Berlin, W. 30, Germany.

FRANKLIN, BENJAMIN: American philosopher and diplomat; born in Boston, Mass., 1706, of poor parents, the fifteenth of seventeen children. Taken from school in his tenth year, he became two years later an apprentice in the printing-shop of his brother, who published the *New England Courant*, and for which Franklin early wrote. Owing to difficulties with his brother, he went to Philadelphia in his seventeenth year, almost destitute. After a series of difficulties and adventures, including a trip to England, he gradually, by hard work and ability, met success. He became the editor and proprietor of a paper, *The Gazette*, and in 1732 of "Poor Richard's Almanac." He became clerk of the General Assembly in 1736, postmaster in 1737, and representative in 1747. In 1753 he was made deputy postmaster-general for the colonies. In 1757 he went to England, representing Pennsylvania, Massachusetts, Maryland, and Georgia with great success. He addrest Parliament, opposing the Stamp Act, and was consequently deposed from the postmastership. Returning to America, he was a delegate to the Congress of 1775, and signed the Declaration of Independence. In 1776 he was sent as

Minister to France, with which country he succeeded in securing an alliance. He raised loans, and in 1782 signed the treaty of peace with England. Returning to Philadelphia, he became president of the Supreme Council of the city and member of the Convention for Revising the Articles of Union. He died April 17, 1790, and Congress appointed a mourning of two months through the states.

Franklin founded the first public library in Philadelphia in 1732, "the mother of American libraries," and led in innumerable municipal improvements. In 1752 he discovered the idea of lighting with electricity, and by his electrical and other scientific discoveries became recognized by and intimate with the scientists of all Europe, and received degrees and honors from numerous English and European universities. In 1752 he organized a scientific society which became the American Academy of Science. Turgot said of him: *Eripuit cælo fulmen, sceptrumque tyrannis.*

FRATERNAL ORGANIZATIONS: In England these are usually called friendly societies (*q. v.*). In the United States they are very numerous and play an important part in economic and social development. They are also very largely fraternal benefit and insurance societies. They are opposed by a small and demonstrative but earnest minority who oppose all secret societies. Many believe they are only needed to-day because the Church and the State do not perform their full duties.

According to the *World Almanac* (1907), the membership of the principal fraternal organizations in the U. S. and Canada is as follows:

Odd Fellows	1,521,095
Freemasons	1,229,001
Modern Woodmen of America	813,642
Knights of Pythias	622,466
Independent Order of Rechabites	488,000
Woodmen of the World	459,211
Improved Order of Red Men	400,774
Knights of the Maccabees	325,000
Royal Arcanum	288,011
Ancient Order of United Workmen	275,603
Independent Order of Foresters	250,000
Order of Eagles	250,000
Foresters of America	241,110
Benevolent and Protective Order of Elks	225,000
Ancient Order of Hibernians	210,000
Knights of Columbus	166,494
Junior Order of United American Mechanics	163,205
Ladies of the Maccabees	145,293
Knights of the Modern Maccabees	125,000
Ladies' Catholic Benevolent Association	95,500
Tribe of Ben Hur	92,500
Knights and Ladies of Honor	92,000
Improved Order of Heptasophs	70,439
Knights of the Golden Eagle	70,431
National Union	62,444
Brotherhood of American Yeomen	61,671
Protected Home Circle	59,981
Catholic Mutual Benefit Association	57,672
Order of Gleaners	56,000
Court of Honor	55,392
Brith Abraham Order	53,853
New England Order of Protection	43,167
Knights of Honor	40,126
Ancient Order of Foresters	38,898
United Order of American Mechanics	36,554
Sons of Temperance	34,789
Independent Order of B'nai B'rith	28,539
Knights of Malta	27,000
Smaller organizations	379,819
Total	9,656,280

(See also A. C. Stevens's "Encyclopedia of Fraternities.")

FREE CHURCHES (OF GREAT BRITAIN) AND SOCIAL REFORM: Until very recent times the Free Churches have shared largely the conception of the Church which was embodied in all Protestant symbols, according to which the Church was an institution whose chief object was to promote and insure the spiritual interests of its members, by the sound doctrine preached and by the sacraments administered.

In recent times, however, two currents of thought have pervaded the mind of the Church in Great Britain and elsewhere, and have illumined and enlarged in the minds of men their conception of the essential nature of the Church and of her mission in the world.

1. The revival and concentration of interest in the life and teaching of our Lord Himself was begun by Strauss's "Leben Jesu" and Renan's "Vie de Jesus." Ever since a growing splendor of light has been poured out upon the Gospel histories, and upon Him—the Light of the World, whose glory fills their pages. Hence it is that the gospel of the kingdom which He preached, which had been somewhat obscured by the gospel of salvation as it had been called, meaning thereby personal salvation, is now restored to its true place in the ministry of the Church. And that gospel sets forth not only the laws and beatitudes of the kingdom of God, but describes the manner and conditions of its gradual growth, till in all human society the healthful order of the kingdom of God be established.

2. Also there has been a deeper study of the life and organization and object of the Church. Especially has this been the case in the Free Churches, which renounce at once the Erastian doctrine of a Church which is upheld and regulated by the State, and the sacerdotal doctrine that the Church is constituted by a priestly caste which is self-replenished. If the Church be a living organism, its life must be within itself, possessing and quickening each member and uniting them by the one spirit which gives life to each. But such an organism it is now seen cannot exist merely to maintain and edify itself. The Church exists to fulfil by great and gracious activities the object for which she was founded, and for which she is continually upheld and inspired by the living Spirit of her Lord. This object is the same as that for which Christ came into this world, and which He proclaimed in His gospel of the kingdom, viz., that the whole of our humanity may be redeemed, and that the kingdoms of this world may become in truth the kingdom of God.

New Currents of Thought

A few words will show how these currents have gradually pervaded the Free Churches, and have thus led them to apprehend their social redemptive mission. In the beginning of last century the evangelical revival awoke the social conscience of England. It was the moral sense of England quickened by the evangelic faith which not only gave birth to the great missionary societies founded at that time, but also to the mighty movement led by Wilberforce and Clarkson, which abolished slavery in every colony and dependency of Britain. Then a new spirit was breathed upon the middle of the century which also awoke a new social and humane spirit, Frederick Denison Maurice and Charles Kingsley, leaders of the "Broad Church," wing of the Church of England, emphasizing the Incarnation, and teaching that all human relations and human society were brought under a new and divine law, and under the obligation of the universal brotherhood of men which was God's family on earth, of

which Christ is the Eternal Head. This doctrine, enforced by other leading divines, such as Bishop Westcott, has influenced large numbers not only in the Church of England, but in the Free Churches. Also in the middle of last century much interest in Britain was awakened in the Inner Mission of Germany, especially under its great representatives, Dr. Wichern of the Rauhe Haus, near Hamburg, and Pastor Fleidner, the founder of the great Deaconesses' Institution at Kaiserwerth, near Dusseldorf, as in later years Germany has again stimulated the social mission of the Church by the Colonies of Mercy which have been established in that country by Pastor Bodelschwing, near Bielefeld, and under his influence in twenty-five other provinces.

The result of these different forces so far as organizations and activities in the Free Churches are concerned has so far exprest and fulfilled itself as follows:

1. The National Free Church Council, which represents all the Free Churches of England and Wales, and represents, therefore, probably more than one half the people of these countries who are members or adherents of the various branches of the Christian Church, has created a Social Questions Committee with three duties:

National Free Church Council

1. The study of Christ's teaching and of the fundamental principles of the Christian faith in relation to the social problems of our time.
2. The upholding of Christ's authority as the Lord and Redeemer of human society as well as of individuals.
3. The wise direction of Christian redemptive efforts so as to abate and remedy great social evils which degrade human life.

This Social Questions Committee has published a "Manifesto on the Social Redemptive Work of the Free Churches," which has been largely circulated, and it has, now (1906), drawn up a program of social work, to be presented and urged upon the local Free Church Councils, which have been formed in every part of the country, and in which all Free Churches are practically united and represented.

In addition to this the Presbyterian, the Wesleyan Methodist, the Primitive Methodist, and the New Connection Methodist churches have each of them formed a special Social Service Committee, the objects of which are almost identical. They are exprest in the following statement, which sets forth the objects of the Social Service Union of the Wesleyan Church:

"The collection and study of social facts, the pursuit of social service, and the discussion of social problems and theories from the Christian standpoint, with the view to educate public opinion and secure improvement in the conditions of life."

2. Soon after Toynbee Hall was established in Whitechapel, a settlement was founded in one of the poorest districts in the extreme east of London, called the Mansfield Settlement, established by Mr. Percy Alden, M.P., then a student at Mansfield College, Oxford, and who gave the name "Mansfield" to this new settlement in the hope that the students of Mansfield College might specially cooperate in its varied work. Following upon this, the Robert Browning Settlement was founded in Walworth, of which the Rev. F. Herbert Stead is warden. The Nonconformists' Students' Union of the University of Cambridge takes an active part in many of the departments of this settlement. In addition there are six other settlements which have been established—more or less in connection with Free Churches—one in Canning Town, for women workers; the Ipswich Social Settlement, Lancashire College; the Settlement, Manchester Women's Settlement, Middlesboro; Croft House Settlement, Sheffield, and the United College Settlement in Bradford. The Wesleyan Methodist Church established some fifteen years ago a strong settlement which has been one of the most prosperous in our country, in Bermondsey—a large and poor district in the east of London. This settlement was founded by the Rev. Scott Lidgett, president of the Free Church Council for 1906. It has two branches, one for men and the other for women.

Settlements

3. The Wesleyan Methodist Church, which has not done much in the formation of settlements, has set a great example to other churches in what has been called its "Forward Movement," which has led to the formation of forty-five missions, established in the heart of the most populous districts in London, and of other great cities of the United Kingdom. Many of these missions are practically settlements, but their work centers in the popular evangelistic services which are held on Sunday and week-days, and in which the preaching of the Gospel is made at once attractive and impressive by song, and choral and orchestral music. Of the two best-known missions, one is the West London Mission, founded by the Rev. Hugh Price Hughes. In it the Sunday services have been held for years in St. James's Hall and in three other halls. Surrounding these, and in a sense emanating from these, there are the ministries of a band of sisters and of brothers for whom a home is provided as in a settlement, but instead of giving only part of their time, the whole time of many of these sisters and brothers is devoted to the various kinds of social ministry. The other is the great Central Mission, founded by the Rev. S. F. Collier in Manchester. In this mission, the two largest halls of Manchester, and many chapels in the poorest districts from which the congregations had ebbed away, are now filled by 16,000 people every Sunday evening, and each of these congregations is organized for various forms of useful social work. But the whole mission finds its center and crown of work in institutions which are founded: (1) to aid men who have fallen out of work, giving them employment which pays their board and lodging, and helping them again to find employment; (2) for fallen women and for women who are in peril, and (3) for the great army of crippled children found in the City of Manchester. The other missions of the Methodist Church do not equal these two in compass and varied organization, but all have the same impress, and have achieved a striking success.

Institutional Churches

4. In other Free Churches a similar movement to the Forward movement in the Wesleyan Church has led to the establishment of Institutional Churches. Three of these have been founded by the London Congregational Union: (1) Whitefield's Tabernacle, in Tottenham Court Road, over which the Rev. Silvester Horne and Rev. James Holmes preside; (2) in Claremont Hall, in the northwest of London, of which the Rev. W. F. Newlands, M.A., is president, and (3) in the south of London, of which the Rev. Herbert Kenward is superintendent. One has been established by the London Baptist Union, of

which the Rev. Thomas Philipps is the superintendent.

The Westminster Church, under the Rev. Campbell Morgan, is also forming itself into a great institutional church, in connection with which a number of social agencies are being organized in the poorest neighborhoods of Westminster. In other towns and cities several church buildings which had become almost derelict because deserted by their former congregations, are now being occupied and used as institutional churches in which large congregations are gathered, and by which many social agencies are carried on in the poorest districts. In every case the members of suburban churches are given efficient help.

But apart from special missions, and institutional churches, there is being widely diffused among a multitude of churches the same social spirit and activity. So in connection with them there are formed Week Evening Institutes for the elder scholars of our Sunday-schools, and the younger people of the church, in which recreation and bright educational classes are provided for the young: Boys' Brigades, Girls' Life Brigades, Leagues of Honor and of Service are also formed in them for the physical and moral training of boys and girls. And in addition to these Week Evening Institutes for the young, there are also being formed in many churches social institutes for the adults, not only for those who are members of the congregation, but for working men and women in the neighborhood. The object of these institutes is thus defined: "To supply the great social need of working men and women of our country—viz., to provide for them rest and recreation in the evening that will be bright and attractive, and give opportunities for social intercourse and pleasure. It is desired that everywhere these institutes be so conducted that the social and recreative attractions shall awaken the desire for higher interests."

5. During the last few years two great religious and social movements have arisen among the working people of Great Britain, and they are chiefly associated with the Free Churches. One is the Adult Sunday-School Movement. For some years this was largely confined to Birmingham and the neighborhood. It was initiated there by Mr. Alderman White, a "Friend." The movement has been from its origin very largely maintained and associated with the Friends. Mr. Cadbury, of Bournville, has, throughout his whole life, presided at an adult Sunday-morning school regularly attended by some 700 or 800 working men. During the last ten years this movement has spread over the country in a remarkable way, and there are now over 100,000 working men assembling in these schools in different parts of the country. In these schools half an hour is devoted to the reading and study of the Bible, half an hour to some educational subject, which may be very elementary, or may open up social and literary studies, and another half hour is devoted to the enrolment of members, the payment of a small weekly fee, and to a bright, hortatory religious service. Five or six years ago a National Council was formed in order to extend and develop these Sunday-morning schools, and with amazing success. This council issues a monthly organ entitled *One and All*; the head offices are in Birmingham, where the organ is published, and the secretary is Mr. E. Gilbert, Bournville, Birmingham.

Adult Sunday-Schools

The second movement is still more remarkable. During Mr. Moody's first visit to Great Britain Mr. Blackham, of West Bromwich, caught the idea of having, on the Sunday afternoon, a service for working men which should be, in his terse phrase, "bright, brief, and brotherly." He called it a Pleasant Sunday-Afternoon Class. This class started in the chapel with which he was connected, and immediately filled the chapel. Mr. Blackham, a business man of consecrated energy, then devoted much of his time to the establishment of these classes throughout the country; and others followed him. There are now 600 of these P. S. A. Brotherhoods, as they are called, tho they also bear other names, such as "Men's Own," or "Men's Brotherhood," established throughout the length and breadth of the land. On the very day on which this article is being written, a National Council has been formed at a great representative assembly, attended by delegates appointed by 500 Brotherhoods, held in London; the Rev. F. B. Meyer has been chosen its first president, and Mr. Ebenezer Goold, who through many years has devoted himself to form these P. S. A. Brotherhoods, is appointed honorary secretary. He is the editor of the *P. S. A. Leader* which is the organ of this movement.

Pleasant Sunday-Afternoon Movement

6. Besides these distinctively church movements, there was early formed a Christian Social Brotherhood, of members of the Free Churches of England, somewhat similar to the Christian Social Union of the Church of England. It had a somewhat limited influence, but there has been developed since an active Scottish Christian Social Union, and in England a Christian Union for Social Service, largely supported by the Free Churches, which has one colony at Lingfield and one in Westmoreland (see LABOR COLONIES), patterned somewhat after Bielefeld, and has been active in other ways, publishing also a monthly *Social Science*. JOHN B. PATON.

FREELAND is the English name of a German book, "Freiland ein sociales Zukunftsbild," written by the eminent Austrian economist and statesman, Dr. T. Hertzka (*q.v.*), advocating socialistic principles, and outlining an imaginary free socialistic state founded in Central Africa. It aroused very general attention, and committees were formed in various countries to raise money and establish such a state. Pioneers started to found the state, which eventually wholly failed.

FREE SOIL PARTY, THE: This was the name of a political party that appeared in the United States about 1846 in the course of the abolitionist movement. (See ABOLITIONIST.) Its standpoint was "the Wilmot proviso," offered by David Wilmot, of Pennsylvania, to amend a bill making an appropriation to negotiate peace with Mexico. It read: "There shall be neither slavery nor involuntary servitude in any territory on the continent of America which shall be hereafter acquired by or annexed to the U. S. by virtue of this appropriation or in any manner whatsoever, except for crime."

It created great excitement. Calhoun had declared that the annexation of Mexico was necessary to protect slavery, which was an in-

stitution placed under the guaranty of the Constitution and necessary to the peace and prosperity of the slave states. The proviso was defeated in the Senate, but taken up in the North. A convention met at Buffalo, Aug. 9, 1848, and formed the Free Soil Party. It was composed of the old Liberty Party (*q. v.*), seceders from the Democrats and Whigs, and a faction of the Democrats called Barn-burners. Martin Van Buren and Charles Francis Adams, of Massachusetts, were nominated for president and vice-president. The platform disavowed attacking slavery in the South, but simply stood for the above principle. The party polled over 300,000 votes and elected several congressmen, among them Charles Sumner, of Massachusetts, and Salmon P. Chase, of Ohio. The conflict then came over the admission of California, and when it was admitted with a constitution prohibiting slavery, the Free Soil Party lost its main need of existence. Agitation, however, sprung up over the Fugitive Slave Law (*q. v.*), and the Free Soilers met in 1852 and nominated John P. Hale, of New Hampshire, and George W. Julian, of Indiana, and polled 151,000 votes. But the aggressive policy of the South roused the North to a more general policy, and the Free Soil Party was merged, in 1856, in the Republican Party (*q. v.*). Its cry had been "Free soil, free speech, free labor, and free men."

FREE SPEECH LEAGUE, THE: Organized in 1902, the league demands freedom of peaceable assembly, of discussion and propaganda; an uncensored press, telegraph, and telephone; an uninspected express; an inviolable mail. It works by means of the press, the platform, and the courts; by persuasion, argument, petition, protest, and demand; through the agencies of election and rejection, but believes that the education of brains and quickening of consciences are first in order of time and effect. *Secretary*: A. C. Pleydell, 175 Broadway, New York.

FREE TRADE IN THE U. S. (See also Tariff Reform in Great Britain. For other countries see Tariff.) As here used free trade means commerce unfettered by law, whether for taxation (support of government) or protection (monopoly of home producers). Again, free trade is here considered only as opposed to taxation (or obstruction) by tariff duties—this because in practice our policy has long been that of free trade throughout the United States; so that we have in fact to deal only with international commerce.

Even as to tariff taxation; it is frequently attempted to distinguish between the ends for which it may be framed—taxation on the one hand, or protection on the other, or both combined. This distinction is ignored, *first*, because any effective taxation of commerce is, in fact, an obstruction—a shackle—of commerce, and therefore inevitably destructive of free trade and its benefits; *second*, because—while there have been examples elsewhere of revenue tariffs as distinguished from protective ones, and some items of our own tariff can be analyzed into revenue and tariff factors—with us political necessities have so far compelled protection to disguise itself as revenue taxation that we have to deal with a system purposely so framed as not merely to include both revenue and protective factors, but so to combine them as to magnify and conceal the extent to which protection results.

I. Tariffs for Revenue

As to even a strictly revenue tariff—that is, one in which the protection feature is so far lacking that the total amount by which the consumer is mulcted, less the expense of collecting it, goes to the government: To be a trustworthy support of government it must be levied upon the necessaries of life. For otherwise, government revenue would be uncertain and shrinking just when most needed.

But this is simply another way of stating that revenue taxation must be upon want rather than wealth—upon need to consume rather than ability to contribute. It stands vigilant and pitiless by the side of the cradle in every wage-earner's home. As each babe is added to that family the revenue tariff adds to the proportion of taxes the father of that babe has to pay—this, while the contribution of wealth is not increased as bond is added to bond in its strong box and acres to acres outside.

We, therefore, find as the most successful and prominent examples of revenue taxation just those most oppressive to the masses of the people and of least concern to the well-to-do—the salt tariff of India, the sugar and salt tariffs of Italy, and the sugar tariffs of France, Germany, and the U. S.—the revenue features of which are thus worked out at the disproportionate expense of the very citizens of those countries who are compelled to work most and permitted to enjoy least.

As to labor: Take a ship arriving at one of our docks from Europe, laden, as it commonly is, with labor in the steerage and goods on their middle decks. If the wage-earner goes to the dock to buy any of these goods he is met by a customs officer—paid by the government, but serving his "protected" fellow citizens—and forbidden to purchase those goods, or fined if he dare do it—in order to compel him to pay a higher price for the necessaries of life. But his employer can go to that very dock and buy the cheap labor imported by the same ship just as fast as it steps from the gangplank. No customs officer touches him; for our tariff was not made that way.

As to "American standards of living." Granted that American standards are comparatively high, and that this is as it should be: To the precise extent that the cost of necessaries is raised by tariff taxation—even tho only for revenue—the wage-earner—having a given amount of money to live on—can buy less; that is, is forced to adopt a lower standard of living.

The method of taxation thus involved is practically indirect; that is, it is not collected from the one who ultimately pays the tax. For example, the wholesale importer pays to the government the duties upon the goods he brings in. He, however, does this not as a tax, but simply as a business investment upon which he realizes from the retailer, who, in turn, does so from the ultimate consumer, who, tho he pays a higher price on account of the tariff, may be utterly ignorant of this, and generally is so as to the extent he is mulcted.

For example, suppose a town meeting held to raise money to repair roads, build bridges, or support the county poor. The almost invariable

way in which this is done is to calculate the total amount required, and then, after practical calculation, to levy upon the gross amount of the assessed property in the town a tax of as many mills on the dollar as will raise the amount required and pay for its collection. The tariff way would be—omitting the complicated machinery actually required to appraise merchandise and allot duties—to provide that the storekeepers should charge two cents a pound more for each pound of sugar, 50 per cent above the ordinary price for each yard of woolen cloth, twice as much for window-glass, 20 per cent more for every stove, etc., and keeping account of the extra amount thus charged by them, turn it into the public treasury until the money was raised. The objection would be instantly made that the wealth of the town would thereby escape taxation, and that the greater part of it would be saddled upon poor men with large families. But that is precisely the "tariff for revenue" system, and such is precisely its effect.

Concealed Taxation

It has been the aim of all governments, most eagerly sought by the most tyrannical, to escape responsibility to the public. A direct tax—that is, one levied upon the individual and paid by him to the collector—is a constant reminder to him of the burden of government, and constantly stirs him to watch and criticize its expenditures, and to insist upon an economical policy in government affairs. In cases of indirect taxation, such as a tariff paid by the wholesale importer, to be repaid, after sundry profits of middlemen are added, by the increased price at which the retail merchant sells it to the final consumer, it is a tax as to which no one knows either how much he pays or even when he pays it; and justifies Turgot's commendation of indirect taxation as the one best means "So to pick the geese as to get the most feathers with the least squawking." A system of direct taxation would practically call for the annual judgment of the masses of the voters upon the policy of the government; but with a revenue tariff once in operation, a government can undertake the most extravagant measures, until, by the slow process of popular education, the public can be educated.

Again: The characteristic of an indirect tax is that it is a tax upon consumption as distinguished from a tax upon wealth. It is obvious that such a tax leaves wealth to escape the burdens of government which it puts upon the shoulders of the masses. For in proportion as a man's income is absolutely required for the sustenance, shelter, and comfort of himself and his family, to that extent is this indirect taxation levied upon the whole of it; while, to the extent that the income of the more fortunate citizen is so large as to enable him to amass wealth by laying aside a part of it, to that extent he escapes indirect taxation.

Again, indirect taxation—especially tariff taxation—is generally levied, not merely upon consumption as such, but disproportionately upon the necessity of the poor rather than upon that of those who have large incomes. There are many ways in which it is perfectly practicable to tax indirectly the income and the property of well-to-do citizens. Many of these ways have indeed been tried—some of them by ourselves in late years. It is not suggested that any of them is free from objection; no tax is so.

Rests on the Poor

But none, either of these, or numerous others which we exploited during our Civil War, were discontinued on account of practical or moral objections. But the income tax, the tax on corporate receipts, the tax on watches, carriages and articles of special luxury, the tax on bank checks, were abolished with a haste that contrasted with the deliberation with which the tariff was even touched, and the obstinacy with which it was meddled with only to increase its burdens.

There is a reason for this: In all governments, from the beginning of time to the present, the laws have been made, if not by the wealthiest men in the country, at least by those a vast majority of whom are in personal or social touch with the more well-to-do few. In other words, taxes have been so adjusted as to bear upon the poor, because taxes were imposed by others than they. This does not apply misanthropy on the part of our legislators. A large proportion of them would, indeed, consider themselves as poverty-stricken toilers compared with those whom they regard as possest of wealth. But between them and the masses of the population even in our own day there is a gulf so great as to class them rather with the money power above than the muscle power below; while in every other country the contrast is still more marked and the natural tendency just described more nearly the inevitable one.

In connection with indirect as compared with direct taxation, it may be remarked here that "protection" has another incident even less capable of defense than the indirectness of the tax levied; and that is the indirectness of the use of the tax. For not merely is it so levied that no one can tell when it is being paid—tho he is none the less mulcted of his money; but it is so applied as not to disclose how much any favored individual gets—tho he none the less lives at the public expense. For example, a plated-ware manufacturer being favored by a duty of 35 per cent knows—as does no one else—the amount of bonus he can therefore exact, and the circumstances of his trade determine the amount of his profits. As to the method and extent by which he is to benefit the community he thus mulcts he is not held to account. He can—as he generally does—hire his labor at the cheapest rate he can get it. In case he wishes to give a present to the public in the shape of a church or a library, he can do so, or he can—as he more frequently does—spend the round amount annually in good living for himself and family, or sink it in speculative business ventures, or leave it at his death to dribble back into circulation again through spendthrift heirs.

Just as in the case of indirect taxation, one motive for it was to avoid the publicity of direct taxation; so the strongest motive for the indirect method of distributing the bonus raised by a protective tariff, except the desire to escape accountability. For it is perfectly easy for government that dares be "above board" to reward a manufacturer who has been a benefactor to the community, by voting him a lump sum out of the public treasury; or to promote the carrying on of any special industry by voting, as Congress lately did in the case of the sugar planters, a bounty for a certain amount of a given quality of product.

A tariff is therefore a tax system so adjusted that the one who pays the tax neither knows how much he is mulcted nor when it is taken from his

pockets; nor who gets the proceeds; nor what is done with them—the perfection of crookedness.

Finally, if the question is one of a revenue tariff such as admittedly have been those imposed by the U. S.—so framed as to raise somewhat of revenue while giving incidental "protection"—the problem of intelligible, not to say equitable, adjustment becomes complicated beyond expression. It involves reliance upon data, the only experts as to which are interested to deceive the lawmaking power in order that they may thrive at their neighbors' expense, and whose willingness thus to thrive insures that they will stickle at no means to do so. It offers the same inducements to falsification, the same opportunities for bribery, the same use of political corruption.

II. Protectionism

But our system is not one of revenue tariff. It rests upon the influence—political, economic, industrial — that protectionism has acquired among us; so that for the purposes of this discussion the terms "protection" and "free trade" are used as the opposite of the other. And since the burden is upon him who defends governmental interference with private business, therefore free-trade argument is most conveniently stated as an answer to protectionist claims.

The first step toward understanding this question is to define "protection" as here practised.

It consists in obstructing imports by the imposition of a fine, proportioned to the extent of his trespass, upon any one who shall bring into this country the goods upon which a tariff is laid —the object being to make those who desire such goods pay one of our own citizens a bonus, equal to a part or the whole of the fine thus provided, above the price they would otherwise have to pay for the foreign goods—and thus to enable the home manufacturer or producer to charge a higher price for his goods than he would otherwise be able to do. The home producer is in that case said to be "protected" from competition and assured control of the market here for goods such as he supplies. This, however, simply means that certain producers are favored —as was intended. Protectionists and free traders would, however, alike protest against stopping here, and say that a national policy should be defined with respect, not to the few individuals whose ends it subserves, but to the general public, whose weal alone justifies legislative interference.

In this light, what is protection? As to the few who are "protected," it is favoritism. What is it to the people at large?

The articles the import of which into this country are to be thus obstructed are not claimed to be harmful in themselves. They are, on the contrary, the very things we want, the possession of which makes a nation rich and its people comfortable—such things as clothes, food, crockery, glassware, and the raw materials we need for our manufactures.

Again, the fines imposed by tariff laws are not levied upon those who are attempting to do something to which we are opposed. They operate alike upon the foreigner who brings his goods here, and the American who, having purchased them abroad, attempts to bring them home. And so far as they operate upon the foreigner, they simply prevent him from doing something that we want him to do. No "protection" is needed to enable us to avoid buying anything we do not want. It is needed only to keep us from getting something we do want to buy—to prevent us from doing what we want to do—self-denial by law.

What are the grounds upon which it is attempted to justify the interference with trade involved in "protection"? The following are some of those urged:

Justification Offered

"*Trade is War.*"—The idea that trade is war, and that, as between the buyer and the seller, if one gains the other one must lose, seems ineradicable from the uneducated mind. Discredited as is the suggestion by the whole theory of our civilization, nothing is more common than to hear suggested, as a conclusive argument of beneficial results to our people, that we have rendered miserable some village in England, or of misfortune to us, that the peasants of Germany expect to prosper from our trade. That this argument is so generally used shows how thin is the skin of culture that covers the savage within us. From its very nature, trade is a benefit to both parties to it. If I do not prefer what my neighbor has I will not trade with him. If he does not prefer my present possession to his, he will not exchange with me. The fact of voluntary trade is of itself a demonstration that, so far as the participants to it can judge—and no one else is competent to do so—they are both benefited by the exchange. So far from the prosperity of the nation with which we trade and the high value it places upon our trade being a proof that we are the losers thereby, it is the most nearly conclusive one possible that we are great gainers, so that no experience is more universal than that the mercantile connection which is valued by one country is equally esteemed by the country with which it trades.

But the suggestion that trade is war may mean that it is a war between the two merchants who are competing for the trade. But the foreign and the home producer are simply struggling to see which can offer the greatest inducements to customers—by offering a better quality of goods, by offering them at a cheaper price, or by supplying them in better assortment. In other words, this war is as to who shall serve best the general public—the consumers. Is it to the interest of this public to put an end to this kind of a war? Is not the climax of assurance capped when the home manufacturer asks that the general public be taxed to put an end to this rivalry to serve it?

"*Protection Lessens the Number of Traders.*"—Scarcely less inherent in the notions of uneducated people is the idea that the trader is a non-producer, and, as a consequence, the corollary that it would be a good thing to obstruct trade and abolish traders.

In the *first* place, to get goods cheap is precisely the problem upon which the most intense application of the brightest and shrewdest men of the world has been devoted for thousands of years; and *second*, at no time has progress in this direction been more marked and its results more beneficent than during the past few years, when governments have interfered less and less, and left their citizens more and more freedom to do as they pleased.

In other words, the very reasons why trade ex-

ists are such as demonstrate that it is a saving to the consumer in the labor requisite to enable him to get the property he wishes to use; and the whole world of trade has always been, and is now more than ever, working with the most intense application upon the problem of reducing to him the cost of this advantage—the success of every trader depending upon the extent to which he can offer greater inducements than his neighbor to the consumer to whom he wishes to sell.

To sum up, an article is finally produced only when it is put into the hands of the final consumer at the place he wishes to use it. The trader is as essential a producer as the manufacturer or the farmer. To discourage him is to increase the cost of the only production in which the consumer is interested—that of furnishing him the article when and where he wants it.

"*Protection Encourages Home Trade.*"—This claim may be stated thus:

"Free traders claim that trade is an advantage—that it is so to both parties to the trade—that the greater the advantage to the one, the greater it is also to the other. Now if that be so, it is more advantageous to a nation to have its citizens trade with each other, and thus have both ends of the bargains they make, than it is for them to trade with foreigners, in which case the latter will, of course, get half the profits, and thereby enrich their own country rather than ourselves."

The fallacy of considering this an argument against foreign as distinguished from domestic trade lies in forgetting to apportion profit to capital and effort. The efforts and the capital of two men produce two profits in the one case, and the same in the other. In the one case, the U. S. furnished both efforts and both capital, and it, therefore, got both profits. In the other case, the U. S. furnished but one effort and one capital and got but one profit. But it had the other effort and the other capital still free for equally remunerative trade at home or abroad; and so, employing it, would still make two profits. If, for example, both Americans traded with Canadians instead of with each other, the U. S. would get two profits. In other words, to get the greatest *number* of profits by trading, it is only necessary that the greatest number of men and capitals be employed in profitable trade. And to get the greatest *amount* of profits it is only necessary that each shall trade with the one from whom he can make the most.

Home Trade

"*Protection Brings Producer and Consumer Together.*"—The comical thing about this argument is that it is precisely what, with all the ingenuity that self-interest, experience, and business training can devise, the producer and consumer are always trying to do with the least trouble and most profit to themselves, and precisely the thing that, whenever a national boundary happens to lie between them, the protectionist attempts to thwart. But the latter will protest that that is not what he means; that his idea is rather to prevent the consumer from being obliged to go so far for his goods, and the purchaser from being forced to seek so distant a market. Here again, that is precisely what each is working at, and precisely the matter as to which each is an infinitely better judge in his own business, and as to his own wants, than his neighbor can possibly be for him. To say that I shall not trade with another man 1,000 miles off, because there is another one 100 miles distant, if, in the end, I can get my goods cheaper of the first than of the second, is most impertinent tyranny. To insist upon it that I ought to go the shorter way when I find it cheaper or easier to go the longer way, is not less so. To insist that I do not know my own business, and that you will attend to it for me, is intolerable.

"*Protection Defends Us from Foreign Monopoly.*"—In one sense this is true. It "preserves" us—for home monopoly. The horror of American monopolists for foreign ones is easily understood. But why the American people should build up home monopoly, in order to avoid a possible world combine, is as hard to understand as it is why, in terror at St. Patrick, "the snakes committed suicide to save themselves from slaughter."

"*Protection Promotes Trade Between Dissimilar Nations.*"—This is a *reductio ad absurdum*, rather than an argument. It assumes that in the intense development of civilization by subdivision of labor we shall require less of the services of those about us, and more of those who, by race and by habitation, are the farthest removed from us.

On lines of travel eastward and westward, tho the measured miles indicate distance, they bring us in great degree continually in contact with civilization similar to our own, in the same zone as to climate, with similar facilities of transport and similar trade and social customs; but from the very relations of the earth to the sun, a journey northward or southward plunges us promptly into a different climate, among people of different associations and different habits. To favor commerce between countries that have least in common is at once to ignore the facts of subdivision of labor and interdependence of individual upon individual, community upon community, nation upon nation, and also to adopt the theory that the farther off in effective distance, and the harder to reach and to deal with a nation is, the more profitable it is to have commerce with it.

Carried to its legitimate result, it would insist upon tearing down the railways between New York and Chicago and subsidizing lines to the poles and to the equator—in discouraging the greater part of our existing commerce, the development of which has shown it to be natural and legitimate, and encouraging a novel sort, the lack of which shows that it is comparatively unprofitable.

"*Protection Secures Us a Favorable Balance of Trade.*"—Few arguments for "protection" are brought to a close without the attempt to conjure acquiescence by flourishing the term "balance of trade." We are told that unless we hamper foreign trade the result will be to make our imports so much greater than our exports that the balance of trade will be against us.

It is hard to realize the extent to which it is actually argued that commercial prosperity consists in exporting more than one imports. The farce broadens when we see that the nations which, on the protectionist theory, have the most favorable balance of trade are such as Turkey, Persia, and Spain, which for generations have been drained by more fortunate countries of the wealth produced or accumulated in them; and that the countries that have continually been menaced with "the advance balance of trade," involved in continually receiving more than they send out, are precisely those countries that profit the most by their foreign commerce—Great Britain lead-

ing. Elaborately to refute the balance-of-trade bogy is to waste time in a world where life is already too short.

To give but one example: If a New York merchant loads a ship with 50,000 bushels of wheat worth $1 a bushel, and sells it in Europe for $60,000 over and above the expense of getting it there, and buys and expends that money in goods which he thinks he can dispose of profitably here, buying them so cheaply that when they arrive here they are worth and appraised at $75,000, the "protection" idea is that by this nefarious proceeding the U. S. has lost $25,000. On the other hand, if the same merchant, sending the same cargo, had so miscalculated that his wheat at Antwerp netted him but $40,000, and then if he had made so bad an investment or had so disastrous a voyage that the goods brought back in return were worth and appraised at only $25,000 when they passed our wharves, the balance-of-trade theory is that the country would have gained $25,000.

Taking the enormous commerce of England; since her capitalists own the ships that carry the most of it both ways, it is perfectly plain that over and above the amount of profits and interest her merchants realize, her imports ought to average an amount above her exports sufficient to pay for both inward and outward carriage. And yet, on the balance-of-trade theory, this essential of prosperity is an index of disaster.

"*Protection Prepares a Nation for Self-defense.*"—In the first place it does not. There was a time in the history of nations when *export* duties upon articles used in war were prevalent, and may have been efficient in keeping within the country the munitions of self-defense. The tendency, however, of import duties is to make the country poor in everything that is best produced or found in its best shape abroad. The only exceptions are the cases of establishments of industries for the express purposes of manufacturing war material. To the extent that these are thought proper this discussion has nothing to do with them. It is not actual self-defense, but interference with business, that is here under consideration.

So far as concerns the idea that the country would be in a general way better prepared for self-defense by cutting off trade with others, it is not true—and especially a mistake when applied to this country. The two great necessities for successful war are men and money. Our men can best be developed by leaving each man to work out his own prosperity in the calling which he finds to offer most inducements, and not by taxing him to hire some one else to attempt unprofitable business.

Again, the U. S. is in a peculiarly favorable position. Our great exports are more and more relied upon by other nations, and more and more a necessity to them. In proportion as we shall accept of their manufactures, they will be able to buy and will purchase more and more of our food products and cotton and become more and more dependent upon us. Free trade, therefore, so far as the U. S. are concerned, makes the world more and more dependent upon us, and a greater number of its principal nations more and more under bonds to keep peace with us.

"*Protection Diversifies Industry.*"—There has never been an inhabited country of the varied natural features of ours in which industry has not been naturally and of necessity most diversified; that is to say, in which the arts and manufactures, and mining, if minerals are at hand, do not follow close upon the heels of agricultural settlement; or where, on the other hand, in case mining and manufactures have prospered and there is land which can be utilized for agriculture, that land is not cultivated by a rural population. To insure this result "protection" has never been found necessary. If, therefore, the claim means anything, it means that "protection" will increase the variety of industries by encouraging some that would otherwise not be carried on. Whether this is a benefit or not depends entirely upon whether the aided industries are such as are then or there legitimate and profitable. In so far as industries become more diversified, because with advancing settlement and civilization a greater variety of them can be advantageously carried on, that diversity supplies the inhabitants of the country in question with a greater amount of the comforts and necessities they wish. But in that case "protection" is not needed. If, on the other hand, the industries of the country are diversified by turning capital and labor into occupations that for any reason are not self-sustaining—the only excuse for "protection"—then the result is to have wasted capital and labor, and to compel the people of that country to be satisfied with fewer of the products of these new industries than they could otherwise have afforded had they been permitted to purchase these where they could get them cheapest.

Diversified Industry

Instead of diversifying industries, "protection" multiplies the leeches upon industry.

"*Protection Builds Up Infant Industries.*"—Here is the one tenet of "protection" that can be logically sustained in hypothesis, but as to which experiments have been grotesque failure—for the simple reason that the hypothetical status does not exist. The theory is that disinterested statesmen with broad views may discern certain classes of business not then developed in their country which it would be obviously to the advantage of that country to have developed, but which for one or other reason it is improbable will be naturally developed there in the immediate future. It is self-evident that in most cases some one can be hired to undertake the business in question; and that—*provided* those thus induced to carry on the business for the benefit of their fellow citizens shall apply to that business the intense application and energy, the tact and the ingenuity which in other business would make them succeed without government aid—an industry thus fostered might grow into a self-supporting one. Such were the arguments of Hamilton and Clay, and indeed nearly every leading advocate of "protection" before the Republican convention of 1884. The trouble here is, however, that for a hundred years we have been trying a series of experiments in this line, which in extent, variety, number, and absurdity have covered the whole field; and all this with the result that to-day the industries that are most dependent upon "protection," and most successful in their late appeals for additional "protection," are the "infants" of one, two, and three generations ago.

Instances might be multiplied indefinitely. Our experience has been that the more an infant is protected the more infantile it grows. The reason is, of course, not far to seek. In the first place, even well-meaning statesmen are generally

mistaken in giving hothouse development to an industry with the natural conditions of which they are not familiar; and in the next place, the fact is that "protection" to an infant industry never has been arranged by disinterested statesmen. There was, to be sure, one tariff drafted by such a man with such an intent—by Hamilton in 1791. But that was never enacted, and from the free-trade argument with which it opens, to the limitations by which it was drafted, it is as antagonistic as would be free trade itself to our tariff of to-day. As a matter of fact, the "protection" to infant industries has been adjusted at the suggestion of gentlemen who either wanted to be hired to carry on an unfamiliar or unsuccessful business, or who wanted government to give them increased profits upon an industry which without "protection" had demonstrated its success.

Tariff and Industries

Again, the system being one that impels those who avail themselves of it to depend even more upon government aid and success in lobbying for it, than upon making their industry a self-supporting one, the economy and enterprise are lacking which alone enable an industry to secure legitimate success. The result is that our protected industries have not merely failed to be self-supporting, but that they have become more and more dependent upon government aid. Indeed, under protection the infant industry which is best protected, and which grows into most obstreperous manhood, is the oldest "industry" of all—human greed—thus encouraged to manipulate Congress and debauch elections.

"*Protection Encourages Industry.*"—A "protected" manufacturer takes me to look over his plant—a great factory, expensive machinery, well-kept grounds, and, incidentally, his own most comfortable and costly home with its surroundings, and says, "Behold the benefits of protection; listen to the machinery humming in that mill; see the scores of operatives to whom I give labor; see the prosperity all about us here." And all the while he not merely admits but argues that the business would not be a profitable one were it not for the protective bonus—that all about him, and his own snug wealth to boot, is but the surplus of a tax in which he has procured his fellow citizens to be mulcted to pay him for carrying on an unprofitable business.

If an industry does not depend upon "protection" then it is no argument for it. If it does, to precisely that extent it is not an industry but a nuisance. It is not legitimately classed with factories, but with the poorhouses of our own country, and the beggars and idle aristocracy of others—with the vermin that infest and drain, rather than the blood which circulates and nourishes the body politic.

In this connection there is another consideration to be kept in mind—that every attempt specially to encourage one industry by tariff taxation is *discouragement* to every other industry directly or indirectly affected by it.

For example: The combined effect of the German and U. S. bounties on the export of sugar was so excessive that for a period of years the German manufacturer could and did deliver raw sugar to the American refiner more cheaply than to the wholesale dealer at home, and the American dealer could and did refine the raw sugar and pay the freight to England by the excess of the U. S. rebate; so that every English citizen was able to buy refined sugar produced in Germany, transshipped to America, refined there, and reshipped to England, at a cheaper rate than the German could get raw sugar. This, of course, made sugar cheap in Great Britain, which promptly became by far the greatest consumer on the globe, not merely in the aggregate, but per inhabitant. Here was a genuine case of a deluge of cheap foreign goods. The continental sugar bounty nations got the "protection" and England got the sugar.

Great Britain's course shows the difference between the way our tariff is made and that in which such questions should be treated. The English Government set on foot an investigation that amounted to something—not merely of sugar-refining at home and sugar-planting in her colonies; *but of those other interests which, prosperous under cheap sugar, would be hurt should sugar be made more dear.* It was found that there were only 4,000 persons—engaged in sugar-refining—who were prejudiced by the deluge of cheap sugar complained of, and, on the other hand, that there were at least 12,000 people employed in the jam and confectionery industries which, through cheap sugar, had lately sprung up in England, and in which she supplied the world. It was found in addition that the *profits* from these industries were *more than all the wages paid* in sugar-refining; while refined sugar was a raw material in the biscuit industry and mineral- and soda-water bottling, and used to the extent of 50,000 tons in brewing and distilling, all of which were dependent upon the cheap sugar thus secured for their prosperity and enormous export trade. As far as colonial planters were concerned it was shown that the loss to the general consumers—mainly the working men of Great Britain—by the attempt to "protect" sugar growing in the colonies, would be greater each year than the whole amount of capital employed in that business.

Here is the fatal weakness of the claim that "protection" encourages industries. In pointing to the one favored industry he proposes to favor, the protectionist forgets the myriad of legitimate industries which this favoritism will injure or destroy. Like a bad physician, the very "protection" which thus blasts the industries of a nation buries its malpractice below the sight of criticism.

Fatal Weakness

Again, the claim that the tariff encourages industry is nowhere more conclusively exploded than in the numerous and flagrant instances in which we impose tariffs upon the raw materials of our manufacturers. The tariff on raw materials—coal, iron, copper, tin, lead, lumber, wool—is not merely (1) a tax on the laboring man, making his fuel and clothing, as well as his tools and every article of furniture, cost him more than it otherwise would, but (2) directly reduces the profitable opportunity and demand for labor.

As to (1) it is so well understood that it needs but a word. The tariff enables the owners of raw materials to charge more than they otherwise could. If it did not, there would be no use for a tariff. The manufacturer having to pay more for his materials, his manufactured goods cost him more than they otherwise would, and he has to sell them for more to make a profit. Every suit of clothes costs the buyer more because of the duty on wool. Every tin roof increases the rent of the victims that are under it,

every can of tomatoes or oysters costs more because of the tax on tin plates. Every yard of calico costs the woman that wears it more because of the tax on dyestuffs; every pound of paint costs more because of the tax on lead; every house costs more because of the tax that is levied on the materials of which it is composed. The result of this is that the wages of the workman are diminished—that is, the same wages will buy less goods.

But the second effect of the tariff on raw materials is still more serious. Even if our people alone were to be considered, it is plain that the higher the price of any article the fewer will be sold—fewer people can afford to buy it. And since the demand for labor depends upon how many goods are to be made (and not on how much profit the manufacturer makes on each piece), it is easy to see that taxed raw materials make the product dearer and reduce the number of men employed and the demand for labor, and thus reduce in the most effectual way the rate of wages the workman can get.

But this is not the worst. In proportion to its product American labor is the cheapest in the world. But the high price of raw materials caused by the tariff (25 per cent on coal, 40 per cent on iron ore, 75 per cent on tinned plates, 40 per cent on copper, 20 per cent on lumber, 50 to 100 per cent on wool) makes them cost more to our manufacturers, who therefore cannot make goods as cheaply as they otherwise could; and hence cannot afford to sell them as cheaply as do the English and the Germans, who get their raw materials free. It, therefore, is the English and Germans, and not ourselves, who largely supply the rest of the world with manufactured goods, and it is American workmen whom our tariff thus deprives of the job of making goods for the rest of the world.

And this dearness of raw materials arises not from their scarcity, but from their abundance, which has tempted their owners to get laws compelling their countrymen to buy of them, but not compelling them to sell reasonably to their countrymen. The owners of iron ore and coal, of lumber forests, or copper and nickel and lead and salt mines, that God put in the ground for all, thus make them a curse instead of a blessing to the land. Given free raw materials, and there would be no limit to the possible expansion of our export trade in American manufactures; to the steady increase in the demand for American labor to make them, and to the steady increase both in the nominal rate of the wages paid and in the purchasing power of every dollar of such higher wages.

"*Protection Preserves Our Manufactures.*"—How does it do so? By far the greater proportion of them are now independent of "protection." Free trade would immediately relieve these of the taxes levied upon them, especially in the materials they use and the increased costs of living of all employed in them, and give them greater prosperity then they now have.

Not merely this, but by releasing a great portion of the remainder from similar exactions, it would render them the gainers rather than the losers. There would practically remain only a few cases in which experiments of a generation or more had demonstrated that the industry could not be made self-supporting here. As to these few thus discredited by experiment, the quicker we stop paying taxes to support them, and get their product more cheaply from others, who are willing to furnish it, the better for us.

As Adam Smith said, a century ago:

"Neither the public nor individuals will suffer any more from the occasional disbanding of some particular classes of manufacturers than from that of soldiers at the close of a war. Our manufacturers have no doubt great merit with their country, but they cannot have more than those who defend it with their blood, nor deserve to be treated with more delicacy."

But this is not all. Just as cheap sugar and free ores developed in England the multitude of industries dependent upon them that have brought her wealth from all portions of the globe; so with the withdrawal of that "protection" by which our industries are obstructed, there would immediately spring into being a myriad of new ones; those now self-supporting would develop to supply the new demand which their cheaper product would create; and there would be thrown open to American industry the world-wide field to which the unparalleled abundance and natural cheapness of our raw materials, the energy, ingenuity, and effectiveness of our labor, entitle us as the chosen people of the century.

"*Protection Furnishes Work.*"—The Almighty's curse furnished Adam with work when it "protected" him from Eden by the flaming sword, and "protection" increases the amount of work which the citizen of a country must do to secure a given amount of the rewards of labor. It diverts capital and labor from occupations in which, because they were profitable, citizens had invested them, into channels so unnatural that a dead loss is incurred, to recoup which government aid is asked; it diverts the labor of a country from the lines in which it can produce what is or would exchange for most of the good things that its people want, into directions where the production will be or will procure less; it diminishes the amount of good things that each shall receive as the reward of a given amount of labor.

Protection and Labor

The conditions of land tenure in Europe are doubtless accountable for the assumption on the part of protectionists that laborers as a class are indebted to employers for giving them work. This is due to a simple cause—that for centuries in most of the civilized nations of the world their lands have been closed to their laborers. Accepting the theory that they are entitled to breathe Heaven's air only so long as some other man permits them to stand upon his possession, they are not less grateful to their landlord than their Maker.

There is happily no need to argue with American working men upon this point. The natural resources of this country are so boundless, the use of them has produced so self-asserting and handy a mass of laborers, that the real conviction of American wage-earners is in accord with the truth—that non-workers, and not themselves, constitute the "dependent" class.

"*Protection Is Needed to Equalize Labor Cost.*"—This is, after all, the most stoutly contested position of latter-day protectionists, tho it was not so of their great predecessors. Hamilton showed that we could already afford to pay higher wages, and that in any case we could import pauper labor. Clay explained that the question was one of effectiveness and not of rate of wages at all, and that immigration would

doubtless bring wages to a level—all things considered.

But our present protective tariff, originating in war time, was defended, not upon the normal cost of production, but upon the plea that it was needed to equalize, first, the increased cost of production caused by internal-revenue taxes, and second, the increased cost of labor caused by the insufficient supply on account of enlistment in the army. The internal-revenue taxes have been abolished, except those on spirits and tobacco; not merely have the armies disbanded, but foreign labor is coming in at the rate of over a million of immigrants each year. The wealthy are no longer taxed on their income; bankers are no longer bothered by a two-cent stamp on their checks; but employers still find a tariff bonus not less pleasant than ever. And so because it is the "last ditch" of their position, they have rallied about the labor cost of production. This question is one of fact. The claim is baseless; the allegations upon which it is based are simply not true. In the nature of things the evidence should be endless—and it is. The issue is not as to the wage per diem the domestic laborer gets as compared with the foreign one, but as to the labor cost in a given product.

In basing their claim for a government bonus upon the fact that they pay higher wages, our manufacturers are guilty of pleading poverty—on the ground that their working partner gets more profits—while suppressing the fact that he is getting less than *his share* of the greater profits his more effective labor has assured for the common business.

"*Protection's Aim Is to Increase Wages.*"—When it is recalled that the advocates of "protection" are not wage-earners, but employers; that the tariff schedules are fixt, not upon any investigation of wages paid or desirable, or even upon evidence as to the profits actual or to be secured, but upon the suggestion of each knot of manufacturers engaged in any particular branch as to the rate at which they should be hired to conduct their business—When it is noted that the claim involves the assumption that labor is best off when left at the mercy of its employers; and that, in order to secure the greater welfare of their employees, our manufacturers should be given a tariff bonus of hundreds of millions per annum—with no security to the employees that they shall share it—it is seen how innocent in more senses than one must be the voter who listens to such a suggestion. But we need not rely upon the American contempt for cant to refute them. The history of our country is an open book, and no one will question that Hamilton and Clay of the dead, and Justin S. Morrill and John Sherman of the living, are qualified to speak for "protection."

Alexander Hamilton was the Secretary of the Treasury and the head of the party of which the present high protectionists are the successors—an honest aristocrat, who was as far from professing a particular regard for wage-earners as he was from bothering his head about their condition. Not merely in his general writings and speeches, but in his great "Report on Manufactures," which is the Koran of the protectionist faith, did he urge as the main ground for "protection" the necessity of offering temporary inducement to capital; but, in support of his claim that he was thus but accelerating our natural development, he explained that wages were not so much higher in this country than in Europe as generally supposed, and that the high wages here were paid not to the manufacturing employees, but to agricultural laborers; and that in any case we could safely rely upon the importation hither of the cheap labor that European manufacturers had. He mentioned as an additional advantage the probability that the importation of foreign labor by manufacturers would lead to the same process for farm labor; and he urged as a great advantage, if only sufficient factories were established, that women could be more frequently worked, and thus be made to help support the family, and that children might be utilized and worked at an earlier age than that at which they would be good for anything in agriculture.

Wages

After Hamilton came Clay, who from 1810 was the high priest of our ante-bellum "protection," the author of most of the tariff bills, their defender in Congress, and the presidential candidate who asked for the suffrages of the people in their behalf. He, in turn, asked for a tariff, not in the interest of labor in general, but in that of manufacturing employers. Adopting and amplifying Hamilton's arguments, he urged that "women and children who would be comparatively idle if manufactures did not exist, may be profitably employed in them," and that ingenuity in the construction and adroitness in the use of machinery, and the possession of raw materials, existed in our country in an immense degree, and more than counterbalanced the lower wages of labor in Great Britain "if they really existed."

In 1846 the U. S. abandoned the theory of "protection," and reduced duties toward a revenue basis, and in 1857 removed most of the "protection" that remained; so that our present tariff dates back only to the Morrill acts of 1861 and later years. As to the objects of these, the records are open to any one who will read. In order to raise revenues for the conduct of the war, a system was adopted of internal-revenue taxation upon the manufacturing employers, wealthy citizens, and great corporations of the country. Each manufacturer paid a tax on his product, each man of wealth was taxed a large proportion of his income; railroads, telegraph, express, and insurance companies, were taxed a large per cent of their gross receipts, and a stamp duty was levied on every contract and on every bank check. These taxes simply called on the wealth of the country to contribute to the common defense. The acts imposing these tariffs were, however, only allowed to pass accompanied by tariff bills, the effect of which was, as says Mr. Blaine, in his "Twenty Years of Congress," "to shut out still more conclusively all competition from foreign fabrics," and "to charge the increased cost to the consumer." The object and effect of the protective tariff was, therefore, *to enable the manufacturers of the country to get back from the people at large such taxes as the former had been compelled to pay for the support of government.*

But that was not all. In his speech of June 2, 1864, Mr. Morrill, of Vermont, called the attention of Congress to the fact that the presence in the army of a large number of working men left the supply short and wages high at home. It was in view of this that there had been progressed under Mr. Sherman's care in the Senate, and Mr. Morrill's protection in the House, another measure demanded by the manufacturers as the price of their contribution to support government, name-

ly, "An Act to Encourage Immigration," better known as the Contract Labor Law of 1864. There was no concealment about it in Congress, tho its promoters naturally avoided such debate as would call it to the attention of the country. The attention of the public was kept tickled with the patriotism of capitalists in submitting to the internal-revenue act, the tariff act was suppressed from prominence and mainly adjusted in committee; while the Contract Labor Law was whipt through both houses and signed by the president, July 4th, Independence Day, 1864. It provided for a U. S. commissioner to advertise throughout Europe the high wages paid in the U. S., and to cooperate with the American employers in contracting for labor abroad. A first lien was given employers who imported labor, for the cost of so doing, upon its wages for the first year, and also "until liquidated by the immigrant," upon any land, whether homestead or otherwise, or personal property, that he might acquire; and the faith of the government was pledged not to call upon immigrants for military service within a certain number of years after they arrived.

Our present tariff was, therefore, a twin of the Contract Labor Law of 1864. It was passed by the same Congress and advocated by the same men who procured government to advertise in Europe to induce foreigners to come over to reduce wages here, and to take the place in our factories of American working men who were fighting in the field, and who, when they returned, found their jobs gone and themselves forced to compete with the contract labor thus imported.

"*Protection Does Increase Wages.*"—To increase the wages of labor sums up the greater part of the expedients by which the best and wisest of our race have attempted to benefit humanity. An overwhelmingly great majority are laborers. The wage of labor, counted tho it may be in money, is really the proportion of its product which it receives. To increase this proportion is to direct more and more of this product into the hands of those who have thus deserved to enjoy it. To increase the absolute amount represented by this portion is to give more of comfort to each dweller on earth, except those who, objects of charity or restraint, would still remain dependent as now, and those others who are possest of such accumulations of either their own or other men's work that they already subsist comfortably without effort.

The test thus offered is a crucial one, politically as well as morally. Not merely is that system most just which insures to labor the largest proportion of its product; not merely is that plan most inspiring that offers the greatest rewards for exertion; but, in a land where government is based on manhood suffrage, increase of the compensation of wage-earners is at once beneficent in principle and the one object to which, as intelligence directs votes, the policy of government must tend.

As already noted, wages are *not* high here when product is taken into account. To stop here, however, would be begging the question, since ability to earn and demand good wages is a blessing in itself. The real question is, "Why are wages high here?"

This is not a new query. In 1773 Adam Smith stated as to America that in the Province of New York the wages of common laborers were 3*s.* 6*d.* or 2*s.* sterling, of ship carpenters 10*s.* 6*d.* and a pint of rum, or 6*s.* 6*d.* sterling per day; house carpenters and bricklayers, 8*s.* or 4*s.* 6*d.* sterling; tailors, 5*s.* or 2*s.* 10*d.* sterling; and that the price of provisions was everywhere much lower than in Great Britain, where wages ranged for common laborers from 1*s.* 6*d.* sterling in London to 10*d.* in Edinburgh, and 8*d.* the usual price throughout the greater part of the low country of Scotland—which latter figures are those most nearly comparable with the American rates—there being then no large cities here like London. Inquiring into the cause of this, he concluded that "plenty of good land, and liberty to manage their own affairs in their own way, seemed to be the two great causes of the prosperity of all new countries. . . . Every colonist has more land than he can possibly cultivate. He is, therefore, eager to secure laborers from all quarters, and to reward them with the most liberal wages. But these liberal wages, joined to the plenty and cheapness of the land, soon make these laborers leave him in order to become landowners themselves, and to reward with equal liberality other laborers, who soon leave *them* for the same reason *they* left their first masters."

Alexander Hamilton, in discussing comparative wages in Europe and this country, noted the same fact, especially that the difference in wages in regard to artificers and manufacturers was much less "than in regard to country laborers," and gave the same reason adduced by Adam Smith—adding the suggestion that laborers who might be imported for manufacturers would doubtless soon find out this state of things, and help furnish a better supply of laborers for agriculture; while Clay, reasoning on the same lines, argued that tho wages might fall on account of the importation of foreign labor, yet that "the extent and fertility of our lands constitute an adequate security against an excess in manufactures, and also against oppression on the part of capitalists toward the laboring portions of the community"—in other words, that our *unprotected* industries would always be a protection to labor against the oppression of protected capital.

Since the settlement of this country agricultural labor has received an average wage, approximately equivalent to its product, without deduction for hire of the land—in bad times the fact being notorious that it is our laborers and not our landowners, as such, who realize the greater part of the product of agriculture. Again, as an increasing proportion of the world's working men are weakened neither by hunger nor the diseases of want and squalor, hands and head become alike more efficient in product, and wage-earners more plucky to insist upon an equitable share of it. With this "protection" has had nothing to do. In this country—whose men have never been hungry, whose children have never been wretched, whose women have never sunk under unwomanly labor—the result—the greatest prosperity since the sun shone upon Eden—is due to our free soil and the blessing of Providence—neither of which came through the custom house.

"*Protection Keeps Our Home Market for Us.*"—If by this were meant what is the fact, that protection shuts us all up, and thus tends to make *us* a market for the protected few who have procured us to be thus fenced in, there could be no objection to the statement, or to any argument legitimately drawn therefrom. But such is not its intended application. Speaking

Home Market

on the assumption that a nation may be regarded as a single individual, it is urged that its markets should be reserved for its own supply; and that, rather than permit foreigners to let us have what it would take us three days to make, in return for something else we can make in two days, we had better work the three days ourselves. It is precisely analogous to the resolve of a tired man, offered a ride, to keep his traveling for his own legs.

"*Protection Increases Population.*"—In proportion as a population becomes dense, in precisely that proportion is the extent of the demand for manufactures such as to make economical the production in the community of the products which that community can use. To the extent that there is capital and brains there, to that extent the development of all manufactures which can legitimately flourish there will follow upon the population that justifies them.

It is only in the same way that manufactures increase the value of land, if we except the infinitely small proportion of the land they occupy. That their establishment is coincident and somewhat in proportion to the rise of land, is simply a result of the fact that it is the consequence of the same development that increases the price of land—the increase in number of those who want to use it.

And the establishment of a village of manufacturing operatives may help raise the price of the land about it. The most ardent protectionist, however, will stop short of the suggestion that the citizens of any village can enrich themselves and increase the value of the land in their village by taxing themselves to pay the profits of an unprofitable industry. If that were the case, the shortest road to wealth for every farmer would be to increase the value of his farm by hiring hands till he had enough to eat all he could raise.

Here, let us say, is a farmer located on a bit of land a hundred miles away from the nearest city. That city is his market. The cost of transportation is so much taken from his profits.

Here steps in the protectionist. There is in this region, say, a stream capable of abundant water-power. "Let us put up a woolen-mill here," the protectionist urges. "Let us agree to pay something more than we pay now for woolen stuffs, and so make it an object for some one to come here and start a manufactory. Hundreds of hands will be employed; the railway will be put through. We will build up a town right in the midst of our farms, and have a market at our very doors. Good prices then for everything." It is done. The mill is built; the railway is laid; the town grows up. And the farmer—what of him? Strange to say, we presently find him getting poorer!

Where is the mistake? It is just here—in the agreement to "pay something more than we pay now" for manufactured goods. If the farmers of *this* locality want a woolen-mill, those in *that* locality want a cotton-mill, and those in the next county an iron-furnace, and so on. The result is that the farmers everywhere pay "something more" for everything they buy.

This, however, is not the worst. Nowadays there is no such thing as a "home market" for any considerable portion of their produce. The farmer in the Genesee Valley not merely sees the trains run past him to Rochester, laden with flour, rolled in Minneapolis, from Dakota wheat, but uses the same flour in his own household, and his village butcher sells fresh meat from beeves killed at Kansas City. No manufacturing town dreams nowadays of looking to the locality about it for any supplies, except only the cheapest part of its "garden truck." The American manufacturer has free trade in the one thing he buys the most of—labor. He lives in a land where transport facilities are so developed that he need not depend upon the locality about him—and he does not; in a country whose surplus of food products is so great that their first price-fixing markets are found at Liverpool, a free-trade city—and so he gets them, too, at free-trade rates. The American farmer has sold his birthright and has lost his pottage to boot.

There is another aspect of the relations between American mill owners and American farmers. All international commerce is practically barter—that is, exchange of goods for goods. The necessity of paying in money for any considerable part of the imports of a commercial country for a single year would require such an amount of our money as is absolutely unattainable, and the attempt to get it would so derange the financial status as to cripple all business, international commerce first of all. This does not mean that our exports must be directly to countries from which we import. With the development of financial communication throughout the world the effect upon us is the same as tho the exchange were direct, provided we export somewhither an amount of goods approximately sufficient to pay for those we import from anywhere.

Now, generally speaking, the two great items of trade are food products and manufactured goods. As compared with Europe, to which most of our exports go, we export food products and import manufactured goods. The extent to which we can export is closely dependent upon the extent to which we can import. We can sell anywhere only in proportion to what we buy somewhere. Our supply of goods is, therefore, furnished in part by our home manufacturers, and in part (indirectly) by our farmers in the shape of goods which are imported to pay for their produce. The competition fostered by our tariff is, therefore, between the home manufacturer and the American farmer.

In this competition, therefore, to supply the American market with manufactured goods, a high tariff not merely enables the manufacturer to avoid competition from the goods which, as pay for his produce, the American farmer would bring into this country, and to secure the home market for himself at a higher rate; but it compels the American farmer, thus obstructed in export trade, to sell farm produce here cheaper than he would otherwise have had to do.

Of late years increasing facilities of communication and the accelerated progress of invention have promised mankind such a reduction in prices as should result from the fact that the whole world has become, as it were, a single locality, and that the tact, ingenuity, and enterprise of the captains of industry in every part of it would naturally be enlisted in rivalry to secure the advantages of wider markets and greater sales.

Trusts

But the world has been disappointed. The railroad, the telephone, and the telegraph, by making the world but a single locality, have not merely inaugurated world-wide competition, but they have awakened producers to the greater intensity of rivalry thus made possible, and facilitated the formation of trusts, or industrial

combines. Not all of them are consequences of the tariff any more than all crime is a result of drink. It is as plain, however, that our tariff promotes trusts as that drunkenness breeds crime.

For, in any industry whose product our government "protects" by a tariff upon similar articles made abroad, it is in the power of home manufacturers to extort from our people the full tariff rate as a bonus for their own pockets; whereas if it were not for the tariff, no combine would "work" unless it included the whole world. As to a protected industry, therefore, the tariff makes it as much easier to form trusts than it otherwise would be, as it is easier successfully to combine the few manufacturers of a single nation than it is to get and keep together in harmony many times as many manufacturers, scattered all over the world.

Monopoly once secured, the results are:

First.—These combines, covering, as they do, many great branches of protected manufacture, and affecting many others, raise the price of manufactured goods, so that the consumer gets less for the same amount of money. It is generally the case also that a large proportion of the concerns which have combined together are those which cannot manufacture the manufactured goods as economically as the others. The ordinary course has been to pay such for remaining idle, leaving all of the product to be made at the manufactories which can produce it most cheaply, while the combine keeps up the price not merely to afford exorbitant profit to the plants still kept at work, but to pay to idle manufactories the bonus agreed upon for their remaining non-productive.

Second.—The object of a trust combine is to make large profits on a limited product. If successful, therefore, a trust makes up by the high rate of its profits what it loses by the smallness of its sales; and it is, therefore, just as well off as tho, by selling goods more cheaply, it made larger sales. But it is the amount of goods to be manufactured, and not the profit that the employer is to make out of each item, that determines the demand for labor and the wages he must pay. Trusts, therefore, enable manufacturers to make more money by employing less labor.

Shipping

It is evident that there are two industries involved in the general term "shipping"—one, that of shipbuilding, the other, that of the carrying trade; also that of these two the carrying trade is the principal one and the other simply incidental—that is, that we build ships in order to carry goods and passengers, instead of carry goods and passengers in order to employ ships. In our shipping industries the principles of "protection" have been most thoroughly applied, and have produced their legitimate results. But for a consideration of this, see Ship Subsidies.

Just Protection Impossible

There are practically no articles to which protection can be applied which are not directly a factor in a myriad of other industries and indirectly so in all the countless branches of industry. Even to secure the data upon which an estimate can be made of what is or is not fair protection, and whether its burdens and benefits are equally distributed, presupposes an accurate knowledge on the part of the framers of a tariff bill of every conceivable branch of every imaginable industry in all of its infinitely varied relations. It is, therefore, not merely impossible for a just tariff to be framed, but impossible—except by the disastrous result of experiment—even to guess at the wide-spread effects of any provision. And even this guesswork is vitiated by the impossibility of estimating alternate developments which such provision has made impossible.

Again, recalling the complexity and the importance of the task thus assigned legislators, who are the men who undertake it—and by what are their deliberations guided? They are Congressmen—a body of gentlemen of whom it is not belittling them to say that on an average they know somewhat more about politics and somewhat less about business than do their fellow citizens who are engaged in non-political business. Neither in capacity nor in opportunity would their most complimentary friends for a moment claim them to be endowed with a tithe of the omniscience necessary. They must depend upon somebody. And they do—upon those who are sufficiently interested to go to Washington or to employ others to go there to argue with congressional committees as to the fairness of what each asks for himself. Bearing in mind that in each case the legislators are and must be largely ignorant of the main considerations—much more so of their practical application—by which any proposed tariff item should be judged; and that the men whose interest is to have the law give them as much as is possible are generally of the few, and often the only ones competent to judge as to the fairness of their own statements; remembering that each is careless of the effect upon others of the particular provision which will benefit him, and that each is jealous of the effect upon him of any provision that will help others; remembering that the most practical, and, indeed, the most common way of settling these differences is not by fighting it out before the congressional committee but by a friendly arrangement by which each abandons opposition to the other in consideration of the other agreeing to stand aside from additional benefit to himself; remembering that a tariff bill is the one measure of legislation that it is impracticable to debate even in Committee of the Whole, and one recognizes at once how apt is the simile in which a well-known author described the effect of pending tariff legislation in Congress upon the swarm of protected—or would-be protected—or prefer not to be obstructed—industries as comparable only to that effect of throwing a banana into a cage of monkeys.

The simile, however, is not a complete one. The real process of tariff construction is that of first throwing the banana to a half dozen who have been gathered, and then attempting to allay the consequent scrimmage by flinging in further bananas until not merely the monkeys originally on hand, but all those from the woods about, who have been attracted by the chatter, shall have had their share in the mêlée and gorged themselves with bananas—all of which have been taken from the hard-working natives to whom they belong.

III. Free Trade

We are told that if we permit free trade, we shall be "deluged with foreign goods." On reflection, few of us can be thus frightened. The more goods we have the better we are off; the

cheaper we can get them the better we like it; the more we are inundated with them the better we are suited. The protectionist says, however, that it is not fair to make him ridiculous. So let him state soberly what is the reason of his fright at this deluge of prosperity. He will probably tell you that the result of it will be to deprive our own people of the labor of producing it.

Now, there may be people of such peculiar taste as to like work in and for itself. Individual protectionists are not generally such, however, and the majority of us rack our wits as to how we can get the most goods for the least work. "But," the protectionist says, "you are still laughing at me. Nobody supposes foreigners will let us have these goods for nothing. No? What will they do then?" "We shall have to pay for them." Exactly, and with what? What have we been paying for them? What are the terms of all international trade? We pay for them by exports of the produce of this country. So this deluge of foreign goods is simply an exchange for goods that have been manufactured here. Such being the case, why is not our labor just as well employed in making here the goods that are sent abroad, as it would be in making the foreign goods imported? "Oh, but," the protectionist says, "there is not as much labor employed." But does not that prove that the importation of foreign goods is a good thing? If two days' work here can make what we send abroad and get back what would take three days' work to do, have we not gained the product of a day's work by the exchange? And if there was any loss; if, for example, we had to work three days to make the goods for which foreigners would give us others which would take us but two days to make, would we need government aid to stop us in our mad career? The protectionist again says we do not understand him, and that what we want to do is to keep our workmen employed. Not unless we pay them. And if they are not to be paupers, they ought to be employed in some business that pays. That business is one of those in which two days' work will buy from somebody else what would have cost three days' labor to make here, and not a business that spends three days' work upon something that it could get in trade by working two days. The workmen should, therefore, go into some of the great industries that do not need "protection." And, in fact, such are the industries in which are engaged nine tenths of the working men in this country, and in which the highest wages are paid.

Does any one claim that trade between men of different nations is a bad thing in itself? The experience of the world to date is directly to the contrary.

Benefits of Trade

It is as natural for men to trade as for blood to circulate. In direct proportion as man rises from a savage state, he trades with his neighbors. In direct proportion to the extent civilization develops, the neighbors he trades with are more numerous and more widely scattered. It was about the centers of trade between different races and nations and in the persons of those who carried it on, and through intercourse of which trade was the object and the opportunity, that the great advances of civilization have been made. Down at the bottom of every prospect of increasing earnings of labor and comfort for the race are—division of labor so that to each shall be allotted what he can do best—the development of processes of production, so that the product of a day's work shall be greater and greater—and the perfecting of facilities of transportation, so that the product of any day's work may be everywhere most easily supplied; and all this to the end that, all workers making the most goods possible, each may receive as his share an ever greater amount in proportion to his exertion. To the extent to which trade is facilitated, this result is advanced. But on the protective theory every reduction in the cost of freight, every increase in the facilities of communication, every addition to the ease with which we can trade with foreigners raises a new evil to be met by increase of tariffs.

In olden times each tribe was separated from its neighbor by a belt of waste land never crossed except at risk of death. Exchange of goods was effected by the battle or the foray in which the warrior spoiled his slain foe, or ravaged the home of the absent one. To-day nations eagerly join in opening new facilities for mutual intercourse, and each uses the arts and the products of all; while "On earth peace, good-will toward men" —the common fatherhood of God and the common brotherhood of man—are preached from every pulpit.

"Protection" or free trade? Which faces backward?

On the whole our people are intelligent and conscientious, and habitually do neither what they know to be foolish nor what they feel to be wrong. And yet most of us have not the least hesitation in bringing from foreign countries everything that we imagine we can get abroad cheaper than here. Rather than make false oaths some American citizens pay many duties they otherwise might avoid. But the fact remains that returning ships are loaded with the baggage, purchased abroad, of protectionist statesmen; and that the woman has not yet gone abroad who has hesitated for a moment to avoid the tariff upon everything she could smuggle; conspicuous cases of unsuccessful smuggling are those of millionaire protectionist manufacturers; and one of the most flagrant cases ever known was that where a communion service of massive silver plate was smuggled by a reputable banker as a present to the church of which he was an ornament. Either we are degenerates or else we know better than to respect a tariff.

Whether a country is rich or poor it will be benefited by free trade with its neighbors. For in either case the result is to give its citizens so many more chances to trade. If they cannot profit by them they will not trade; if they can, then they and through them their country will be richer for their having them. No country is either so rich or so poor that it is not to its advantage to have its citizens better off than they are.

By permitting us to obtain each what things we need from the locality that has the greatest facilities for their production, trade increases enormously the sum of things which a given quantity of labor can secure. Men of all nations trade with each other, for the same reason that men of the same nation and the same village do, because they find it profitable; because they get what they want with less labor than they otherwise could. To this motive we owe civilization and the progress the world has so far made. It involves considerations far too complex for the omniscience of a Congress or the omnipotence of a Parliament. It can safely be left only to those

instincts which are to society what the vital instincts are to the body; which have brought us thus far from savagery; and which have established free trade as "the international law of God." JOHN DE WITT WARNER.

THE TARIFF AND TRUSTS. STATISTICAL ILLUSTRATIONS

The largest and most typical of tariff trusts is the U. S. Steel Corporation. Its outstanding capital was $1,439,055,864 in 1905.

Its controlled and "community-of-interest" companies bring its capitalization up to about $1,700,000,000.

It owns or controls about 80 per cent of the Lake Superior iron ore mines, the Connellsville coking coal mines, operates 1,200 miles of railroads, and mines over 20,000,000 tons of iron ore a year, mainly transported on its more than one hundred vessels. It produces two thirds of our steel products, or more than does any other country than the U. S.

In 1905 its gross sales and earnings were, as reported, $585,331,736; its net earnings $119,787,658. It paid $128,052,955 in wages and salaries to its 180,158 employees—an average of $710.75 each.

Its owners thus got about as much in net profits as its 180,000 employees got in wages. In 1902 net profits exceeded wages and salaries by $20,000,000. In 1906 the net profits are $156,619,111. The total of wages was probably about $136,000,000. Since this trust was born, in 1901, its total net earnings has about equaled its total wages and salaries paid.

This trust exports goods to all parts of the world and sells them abroad at "very much lower rates than those here," as testified its first president, Mr. Charles M. Schwab. This difference has probably averaged about $10 per ton.

United States Steel Corporation Profits

In 1905 the U. S. Steel Corporation sold 9,226,386 tons of "rolled and other finished products." The average selling price was probably less than $40 a ton, making the total receipts from this source about $370,000,000. Other receipts, from freight and passenger rates, sales of cement, spelter, copperas, etc., may have amounted to $20,000,000 or $25,000,000. Thus the total of "gross sales and earnings" probably amounted to less than $400,000,000. The "gross sales and earnings" of $585,331,736, in 1905, undoubtedly included sales between the subsidiary companies. This fact was so stated in the 1902 report.

Deducting net earnings—roughly $120,000,000—we get $280,000,000 as the total cost of production, including all administrative, selling, and general expenses, employees' bonus funds, taxes, etc. The rate of profit was, therefore, about 43 per cent. As this rate would look very high, the officials report fictitious gross sales and cost of production, the latter as $440,013,432. But even on this cost, the rate of profit is over 23 per cent.

Deducting $5,000,000 as the estimated profits on everything else, we get $115,000,000 as the net profits on the sale of 9,226,386 tons of steel. The profits then average $12.50 a ton. The profits on goods sold here average about $14, and on the goods exported about $4 a ton. Ten or 12 per cent of all goods sold were for export. *All* goods for export are sold to and through the U. S. Steel Products Export Company, whose stock is owned by the Federal Steel Company of the U. S. Steel Corporation. This selling device, like the fictitious gross sales and costs, helps conceal export prices and tariff profits. *Prices* are quoted delivered in foreign ports. This selling company contracts in advance for tonnage to different foreign countries and can then quote relatively lower prices, delivered in foreign ports, than for export from New York.

But often the selling company has agreements with foreign steel producers as to prices at which each can sell certain products and as to territory in which each producer can or cannot sell. Thus there is an "International Rail Syndicate" of manufacturers of steel rails in the U. S., Great Britain, Germany, France, and Belgium, which practically reserves the two American continents to our manufacturers. So there is to-day little or no competition as to rails. Thus the *Iron Age* of Jan. 21, 1907, says:

"Whatever understanding has been maintained between the largest German and American steel interests in the past year respecting exported material has been facilitated by an unprecedented condition of activity. The falling off in rails (exported from Great Britain), as has been claimed on behalf of British rail-mills, is due to their unfortunate experience under the international rail syndicate's allotment of business."

Since the formation of these international syndicates, and probably largely because of them, there has been less difference between export and home prices than formerly. Thus, at the end of 1906, the average difference was estimated at $5 or $6 a ton. Previous to 1906 the average difference was, perhaps, $10 or $12 a ton. On many products, however, such as wire nails, most wire and wire products, and tin plates, the average difference is still about one half cent a pound, or over $10 a ton.

Previous to the international agreements of 1905 and 1906 the difference between the export and home prices may be said to have measured roughly the tariff profits of the Steel Trust. Since 1905 the tariff profits undoubtedly exceed this difference. The number of tons of steel sold by the trust in 1906 is not as yet known. It may be estimated at 11,000,000. Taking the amounts exported for each year and estimating the tariff profits—after making allowance for goods exported without tariff profit—as indicated in the table, we get the following as the

TARIFF PROFITS OF THE UNITED STATES STEEL CORPORATION

YEAR	Finished products, Tons	Tariff per ton	Profits, amount	Total net profits
1901....	6,000,000[1]	9	$54,000,000	$84,787,596
1902....	8,197,232	10	81,972,320	133,308,764
1903....	7,635,690	8	61,085,520	109,171,152
1904....	6,792,780	7	47,549,460	73,176,522
1905....	9,226,386	9	83,037,474	119,787,658
1906....	10,578,433	8	88,000,000	156,619,111
Totals.	48,852,088	Av. 8.50	$415,644,774	$676,850,803
Deduct tariff profits.....				415,644,774
Net profits less tariff profits.....				$261,206,029

[1] Estimated for nine months in 1901.

Thus during the five years and nine months of its existence the Steel Trust reports net profits of $676,000,000, or an average of $118,000,000 a year. This is an average of over 8 per cent, even on the nominal capital of the trust. As the actual value of all property taken over by the trust probably did not exceed $400,000,000 in 1901, and as less than $200,000,000—perhaps not $100,000,000—has been added for new properties since, it is evident that the actual capital necessarily invested has averaged only about $500,000,000. On this the profits have averaged 23.5 per cent (?). Taking out the estimated tariff profits of $415,000,000, there would still be left an average profit of about 9 per cent (?) on all actual necessary capital. The industry would thus thrive if all protection was removed.

As the Steel Trust makes about two thirds of the steel made in this country, the total tariff tax on this class of steel products is about $177,000,000. Besides, we imported in 1903 $52,456,840 of iron and steel on which $16,865,971 of duty was collected. The tariff tax at wholesale, then, amounted to about $200,000,000. At retail, and after the iron and steel had been worked into machinery, tools, implements, etc., the tariff tax was, perhaps, twice this amount, or $400,000,000.

The trust has lately utilized only about half of its protection. On some products less, on others more. That no duty whatever is needed, except for purposes of plunder, is clear from the immense quantities of these products exported. Thus, in 1906 we exported 390,000,000 pounds of wire, over 27,000,000 pounds of tin-plate, and 328,036 tons of steel rails, valued at $8,903,411. The wages of those making tin plates for export are reduced 25 per cent over what is received on other tin plates.

Mr. Charles M. Schwab said, in a letter to H. C. Frick, in 1899, that steel rails were made here for less than $12 per ton, while the cost to produce them in England was $19. He says that similar differences existed as to other steel products. The tariff duties serve no honest purpose. They are maintained by the brutal force and political power of the Steel Trust.

The "Report of the Bureau of Statistics on Commerce and Finance," for Aug., 1900, particularly mentioned the export and home prices of steel rails, then $24 and $35 respectively, and the extreme prices for wire and nails, which "had advanced from $1.35 to $3.20 in the course of a year."

THE TARIFF TAX ON WOOLENS

The factory value of the woolens manufactured in this country in 1900 was $295,990,484. Adding 8 per cent for increase in population and 12 per cent for increased prices from 1900 to 1905, the value of the manufactured product in 1905 was $356,000,000.

The imports of woolen goods for consumption in 1905 amounted to $18,021,042. The duty collected was $16,547,592, or 91.82 per cent ad valorem. Including transportation costs, these goods were worth $38,000,000 when they reached our shores. Adding these values we have $394,000,000 as the factory and import value of all woolens. The *Statistical Abstract*, however, tells us that the raw wool retained for consumption in 1905 was 6.52 pounds per capita, against 5.72 pounds in 1900. As the imports of manufactures were but slightly larger in 1905 than in 1900, we should add at least 10 per cent to this factory value, making it

$433,000,000. Adding 15 per cent for profits we get $498,000,000 as the value of the woolen goods ready to be made into clothing, etc. The retail value of the clothing, etc., was probably 50 per cent greater, or $747,000,000. This gives an average of $41.50 per family.

Our imports of raw wool in 1905 amounted to $35,444,449, on which a duty of $16,529,787 was paid. Hence the total duty collected on wool and woolens was $33,077,379.

As only about one ninth of our woolen goods are imported and as the tariff on these goods amounts to $16,547,592, or perhaps $27,000,000 at retail, the increased cost to our consumers of all woolens should be about nine times this amount, or $243,000,000. If it is only $200,000,000 it averages $11.10 per family, of which only $1.84 goes to the government, leaving $9.26 mainly for the American Woolen Company, and somewhat to the few owners of about 40,000,000 sheep. The number of sheep has changed but slightly during the last quarter of a century. The per capita consumption of wool averaged 5.6 pounds from 1898 to 1905, inclusive, as against 6.8 pounds from 1890 to 1897, inclusive. The decreased consumption of wool, under almost prohibitive duties of nearly 100 per cent, has resulted in greatly increased consumption of cotton and shoddy goods.

The Sugar Tariff—Trust Tax

Our people consume about 72 pounds of sugar per capita. The average price paid is about 5½ cents per pound, or over $18 per family, and our total sugar bill is about $325,000,000.

In 1905 we imported 3,680,932,998 pounds of raw sugar, valued at $97,645,449, on which $51,171,284 of duty was collected. About 2,200,000,000 pounds was produced in this country, making a total used of 5,896,163,840 pounds, or 2,632,216 tons.

The duty on refined sugar is 1.95 cents per pound, plus a countervailing duty equal to any export duty that may be paid by foreign countries. Our refiners are specially protected by an extra or "differential" duty on refined sugar—nominally 12½ cents per 100 pounds, but really much more—and also by a part of the countervailing duties. These latter have now about ceased.

The extra protection on refined sugar is probably about ⅛ of a cent per pound. Of course the whole duty of 1.92 cents per pound protects the producers of the 576,124 tons of beet and cane sugar not imported.

Here, then, is a tariff tax of $51,000,000 collected by the government, and of $38,000,000 more collected by the trust and other protected interests, on sugar sold at wholesale. At retail the tax is probably over $125,000,000—2.15 cents per pound, or nearly 40 per cent of the total price paid by the people. The sugar bill per family is therefore about $18 a year, above $7 of which goes to the Sugar Trust and other protected interests.

That there is no economic or moral justification for any protection factor here is clear from the fact that sugar is refined more cheaply here than anywhere else, and that the total labor cost of refining, according to the 1900 census, was less than 3 per cent of the value of the product, or only 15 cents per 100 pounds. That is, *the net extra protection on refined sugar is more than the total labor cost of refining sugar.*

Amount of Tariff Tax

Somewhat careful estimates of the tariff tax were made for the year 1903. It is probable that the tax per family is now about the same as it was then.

By comparing various estimates of earnings and expenditures the conclusion was reached that in 1903 the net value of all goods produced was about $18,000,000,000, and that the amount consumed by our 17,000,000 families was $16,000,000,000, or about $9.41 per family. The percentage of expenditures for the principal items entering into the cost of living for the average family was based upon the July (1904) Report of the Bureau of Labor.

Space will not permit a detailed explanation of how the estimate of the tariff tax on each item was reached. The $16.52 of legitimate tariff taxes collected by the government were, of course, known. The main items on which they were collected were also known. Frequently, however, as in the cases of steel rails, wire, borax, and hundreds of other products, almost no duty was collected by the government while almost the full amount of the tariff tax was collected by the protected trusts from consumers.

In a general way it may be said that to the factory and import values of each important product were added a fair allowance for transportation and for profits of middlemen and that this amount, divided by 17,000,000, gave the per family consumption for each product. On this the tariff tax was figured as closely as possible, considering the known facts in each instance.

The conclusion is reached that the average family pays $111 of tariff tax, of which $16.52 goes to the government and $94.48 to the trusts and middlemen. That this estimate of about 10 per cent of all expenditures as the proportion collected by the trusts is reasonable is apparent from other deductions. Thus, at the present time (March, 1907) average prices in the U. S. are about 50 per cent higher than they were ten years ago. In England—generally speaking a free-trade country—average prices are only about 30 per cent higher than ten years ago. Here is a difference of 20 per cent. If only two thirds of this difference be credited to the tariff and tariff trusts, we have fully 10 per cent of the cost of living chargeable to the tariff; even if the tariff was ineffective in 1906, as we know was not the case.

Export Prices

No stronger indictment can be brought against our tariff system than that furnished by the difference between export and home prices. Probably fully 80 per cent of the $570,000,000 worth of manufactured goods exported in the fiscal year 1906 were sold at prices below those prevailing at home for similar goods. The average difference was perhaps 15 per cent.

This system of favoritism to foreigners not only shows the needlessness of any tariff whatever on goods sold in this way; it shows that "protection" that taxes the protected and gives to the unprotected is a suicidal policy. It increases the cost of living and of producing in this country and decreases the cost in foreign countries.

In the following table are compared the export and home prices in the summer and fall of 1906 on a few articles:

Export and Home Prices of Certain Articles

Articles and Description	Export price	Home price	Difference, per cent
Cultivators, wheel, No. 61, each	$4.00	$5.00	25
Wheelbarrows, garden, wood wheel, each	2.50	3.00	20
Thrashers, grain, horse or steam power, 32-in. each	300.00	400.00	33⅓
Rubber belting, 6-in., per foot	.39	.30	33⅓
Horse-powers, 10 horse, each	143.00	190.00	33⅓
Engines, traction, 8 horse-power, each	917.00	1,225.00	33⅓
Engines, farm, 8 horse-power, each	563.00	750.00	33⅓
Clothes-wringers, 10 x 1¾, per dozen	18.70	22.50	20
Incubators, No. 1, each	15.00	20.00	33⅓
Brooders, 200 chicks, each	9.20	11.50	25
Potato-diggers, each	90.00	100.00	11
Shovels, D-handle, square point, No. 2, per dozen	8.25	11.00	33⅓
Watches, 21-jewel Crescent st., nickel case, each	15.43	19.88	28
Watches, 23-jewel Riverside Maximus, each	31.77	43.15	35
Watches, 21-jewel Father Time, each	14.42	19.89	38
Knives, kitchen, per gross	12.00	16.00	33⅓
Auger bits, snells, ½-inch, per dozen	1.62	2.40	48
Auger bits, Jennings, ½-inch, per dozen	1.21	2.00	60
Bits, expansive, Clark Brown, per dozen	4.86	8.10	66
Shears, barber's, 8-inch, japanned, per dozen	3.80	4.80	26
Shears, tailor's, 13-inch, per pair	3.60	4.32	20
Soap, toilet, violet, per gross	32.00	40.80	25
Soap, toilet, sweet lavender, per gross	14.04	19.12	35
Soap, toilet shaving stock, large, per gross	13.00	16.74	20
Soap, toilet glycerin, per gross	8.34	12.75	52
Florida water, per case	2.75	5.00	82
Vaseline No. 2	.58	.70	20
Plows, disk No. 1, each	32.50	40.00	25
Kerosene in barrels, gallon	7.50	.12	60
Wire nails, 100 lbs	1.55	1.90	23
Barb-wire, 100 lbs	2.22	2.45	10

Byron W. Holt.

FREE TRADE CLUB, THE UNIONIST: An English club, the object of which is to unite and combine in common work free-traders in all parts of the country who may, whether as conservatives or liberal unionists, belong to the Unionist Party. It exists to organize those who are willing to assist in the dissemination, by speeches and lectures, of unionist and free trade principles. The policy of the club is actively to support free trade, and equally energetically to oppose protection in all its forms and under whatever names it may be

put before the electors. In furtherance of its object, the club proposes: (1) To organize those who are willing to assist in the dissemination by speeches and lectures, and by the publication of leaflets and other literature, of unionist and free trade principles; (2) to afford opportunities to its members of meeting to discuss the political situation; (3) to entertain from time to time eminent free trade statesmen at dinner, and hear from them addresses on current events; (4) to establish a connection with local bodies in various parts of the country, with a view to furthering the object of the club. With the approval of the executive committee, other unionist free trade bodies may be affiliated to the Unionist Free Trade Club under the following conditions: "The objects of the affiliated body must be the same as the objects of this club, namely, to unite in common action free-traders who are unionists; and its rules and any amendment to its rules must be submitted to the executive committee for approval. Beyond retaining the power to cancel the affiliation at any time, the club will not exercise any control over these affiliated bodies, and will not be in any way responsible for any action which they may take." The president of the club is the Duke of Devonshire; the secretary, E. G. Branker; office, 38 Victoria Street, S. W., London, England.

FREILIGRATH, FERDINAND: German poet and Socialist, born at Detmold, 1810; was educated at the gymnasium of his native town. Destined for a mercantile career he was apprenticed to an uncle in Soest, and in 1831 went to Amsterdam to fill a position. Returning in 1836 he held a position in Barmen until 1839 when the success of his first poems, "Tropenlieder," encouraged him to give up mercantile pursuits and devote himself to poetry. During the following years he wrote prolifically, and for several years kept far from politics. In 1844, however, he became an enthusiastic fighter for a "free Germany," saying: "Firmly and irrevocably do I place myself on the side of those who with brain and brawn endeavor to stem the tide of reaction. No life for me hereafter without liberty!" In the same year he met Marx at Brussels and became greatly interested in the latter's doctrines. His poems at this time "breathed of the liberty to come while they sighed over the misery that was." While previously obscure, he became of a sudden one of the most popular poets of the day.

In 1846 Freiligrath went to London as commercial correspondent, and remained there until 1848 when the news of the "March Day" drew him home. He was hailed with enthusiasm, and became leader of a democratic party. In a poem entitled "Die Toten an die Lebenden" (The Dead to the Living), he voiced his thoughts of liberty, and was accused of having tried to incite the citizens to riot. He was arrested on Aug. 18th and held until Oct. 3d, when his case was tried before a jury, being the first case to be thus tried in a German court. He was unanimously acquitted, and was triumphantly received by the thousands who had gathered about the courthouse. Shortly after Freiligrath went to Cologne, where he became editor of the *Neue Rheinische Zeitung* founded by Marx. In May, 1849, the paper was suppressed on the charge of having published anarchistic matter, and an order was issued for the arrest of the editors. Freiligrath escaped to Holland, and later ventured back to Cologne disguised as a coal-heaver. In 1851 he returned to England, just in time to escape apprehension on a charge of lese-majesty growing out of some of his poems. Since then he took no active part in political life. In 1867 Freiligrath, who held a responsible position with a bank, suddenly found himself penniless by the collapse of that institution, and when his friends heard of this they took up a collection which netted 60,000 thalers, contributions coming even from the United States. In 1868 he went to Stuttgart, and in 1874 to Cannstadt, where he died two years later.

FREMANTLE, THE HON. AND REV. WILLIAM HENRY: Dean of Ripon, England; born 1831; the second son of the first Baron Cottosloe. Educated at Eton and Balliol College, Oxford, he held a fellowship of All Souls, 1855–63; ordained in 1858, he became curate at Middle Claydon, vicar of Lewknor, rector of St. Mary's, Bryanston Square, London, 1865, and canon residentiary of Canterbury Cathedral in 1882. In 1895 he was appointed Dean of Ripon. He has been a frequent writer, and in 1882 gave the Bampton Lectures at Oxford on "The World as the Subject of Redemption," in which he advocated the broadest application of Christianity to social and political life. Other social works are: "The Gospel of the Secular Life" (1882); "Christian Ordinances and Social Progress" (1900). *Address*: The Deanery, Ripon, England.

FRENCH REVOLUTION, THE, played an important tho a frequently misunderstood part in social reform.

France was groaning under despotism, royal extravagance, and financial ruin. In 1774 Louis XV. ended his profligate reign, brilliant only because of its literary men. Louis XVI., married in 1770 to Marie Antoinette of Austria, was pure, stubborn, and weak. Turgot (*q. v.*), entrusted with the finances, tried to levy taxes equally. The nobility resisted, and in 1776 he was deposed. Necker followed, vainly trying to stave off national bankruptcy. France, aiding America against England, for five years fought England, and grew still poorer. The nobility and the higher clergy dodged the taxation; gaiety ruled in the court; the people hated the foreign queen. Finally, in 1789, after various efforts with Parliament, the king was compelled to summon the states-general (see ESTATES) to vote taxes. Meanwhile the writings of Rousseau and others were filling the people with ideals of equality. The First Estate, the clergy, returned to the assembly 291 members, 48 bishops, and 208 parish priests, the poorer priests largely on the side of the people. The Second Estate, the nobility, returned 208 members. The Third Estate had 557 members, nearly half of them barristers. They met at Versailles. The king was stubborn, but they would not vote as he willed. June 17, 1789, they formed themselves into a national assembly, and June 20th, on the neighboring tennis-court, took an oath not to separate till "the constitution of the kingdom had been established and confirmed on solid foundations." The king attempted to compromise, but finally threw himself into the hands of his courtiers, and called out the army. Paris rose, and blood was shed July 12th. July 14th the Bastille was taken. Uprisings occurred in the provinces. Aug. 4th the old feudal rights were abrogated, and the famous Declaration of the Rights of War declared. June 19, 1790, nobility was abolished. The nobles fled. The royal family finally attempted to do so, but were captured (June, 1791). The assembly was in control, and completed a constitution. Robespierre and other Republican leaders were, however, agitating in Paris for the deposition of the king. Violence broke out, and Lafayette put down the Republicans with bloodshed. Sept. 14th the assembly completed its constitution and the king swore to obey it, and chose a Girondist cabinet. A legislative assembly elected under the constitution met Oct. 1, 1791. Meanwhile the nobility in foreign lands were gaining friends, and the king was declared to be conspiring with them. War was declared with Austria. The Girondist ministry was ejected, and they sided with the Jacobins against Lafayette as leader of the conservatives. June, 1792, the populace of Paris rose against the assembly, and marched to Versailles and forced the king to don the red cap. Mean-

The Causes

Republicanism

while, Prussia declared war on France. The Jacobins organized a new insurrection Aug. 10th, sang the Marseillaise, and set up in Paris an insurrectionary commune. The people, under Robespierre and Danton, were victorious. Guillotining increased. The march of the Germans increased the terror, and Sept. 21, 1792, the republic was declared. In the new national convention the Girondists on the Right were in the majority; the Jacobins were high on the Left, and called the "Mountain"; below sat the moderates. In November the king was accused, Jan. 17, 1793, condemned, and Jan. 21st guillotined. Roland and the Girondists had tried to prevent it. It roused the hostility of all Europe. Demouriez, however, in command of the French armies, was successful, and entered Belgium. England now declared war (Feb. 1, 1793), but the war spirit in France grew. Demouriez, however, was accused in Paris, and after a defeat he conspired with the Austrians and marched against France to overthrow the Jacobins. They created the terrible Committee of Public Safety. Disturbances broke out in the provinces, and La Vendée arose in a bloody insurrection. The Girondists in the south threatened Paris. The allies were slowly uniting.

The Reign of Terror

It was a crisis. Some think that Danton, who, altho rough, was a sincere patriot, felt that a little bloodshed now would save bloodshed in the end. He led in a sanguinary policy. Marat, at the head of the Sans Culottes, overthrew the Girondists June 2d, but was himself assassinated by Charlotte Corday. Danton made the convention proclaim martial law and a new constitution. A new calendar was proclaimed and statues erected and fêtes celebrated to Nature and Reason. The republic was successful on the field, insurrection put down, and the invaders repulsed. The queen, the leading Girondists and aristocrats, the ci-divants were guillotined. Hébert now led the terrorists and Danton the moderates. Robespierre, who seems to have been an ambitious fop, sided with neither. Robespierre became dictator. The French armies were victorious, Napoleon being in charge of the artillery in Italy. Robespierre undertook to bring in "the fête of the Supreme Being." He trusted in his ideas, but was laughed at; he allowed the reign of terror to go on, and created personal hostilities. His arrest was voted, and he was guillotined. Paris was weary of revolution; the armies on the frontier were victorious, but, tho Republicans, they by no means sympathized with affairs at home. Jan., 1795, the convention closed the Jacobin clubs, which had worked such evil. Famine broke out in Paris and insurrections broke out. They were easily put down and the power left with the bourgeois. A Girondist constitution was now declared. The death penalty was abolished, five dictators were to have power. The royalists made one last effort. Barras now called Napoleon to Paris, and his artillery cleared the streets and left Paris in the hands of the Directory.

The End

Babœuf plotted his communistic conspiracy, but was put down. Napoleon was put at the head of the army in Italy, and commenced his brilliant succession of victories. The Directory, however, at Paris was threatened, and was only sustained by recalling part of the army. In 1797 Napoleon entered Paris in triumph. He was, however, sent to Egypt, but, victorious there, returned once more to Paris to find political weakness and division. A new constitution was proclaimed, with consuls: one supreme, Napoleon. He established himself in the Tuileries, conducted brilliant war and a despotic policy, and May 18, 1804, had himself proclaimed emperor. So ended the Revolution. (See France.)

It was in the beginning a parliamentary contest with the king over taxes. Revolutionists with ideas of the rights of man took the opportunity to rouse the suffering *canaille* of Paris to insurrection. Successful in the field against foreigners, they could not agree at home, and having unchained the spirit of terror, could not chain it till a strong hand came, and the people, weary of bloodshed, submitted to an empire. It established nothing; it simply ended the old régime. When the people grew strong again they overthrew the empire. It was thus led by bourgeois men, yet participated in by all classes. Its cries of "Liberty, equality, fraternity," were individualistic, not in the modern sense socialistic. Economically and politically it did with terror and confusion what was done legally in England and Germany by overthrowing despotism. It succeeded negatively; positively it failed because it lacked unity.

FRESH-AIR WORK: The taking of poor children from the tenements of congested cities either to the country, mountains, or seashore for recreation, convalescence, or general improvement of physical and mental conditions. This movement had its origin in the United States with the Rev. William A. Mühlenberg, rector of the Church of the Holy Communion, New York, N. Y. He sent poor and sick people from his parish to the country for short vacations as early as 1849. A number of churches followed this example, and in 1872 *The New York Times* started a system of free daily excursions. This example was also imitated in other parts of the country. In 1874 the first societies were organized for carrying on this work. New York City alone has now over fifteen general, or non-sectarian, societies, and over twenty denominational or special organizations engaged in this work. A number of newspapers, e. g., *The Evening Post*, the *Tribune*, the *Journal*, took up the cause of New York's poor and sickly tenement children. The work of the New York *Tribune* may be mentioned. Its fresh-air work began in 1876. In twenty-five years (1876–1901) about 193,348 children were sent to the country for two weeks, at a total cost of $485,538; and 333,321 mothers with babes were taken out for one day's excursion, either by railroad or steamboat. The banner year during this time was 1892, when 15,236 children were sent to the farms for two weeks. The children are usually boarded free by the farmers, one or two in a family; and the railroads give free or greatly reduced transportation.

United States

Individual churches in New York City send each from 100 to 600 children and mothers out, and some societies as many as 1,200. Nearly every large city in the U. S. has now various agencies to carry on fresh-air work. An estimate for forty cities places the day's outings to children and mothers at or about 1,200,000, provided by general agencies. This number is nearly equaled in some cities by the different churches.

In some cases camps are arranged for young men, and special cottages for young women. The benefits are usually free; but part of the cost is paid in some cases by the beneficiaries.

In England the custom prevails to have them pay from 20 to 35 per cent of the cost. This leads, however, to competition among the various societies for customers—an evil which not only prevents cooperation, but reduces the system to a commercial basis, and thus largely diminishes the beneficial influence of the managers. For be it remembered that fresh-air work is intended to benefit not only the body, but the morals and minds of the children, by inculcating habits of cleanliness, of nature study, and of higher enjoyments.

Switzerland was the first country in Europe which took up fresh-air work. Pastor Bion, of Zurich, sent sixty-eight poor children to the mountains in 1876. The benevolent society of Hamburg arranged vacations for children in the country the same year, and Frankfort-on-the-Main began in 1878. The system has spread all over Germany, Austria—Vienna began in 1874—Hungary, France, Switzerland, Denmark, England, Italy, Belgium, Spain, Holland, and—Japan.

Europe

The work in Germany is well organized; there is a central committee in Berlin, which receives regular reports from the different societies. Co-

operation is thus assured between the various organizations. Owing to this fact pressure has been brought to bear on the municipalities, and several cities are now making provision for this work in their budgets. The German committees held conferences in 1881, 1885, 1887; and in 1888 the international congress met in Zurich.

Germany's Complete System

The work done by these committees may be estimated from the following figures: From 1876–99 they sent 382,805 children to "vacation colonies" at an expense of about 18,000,000 marks. This number does not include the many day excursions given to many children. In 1896 the societies of 125 cities provided two weeks' outings for 30,000 children. In 1899 there were 200 societies in various cities of Germany, 171 of whom were connected with the central committee. Their total expenditure in 1898 amounted to 1,086,236 mk. for 30,414 children; the number of the latter increased in 1899 to 32,124.

Two departures from the ordinary fresh-air work need special mention: (1) Many of the poor children are followed up during the winter by being provided with healthy food and frequent afternoon outings, in order to maintain the advantage gained during the summer. (2) So-called *Ferien Reisen*, or trips for healthy and well-to-do scholars conducted by their teachers, are arranged for the purpose of making them acquainted with the neighborhood of their homes, kindling patriotism, and furnishing exercise. The trips are always made on foot to battle-fields, castles, famous sights, etc. They extend from three to fourteen days. In order to avoid stopping at hotels and inns, so-called *Schulherbergen*, school-inns, have been established, in which the boys stop. In 1904 Germany had sixty-six of these with 252 beds; Austria ninety-eight with 439 beds. Scholars' trips have rapidly grown in favor; in 1884 twenty-one students availed themselves of the school-inns; 1894—3,787; 1899—9,107; 1901—12,545; 1903—14,500.

Scholars' Trips

Of this number 31 per cent were German Austrians, and 69 per cent Germans. According to schools there were 21 per cent university students, and 79 per cent scholars of middle schools; 366 schools in Germany and Austria arranged trips for their scholars. The school-inns furnish excellent accommodations free to the scholars of those schools that belong to the *Verein*, usually for a day. The trips are limited to scholars of over sixteen years of age. In 1898 Leipzig inaugurated a movement to enable poor scholars to take part in these trips.

France has not developed fresh-air work to the extent of other countries; altho this charity is becoming more popular every year. All of the large cities have arranged vacation schools. Paris heads the list with 4,254 children in 1897.

Switzerland has many vacation colonies, usually situated in the mountains; the number in 1895 was 73 with 2,119 children.

The system of fresh-air work in Europe is conspicuous by its efficiency owing to cooperation and to affiliation with the public schools. All children who need an outing are reached, and overlapping is avoided. The American system is more expensive, and less efficient, owing to lack of cooperation.

While in the U. S. we have as yet nothing comparable to these European scholars' trips in extent, we have their beginnings in the taking of school children in New York and elsewhere to historic sites, vacation trips and camps, conducted by private schools and parties, and the beginnings of this in public ways in Chicago and elsewhere. RUDOLPH M. BINDER.

FRIENDS' SOCIAL UNION, THE: An organization among the Friends or Quakers of England, constituted early in 1902. The Council came into being by a very interesting process of evolution. Beginning as a subcommittee, it passed into the Union for Social Study and this, by the perfectly natural transition from theory to practise, became the Friends' Social Union. The aim and object of the union is to evoke the spirit of justice and of social service, and to consistently apply religious faith to social and civic life. This purpose the union endeavors to achieve by the following methods: (1) Lectures, classes, and reading

circles; (2) social service committees in connection with the quarterly and monthly meetings and the adult schools; (3) the publication of leaflets on social questions, local administration, etc., written especially with a view to helping the members of adult schools; (4) visits to institutions, illustrating the work of social reform, of philanthropy, or of education.

The organizing secretary is a sort of social evangelist, traveling throughout the kingdom under the auspices of the union, delivering lectures on such themes as the housing problem, the unemployed and the unemployable, constructive philanthropy, what the individual can do in the work of social reform, the problem of poverty, child life in the town, the church and the social problem, etc. These addresses are usually followed by useful discussion, and in many instances result in the formation of a social service committee, a discussion society, or of a civic league, the stimulus and enlightening influence of which are by no means confined to Friends but are felt profoundly far beyond the boundaries of Quakerdom. The chairman of the committee of the union is Mr. B. Seebohm Rowntree; secretary, Mr. Percy Alden, M.P., 1 Woburn Square, London, England.

FROEBEL, FRIEDRICH WILHELM AUGUST: German philosopher, educational reformer, and philanthropist; born at Oberweissbach, Thuringia, 1782. His father was pastor of the village church. His mother died when he was in his infancy, and he was neglected in consequence. At the village school he was considered stupid, and he was apprenticed to a forester. The forest then became his college. Every natural object—stone, insect, plant, or tree—suggested to him some general truth; and he perceived some underlying connection between all objects, however apparently remote from each other. His inborn tendency to mysticism was strengthened by his lonely meditations in the forest, but after overcoming many obstacles he at last obtained permission to attend the university at Jena. He went from professor to professor seeking for a connection between the sciences. His career at Jena ended ignominiously by his imprisonment for nine weeks through incurring a debt of $7 or $8. He returned home, was sent on a farm, and then, on the death of his father, was set free to shift for himself. He wandered about as land surveyor, accountant, secretary, and at last became a very successful teacher in a model school at Frankfort. After a short time at a university, he was patriotic enough to enlist as a soldier for the campaign of 1813. While in the army he gained his two most devoted followers, Langethal and Middendorff. On the termination of the war, he returned to Berlin, and obtained a position under Professor Weiss. But his own ideal soon forced him to give up his position and to unfold his system of education. He set out on foot for Griesheim, a small village where a sister-in-law lived. Here he founded a school, composed at first only of his little nieces and nephews. Removing his school to Keilhau, he sent for his two friends Langethal and Middendorff, and soon their pupils began to rapidly increase. Financially it was not profitable, and for many years the teachers suffered the hardships of poverty. Froebel opened another school in Switzerland, and the Swiss Government was wise enough to send young teachers to him for instruction. He discovered that one of the greatest obstacles in the way of a perfect education, or "self-completion," was the general neglect of children in their earlier years. His great work on "The Education of Man" (1826) deals chiefly with the child up to the age of seven. Returning from Switzerland, he founded at Keilhau the first kindergarten in 1837. He sought to base a course of educational exercises on the games in which children were most interested. His first kindergarten failed for lack of funds; but by pen and lecture he spread the principles of his system; and until his death he continued to train male and female teachers in the impartation of his ideas.

In 1851 his nephew published a book which the government accused of teaching socialism and irreligion, and unfortunately confounding his views with Froebel's, an edict was issued forbidding the establishment of schools based on Froebel's principles. He took this greatly to heart, and in May, 1852, died, and was buried at Schweina.

The starting point of his researches was his belief in the unity of creation. Education meant with him unity of development, perfect evolution in accordance with the laws of his being. From this belief naturally followed his doctrine: "All education not founded on religion is unproductive."

He agreed with Pestalozzi in this belief: That the true educator *creates* nothing in the children, but guides the growth of inborn faculties. Children grow as plants grow. But he went beyond Pestalozzi in holding that the function of education was to develop the faculties by arousing *voluntary activity*. (See KINDERGARTEN.)

FRY, ELIZABETH (née GURNEY): English prison reformer; born at Earlham, Norfolk, 1780; brought up a Quaker. In 1813 she began taking an active interest in prison reform, and four years later assisted in forming an association for the amelioration of the lot of prisoners. Her activity was extended also to the deportation of convicts, and she induced the government to make certain regulations for their transportation. Her work was fruitful not only in England but also in other European countries which studied the reforms instituted at her instigation. She died in 1845.

FUGITIVE SLAVE LAW: A United States fugitive act, passed in 1793, declared that whenever a person held to service, etc., shall escape into another state or territory, the person to whom such service may be due, his agent or attorney, may seize or arrest such fugitive and take him before any judge of a court of the U. S., or any magistrate of a county, city, or town, and upon proof to the satisfaction of the judge or magistrate, whether by oral testimony or sworn affidavit, that service is owed as claimed, the judge or magistrate shall give a certificate thereof to the claimant, which shall be sufficient warrant to remove the fugitive.

This act, long obsolete, was later more and more made use of by the slaveholders of the South. That Northern states should be compelled to help Southern slaveholders catch their slaves created great indignation at the North. The constitutionality of the law was tested, but it was decided constitutional, two judges dissenting. This led to the passage of a still more rigorous bill in 1850. U. S. commissioners were to perform the judicial acts, and U. S. marshals execute warrants and processes. Owners could

themselves pursue and demand the help of the commissioners and marshals. The sworn statement of the claimant was to be sufficient proof. Any aid rendered to fugitive slaves was made a penal offense, and all citizens were required to aid in the capture of the runaway, if required. This law almost more than any other roused the North. It was openly violated and resisted, tho often obeyed. After the war the fugitive slave laws were repealed.

FUNK, ISAAC KAUFMAN, LL.D.: American publisher, born at Clifton, Ohio, 1839, of Dutch-Swiss descent. He graduated at Wittenberg College, Springfield, Ohio, 1860. Entering the Lutheran ministry, he was pastor at Moore's Hill, Ind., Carey, Ohio, and Brooklyn, N. Y. (1865–72). Resigning his pastorate, he became, after travel in Europe, associate editor of *The Christian Radical*, published in Pittsburg, Pa., and then in New York City. In 1876 he founded and edited the *Metropolitan Pulpit*, now the *Homiletic Review*. In 1877, with Mr. Adam W. Wagnalls, a lawyer, he established the publishing house of I. K. Funk & Co. (Funk & Wagnalls Company, 1891), with branches in Canada and England. In 1884 the firm started *The Voice*, a campaign paper in the interests of the Prohibition Party, which soon had a circulation of 130,000, and in the presidential campaign of 1888 ran up to 700,000 weekly. It was merged in the *New Voice*, 1898, and later sold. In 1888 the *Missionary Review* was founded; 1889, the *Literary Digest*, and 1907, *The Circle*. The firm has published, among a long list of books, various encyclopedias and dictionaries, notably the Standard Dictionary, the last at a cost of nearly $1,000,000. For many years Dr. Funk was a leading figure in the Prohibition Party; he has also been active in other movements, like reformed spelling; of recent years he has given large attention to psychic research. *Address*: 44–60 East Twenty-third Street, New York.

G

GALL, HEINRICH LUDWIG LAMPERT: "The First German Socialist," born at Aldenhoven bei Jülich, 1790. He held various clerkships in government offices in Cleve, Düsseldorf, Luxemburg, Treves. The sufferings of the people after the War of 1815 moved him deeply; and he analyzed the industrial situation and the social evolution which put all power into the hands of capitalists, and left the workers poor. Doing what he could to spread his ideas, he met with no encouragement, and in 1819 left his government situation to devote all his time and his considerable means to the service of social reform. He conducted to America an ill-fated, ill-planned company of the offscourings of German cities (thieves, convicts, and harlots), and organized a colony near Harrisburg, Pa. He believed he could make of them successful colonists; naturally he failed, exhausting his means, and receiving only criticism and opposition. Returning he entered the government service once again, and made numerous inventions in distilling apparatus, etc., all to get the means to carry on his propaganda. He traveled in England and France, meeting Owen, Fourier, and the Saint Simonians, and tried to form an international movement. He traveled all through Germany, even to East Prussia, opprest with the condition of the masses. In 1828 he published a paper, *Menschenfreundliche Blätter* (Humanitarian Leaflets), but was compelled to discontinue it for lack of support. He wrote many books, especially "Mein Wollen und Mein Wirken" (1835), in which he outlines the principles of modern socialism, the helplessness of the individual worker, the need of industrial organization by the workers. Condemned to imprisonment in one of his travels, he fled to Treves, where he died Jan. 31, 1863. See Stegmann and Hugo's "Handbuch des Socialismus" for a full account.

GALVESTON IDEA, THE: The so-called Galveston idea is the government of a city by a small commission elected by the citizens. Tho already adopted in various cities of the United States, especially in the Southwest, it began in Galveston, Texas, in 1901 upon the crisis that arose in the city after the disastrous storm of Sept., 1900. The plight of the city was desperate: one sixth of the population was drowned; one third of the city property was destroyed, its streets and harbor ruined, its buildings wrecked, its credit gone, its bonds fallen to sixty, its population fleeing.

Origin

The existing government of a machine mayor, in contest with a divided body of aldermen, was helpless and cumbersome. No one trusted it. There was, however, a private committee of fifteen business men, the Deep-water Committee, formed to secure national appropriations for deepening the city's harbor. This committee faced the situation and adopted the commission idea, and formulated, asked, and received a charter for it. It said to the legislature, "It is a question with us of civic life or death."

There were hints for the idea in the commissions of Washington and Memphis, Tenn., and in the selectmen of New England townships. Citizens' committees have repeatedly been depended upon in times of civic crisis.

The new charter went into effect Sept., 1901. According to it the commission had five members, three, including the mayor, appointed by the governor of the state, and two elected by the people. The machine politicians opposed it, but nearly 80 per cent of the voters were for it. In 1903 the nomination of commissioners by the governor was declared illegal, and since then all the five commissioners have been elected by the people, the vote of the opposition being small and growing less.

The working and results of the commission is as follows, according to Mr. G. K. Turner, to whose article in *McClure's Magazine* (Oct., 1906) we are mainly indebted for our information: The commission consists of five men, including the mayor, who is presiding officer and general director, but who has no power beyond his vote as a commissioner, except in minor cases of emergency. The commissioners also come to the board for all power to act. The commission, at its first meeting, divides its departments among its members by vote, under these heads: commissioner of finance and revenue, police and fire commissioner, commissioner of streets and public

property, and water-works and sewerage commissioner. The mayor is elected specifically for his office, but the commissioners are not. The public are practically certain, when they cast their votes, of the office each man will assume. The elections to the board are at large, and the whole body is elected together every two years—the election taking place in May, a time as far removed as possible from the time of other elections.

Constitution

The commissioners are not superintendents, tho salaried men, the mayor receiving $2,000 and each commissioner $1,200 a year; they are governors or managers of departments. Each outlines the policy of his department, and all questions concerning it are referred to him for his opinion. All matters of the daily conduct of the departments are under the supervision of the responsible heads. Superintendents under them take the actual management of the departments. The commissioners advise and direct, and the commission is the responsible party.

The result has been brilliant. The commission found the city bankrupt, it has raised its credit to above par. It has saved Galveston one full third of her gross running expenses. The annual cost of the government of Galveston has averaged about $650,000. In the four and a half years of commission government ending Feb., 1906, a saving of at least $1,000,000—over $220,000 a year—has been made.

The commission has introduced great civic reforms, yet all with a slight decrease instead of increase of the taxation. A huge sea wall has been built, which, with the grade raising the city to the top of the wall, and other improvements, will cost $4,200,000. In this the United States Government, the state, and the county have cooperated, but the city has been bonded at par. The worst dance halls and dives have been closed; law is enforced; graft is not suggested; good streets, pavements, lighting, sewers have been introduced; hygiene has been attended to, and there are now no epidemics of yellow fever. Galveston is now the second city in the U. S. in value of exports. All this, of course, is not due to the commission idea alone, but this has made the result possible.

Results

The plan has been so successful that it has rapidly spread. Houston, Texas, early adopted it, and later Fort Worth, Dallas, El Paso, and Austin. Des Moines, Iowa, with 75,000 inhabitants, has adopted it, and many other cities are considering it.

REFERENCE: *Galveston, A Business Corporation*, article by G. K. Turner, *McClure's Magazine*, Oct., 1906.

GAMBLING (see also STOCK-GAMBLING) has become undoubtedly, in one form or another, one of the gigantic social evils of the present day. Josiah Flint, in a series of articles in the *Cosmopolitan* (April to June, 1907), estimates that $40,000,000 are bet annually over the telephones in New York City. Single pool-rooms in New York are said to have cleared $3,000,000 a year. G. K. Turner (*McClure's Magazine*, April, 1907) conservatively estimates the gross annual receipts of gambling in Chicago at $15,000,000. But this is from pool-selling only. Besides this are the enormous wagers lost and won on the various race-tracks of the United States, besides the collectively large amounts spent in bets on ball games, yachting and automobile racing, football, and other sports. One must add to this an unknown but fabulous amount made and lost in card and other games of chance, sometimes in large single amounts, more frequently in small but multitudinous sums in private parlors in Bridge, the fashionable game of the hour, by men and now very extensively by women both of the wealthy and of the middle classes. (See LUXURY.)

Extent

To all this the millions made and lost in stock-gambling (*q. v.*) should be added in the opinion of most.

In Great Britain conditions are said to be the same in the fashionable set (witness baccarat scandal), and if on the Continent it is less so, except in the gambling centers like Monte Carlo and certain fashionable capitals and watering-places, this is made up by the lotteries, conducted often by the national governments, and for which all classes, especially the lower middle classes, buy tickets.

Yet tho so wide-spread and, in the U. S., at least, so much on the increase in society, all social writers and authorities in jurisprudence consider it an evil.

Says Judge Catron, formerly of the Supreme Court of the U. S.:

"Gaming is a general evil, leads to vicious inclinations, destruction of morals, abandonment of industry and honest employments, a loss of self-control and respect."

The English courts for centuries have held that:

"A common gambling-house, kept for lucre or gain, is a common nuisance, as it tends to draw together idle and evil-disposed persons, to corrupt their morals and ruin their fortunes."

In New York State common law prevailed until 1815, when the legislature enacted a statute forbidding the act of betting or wagers upon future events. The New York Court of Appeals in 1848 said:

"The evident intention of the legislature was to discourage and repress gambling in all its forms, including bets and wagers and every species of wager contracts of hazard, as a great public mischief calling for effective measures of prevention and remedy" (Ruchman vs. Pitcher, 1 N. Y., 450).

Since then bills against gambling, pool-selling, etc., have been frequent in this and other states, tho pool-selling on enclosed grounds has been frequently legalized and then again forbidden. Yet the evil goes on.

One of the prime reasons for the continuance of pool-rooms, in spite of legislation and occasional raiding by the authorities, is the enormous financial interests in them which are willing and usually able to pay the largest amounts for immunity from and even protection by the police. The necessity also of the telegraph and telephone to the pool-room, to enable it to secure its news from the race-track, makes the income of the telegraph and telephone companies from this source so valuable that they are willing to go great lengths to maintain the service and protect the gamblers. Mr. Flint (see above) estimates that the Western Union Telegraph Company and the telephone companies received recently from five to ten million dollars annually from their race-track and pool-room

Money Interests Involved

service. Many people believe that if it were made impossible for pool-rooms to secure telegraphic service at least pool-room gambling, by far the greatest evil, would be cut off. Agitation, therefore, in New York, led largely by Dr. Slicer, tho criticized by many, has agreed not to attack betting on the race-course, for those who desire to go there and make wagers, but has secured the enactment of laws against pool-rooms, etc. Owing to the efforts of Captain F. Norton Goddard and the City Club, working through Mr. Jacob Schiff, one of the directors of the Western Union, and Helen Gould's influence upon the Gould interests, the Western Union Company was induced, May 21, 1904, nominally to give up its racing service. The evil, however, goes on. The American Telephone and Telegraph Company (formerly the American Bell Telephone Company) has taken up the service. Racing news is conveyed, says Mr. Flint, by secret channels from the race-grounds to telegraph and telephone offices outside the limits, transmitted as general news by the Western Union and telephone companies over the country, and conveyed to the pool-rooms by secret wires. "Johnny Pair," of Chicago, is said to have secured $15,000,000 annually by organizing such a racing-news service. Many persons, however (among them Dr. Wilbur F. Crafts, of the International Reform Bureau of Washington, D. C.), believe that this effort to allow gambling on the race-tracks, but forbid it elsewhere, is the work largely of the New York Jockey Club, led by Mr. August Belmont, desiring to have a monopoly of race-gambling, and that the club, therefore, induced the "innocent reformers" to take the above-mentioned position. Says Dr. Crafts:

"In state after state shrewd efforts were made to induce the legislature to legalize race-gambling on tracks controlled by the New York Jockey Club, while making such gambling a felony everywhere else in the state. Their efforts in this direction had been very successful from a financial point of view in New York State, despite an anti-gambling provision in the constitution, but an effort to secure a similar law in the District of Columbia and in the State of Pennsylvania was defeated, also in Ohio and Missouri, while a seeming success in New Hampshire was thwarted by a decision of the Supreme Court. The movement, however, goes on and appears anew in nearly every session of state legislatures."

The companies and pool-rooms are, however, able often to violate law with impunity, or when raided in order to satisfy the public outcry, to receive warning beforehand, and afterward to reopen, by the purchase of the police (usually now through the "man higher up"). Mr. Flint estimates that each New York pool-room pays the police on an average $75 a week, which for 300 pool-rooms (estimate of existing number in New York) makes $1,170,000 a year for the police. For the perhaps 2,000 pool-rooms said to have existed before the recent raids, a proportional fabulous amount was received. This largely goes to the politicians and the higher officials. Prominent Tammany politicians like Big Tim Sullivan in New York, or others like McCarren in Brooklyn, are known to have extensive gambling interests, Sullivan being the head of a pool-room company. Yet little or nothing is done. The money is paid secretly to representatives of the police department in citizens' clothes; no written record is in evidence, and detection all but impossible.

The following account of the main forms of gambling, outside of ordinary card games and betting, is abridged from an article by Mr. H. C. Vrooman, in the *Arena* for Feb., 1895:

"The forms of gambling and speculation are almost endless. The older forms are with lotteries, faro, thimbles, dice, cards, and the like. Not to mention billiards and pool-playing for drinks, the raffles and chances at fairs—where under sometimes sacred auspices is fed the passion for gaining something for nothing—there is every grade of respectability and unrespectability. There is a very popular device, 'a nickel in the slot.' It consists of a contrivance into which a nickel is dropped, and in case the nickel touches a certain spring it throws out a little shelf containing a handful of nickels. Some of the machines are large and gorgeous, with the money shelves arranged in a circle which revolves like a wheel of fortune. It requires but five cents, and there is a chance of winning over $1. These machines are most common in saloons, but are not infrequently found in candy stores near schools, where the boys crowd at noon to take their initial lesson in gambling.

"Another interesting device that requires but a small sum to invest in is 'shooting craps.' It is played on a semi-circular table with dice. The point of the game is that certain relations of the dice point to numbers on the board. It is a favorite with those with very short purses, especially negroes.

"Horse-racing furnishes a very popular method of gambling on a larger scale. For those who cannot go to the tracks and do their betting there, there are popular resorts, known as 'pool-rooms,' where 'the odds' are posted and bets taken just as at the track. The popular name 'pool' is a survival from the old French mutual pool system, still in vogue in some places in the South. It is very similar to a 'blind pool.' That is, each player puts in a certain sum against some other player, and the book-maker or manager acts merely as a commis-

Pool-Rooms

sion agent. The old process was too slow for the ambitious American, and the method now in vogue gives the book-maker one side in every play, and is usually so arranged as to give 60 per cent odds in his favor. The 'book-maker' is the manager of the pool-room. He makes a schedule of the horses running and an estimate of the proportion of chances in favor of each, based on the horse's record, the weather, the jockey, etc. This schedule, 'the book'—most commonly called 'the odds'—is posted in the 'pool-room' twenty minutes before the race occurs, and betting continues until the telegraph announces, 'They're off.' The race may occur in New Orleans and the playing in Chicago. The telegraph enables the playing to proceed the same as at the race-track.

"The betting by the individuals is called 'playing the races.' The book-maker plays against the public. He arranges the odds on the basis of the patrons playing on a variety of the horses and balances his risks by their variety. The following is an illustration of 'the odds': Gallop, 7–5; Theodore, 3–2; Baby Bill, 8. This means that the book-maker will stake $7 against $5 on Gallop, $3 against $2 on Theodore, and $8 against $1 on Baby Bill. The option is open for the player to take any horse he wishes. The book-maker must either know public sentiment in regard to what bets will probably be taken, or he must start rumors afloat to create a sentiment that will turn bets to his advantage. If races were run honestly, a good judge of horses could often win; but often, at least, they are not. A book-maker 'stands in' with some jockey to prevent a fast horse winning, perhaps by tying a small silken thread around the hind ankle, which pulls the cords and cramps the leg. An electric battery has been carried by jockeys with wires connected with the spurs to partly paralyze a horse. A horse may be filled with water just before a race, having been previously liberally fed with salt. Sometimes a fast horse is entered under another name, etc.

"Next to the horse-racing ranks the 'clock' or 'tape game,' the 'bucket-shop,' the 'open board,' and the regular 'board of trade'—thence on to the subtleties and refinements of general speculative business, such as booming cities to sell real estate, watering stock,

Bucket-Shop

manipulating railroads to buy cheap and sell dear, etc. The 'clock game' and the 'bucket-shop' are based on the board-of-trade methods, only they are gambling pure and simple, never dealing in real commodities at all. The 'clock game' is especially barren of any semblance to real business in that the prices quoted do not follow the market, but are arbitrarily arranged by the management. There is a central office, where a scale of prices is made up every day on fictitious mining stocks and sent out, with the legitimate prices of wheat and corn and the regular board-of-trade articles, to the various gambling-rooms, where the little tickers record on the tape the rise and fall in price. These figures are placed as fast as they come in on a vast blackboard on one side of the room, and the crowd buy and sell the artificial margins in regular "Change' style. Some of them do not even go through the form of pretending to receive by telegraph the regular market prices. The manager makes up a schedule of prices purely from his imagination, adapted to trap the gambling public. This is made on a roll of tape, is unwound

right before the crowd, and the prices of stocks are recorded on the blackboard. The buying or selling of margins goes on, based on the last recorded figure on the board, looking for gain to the chance of a higher or lower figure on the tape.

"The 'bucket-shop' is similar to the above, except that the schedule of prices on which the gambling is based is supposed to follow the actual market as quoted in the board of trade. The 'open board' is a duplicate of the regular board of trade in form, but is an immense bucket-shop in character. The marked difference between the board of trade and the bucket-shop is that the speculations on the board of trade have to do with the actual market, and heavy buying or selling there is supposed to influence the price of the commodities, while speculation in the bucket-shop is gambling pure and simple on how the market is going to turn."

More recently new devices have been invented. In Chicago a steamboat, *The City of Traverse*, owned by professional gamblers, at times carries at night would-be gamblers on to Lake Michigan to where it is difficult to know where the state lines run and thus almost impossible to convict under any state law. "Dope shops," or places for the sale of falsified "tips" as to what horse will win, are among the lures and devices and yet attract many patrons.

GARDEN CITY MOVEMENT, THE: A movement to organize in the country industrial communities where, with many of the advantages of the city, healthful and more or less model factories and other forms of business can be conducted, and where the workers and other residents can occupy inexpensive but attractive, hygienic, and comfortable homes, each with its little garden, and all to be surrounded, if possible, by a belt of agriculture, so as to combine as many as possible of the advantages of the city with those of the country. In 1898 Mr. Ebenezer Howard of London published a book, "Garden Cities of To-morrow," advocating these ideas in detail, and in 1899 a Garden City Association was formed in London to carry them out.

The fundamental principle of this association was "to begin at the beginning"; that is, to buy at the start a considerable tract of unimproved land, so that, even if it could only be developed a little at a time, all should be developed on a carefully thought-out and harmonious plan, taking into consideration convenience, health, and beauty for the whole tract. In this way, too, the large unearned increment that would, of necessity, arise from the development and population of a considerable area bought at the value of unimproved land could go to the community and not private speculators and investors. This, indeed, is the economic basis of the idea—that the land should be bought by a company acting as trustees, with capital invested in it, at profits to be limited to a cumulative 5 per cent, all profits beyond that amount from the sale or lease of land to be spent either in improvements of the estate, the erecting of public buildings, etc., and also to create a sinking-fund with which gradually to pay off the original investments, until the citizens finally would own the city and control their own civic life. Mr. Howard showed conclusively how, in this way, at rents much lower than in ordinary towns, with many more advantages in the way of parks, public buildings, libraries, baths, gymnasium, club-house, etc., attractive houses could yet be built and the investors be secure in their 5 per cent; and at the same time a sinking-fund could be maintained with which rapidly to pay off the investments.

Aided by the example of such model villages as BOURNEVILLE and PORT SUNLIGHT, the idea slowly spread, and in 1893 a Garden City Limited Company was formed with a nominal capital of £300,000, of which about £110,000 was paid in by 1,340 shareholders. A beautiful tract of 3,818 acres was bought near Hitchin, Hertfordshire, thirty-four miles north of London, at a price of about £40 per acre, including the land, timber, some cottages, and attractive ruins and picturesque old churches. An admirable plan was prepared by Parker Unwin, and operations commenced, the name Letchworth (Garden City) being given to the town. The town itself is to occupy only 1,200 acres, with many open spaces, 150 acres being reserved for factory sites. Provision is made for a population of 35,000, with nine per acre in the estate and twenty-three per acre in the town portion. An organ, *The Garden City*, is published; and in 1905 a Cheap Cottages Exposition was held. The effort was made to see how good a house could be put up for £150. The present rental of land varies from £10 to £25 per acre, and the annual ground-rent of a cottage in the town area, from *17s. 6d.* to £2. For the present the company is granting leases of not over ninety-nine years, the reversion falling to the company. Various cooperative building associations have undertaken to put up buildings and develop the land.

A factory area has been laid out so that every factory has its own siding in direct communication with the Great Northern Railway, which traverses the estate for two miles. Ten factories are at work, and other manufacturers have taken sites. A number of builders and builders' merchants are on the estate; shops have been erected; and between 300 and 400 houses and other buildings have been or are being built, with a capital value of £215,000. Sites for 120 more have been let. A post-office, telegraph, telephone, and two banks are established. The population is over 5,000.

The Garden City Association has undertaken also to develop an estate near Manchester, one at Warington, others elsewhere. The association has offices at 602 Birkbeck Bank Chambers, W. C., London. Its secretary is Ewart G. Culpin. *Address:* First Garden City, Ltd., 326 A, High Holborn, London, England, and at Letchworth, Hertfordshire, England.

The garden city movement has spread also to other lands. An active association has been formed in Germany, a small but enthusiastic one in France, and there are beginnings in Belgium, Holland, and elsewhere. In the United States a Garden City Association was formed in New York in November, 1906 (incorporated January, 1907), with W. D. P. Bliss as secretary. This association has made beginnings, but its chief purpose is to spread the Garden City idea and let this idea take shape in any form it will. Secretary's *address:* Metropolitan Building, New York.

GARRISON, WILLIAM LLOYD: American abolitionist; born at Newburyport, Mass., 1805; son of a sea captain. When only nine years old he was apprenticed to a shoemaker, afterward to a cabinet-maker, and at thirteen to the printer of the Newburyport *Herald*. At sixteen he began

to write unsigned articles for the papers, and soon became editor of the *Herald*. Removing to Boston, he worked as a journeyman printer, and in 1828 became editor of the *National Philanthropist*, the first American journal established to promote total abstinence. This he conducted for six months, and then went to Bennington, Vt., to establish the *Journal of the Times*.

While in Boston he met Benjamin Lundy, a Quaker philanthropist, editor of the *Genius of Universal Emancipation*, a magazine published in Baltimore. Lundy resolved to ask Garrison to aid him, and for that purpose *walked* from Baltimore to Bennington. Garrison determined to devote his life to this work. From 1829 the paper was published weekly by Lundy and Garrison—Lundy favoring gradual and Garrison immediate emancipation. Baltimore was one of the chief markets of the domestic slave-trade, and Garrison thundered denunciations at the traffic. The owner of a Newburyport vessel had allowed his vessel to carry a cargo of slaves from Baltimore to New Orleans; and for denouncing this act Garrison was arrested and fined $50 and costs. In default of payment he was committed to jail. His imprisonment created much indignant comment. Arthur Tappan, a New York merchant, paid his fine, and he was set free. In order to speak more freely, he dissolved partnership with Lundy, and started a paper of his own in Boston. Before commencing, he privately interviewed some of the leading citizens; but they all excused themselves. He and his partner, Isaac Knapp, issued the first number of *The Liberator* on Jan. 1, 1831. It began without capital and without subscribers, its editors publishing their resolve to print it "as long as they could subsist on bread and water." Its motto was, "Our country is the world; our countrymen are mankind"; and Garrison, in his address to the public, uttered the historic words which embody the whole spirit and purpose of his life: "I am in earnest; I will not equivocate; I will not excuse; I will not retreat a single inch; and I will be heard."

The paper lived long enough to publish the proclamation of emacipation and the extinction of slavery. Garrison and his partner met every opposition. Their office was a garret, their bed its floor, and their only helper a negro boy. The mail frequently brought letters to Garrison threatening him with assassination if he did not discontinue his journal; and the Legislature of Georgia offered $5,000 to any one who should arrest, bring to trial, and prosecute him. The first society organized to support his principles was the New England Anti-Slavery Society, formed January, 1832. In the spring of the same year Garrison published "Thoughts on African Colonization," proving by official documents that the American Colonization Society was organized in the interests of slavery. Garrison was soon after deputed to visit England and expose the true character of this colonization society. He was warmly received, becoming acquainted with Wilberforce, Clarkson, Brougham, O'Connell, Thompson, and others. Thompson came over to America to address meetings. Wherever he appeared it was the signal for riots and violence. In Boston "a mob of gentlemen of property and standing," when they heard that Thompson was about to address the Women's Anti-Slavery Society of that city, turned the streets into a bedlam. Garrison fell into their hands; and, throwing a rope around his body, they dragged him through the streets. In all probability he would have been hanged by the mob had he not been rescued and consigned to the jail for safety. These attempts to suppress the abolitionists by violence continued several years, but Garrison was never daunted. There was no schism in the body of abolitionists until 1839, when some of the adherents began to accuse Garrison of religious heterodoxy and to blame him for his severity on the churches for their moral stagnancy and complicity with slavery.

Garrison was a non-resistant, and believed in the use of moral rather than political means. Those who differed from him formed a new National Anti-Slavery Society in 1840, and gave rise to the Liberty Party in politics. Garrison's mind was never narrowed by its intensity, however; and he always esteemed and honored every earnest opponent of slavery, even tho their special modes of working differed. He was intolerant only of treachery. After long and painful consideration he realized that the proslavery clauses of the United States Constitution were immoral, and that it was wrong to take an oath for its support. "No union with slaveholders" was his motto; and he denounced the Constitution as "a covenant with death and an agreement with hell." Arguments and exposures buttressed his denunciations. The blind and idolatrous reverence for the Constitution, which had been the political mainstay of the slaveholders, began to abate. The Fugitive Slave Law revealed to all the practical workings of the proslavery clauses. On the outbreak of the war, Garrison at once ceased advocating disunion, as he foresaw that in the struggle slavery would be abolished. During the war Lincoln recognized and honored his services; and the whole nation knew that if emancipation were secured, it would be due to his uncompromising spirit and heroic perseverance. In 1865, when liberty had been proclaimed, he declared that his career as an abolitionist was necessarily ended, discontinued *The Liberator*, and counseled the dissolution of the anti-slavery society. Garrison had revisited England in 1840 and 1846. In 1867 he again crossed the Atlantic, and was received with great honor in London, Edinburgh, and other cities. He made a fifth and final visit in 1877. On May 24, 1879, he died in New York, and was buried in Boston after a most impressive funeral service.

GAS WORKS. See LIGHTING.

GAUTIER, EMILE JEAN MARIE: French anarchist; born at Rennes 1853; educated at the lyceum of his native town; studied jurisprudence at Paris; admitted to the bar 1876. For a time he was on terms of friendship with Guesde, but later became his bitterest enemy. He organized clubs in Paris and other French cities, and lectured on the theory of anarchism. In 1883 he was arrested for making inflammatory speeches, and sentenced to five years' imprisonment. Pardoned in 1885, he joined the opportunists, and withdrew from active politics. He has written "Le Darwinisme Social" (1880); "Les Propos Anarchistes" (1885); "Le Monde des Prisons" (1888), etc.

GEDDES, PATRICK: Scottish botanist and author; born in 1854; educated at Perth Academy; Royal School of Mines; University College, London; the Sorbonne; and the universities of Edinburgh and Montpellier. He was demonstra-

tor of practical physiology at University College, London; of natural history at Aberdeen; and of botany at Edinburgh. He lectured on natural history at the Edinburgh School of Medicine. Since 1888 professor of botany at University College (St. Andrew's University), Dundee, Mr. Geddes has traveled extensively in Europe, the Orient, and North America. In addition to his professorship, he has been active in the organization of University Hall, Edinburgh, a student colony. Its "Outlook Tower" is partly devoted to biological, sociological and geographical instruction, partly to architecture, agriculture, etc.

Mr. Geddes is the author of numerous articles on botanical and zoological subjects, which appear in the "Encyclopædia Britannica" and in "Chambers's Encyclopedia." In collaboration with J. Arthur Thomson, he has written "Evolution of Sex"; and independently, "Chapters in Modern Botany," "City Development," etc. *Address*: University Hall, Edinburgh, Scotland.

GEORGE, HENRY: The great American advocate of the single tax; born in Philadelphia, Pa., 1839; began business life as an office boy; later went to sea and visited every part of the globe. Becoming a printer, he went to California and became compositor, reporter, then a successful journalist. In 1871 he joined with two others in founding the San Francisco *Post*; but his mind was now occupied with the social problem of the distribution of wealth. His first economic publication was "Our Land and Land Policy," which appeared in 1871. Four years later he retired from editorial work, but continued to write for the newspapers. His principal work, "Progress and Poverty" (commenced in 1877 and finished in 1879), attracted attention immediately upon its publication. Its main doctrine is that "nothing short of making land common property can permanently relieve poverty and check the tendency of wages to the starvation point," and that the best, easiest, and quickest way to make land common is not to do it technically, but to leave all land titles in individual ownership, and to tax the land ultimately to its full annual rental value; thus without revolutionary methods gradually appropriating to society for the good of all the full rental value of the soil. This, Mr. George believes, could be and should be a SINGLE TAX.

In 1880 the agitation of the land question in Ireland led Mr. George to publish a book on "The Irish Land Question," embodying his views, and in 1881 he went to Ireland as a newspaper correspondent to examine the actual condition of the peasantry, and was imprisoned for a time as a suspect, but afterward released with apologies. The Irish Nationalists as a class, however, did not embrace his ideas, and in 1883 Mr. George visited England and lectured in the principal cities, advocating the theory advanced in his book and eliciting universal attention.

Returning to the United States, Mr. George found his influence very much increased and his ideas widely spreading, particularly in New York City. In 1886 he was nominated Mayor of New York City by the United Labor Party, and after a campaign of intense popular excitement received the phenomenal vote of 68,110 ballots, being only defeated by the Democratic candidate. In this campaign he was enthusiastically supported by the Socialists; but when, in the state convention at Albany of the United Labor Party, which nominated him for governor in 1887, Mr. George declared distinctly against socialism and for a single tax, based largely on individualistic ideas, the Socialists opposed him. Meanwhile, the educational movement had been going on; but in the state election Mr. George polled but a small vote. At the beginning of the year he had started a weekly organ, the *Standard*, which attained a large circulation; and the coming out for his ideas of Father MCGLYNN, a popular Roman Catholic priest of a large New York City parish, in spite of the opposition of the archbishop, created great excitement, and a religious society, called the ANTIPOVERTY SOCIETY, was organized to develop the religious side of the question. Meanwhile, Mr. George lectured to immense audiences all over this country and in Canada, England, Scotland, and Australia, while his ideas penetrated Germany and France. He came to feel more and more, however, that to put his ideas into practical execution, the first thing necessary was to clear the ground by repealing other taxes, and, first of all, what he regarded as the great imposition of the tariff. He wrote, therefore, his book on "Free Trade," one of his ablest efforts, and worked henceforth with the Democratic Party, in the hope of inducing them eventually to stand for absolute free trade. He wrote, later, "The Condition of Labor," addrest to the Pope; "A Perplexed Philosopher," answering SPENCER; and "The Science of Political Economy" (1897). Nominated for Mayor of New York, he died during the campaign, Oct. 29, 1897.

GEORGE, HENRY: American journalist; advocate of the single-tax system; son of Henry George, the economist; born at Sacramento, Cal., 1862; educated in public schools; entered a printing-office at the age of sixteen; has been engaged in journalistic work since 1881. He was secretary to his father during the latter's tour of Great Britain in 1883. On his father's sudden death in New York, during the mayoralty campaign of 1897, he was nominated in his father's place by the Jeffersonian Democracy. He is the author of: "Life of Henry George," 1900, "The Menace of Plutocracy," 1905, and "The Romance of John Bainbridge," 1906. His political views are those of the Single Taxers and radical Jeffersonian Democrats. *Address*: 180 St. Nicholas Avenue, New York City.

GEORGE JUNIOR REPUBLIC, THE: An association founded July 10, 1895, by William R. George, at that time a young business man in New York City. It is located at Freeville, Tompkins County, N. Y. Its object is to instil habits of thrift and obedience to law, of self-reliance, self-control, good citizenship, and religion in its broadest sense into the lives of boys and girls from fourteen to twenty-one years of age, whose natural tendencies and environments would lead them into viciousness. In addition, some who have not bad inclinations have become members of the little community to their great advantage. Altho the system is universally regarded as being unique on account of its wide divergence from the customary systems of training, it is, nevertheless, a marvelously simple method. In point of fact it is no more nor less than any little village in the State of New York. The young people buy and sell, have little or much according to their earnings, live in either homes or hotels, live under and enforce the laws of New York State, plus a few special ones of their own, have

their own system of civil and criminal courts, a jail, police, bank, store, school, shops, paper, church, etc., etc., just the same as in the big republic; the only essential difference between their village and any other in the township is the fact that the inhabitants thereof become voting citizens at the age of fourteen instead of twenty-one.

The association owns or controls at the present a little over 300 acres of land, with about thirty buildings. There is a total population, including helpers, of about 190 people. Two citizens have already come from abroad. The citizens in general come from all parts of the United States. Many more citizens could be admitted if the board of trustees had greater accommodations. The work is supported by voluntary subscription, payment for board in certain cases, and sales of mission furniture, chocolate and ginger wafers, and some other things produced by the citizens.

"Republics" have been established in Maryland, Pennsylvania, and at Litchfield, Conn. More than 400 graduates are making their way in the world; several are in leading colleges at the present time, and but comparatively few of all the ex-citizens have proved a disappointment to their friends. ESTHER B. GEORGE.

GEORGE, WILLIAM REUBEN: Founder of the GEORGE JUNIOR REPUBLIC; born at West Dryden, N. Y., 1866; educated in public schools; entered business in New York. He became interested in boys and girls of the poor by conducting (1890–94) parties of them into the country for vacations of two weeks, and in 1895 he founded the colony, or "republic," which bears his name. *Address*: Freeville, N. Y.

GERMAN EMPIRE: A federated empire of the German states and kingdoms, constituted April 16, 1871.

I. Statistics

Colonies and Dependencies.—Area, 1,027,820 sq. m.; population, 13,522,000. In Africa, 931,460; population, 13,047,000. In Asia and Oceanica, 96,360; population, 475,000. Imports from German colonies to Germany (1903), 7,535,000 marks; exports from Germany to colonies, 24,486,000 mk.

From 1816–55 the yearly average increase in the population of the empire was 0.96 per cent; from 1855–95 it was 1.04; from 1900–5, 1.5 per cent. The marriage rate in 1904 was 8 per 1,000 of population, the birth-rate 35.2 per 1,000, the death-rate 20.7 per 1,000. (See BIRTH-RATE; DEATH-RATE; MARRIAGE.) In 1900 there were 27,737,247 males and 28,629,931 females. Of the total population over the age of twenty-one there were 4,092,703 males unmarried and 3,572,578 females; there were 9,793,671 males married and 9,698,082 females; there were 840,410 males widowed, divorced, or separated and 2,413,659 females. There were 4,253 males married under the age of twenty-one, and 96,873 females; there were 107 males widowed, divorced, or separated under the age of twenty-one, and 1,008 females. There were (1900) 6,232,114 inhabited houses and 12,260,012 households; 54.3 per cent lived in towns of 2,000 inhabitants.

Vital Statistics

Emigration. — 1901 — 22,073; 1902 — 32,098; 1903 — 36,310; 1904 — 27,984; 1905 — 28,075. About 90 per cent went to the United States.

There were (1905) forty-two cities with more than 100,000 inhabitants—one with over a million; ten over 250,000; thirty-one over 100,000.

Principal Cities.—Berlin, 2,040,148; Hamburg, 802,793; Munich, 538,983; Dresden, 516,996; Leipzig, 503,672; Breslau, 470,904; Cologne, 428-

AREA AND POPULATION

STATES AND PROVINCES	Area in sq. m.	Population 1905	By CENSUS OF 1900				Deputies in Bundesrath	Deputies in Reichstag

722; Frankfort-on-the-Main, 334,978; Nuremberg, 294,426; Düsseldorf, 253,274; Hanover, 250,032; Stuttgart, 249,443; Chemnitz, 244,405.

Religion.—Germany enjoys liberty of conscience and freedom of religious worship. In 1900 there were 35,231,104 Protestants, or 62.5 per cent of the population; 20,327,913 Roman Catholics, or 36.1 per cent; 203,793 other Christians, or 0.4 per cent; 586,948 Jews, or 1.0 per cent; 17,535 unclassified or other religions, or 0.03 per cent.

Education

Education is well developed, being compulsory through the empire with a school age from six to fourteen. There were in 1902 or thereabouts, 59,384 elementary schools with 124,027 teachers and 8,924,779 pupils, besides 643 private schools, with 41,328 pupils. Secondary schools (1903); gymnasia (preparatory for university education), 468; pro-gymnasia (slightly lower), 100; real-gymnasia (without Greek, and with more "modern subjects"), 122; real progymnasia, 48; oberrealschulen (no classics), 64; realschulen, 265; normal schools, 185; other schools, 88; technical institutes, 9. Numerous *Gewerbeschulen* (technical schools), agricultural, brewing, mining, veterinary, architectural, forestry, art, 425 commercial schools, and 4 commercial universities; 100 schools, including universities, for textile work; 12 for metal work; 12 for wood-working; 4 for ceramic work; 19 for naval architecture and engineering; 19 for navigation; 7 public and many private music schools, military academies, etc.; universities, 21. Berlin (1904) has 6,096 students; München, 4,976; Leipzig, 3,575; Bonn, 2,818; Freiburg, 2,029; Breslau, 1,800; Halle, 1,780; Heidelberg, 1,655; Göttingen, 1,581; Tübingen, 1,581. (See EDUCATION.)

Justice is well administered on a uniform system with a uniform code. (See CRIME.)

Commerce has been rapidly developed in recent years. In shipping, Germany stands to-day second in the world. (For statistics, see COMMERCE; SHIPPING.)

There has been since 1888 a Zollverein or Customs League, which embraces the whole of the empire, with the exception of a few small districts, as well as Luxemburg. Import duties are levied, the country's policy being strongly protectionist since 1879.

Agriculture is the leading occupation according to the census of 1895 (the latest on this point). Of the total population, 18,068,663 were engaged in agriculture, 18,100,442 in various industries, 5,966,846 in commerce, 2,835,014 in the professions, 2,152,789 in metal work, 886,807 in domestic and personal service. Of these 22,913,683 were actually engaged in active service. Ninety-two per cent of the area is said to be productive. The main crops in 1904 were rye (6,099,270 hectares; hectar = 2.47 acres), hay (5,946,990), oats (4,189,681), potatoes (3,287,861), wheat (1,917,513). Forestry is very important. (See FORESTRY.)

Industries

Mining is important, the main districts being Westphalia, Rhenish Prussia, Silesia, and Lorraine for coal and iron, the Harz Mountains for silver and copper, Saxony for coal, iron, and silver. The coal mined in 1904 was 120,815,500 metric tons; lignite, 48,632,800; iron ore, 22,047,100. The total value of the minerals was 1,364,000,000 marks. There are about 100 iron foundries which produced 10,058,273 metric tons in 1904. There were (1903) 1,657 works producing finished iron. The total value of the product of the foundries of all kinds was (1903) 761,538,000 mk.

In 1895 there were engaged in the iron manufacturing 524,707 persons; machinery and instruments, 582,672; textiles, 993,257; woodenware, 598,496; leather and India rubber, 160,343. Iron is chiefly manufactured in Prussia, Alsace-Lorraine, Bavaria, and Saxony; steel in Rhenish Prussia; textiles in Saxony; linen in Westphalia and Silesia; cotton goods in Alsace-Lorraine, Württemberg, Baden, and Bavaria; glass and earthenware in Silesia, Thuringia, and Saxony; clocks and underwear in Württemberg and Bavaria; beer in Bavaria and Prussia. Beetroot is an important product. (See AGRICULTURE.)

II. Constitution and Government

The present German Empire, a federation of Germanic kingdoms, principalities, and free cities, dates from Jan. 18, 1871, when William I., King of Prussia, was elected emperor on motion of the King of Bavaria, by the North German Confederation and representatives of all the German states and crowned in Versailles. The old Germanic Holy Roman Empire, dating from the coronation of Charlemagne in Rome, 800, and at the head of which the Hapsburg dynasty of Austria had stood for over 500 years, was overthrown by Napoleon and ended in 1806. The succession of the empire is hereditary by right of primogeniture (male line) in the Hohenzollern house. The present emperor is William II., born 1859; emperor 1888.

Constitution

The constitution of the empire dates from April 16, 1871. The states of Germany form, according to its terms, "an eternal union for the protection of the realm and the welfare of the German people." The emperor represents Germany internationally, and has the right to declare war, make peace, and enter into relations with other nations, if not otherwise provided by the constitution. Offensive war can be declared by the emperor only with the approval of the *Bundesrath* and the *Reichstag*. Legislative power rests in these two bodies. The *Bundesrath*, presided over by the chancellor, is an upper federal council, and represents the individual states of Germany. It is composed of 58 members—17 from Prussia, 6 Bavaria, 4 Saxony, 4 Württemburg, 3 Baden, etc. —appointed by the governments of the different states. The *Reichstag* has 397 members—about one for each 131,600 inhabitants—and represents the people. Since May 21, 1906, the members of the Reichstag receive $750 for the session with

MEMBERS ELECTED AND VOTES CAST FOR THE REICHSTAG IN 1903 AND 1907

	Votes, 1903	Members elected	Votes, 1907	Members elected
Conservative	948,448	73	1,070,658	80
Liberal-Union	243,230	11	343,369	21
National Liberal	1,317,401	50	1,654,738	55
Social Democrats	3,010,771	82	3,258,961	43
Agrarians and Anti-Semites	91,217	18	147,933	29
German Nationals	333,403	15	447,308	25
Center (Roman Catholic)	1,857,273	100	2,183,381	105
Poles	538,206	16	743,582	20
Guelfs, Danes, Alsatians	210,724	9	172,078	9
Independent	474,477	32	260,513	10

$5 reduction for each day's absence. During session, and one week previous and after, the members travel free over German railways. They are elected for five years by universal (male) suffrage.

The number of enrolled voters in 1903 was 12,531,200 and 9,533,800 voted. In 1907 10,282,508 votes were cast largely through an organized effort to defeat the Social Democrats, who, however, increased their vote by nearly a quarter of a million. They, however, lost 39 seats partly by the combination of forces against them in certain constituencies and partly because the representation of the different states and cities, determined by the constitution of the empire, tells largely against the cities and industrial sections, where the population latterly has largely grown, and where the Socialists have their main strength. The result is that in 1907 the Socialists with 3,258,961 votes won only 43 seats, while the Center (Roman Catholic) with 2,183,381 votes won 105 seats and the Conservatives with 1,070,658 votes won 80 seats, together having 185 seats to the Socialists' 43, for a smaller combined vote. (See SOCIALISM.)

The Bundesrath and Reichstag both meet annually, convoked by the emperor, who has the right to prorogue and dissolve the Reichstag on vote of the Bundesrath, tho the Reichstag cannot be prorogued for over thirty days without its own consent, and in case of dissolution must be reelected in sixty and convoked in ninety days. All laws for the empire must have a majority in both houses, and the emperor can veto no laws passed by them.

The administration of the empire is carried on under fifteen ministers of state, who, however, do not form a cabinet: 1. Chancellor of the Empire, at present Fürst von Bülow. 2. Ministry for Foreign Affairs. 3. Imperial Home Office and "Representative of the Chancellor." 4. Imperial Admiralty. 5. Imperial Ministry of Justice. 6. Imperial Treasury. 7. Imperial Postoffice. 8. Secretary for the Colonies. 9. Imperial Railways. 10. Imperial Exchequer. 11. Imperial Invalid Fund. 12. Imperial Bank. 13. Imperial Debt Commission. 14. Administration of Railways. 15. Imperial Court-martial.

These act independently of each other, but under the general supervision of the chancellor. Local government in the empire varies very largely between the different states. Each state has its own constitution, government, legislature (usually bicameral), and laws. The suffrage, too, in the states varies very materially, and in general is much more limited than for the empire. The Prussian suffrage, for example, is divided into three classes, according to the amount of taxes they pay, very much favoring the upper classes. (See SUFFRAGE.)

Internal Communication

Germany had (1905) 39,052 post-offices and 32,312 telegraph-offices with 278,061 employees. The united postal, telegraphic, and telephonic service yielded a revenue of 72,097,950 marks—receipts, 596,177,563; expenditure, 524,079,613. The railroads (see RAILROADS) are nearly all owned by the states, only 3,257 miles out of a total of 34,669 being private. They were valued (1904) at 14,325,729,000 mk.; receipts, 2,278,479,000; expenditure, 1,441,435,000; net revenue, 837,044,000—being 5.84 per cent earnings on the capital.

Finance

The common expenses of the empire are met by the revenues yielded from customs, excises, and posts, telegraphs, and railways. In case of a deficit the individual states are assessed in proportion to population. The total receipts for 1906 were 2,395,130,000; expenses, 2,387,271,000 mk.; for 1905, 2,253,782,000 and 2,247,363,000 respectively. The largest item in the expense account was the army with 705,754,000 mk. in 1905 and 743,035,000 in 1906. The respective figures for the navy were 248,184,000 and 265,402,000 mk.

Army and Navy

Germany has a large and well-trained army, the peace strength being 24,687 officers, 589,676 rank and file, and 109,527 horses. Service is universal and compulsory for all able-bodied men. The navy is increasing in numbers and efficiency. Its peace strength is 33,500 officers and men, 18 modern battle-ships, 27 protected cruisers, 70 destroyers, 47 torpedo boats, besides a number of older and smaller ships, and others building. (For details, see MILITARISM.)

III. Social Reform

Social reform in Germany, as elsewhere, is affected by the past. Germany was too full of the spirit of local freedom to develop a centralized government, as in France or England. It developed separate kingdoms and states, only loosely federated into an empire, coming down from Charlemagne. Its great free cities developed art and education. Germany led in the battles of the emperors against the Pope and in the Protestant Reformation. She became the home of theology, philosophy, science, and letters. Her social spirit developed the Peasants' War (*q. v.*), and also the mystic communism (*q. v.*, see also ANABAPTISTS) which has given America many German communities.

Modern German social reform may be said to begin with Hegel's socialistic philosophy and Fichte's socialistic turning of an individualistic philosophy (see FICHTE and HEGEL), but this was in accord with the German medieval conception of the Christian paternal State. (See BISMARCK.)

Nevertheless, in the early part of the nineteenth century, German statesmen and economists drew their ideas mainly from England and the orthodox political economy of Adam Smith. Particularly was this true of the Stein-Hardenberg legislation of Prussia. Germany more than most countries of Europe, perhaps because of the lack of a strong centralized power to break the power of the old gilds and free cities, was in the control of innumerable special privileges, rights, and monopolies, granted to the old gilds and cities. This mass of special privileges and imposts had to be done away with. There were, however, some early voices for socialism. (See GALL; HUBER; RODBERTUS; WEITLING.)

Beginnings

Such was the condition of things when the revolutions of 1848 awoke Europe. In Prussia the demand in 1848 was for constitutional government, freedom of religion and the press, the right of coalition, etc., with demands here and there by the proletariat for the organization of labor, State employment of the unemployed, etc. Blood was shed. The king, Frederick William IV., promised reforms and the reorganization of Germany. The National Assembly was called at Frankfort, where Bismarck won his first laurels in gaining the leadership for Prussia.

The only industrial organizations effected immediately after the revolution were various clubs, mainly under the patronage of the Liberal Party, and the cooperative land banks and societies, organized by Schulze-Delitzsch (*q. v.*). In Berlin, however, Lassalle (*q. v.*) was growing more radical, and on April 12, 1862—sometimes called the birthday of German socialism—being invited to lecture before a workingman's club, he argued that the Revolution of 1848 had politically freed the Fourth Estate, even as the French Revolution

freed the Third Estate, and that henceforth working men must organize for industrial freedom. He was arrested and sentenced to imprisonment, later commuted to a fine. A central committee of working men's clubs in Leipsic wrote him, calling on him to outline a policy; and he did so in an open letter, which has been called the charter of German socialism.

Meanwhile Marx and Engels had published from Brussels in 1848 their Socialist manifesto, and in 1864 the International Workmen's Association was founded. It was from these various elements and movements (for details, see LASSALLE; MARX; INTERNATIONAL) that in 1869 the Social Democratic Working Men's Party was formed at Eisenach, the main leaders being Liebknecht and Bebel. (See their names.) In 1870 Liebknecht and Bebel and Hepner were arrested for the publication of treasonable writings.

Socialism

In 1874, however, ten members of the Social Democratic Party were returned to the Reichstag by 450,000 votes. Bebel and Liebknecht, tho still in prison, were elected. The government determined to be more stringent. House searches were made, and the Working Men's Association was declared by the police to be dissolved in Prussia. The Social Democratic Working Men's Party shared the same fate. Misfortune brought the two rival parties together, and a congress held at Gotha in May, 1875, completed the union. The program then adopted became the basis of the great Socialist agitation which followed in all parts of Germany.

On May 11, 1878, the emperor was shot at in Berlin by a young man called Hödel, an ignorant man of low character. He was declared to be a Socialist because photographs of Socialists were found in his pocket. Immediately an anti-Socialist bill was introduced into the Reichstag, which that body, however, refused to pass. Another attempt was made upon the life of the aged sovereign by Dr. Karl Nobiling, who, on June 2, 1878, fired at the emperor from an upper window in the Linden and severely wounded him. The cry for repressive measures against the Socialists now became general.

Repression

A "Law against the publicly dangerous endeavors of social democracy" was passed, tho the Progressist leader, Richter, said, "I fear social democracy more under this law than without it."

The law prohibited the formation or existence of organizations which seek by social democratic, socialistic, or communistic movements to subvert the present State and society.

Henceforth the socialistic propaganda was carried on in secret, but more successfully than ever; in the Reichstag at least the Socialists were free. The publication of parliamentary reports being privileged, journals with socialistic tendencies were able to reproduce in full the speeches in which Bebel, Liebknecht, and their fellows preached the principles of a movement which the government had just been given a commission to suppress.

Bismarck therefore tried other tactics. Through a movement for a so-called State socialism, he undertook to take the wind out of the sails of the Social Democrats, and also favoring Stöcker's so-called Christian socialism (*q. v.*) and the academic *Katheder Sozialisten*. (See SOCIALISM OF THE CHAIR.) As early as 1847 Bismarck had spoken in favor of State railroads, but did not definitely, or at least publicly, adopt the principles of State socialism till 1878. His first step, however, was to reverse the taxation policy of the State and establish protection. His next step was to try and introduce various state monopolies, such as a tobacco monopoly. He did not succeed in getting these efforts at first supported by the Reichstag, yet from that date the government has moved in this direction till to-day most German railways are State roads (see RAILWAYS), and German legislation is notoriously paternal. A fuller State socialism has been reached in the various State insurance laws. In 1881 came the first word from the government upon the subject. The Sickness Insurance Law was passed in 1883, the Accident Insurance Law in 1884, and the Old Age Law in 1889. (See INDUSTRIAL INSURANCE.)

State Socialism

By all this, however, the Social Democrats have no more been diverted from their purpose than they could be suppress. In 1881, however, occurred the Niederwald plot against the imperial family. Arrests were made, and two avowed anarchists were (1884) sentenced to death.

In 1884 another general election took place, and in Berlin two out of the six places fell to Socialists, and in Hamburg and Breslau two out of three. The Socialist vote polled was 549,990.

Repression was made more vigorous than ever. The year 1889 was marked by the largest strike Germany had ever known, which took place in the coal-mines of Westphalia and the Rhenish provinces, and threatened to spread, and did spread, more or less, through the empire, the emperor himself taking an interest in hearing the complaints of the miners, ordering an investigation leading to further legislation.

In 1890 the emperor accepted Bismarck's resignation as chancellor, partly upon Bismarck's insistence that the Anti-Socialist Law be renewed, a step which the young emperor did not favor, and on its expiration (Sept. 30, 1890) it was not renewed. The banished Socialists came back in great numbers. Liebknecht assumed the editorship of the *Volksblatt*, and activity went on more rapidly than ever, especially in Berlin, Hamburg, and the industrial centers. Since then the growth of the party has been steady. Its annual congresses have had large and enthusiastic attendance. Strong and wise leaders and organizers have appeared. (See AUER; BEBEL; BERNSTEIN; KAUTSKY; SINGER; VON VOLMAR.) A wing of the party led by Bernstein, while faithful to the Socialist ideals and movement, have favored since 1899 a more opportunist political course (see BERNSTEIN; also REVISIONISTS), and this has been hotly opposed (see KAUTSKY), but it has not divided the party, and wise leadership has prevented a secession. The party has developed a large newspaper and tract literature, the sales of which, together with the dues and gifts to the party, give it a firm financial basis. In 1907, tho unusual efforts were made to defeat it, the party increased its vote by over a quarter of a million, polling 3,258,961 votes and only losing seats because of unjust distribution of representation (see above; also SOCIALISM). The party thus far has not largely reached the agricultural classes, tho it is working for this. (For statistics, see SOCIALISM.)

Socialist Gains

Christian socialism in Germany must be

sharply distinguished from the Social Democratic movement, and stands indeed for more than one movement. Roman Catholic Christian socialism came first, in the utterances of Bishop von Ketteler of Mayence (1850) and the Catholic working men's clubs, begun by Father Koeping in Bavaria in 1847, and organized into a national movement led by Canon Monfany, about 1870. In 1872 these clubs had 72,000 members, mainly in Bavaria and Westphalia. (For details, see CHRISTIAN SOCIALISM; also ROMAN CATHOLIC CHURCH.)

Christian Socialism

This movement has become permanent, largely the result of Bismarck's *Culturkampf* (or contest with Rome and the expulsion of the Jesuits, 1872). The Roman Church, deprived of State influence, at least in northern Germany, appealed to the people, especially to the agricultural peasantry and the smaller landowners. Developing social clubs for mutual aid of many kinds, under the patronage and guidance of the Church, she has built up a powerful movement, especially in Bavaria—so much so that in some places little social effort can be successfully attempted without the cooperation of the parish priest. Well-attended congresses have been held, literature and papers circulated, till to-day the Romish political influence in the empire casts 2,183,381 votes (1907), has 105 seats in the Reichstag (the Center, with a strong aristocratic wing), a group the government is compelled to recognize and on which it often must depend to obtain a working majority for government measures. The Catholic labor-unions, 1905, numbered 1,600 locals, with 260,000 members. Protestant Christian socialism has had a more checkered career. Passing by earlier individual utterances (see HUBER TODT), the movement began as an organized force in 1877 with Stöcker, at that time the brilliant court preacher in Berlin. (For details, see CHRISTIAN SOCIALISM; also STÖCKER.) Favored by the government (see above), for political reasons, it took a political form and tried to rally the working men and others on "a Christian constitutional monarchical basis." This government support and political bias temporarily aided the movement, but eventually killed it. Stöcker himself became largely interested in the anti-Semitic movement, and tried to unite this with his Christian Socialist politics. After considerable success, the government for political reasons withdrew its support, and the movement became divided. Stöcker with more persistency than wisdom persisted in a lessening political movement. Todt, and later Naumann (*q. v.*), favored a more purely evangelical form. Paul Göhre led a radical wing favoring cooperation with the Social Democrats. Agitation resulted, considerable literature was developed, and numerous congresses and conferences were held. But the movement never had unity from the start, and became finally completely divided, each element working in its separate way, without large numerical following. In 1896, under the leadership of Pastor Naumann, a *National Social Party* was formed at Erfurt, standing for a strong support of the government, the endeavor to help the cause of labor by evolutionary legislation, and the Christian religion as the basis of all moral life. This movement grew somewhat, polling 30,500 votes in 1903, but was voluntarily dissolved the same year, and its forces scattered among different parties. Göhre himself has joined the Social Democrats.

In 1894, however, commenced a movement which has been more permanent. The miners in the Rhine-Westphalia coal-fields, who did not favor the antireligious bias of the Social Democrats, and also favored trade-unions patterned on the English model, started some so-called "Christian Unions" (*Christliche Gewerkschaften*), and the movement grew till in 1902 they had 35 chief organizations with 175,069 members and, in 1906, 2,333 local unions with 215,884 members. These unions are not connected with any religious body, and are technically neither Roman Catholic nor Evangelical (tho by that fact Protestant rather than Catholic), but are broadly religious in their tendency. Politically opposed to the Social Democrats, they have thereby an unavowed connection with the Center (Roman Catholic), but confine themselves mainly to trade-union efforts. (See TRADE-UNIONS.) An avowed "Evangelical Labor-Union" connection has (1905) 72,000 members. German trade-unionism is a somewhat divided movement, tho the tendency at present is toward unity and a strong development. The oldest national union is that of the printers and type-founders (1848); reformed 1867. The unions, now loosely connected with the Social Democrats ("free *Gewerkschaften*") began to be formed about 1865, independently of and for a time even hostile to the Social Democrats. They grew very slowly till 1895, but after that with rapidity and increasingly, tho vaguely connected with the Social Democrats. As the Social Democrats become less theoretical and more practical in advocating immediate measures, these unions tend more to coalesce with them, tho not technically committed to any party.

Trade-Unions

In 1868 another trade-union movement began, led by Drs. Hirsch (*q. v.*) and Duncker (*q. v.*), founders of the Progressive Party in the Reichstag. The Hirsch-Duncker union grew rapidly; came to grief over an unsuccessful strike of the miners, but then began to grow steadily. They are formed avowedly on the English model and (since 1876) exclude Social Democrats from their ranks. Politically they are eclectic and support those parties which most favor immediate progressive labor measures. In 1905 there were 2,158 Hirsch-Duncker unions with 111,887 members. The total trade-union movement of Germany is as follows:

Social Democratic unions....	9,525	with 1,372,539	members
Christian trade-unions.....	2,333	" 188,106	"
Hirsch-Duncker unions.....	2,158	" 117,097	"
Independent unions.....	812[1]	" 144,601	"
	14,828	1,822,343	

[1] Not completely listed.

Quite separate for the most part from either the trade-union or the Social Democrat movement is the German cooperative movement. Beginning with the Schulze-Delitzsch (*q. v.*) loan associations in 1848, and the Raiffeisen (*q. v.*) cooperative banks, which, tho begun in 1849, were little known till 1874, cooperation, first in loan associations and more recently in other forms, has assumed large proportions. (See COOPERATION.)

More characteristic of Germany is the aid in various forms which the government has extended to the labor movement. Of the important government industrial insurance system we have already spoken (see INDUSTRIAL INSURANCE for details, statistics, etc.). Beginning in

1887 with sickness insurance, by 1904 60,000,000 persons (the sick, the injured by accident, invalids, and their relatives) had received $1,000,000,000 as indemnity, the working men having raised only the smaller part of this sum in the form of contributions, and receiving an indemnity which was by $375,000,000 larger than what they had paid in.

Of the accumulated amount of $375,000,000, nearly $100,000,000 had been applied to the erection of working men's houses, hospitals, and sanitariums, to places of cure, people's baths, and similar institutions.

Legislative Action

A considerable industrial legislative code has also been enacted (see FACTORY LEGISLATION; Digest of Section GERMANY), stimulated somewhat by the International Government Labor Conference, which met, invited by the Kaiser, in Berlin, March 15, 1890.

Almost as important are the action of the German municipalities on municipal housing, pawn-shops, etc.; but for this, see especial articles, MUNICIPALITIES, GERMAN; HOUSING; PAWNSHOP. Characteristic especially of this action, as of all of German State proceedings, is the cooperation of voluntary individual action with State aid and under State supervision.

Public Employment Bureaus

This is particularly true of the important movement for public employment bureaus in Germany. Leipsic early began a municipal employment bureau, and Stuttgart a non-municipal but public (not commercial) bureau as early as 1865, and these two types were slowly copied till a social congress, held in Berlin, 1893, gave a great impetus to the movement, and to-day public employment bureaus exist in every important German town, a number of them being municipal. In Prussia alone there were 226 such public bureaus in 1904, and it is estimated that in the year ending March, 1904, situations were found for 600,000 persons (for the empire). Almost invariable features of them is that they are controlled by boards composed of equal numbers of employers and employees, a consideration regarded as vital to their success; and that if not municipal are under strict municipal control. (See PUBLIC EMPLOYMENT BUREAUS.) Connected with these practically if not organically is the German system of colonies and relief stations for the unemployed. The German Labor Colonies (see LABOR COLONIES), beginning in 1881 with Wilhelmsdorf, near Bielefeld (*q. v.*), started by Pastor von Bodelschwingh (*q. v.*), have multiplied till there are now thirty-three in the empire, which received in 1904 10,009 homeless wanderers. Their permanent effect is questioned by some—they shelter an admittedly weak body of men—but they have at least developed some into efficiency, and are said to have almost relieved Germany of the tramp which previously infested the empire. (See UNEMPLOYMENT.)

Correlated with these are the relief stations (*Verpflegungstationen*) and the home shelters (*Herbergen zur Heimath*) now scattered throughout the empire. The relief stations are stations established usually by the public authorities where working men traveling in search of work can apply for situations, be directed where to go, and provided with a meal or lodging overnight in exchange for a little work. These stations are over 1,000 in number, within walking distance of each other, and connected by telephone, so that a workingman can traverse the whole empire (or large portions of it) and hear of the possibilities of employment. Each man, however, who applies must have or purchase a labor passport with a certificate of past employment, civil papers, etc., and this must be shown and stamped at each station he visits. The home shelters are institutions conducted by private philanthropy and usually on a religious basis, which provide unemployed working men a longer shelter than the relief stations, with which, however, they are sometimes combined. The first home shelter was instituted at Bonn in 1854, and grew slowly in numbers, tho recently much more rapidly. There were reported 461 of the home shelters in 1905. The center of this movement is now the Herbergen zur Heimath at Bielefeld. Pastor von Bodelschwingh has united the movement under a German Travelers' Home Society. (See RELIEF STATIONS.)

Home Shelters

Important evangelical social work is done by the Inner Mission commenced by Wichern in the Rauhe Haus at Hamburg in 1848, and developed to-day into very large and ramified charities and social work. (See INNER MISSION.) For the numerous German charities and relief institutions, conducted partly by the State and partly by private philanthropy under State control, see PAUPERISM AND THE RELIEF OF. This work assumes in Germany a more scientific and combined form than in most countries, and numerous national societies have arisen for the study and prosecution of social reform work. (See also SOCIAL INSTITUTES; MUSEUMS OF SECURITY; PROSTITUTION; TEMPERANCE; WOMAN'S MOVEMENTS.) Among the more important national social reform societies are:

Reichs-Versicherungsamt, Berlin W., Königin Augusta str. 25, 26. (State Industrial Insurance Office.)

Centralstelle für Arbeiter-Wohlfahrtseinrichtungen, Berlin S. W., Dessauerstr. 14 (Prof. Dr. Albrecht). (Industrial Betterment.)

Bureau für Sozialpolitik, Berlin W., Nollendorfstr. 29, 30 (Prof. Dr. Ernst Francke).

Institut für Gemeinwohl, Frankfort-on-the-Main, Kettenhofweg 27.

Soziales Museum, Munich.

Soziales Museum, Frankfort-on-the-Main.

Bergischer Verein für Gemeinwohl, Barmen.

Centralverein für das Wohl der arbeitenden Klassen. Sekretär, E. Rüdiger, Schöneberg, Stubenrauchstr. 8. (For the benefit of the working classes.)

Verein für Sozialpolitik. (Meets every two years for important conferences.)

Internationales Institut für Sozialbibliographie, Berlin W., 50, Spichernstr. 17.

Deutscher Sparkassen-Verband. (Savings.)

Deutscher Verein für öffentliche Gesundheitspflege. (Health and Hygiene.)

Deutscher Verein gegen den Missbrauch geistiger Getränke, Charlottenburg, Fasanenstr. 59. (Temperance.)

Verband deutscher Arbeitsnachweise, Berlin C., Gormannstr. 13. (Labor bureaus.)

Charitasverband für das *katholische* Deutschland (1897), Freiburg in Breisgau (Geistl. Rat Dr. Lorenz Werthmann). (Charitable Association of the German Catholics.)

Centralausschuss für die innere Mission der deutschen *evangelischen Kirche*. Berlin W., Genthinerstr. 38. (Central Committee for the Inner Mission.)

Centralkomitee der deutschen Vereine vom Roten Kreuz. Berlin W., Wilhelmstr. 73. (Red Cross.)

Gesamtverband deutscher Verpflegungsstationen, Behtel bei Bielefeld. (Relief stations.)

Deutscher Herbergs-Verein, Bethel by Bielefeld (Pastor Mörchen). (Home shelters.)

Centralvorstand deutscher Arbeiterkolonien (Geheimrat von Massor, Potsdam, Lennéstr. 12). (Labor colonies.)

Deutscher Verein für Armenflege und Wohlthätigkeit (1880).

GERMAN MUNICIPALITIES. See MUNICIPALITIES, GERMAN.

GERRYMANDERING: In United States politics, an arrangement of political divisions in disregard of natural boundaries, as indicated by geography or position, so as to give one party an unfair political advantage. It is done sometimes by throwing the greatest possible number of hostile voters into a district which is certain to be hostile, sometimes by adding to a district where parties are equally divided some place in which the majority of friendly voters is sufficient to turn the scale.

The word is derived from Elbridge Gerry, a leading Democratic politician in Massachusetts (a member of the Constitutional Convention of 1787, and in 1812 elected Vice-President of the U. S.), who, when Massachusetts was being redistricted, contrived a scheme which gave one of the districts a shape like that of a lizard. An artist, seeing a map of the district in an editor's office, remarked, "Why, this looks like a salamander." "Say rather a Gerrymander," replied the editor; and the name remained.

GHENT, WILLIAM JAMES: American author and Socialist; born at Frankfort, Ind., 1866; educated in the public schools. Learning the printer's trade, he worked as a compositor in various parts of the country, and later as a reporter and editor on several New York City periodicals. He has contributed to many papers and magazines, particularly *The Independent*. He was one of the founders of the Social Reform Club of New York (1894). An independent Socialist from 1893 to 1904, when he joined the Socialist Party. Since 1906, secretary of Rand School of Social Science. He has written: "Our Benevolent Feudalism," 1902; "Mass and Class," 1904. *Address*: 260 West Fifty-fourth Street, New York City.

GIDDINGS, FRANKLIN HENRY: Professor of sociology; born at Sherman, Conn., 1855. After preparatory studies at Great Barrington he entered Union College in 1873, received the degrees A.B. and A.M. Entering journalism, he was connected with the *Daily Union and Republican* of Springfield, Mass. In 1885 he made an investigation of cooperation and profit-sharing for the Massachusetts Bureau of Labor, the results being published in its seventh annual report. In 1888 was appointed resident lecturer and in 1891 associate professor of political science at Bryn Mawr College. In 1891, without leaving Bryn Mawr, he was appointed lecturer on sociology in the School of Political Sciences at Columbia University, and in 1894 professor of sociology in that university, leaving Bryn Mawr. Professor Giddings has been chairman of the Publication Committee of the American Economic Association, and vice-president of the American Academy of Political and Social Science. His contributions to economic journals have been almost constant, and since 1891 mainly concerned with the province and contents of sociology, in which department Professor Giddings has come to be an acknowledged leader. His views have often caused him to be classed as an independent Socialist and radical. Author: "The Theory of Socialization"; "The Elements of Sociology"; "Democracy and Empire"; "Inductive Sociology." *Address*: 150 West Seventy-ninth Street, New York City.

GIDE, CHARLES: French political economist; born at Uzès, France, 1847. From 1874–80 he was professor of jurisprudence at Bordeaux, and since 1880 has held the chair of political economy at Montpellier. He is editor of the *Revue d'Économie Politique*. His chief work is his "Princeps d'Économie Politique" (1883), which has been translated into English. He is even better known by his valuable reviews and magazine articles as one of the leaders in the revolt against the classic French economists, and also for his active interest in the French Protestant movement toward Christian Socialism.

GIFFEN, SIR ROBERT: British statistician; born at Lanark, Scotland, 1837; educated at Glasgow University (LL.D., 1884). He was successively engaged as a solicitor's clerk and as a journalist, being connected in an editorial capacity with the *Globe* and with the *Economist*. From 1870 to 1876 he edited the trade and finance articles for the *Daily News*, and in the latter year was appointed chief of the Statistical Department of the Board of Trade. In 1882 he was appointed controller-general of the departments of commerce, labor, and statistics, retaining this office till 1897. From 1882 to 1884 he was president of the Statistical Society. He has written: "The Progress of the Working Classes in the Last Half-Century," 1884; "The Growth of Capital," 1890; "Economic Inquiries and Studies," 1904, etc. *Address*: Haywards Heath, Sussex, England.

GIFTS AND BEQUESTS: The year 1906 was remarkable owing to large gifts to public institutions by private individuals both in the United States and in Great Britain. According to records kept and published by various papers, particularly *The Chicago Tribune* and *The World Almanac*, the benefactions of 1906 in the U. S., not including small donations, amounted to $106,338,063, and according to *Whitaker's Almanack* in Great Britain to £4,486,440. The record from 1901–6 in the U. S. is:

BEQUESTS AND GIFTS FOR

1893–1900	$330,000,000
1901	107,000,000
1902	94,000,000
1903	77,000,000
1904	88,000,000
1905	104,586,422
1906	106,338,063
Total 1901–6	$576,924,485
Total 1893–1906	906,924,485

In Great Britain:

1901	£1,926,850
1902	4,443,200
1903	1,577,140
1904	1,370,750
1905	1,704,100
1906	4,486,440
Total 1901	15,514,480

GILD OF ST. MATTHEW, THE: A Christian Socialist society founded in 1877 by some of the young men and women of Bethnal Green who had come under the influence of the Rev. Stewart D. Headlam, curate of the parish church. It was the outcome of the belief that the atheistic secularism of Mr. Bradlaugh and the Hall of Science was the result of the secular work of Christ and His Church having been neglected by churchmen. When Mr. Headlam had to leave Bethnal Green, the gild, with Mr. Fred. Verender as its secretary, extended its work and sent lecturers far and wide to secular halls, working men's clubs, etc. Besides the warden and secretary, Mr. Shuttleworth, Mr. Hancock, Mr. Carson, Mr. W. E. Morris, Mr. Dearmer, Mr. Moll, and Mr. Merson were priests who took an active part in the gild work.

The gild's study of social and political questions has made it a society of Socialists, sacerdotalists, and sacramentalists. It took an active part in the reception of Mr. Henry George, and the propagation of his principles, with which in England the name of Mr. Verender will always be connected. *The Church Reformer* was for ten years its organ, and the future church historian will find the columns of this publication replete with valuable information. The gild is mainly responsible for the Christian Socialist movement begun by Maurice and Kingsley having spread and fructified among "High Churchmen"; it has always been a small body—generally about 100 priests and about 150 laymen. Besides its general socialistic propaganda, and its insistence on the necessity of getting the mass restored to its proper unique place in the Church worship, it has worked for the abolition of the patron and the establishment of the parish in his place; for the State confining its educational function to secular schooling, and has strongly opposed municipal Puritanism. During the Easter of 1906 it organized a clerical address of congratulation to the thirty Labor members of Parliament. It also in that year undertook the circulation of a dozen little books of the Faith and Freedom Press designed to save the clergy, Sunday-school teachers, and others from spreading crude and false notions of the Christian faith which are the notions which skeptics so easily attack.

The chief work of the gild is now done by the members in their various parishes, and by the circulation of literature. The books on which they specially rely for this work are: The Rev. Thomas Hancock's "Pulpit and the Press," "The Banner of Christ in the Hands of the Socialists," and "God as Our Schoolmaster is Always in All Schools"; the Rev. Stewart D. Headlam's "Laws of Eternal Life," being lessons on the church catechism, "The Meaning of the Mass," "Secular Schools," "Priestcraft and Progress," "Municipal Puritanism," and "Christian Socialism"; Rev. Conrad Noel's "Day of the Sun." Also Mr. G. Shea's "What It Is and Who Should Join It," "The Church and the Polling Booth," "Disorders in the Church" (maintaining that they are social and industrial, not ritual), and many other leaflets. These can all be obtained from Mr. Fred. Verender, 376 Strand, London, W. C., England.

STEWART D. HEADLAM.

GILDS: The various trade- and labor-unions, as well as friendly societies, etc., are treated in separate articles. Under this head are considered only the ancient labor-unions and the medieval gilds.

I. Ancient Labor-Unions

That labor-unions have existed all through history has long been known, but only recently have they been carefully studied. Particularly has Mr. C. Osborne Ward investigated the subject, and his "The Ancient Lowly," altho he reaches conclusions by no means accepted by all scholars, contains a fund of valuable information. According to Mr. Ward, the gild grew from the family. When the paterfamilias died the oldest son usually took his place; but some of the younger sons, being of the same blood as the head of the family, would rebel at this. Out of this division, according to Mr. Ward, came classes—the aristocrats, or heads of families, and the dispossest freemen who were not slaves. These developed the artizan classes and, when these united, the first labor-unions. These unions were connected with a religious cult. As the aristocrats worshiped the shades of their ancestors, and made that worship the center of the family, so the labor-unions found their patron gods.

History

The date of the earliest labor organization cannot be fixt; but it must have been very early. As early as 1180 B.C., according to Plutarch's "Theseus," one Menestheus rose against the aristocrats at Athens to demand for the people the right to be initiated into the Eleusinian mysteries. There must have been at least some understanding between working men at this time, and one of their first grievances was that they were excluded from the aristocratic religious rites, the aristocrats teaching that working men had no souls. A fragment from the age of Solon shows that in his time (about 600 B.C.) trade-unions were common (Granier's "Histoire des Classes Ouvrières," pp. 283–287). The celebrated Roman Law of the Twelve Tables specified the manner of organization of working men, and is declared by some (Gaius's "Digest"; Plutarch's "Numa") to be a translation from the Greek law of Solon; and the law of Solon is said to be a paraphrase of the still more ancient law of Amasis, King of Egypt. References are found by some to trade-unions in the Bible, in the time of Joshua (1537–1427), and certainly in the time of Solomon. Hiram of Tyre, who is said to have been the architect of the Temple at Jerusalem, brought with him from Tyre 3,200 foremen and 40,000 free artificers—not a large number, when it took the immortal Phideas, Callicrates, the chief architect Ictinus, and probably 50,000 unionist craftsmen ten years to design and complete the Parthenon—the perfection of architectural art.

By the time of Numa Pompilius we find unions fully developed and recognized by law. (See Plutarch's "Numa.") Mommsen ("De Coll. and Sodal Rom.," p. 78) says: "The relics of innumerable communal associations of ancient times are seen scattered all through Italy, as found among the inscriptions of the Italian towns." Down to B.C. 58 of the times of the emperors, the right of working men in Rome to organize was unabridged. Numa divided the unions into eight great classes, a clear witness to their number.

Later, the unions became innumerable. Ward describes a great number both Greek and Roman. The source of our knowledge of these is mainly from inscriptions, tablets, columns, and mutilated manuscripts. Most of the historians were too aristocratic to notice labor organizations, and, according to Ward, the references they did make to uprisings of slaves and laborers were mutilated by aristocrats.

The early Greek unions were called *thiasotai* (or disciples of mutual love), *sussitoi* (or those who eat at a common table), *omotaphoi* (or burial societies). According to Ward, the *hetaroi* and *hetæræ* were male and female associates of labor societies, and only later was the latter term used for prostitutes, because laborers were despised. Ward mentions especially the Greek *thiasoi* and *eranoi* as general names for Greek gilds. Of the Roman organizations we have fuller information.

Names

The *Fabri navalium*, or ship carpenters and boat-makers of the Tiber; the *collegium vascularíorum* (metal vessel makers); the *collegium pistorum* (millers); the *collegium incendarium* (firemen); the *collegium vinariorum* (wine dealers); even the *collegium lupanariorum* (brothel keepers); the *collegium bisellariorum* (makers of chairs for the gods); the *collegium centonariorum* (ragpickers or junkmen); the *collegium soliarium baxiarum* (shoemakers); the *fullonum sodalicum* (fullers); the *corpus nemesiacorum* (fortune-tellers); the *collegium armariorum* (gladiators); the *communionis mimirum* (actors); the *collegium castrênsiariorum* (sutlers); the *collegium vinatorum* (planters); the *collegium farrariorum* (mowers), and a long list of others too numerous to mention.

These *collegia* seem to have been scattered all over the Roman Empire, in Asia Minor, the Greek islands, Spain, and Gaul, as well as in Greece and Rome. Mr. Ward says they were established in England by the Romans, and gave rise to the medieval gilds, especially in Kent, whence "the men of Kent" brought the Labor movement to America.

All these unions were more or less combinations of religious societies, burial societies, convivial societies, and friendly societies, with dues and benefits. Each organization took some patron god and celebrated his worship. They had banners and processions and days of worship. This was partly to cover their meeting for other purposes. They had occasional or regular convivial meetings, and suppers in common, and their dues were sometimes simply exacted to meet the expense of these. Almost invariably they were burial societies with dues to meet the expense of the burial, of which the ancients made much. Sometimes they were trade-unions and friendly societies in the modern sense. They had fixt prayers and a ritual for the conduct of their meetings. Their officers were presiding officers (of both sexes), a "president of finance," a stewardess or housewife, a manager or trustee, a recording secretary or scribe, lawyers to defend the members, priests to conduct the religious rites.

Organization

Some of the inscriptions give the best picture of their organization. One written in plain Attic Greek (translated in the *Revue Archéologique*) reads: "Because of rulable and just administration of the common fund of money of the community of *eranistai*, and having ever conducted himself with kindness and with honesty; and because he has righteously husbanded the funds successively paid by the *eranistai* themselves, as well as the annual subscription, according to the law of the *eranas*, and in view of the fact that in everything else he still continues to show integrity to the oath which he swore to the *eranistai*, therefore hail Alcmeon. The community of the *eranistai* rejoice to praise Alcmeon, son of Thon, a stranger who has been naturalized—their president of finance—and do crown him with a chaplet of foliage because of his faithfulness and good-will to them. They are, moreover, rejoiced, and praise the trustees, and also the priests (chaplains) of Jupiter the Savior, and of Hercules, and of the Savior of the Gods. And they crown each of them with the wreath of honor because of their virtue, and their lively interest in the community of the *eranistai*."

The stone is broken and the date is gone, but it seems to be of the Aristotelian period.

That these unions were very much like modern trade-unions, and even in advance of many present unions, is seen by the following inscription, discovered at Pompeii, showing that they endeavored to influence politics, and that they honored women (Ward's translation):

1. "The members of the Fishermen's Union nominate Popedius Rufus for member of the Board of Public Works."
2. "The International Gold Workers' Association of the City of Pompeii demand for Member of the Board of Public Works Cuspis Pansa."
3. "Verna, the home-born, with her pupils in all right, put Mrs. Capella to the front for a seat on the Board of Magistrates."

To these unions Ward ascribes great influence in ancient times. Socrates, he says, was a member of them; and his last words as he lay dying was to remind his disciples that they (the *thiasotai* or brethren) owed their cook for a chicken on which they had banqueted. Southern Italy had a great many of these unions, and here Plato found a system of communisms supposed to have been founded by Pythagoras. Jesus Christ, Ward believes to have belonged to such a union, and to simply have proclaimed successfully to the world the brotherhood and equality which the unions had long preached and striven for in private. The early Christian churches, he says, were first developed where these unions were strong, as at Pergamus, Laodicea, Ephesus, and Hierapolis ("the seven churches"), Antioch, Rhodes, and elsewhere. Many of these unions doubtless became corrupt; their feasts became feasts of revelry and dissipation; but originally, according to Ward, the Bacchic festivities, the Bacchanalia and Saturnalia, were not licentious.

These unions were almost exclusively of free working men, tho occasionally slaves were admitted. But the condition of the slaves was terrible in the extreme. At Sparta, Lycurgus instituted a communism, but it rested on slavery of the helots. There were common tables, but they were waited upon by nearly naked slaves. The slaves were State slaves, and were flogged once a day. The young *ephori* were taught to hunt for the helots and kill them as they toiled in the fields, in order to keep the helot class in subjection. Two thousand helots are known to have been killed in the fields at one time. At Athens slaves worked the State mines at Laurium and elsewhere, both sexes working naked in the mines under the lash, and loaded with chains. In Rome they were made to fight each other and wild beasts in the arena. In Sicily they were housed in dungeons, compelled to work naked in the fields, beaten, tortured, crucified. Hence arose great slave strikes.

Slaves

Slave Revolts

The earliest slave strike in Greece was probably a rising of the Spartan helots, which was put down in cold blood in the time of Agis I. (about 1055 B.C.). During the Peloponnesian wars there was a great strike of the 20,000 Athenian slaves at Sunium, who went over in a body to the enemy, Sparta (413 B.C.). Another strike seems to have occurred at the same place, B.C. 133, when 1,000 slave miners killed their overseers and rushed into the town and temple for security, but were finally overpowered. According to Livy ("Annales," lib. iv., 45), the slaves rose in Rome 407 B.C., and tried to fire the city, but were betrayed and the ringleaders crucified. B.C. 194, the slaves rose in Latium and gained the city, but were again betrayed to forces marching from Rome, and some 2,000 were slaughtered (Livy, xxxii., "Epitomy"). B.C. 196, a great strike seems to have taken place in Etruria, and another in Apulia, B.C. 185–184 (Livy, xxxix.). In the island of Chios the slaves rose at an uncertain date, and, under Drimakos, a soothsayer, escaped to the mountains and maintained independence there under their slave king. But finally, according to the story, the *Chiots* offering a great reward for Drimakos's head, the old man called a boy friend to him and had him cut off his head to get the reward, which the youth did, a temple afterward being built to Drimakos. In Sicily, under Eunus, 143–133 B.C., the slaves rose and conquered their masters and chose Eunus king, and finally had a force of 200,000 men, defeating army after army sent against them from Rome during a period of six years. In Pergamus, in Asia Minor (B.C. 130), King Attalus willed his empire to Rome; but Aristonicus, a natural brother, roused the slaves, and offered them their freedom if they would support him. He, with his *eranoi*, defied Rome and defeated her consular armies, till finally overthrown by M. Paperna (B.C. 104). Another great slave rising took place in Sicily under Athenion, who united with the free workmen and defeated Rome in six great battles. The rising of the gladiators under Spartacus is better known. Spartacus at Capua plotted his escape with 200 gladiators, 74 B.C. Gaining weapons, they attracted slaves and working men to them till they had ultimately an army of 300,000 men. He defeated army after army of the Romans by shrewd tactics and desperate valor, but finally was conquered by Crassus, Spartacus himself perishing in the battle; 60,000 workmen fell in the battle, and 6,000 were crucified by the Romans along the road from Capua to Rome.

II. Medieval Gilds

The medieval gild in one sense doubtless sprang from the ancient labor-unions, but in an important sense it did not. Medieval life sprang from Germanic life, adapted to and molded by the Roman civilization it overran. Wherever the Germanic tribes went, in Germany, England, France, Italy, or Spain, they found labor-unions, and, as it were, inherited them. Yet is the medieval gild essentially German and not Roman.

The Roman gilds were mainly of slaves or of the despised. The medieval gilds were composed essentially of freemen. They were not simply trade-unions.

Origin

Some have argued that the medieval gilds sprang from the early common banquets of the Gothic tribes. They more probably sprang from a variety of causes. The name "gild" is probably derived from the Anglo-Saxon *gylden* or *gildan*, "to pay," since a distinctive feature of all the gilds was the common contribution or assessment. The word at first seems to have been used for any association for any purpose that had contributions to a common fund. "The early gilds," says Professor Seligman, "had no connection with trade or industry." They were largely social, often protective, sometimes political, almost always with a religious spirit. Says Gierke ("Deutsches Genossenschafts-Recht," p. 227): "The old Germanic gild embraced the whole man and was intended to satisfy all human purposes; it was a union such as exists to-day only in our towns or states; it answered at the same time religious, moral, social, economical, and political purposes."

An important variety of these gilds were the *frith*, or *peace gilds*, sworn communities for the protection of right and the preservation of liberty. Many gilds were formed by and often composed of the clergy. A still larger class were purely social and charitable. There were said to have been as many as 909 gilds in the county of Norfolk alone. Contributions to the common treasury, masses for the living, and funeral rites for the deceased brethren, observance of a mutual charity, and the bathing, feeding, and clothing of 100 poor men, are among the obligations of most of the gilds whose members promised to conduct themselves as righteously as possible, and be of "one heart and of one soul."

These gilds, of one kind or another, extended all over Germanic Europe and endured in most countries till the time of the Reformation, and in a few instances to the nineteenth century. In England, Henry VIII. sequestered the property of the religious gilds. In Denmark and North Germany their property was devoted to the public service. The most important, however, of all medieval gilds were the *gilds-merchant* and the *craft gilds*. The former came first and grew to great power, becoming often the real municipal corporation of the towns. Gradually, however, the craft gilds gained upon them, and finally replaced them.

III. Gilds-Merchant

The gilds-merchant in all European countries seem to have been developed about the same time. In England, they are mentioned first in "Doomsday Book," both knighton-gild and gild-merchant existing at Nottingham. Lincoln is said to have had one during the Danish supremacy, and soon after *Doomsday* they are frequently mentioned in town charters. The drapers' company of Hamburg dates from 1153, and that of the shoemakers of Magdeburg from 1157. Similar associations existed in Milan about the same time. They were common in France in the reign of Louis IX. By the close of the twelfth century they were general throughout Europe. The Hanseatic League, which was practically a league of North German gilds-merchant, and which came to have such power, dates from the thirteenth century. Their charters were essentially monopoly licenses to sell. With the license also went certain privileges and exemptions. Says Professor Seligman, from whose "Two Chapters on the Medieval Gilds of England" we derive much information:

Development

"It was essential for the merchant traveling from town to town, or even trading within the burgh, to be freed from these burdens, and we find accordingly immunities of this kind in almost every case. . . .

"Another privilege that is often mentioned is the *hansa*. What this was is not very clear. The magnificence of the Hanseatic League and its branches in medieval England are well known, and the Steelyard of the hanse-merchants or Easterlings, who were already protected by Æthelstan, became a renowned institution of London. . . . But the term is much older, and occurs frequently in the English charters, probably at first having reference to the privileges of merchants when away from home. For the English had their gilds in foreign ports also. Its meaning, however, soon became equivalent to gild, or the rights of a gild, and in this generic signification it is used all through the later documents. The 'hanse of the gild' thus became a collective name, which included all the usual attributes of a trading corporation."

The constitution of the gilds shows their character. Seligman tells us that "at the head stood the alderman or master, who probably paid something for his position, and at his side were the wardens or stewards, and occasionally other officers, such as seneschals, ushers, clerks, deans, and chaplains. Membership was obtained by heredity, purchase, or gift, and frequent mention is made of the seats of the associates, which probably referred to their position at the feasts or the arrangement of the booths in fair-time. The alienation of the seats, whether by sale or gift, was forbidden, and while the sons and sometimes the nephews and daughters of members were admitted free of all charges, others were obliged to pay an entrance fee and produce two sureties. In the oath that was administered on initiation, the new member pledged himself to conform to the ordinances, to be subject to the same burdens as his fellows, to inform the officials and inhabitants if he discovered any merchant in town who was not a member, and to obey the command of the mayor as well as to maintain the good usages of the city. Peace and good-will between the members were enjoined; provisions of a charitable character, such as alms to the impoverished and visits to the imprisoned, are occasionally found; the morning speeches and periodical banquets were not omitted, and the members were admonished not to forget to drink their gild-merchant, on which festive occasions the officers availed themselves of the opportunity to collect the taxes."

Constitution

The gild-merchant was then at the outset a mere company of traders; but the term merchant, which by no means conveyed the same ideas as at present, included not only those that carried on foreign commerce, but petty traders of all kinds, even artizans. The gild, however, in course of time lost its character as a purely private society, and became closely connected with the municipal organization, altho never identical with it. When the towns and boroughs obtained charters, they took care to have it included that the men of the place should also have their gild-merchant. "Gild law" often became the law of the town. But in England and the north of Europe the gilds-merchant, having grown rich and tyrannical, excluded the landless men of the handicrafts; these then uniting among themselves, there arose everywhere by the side of the gilds-merchant the craft gilds, which gained the upper hand on the Continent in the struggle for liberty in the thirteenth and fourteenth centuries. In England these companies usually existed side by side with the old town or merchant-gild; until at length their increasing importance caused the decay of the old gilds, and the adoption of these crafts as part of the constitution of the towns (thirteenth to fifteenth century).

In the great cities like London and Florence the gilds-merchant, if organized, never seem to have taken deep hold. The craft gilds seem to have been early organized.

IV. Craft Gilds

The origin of these craft gilds is more disputed than that of the gilds-merchant. There are three main views. Brentano, in his "Gilds and Trade-Unions," argues that they were associations of craftsmen to protect themselves from "the abuse of power on the part of the lords of the town, who tried to reduce the free to the dependence of the unfree." There seems, however, little to support this view. Dr. Cunningham ("History of Industry and Commerce," vol. i., p. 310) says

Origin

they were "called into being not out of antagonism to existing authorities, but as new institutions, to which special parts of their own duties were delegated by the burgh officers or the local gild-merchant." Professor Ashley ("Introduction to Economic History and Theory") takes the middle ground that they were self-governing bodies of craftsmen, more or less under municipal control. They are, however, in no case to be identified with modern trade-unions, and tho Brentano and Mr. George Howell following him have held that modern trade-unions are descended from them, there seems to be no proof of this. The prototype of the modern trade-union is to be sought rather in the journeymen associations that sprang up later, as the craft gilds grow aristocratic and wealthy. The craft gilds were rather gilds of employers. As the gilds-merchant were monopolies in traffic, so the craft gilds were monopolies in production.

The early charters, says Professor Seligman, all contain as a cardinal point the provision that no one should venture to carry on the trade either in the city or suburbs unless a member.

The crafts could thus not be initiated without permission. The towns often assumed the right of recognizing the formation of gilds, which was regarded as a perfectly legitimate exercise of municipal powers. The regulations of the craft were subject to the periodical approval of the municipal officers, and the gilds were formed and recognized as welcome auxiliaries to the means for the enforcement of the market laws. Care, indeed, must be taken not to exaggerate the involuntary character of the unions, for the early rights of the craft gilds were probably, in part at least, the growth of self-assertion. But, above all, the ordinances were the outgrowth of a general medieval policy.

Their constitution resembled that of the gilds-merchant. The unions known by the names of mystery, faculty, trade, fellowship, or (from the fact of possessing particular costumes) livery company, were divided into two or three categories. At the side of the alderman or master, the chief officer, stood four or six wardens or searchers who possest the general authority to inspect work and rectify abuses. As in all gilds, the social gatherings, processions, and annual feasts played a great rôle, and we find here and there provisions for the common welfare, assistance to the needy, and the maintenance of a chaplain. But these few ordinances of a charitable character played an exceedingly insignificant part in the constitution of the craft gilds. The true significance of the crafts was economic, not social.

Constitution

Membership in the gild in the period of their prosperity depended on full citizenship. Non-citizens, whether aliens or simple strangers, enjoyed but a precarious position. The qualification of freeman was necessarily relaxed in the case of women, who were also admitted as members, for certain occupations were almost exclusively conducted by them.

But participation in the franchise was not enough. A perfect acquaintance with the details of the trade and the ability to produce good work were in all cases preliminary requisites. In fact, the main provisions of the craft, the very soul of its constitution, were the regulations intended to insure the excellence of the products and the capacity of the workman. The ordinances almost invariably commence with a recital of the various subterfuges employed by knavish artificers to deceive the public.

The whole character of the craft gild is seen by these regulations to be due to the compulsion of the city authorities rather than to any philanthropic anxiety on the part of the trades. Carefully ascertained rules as to the exact proportion and quality of the raw materials were prescribed with great minuteness; the mixing of good and bad wares was strictly prohibited, and the greatest care was exercised in the selection of proper tools.

Similar considerations led to the prohibition of night-work or sales by candle-light. Said an edict: "The spurriers shall not work after curfew, 'by reason that no man can work so neatly by night as by day,' and especially because many persons 'compass how to practise deception in their work,' and introduce false and cracked iron for tin and put gilt on false copper."

It was imperative on the craftsman to furnish an adequate guaranty of his fitness to join the gild and produce good work. This guaranty consisted in the fact of a previous apprenticeship and the evidence of a good moral character. The apprenticeship continued as a rule for seven years, when, in Germany at least, the apprentice was given an opportunity to travel (Wanderjahre) and study his craft in other cities. On his return home he was expected to produce some masterpiece to show his skill, and only then was he admitted into the gild of his trade.

These regulations were but a part of the whole medieval system. The Middle Ages were a period of customary, not of competitive prices, and the idea of permitting agreements to be decided by the "higgling of the market" was an impossibility, because the laws of the market were not left to the free arbitrament of the contracting parties. The severance of occupations was imposed upon the trades, not spontaneously adopted by them, and the medieval statutes teem with provisions of this nature, as, for instance, that shoemakers shall not be tanners, brewers not be coopers, cordwainers not be curriers, butchers not be cooks, drapers not be "litsters," while a statute of 1363 admonishes all artificers and handicraft people to use only one mystery or occupation.

Trade System

But the subordination of the gilds to the general laws of the realm constitutes only one half of the explanation. The other half must be sought in the commanding influence of the towns in economic life. All powers of market and social police were from the first massed in the hands of the urban authorities. The gilds developed and were developed by this life. They aided, too, in art and religion.

All medieval gilds, as has been said, were largely religious; and Gierke says in his "Deutsches Genossenschafts-Recht" (p. 227): "As a religious community, as a union for worship, which probably the name signifies, every gild had a patron saint, whose name it bore, and by whom its members swore, and an altar of its own, which it maintained. The erection of benevolent institutions, perpetual masses, and similar gifts to the Church, the giving of alms and the assistance of pilgrims, the maintenance of altar lights, and other pious acts were matters of the union and among its purposes."

Says Mr. J. Bleecker Miller: "That was a time when the *Cathedral* system was the religious or-

ganization of a great city, with its centralized government under one head, its chapter of priests who attended to the religious wants of the city as a whole, and with the citizens divided according to their trades and professions into smaller religious and political communities, called gilds."

The gilds did much for charity. A brother of the craft would give house and lands to better the annual feast, which the craft always held; or he might found a school, a hospital, or an almshouse, and after defining the amount of his benefaction, would leave the surplus, if any, to the discretion of the gild. Or he would make the gild the trustees of the fund, from which the mass priest should receive his stipend for spiritual offices, the residue being left to the gild as remuneration for management. Occasionally the corporations bargained for the amount of the spiritual service, and refused to agree to a proposal which might be too costly for the fund to bear. They exacted fees for apprenticeship, for taking up freedom by inheritance or servitude, and more lately for admission into the gild by purchase. Like prudent men, who might be liable to occasional charges, they saved and invested these funds, as also gifts for lending without usury to poorer citizens, for apprenticing poor boys or girls, or for marriage portions, or for widows' pensions, or for the relief of the destitute members of the craft, the first and the most enduring duty of the gild. The gild estates, the chest of the company, its revenues and rents, were, like the endowments of an academical college, at once the support of the fraternity and the means by which the discipline of the order or craft was maintained.

Of their life Seligman says:

> But there was no monopoly or exaggerated exclusiveness. Any one could become apprentice, and the number was limited only by the ability of the master to support them or by considerations of a police nature. The apprentice formed a member of the master's family. For the principles of the law of parent and child were made applicable to a certain extent, and all responsibility for purchases of the apprentices as well as for their behavior were imposed on the masters by city ordinance. From one of the indentures that have been preserved we can obtain a clear view of his position. The apprentice is to keep his master's secrets, do him no injury, nor commit excessive waste of his goods. He is not to frequent taverns, commit fornication or adultery with the housemaids or in town, nor betroth himself without his master's permission. He is not to wear certain garments, play at dice, checkers, or any other unlawful game, but is to conduct himself soberly and piously as a good and faithful servant, or in default to serve double time. The master, on the other hand, agrees to find him in all necessaries, food, clothing, bed, and so on, for four years. In the fifth year he finds himself, but receives 20*s.* and the tools of the trade; and in the sixth year he gets 40*s.*, but finds his own tools. The master agrees on his side to teach him the craft without any concealment. . . .
>
> The condition of the workmen proper was essentially similar. They were known by the various names of varlet, sergeant, yeoman, garson, bachelor, allowe, and journeyman, and were taken for any stipulated period, although probably at first engaged by the day, as the last term implies. Restrictions were rarely placed on their number; but the necessities of a small household would in general preclude the master from employing more than a limited number. . . .
>
> All possible disputes were settled primarily by the wardens, some of whom were in certain crafts chosen from the ranks of the journeymen themselves. If the master refused to give the stipulated wages, the wardens forbade him to work until the obligation should be fulfilled. The journeyman was likewise protected against other exactions on the part of unscrupulous masters, such as attempts to compel him to serve beyond his time or against his will, while a stimulus was given to loyal fidelity by prescribing assistance out of the gild funds in case of illness or misfortune. . . .
>
> But a conflict of interests was in general unknown. The journeyman always looked forward to the period when he would be admitted to the freedom of the trade. This was a rule not difficult for an expert workman to attain. No insuperable obstacle was thrown in his path. In fact, there was no superabundance of skilled labor at this time. It was a period of supremacy of labor over capital, and the master worked beside the artizan.

V. Journeymen's Associations

Naturally, however, there were sporadic cases of disaffection on the part of workmen against imagined or real maltreatment by the master. Out of them came the journeymen's associations. Thus in 1303, in one of the earliest craft ordinances that we possess, the journeymen cordwainers of London are forbidden to assemble or make any provisions prejudicial to their masters or to the public. But altho this, as well as the similar case of the journeymen weavers in 1362, resembles to a certain degree our modern strike and boycott, it is not indicative of any general banding together of the men against the employers.

At first these associations were simple fraternities of a social character. They were considered harmless and in most cases freely permitted. Sometimes, however, they were prohibited, as tending to weaken the paternal authority of the craftsmen. The "congregations" of the journeymen cordwainers above mentioned were doubtless of this class, and continued, for over three quarters of a century later they are again charged with making an illegal fraternity, for which they sought a confirmation from the Pope. The general proclamation of 1383 was, however, not directed especially against such associations, as has been represented. For this forbade conspiracies and combinations of all kinds, and did not mention the workmen at all. Probably the regulation was designed to prevent the recurrence of such riots as had taken place during Wat Tyler's uprising in 1381. The character of the early journeymen's gilds is shown by their fraternities in Coventry, where the journeymen or young people of various trades, "observing what merry meetings and feasts their masters had, themselves wanted the like pleasure, and did therefore of their own accord assemble together, and for their better conjunction make choice of a master with clerks and officers." But as this was found to be to "the prejudice of the other gilds and disturbance of the city," the mayor and citizens petitioned the king, in 1425, to abolish them.

The journeymen's associations which later seem to have been quite common (for a statute of 1402 speaks of "fraternities or gilds of servants" in general) were thus mere social brotherhoods, formed by the young "desirous of merry meetings and feasts." It is not permissible to cite them as proving any conflict between labor and capital at this period. The unions were everywhere confined to the youths, who in turn gradually became masters and were enrolled as full members of the craft gild proper. But gradually this changed. The gilds became too rich and strong, and were hated. Says Professor James, in a chapter written for McNeill's "Labor Movement":

> **Downfall**
>
> The complaints about the heartless policy of the gilds began as early as the fifteenth century, and did not die out until the gilds themselves died. During the fifteenth century the abolition of the gilds was demanded on this ground. When Henry III., of France, in 1581, extended the provisions of the gilds to all branches of mechanical industry in France, the Parliament refused at first to register the edict. In 1614, the third estate in France moved the abolition of the gilds; in 1624, a party in the city council of Bremen; in 1669, the Elector of Brandenburg, in the German Parliament, made the same motion. In Prussia, beginning with 1688, a series of laws was adopted looking toward the reformation of the gilds in the direction of greater freedom, and in the interest of a growing industry. But the chief attack upon the old gild system came on its theoretical side from Adam Smith and the French Physiocrats.

God, said the physiocratic school of economists, made the right to labor the property of every person by giving to every one wants and referring him to labor as a means of satisfying them. This property is the first in order of time, the most holy and the most inalienable. Owing to the restrictions on labor maintained by the gilds, the poor are condemned to protract a precarious existence under the control of the masters, to linger in poverty or to betake themselves and their industry to foreign lands. Just as the whole existing system of law had proceeded from the selfish efforts of privileged classes, who resisted every reform, so in making the regulations in regard to organization of the system of apprentices and journeymen the councilors of the government had always been the employers. They served merely to secure to the masters the labor of the apprentice for a long time at a very low rate of wages or for no wages at all; to keep down the wages of the journeyman and to diminish competition by limiting the number of masters. It is one of the first duties of justice to free those whose only property consists in the skill and strength of their hands from the limitations placed upon them by the gilds.

Justice and economic expediency thus united in demanding the freedom of labor. The same demand for freedom of industry and of contract was made by those interested in the large industry which was now beginning to rise in England. The gild system was in the interest of the small employer, but opposed to the interest of the large employer. The mere requirement that a man should have passed through an apprenticeship, and, on the Continent, a journeymanship also, stood in the way of those who wished to utilize their capital.

Thus theory and pecuniary interest united in demanding the abolition of the old system. In France, the old system was abolished on the memorable night of Aug. 4, 1789. In Germany, Prussia, in 1810, was the first to do away with the old system completely. England, under the control of the large capitalists, abolished the apprentice law of 1562 in 1814.

The prohibitions of coalitions of laborers were, however, left on the statute-books. The prohibitions in England were abolished by the law of 1824. In France they were not abolished until 1864; for all Germany not until 1871; for Austria in 1870. Nevertheless, many traces of the mediæval gilds still remain, especially in England. (See LONDON.)

In Scotland, the companies of merchant freemen still exercise great power, and the magistrate next in rank to the mayor (provost) is the dean of the gild. But all these modern city gilds are mainly mere inherited monopolies.

GILL, ALFRED HENRY: English Labor Member of Parliament; born at Rochdale, 1856; commenced work at seven by selling newspapers; and at ten was employed as half-timer in a cotton-mill. At the age of twenty-three he went to Oldham, where he worked as a cotton-spinner. In 1886 he became chairman of the Crompton cooperative society, and ten years later was appointed general secretary of the Bolton Operative Spinners' Association. In 1899 he became a justice of the peace. Elected to Parliament in 1906 for the District of Bolton, he was chairman of the Parliamentary Committee of the Trades-Union Congress for 1906–7. *Address*: 61 Hampden Street, Bolton, England.

GILMAN, CHARLOTTE PERKINS (formerly MRS. STETSON): American author and lecturer; born in Hartford, Conn., 1860. She early took an active interest in social matters, and in 1890 began lecturing in California for the Nationalists; since then she has lectured in all parts of the United States and in England. She has been identified with the Socialist Party, the People's Party, and, especially, the Woman's Movement. For nine months (1895–96) she was engaged in settlement work in Chicago. Mrs. Gilman is a liberal Socialist. She advocates the economic independence of women; and she believes that social life is organic, that industries are the organic functions of society, and that human work is not proportioned according to individual desire but to the social energy previously supplied to the individual. Hence she maintains that property rights inhere in the consumer's needs, because only when these needs are met can society secure his best product. Among her works may be mentioned: "In This Our World," a volume of verse, 1898; "Women and Economics," 1898; "Concerning Children," 1900; "The Home," 1903; "Human Work," 1904. *Address*: 179 West Seventy-sixth Street, New York City.

GILMAN, NICHOLAS PAINE: American clergyman and sociologist; born in Quincy, Ill., 1849. His early education was obtained in the public schools and academies of Maine and New Hampshire, and at the Harvard Divinity School, from which he was graduated in 1871. From 1872–84, with the exception of 1878–81, when he was professor in Antioch College, he was pastor of Unitarian churches in Scituate, Bolton, and Wayland, Mass. Mr. Gilman was associate editor of the *Unitarian Review* of Boston, 1885–90; editor of the *Literary World* of Boston, 1888–96; and editor of *The New World*, 1892–1900. From 1892 to 1896 he was secretary of the Association for the Promotion of Profit Sharing, and editor of *Employer and Employed*. In 1895 he became professor of sociology in Meadville Theological School, Meadville, Pa. In addition to numerous articles on religious and theological subjects, he has written: "Profit Sharing between Employer and Employee," 1889; "Laws of Daily Conduct," 1891; "Socialism and the American Spirit," 1893; "A Dividend to Labor," 1899; "Methods of Industrial Peace," 1904. *Address*: Meadville, Pa.

GIOJA, MELCHIORRE: Italian economist; born in Piacenza, Italy, 1767. Receiving priest's orders, he welcomed the entry of the French into Italy, and argued for the establishment of an Italian republic. Made State historian, he lost this position by a work he wrote on divorce (1803), and being afterward placed in charge of the Italian statistics, he lost this office by his criticism of State officials. He was in prison for eight months in 1820 on a charge of conspiring with the Carbonari. Gioja was among the foremost Italian economists of his day, a leader in statistical science, and a critical student of all economical schools. He largely favored State interference. Among his works are: "Nuovo Prospetto delle Scienze Economiche," 1815–19; and "Filosofia della Statistica," 1826. He died in 1829.

GIRLS' FRIENDLY SOCIETY, THE: A society organized in England for women of all ages and of all ranks of society in all parts of the world for mutual help. Its aim is declared to be to set before its members a high ideal of purity of thought, word, and deed; to help them to be true to that ideal; to be a standing witness to the possibility of purity of life and conduct for every

woman and girl in the land; to guard the hundreds of thousands of girls who are growing up to womanhood from acknowledged dangers, and to extend to them the boon of loving Christian fellowship and of fellowship in Christian work.

The various departments include help for sick members, the care of workhouse children, registry work, protection in emigration and in traveling, the provision of lodges and recreation rooms, industrial training, and the encouragement of temperance and thrift. There are 1,442 branches and 164,174 members. The patroness of the English society is the queen and the society enrolls some 300,000. *Secretary*: Miss Ethel Smith. Central office: 39, Victoria Street, Westminster, S. W.

The Girls' Friendly Society in America was organized 1877. It has 487 branches and 5,848 associates and 23,714 members and probationers in the United States. *General Secretary*: Miss Eve Alexander, 659 West Lexington Street, Baltimore, Md. Central office: Church Mission House, New York City.

GLADDEN, WASHINGTON: American author and clergyman; born at Pottsgrove, Pa., 1836; was graduated from Williams College in 1859 (D.D., LL.D.). He entered the Congregational ministry and held several pastorates; since 1882 that of the First Congregational Church at Columbus, Ohio. He has been a voluminous writer of books and articles, particularly on Christian social problems and work. He represents the progressive, tho not radical, Christian Social thought, favoring many socialist proposals and principles; yet he is not a Socialist. Recently he attained particular prominence by urging that the Congregational Missionary Society should return a large gift from Mr. J. D. Rockefeller, on the ground that it was "tainted money." Among his works may be mentioned: "Working Men and Their Employers," 1876; "Applied Christianity," 1887; "Tools and the Man," 1893; and "Christianity and Socialism," 1905. *Address*: Columbus, Ohio.

GLASGOW: Among the cities of the world Glasgow has a preeminent reputation for the boldness of its municipal enterprise. It is, however, seriously handicapped, as compared with many European towns, by the fact that it has been built almost entirely on privately owned land, a circumstance which renders every improvement scheme highly expensive. The local habit, too, of building the dwellings in tenement blocks of four flats or stories, with one outer entrance and inner staircase common to them all, and in which, as a rule, some twelve families reside, causes a great crowding of the population. Except in the outskirts of the city, there are no gardens or front plots whatever, each tenement block being provided with an asphalted back court with a common wash-house and ash-pit. It takes a vast deal of municipal improvement to give a favorable aspect to a city so closely built as this, with the children compelled to pass their outdoor life on the streets. The streets themselves, however, are wide and excellently made; and in the center of the city there are numerous handsome warehouses, shops, and public buildings. Next to London, Glasgow has the largest population of any British town. Within the municipal boundaries it has 800,000 inhabitants; with suburbs included there are about 1,000,000 (1906). About one fifth of the people are of Irish birth or descent. The chief industries are engineering, iron-founding, ship-building, and textile manufactures. Its shipping is the greatest in the world, and its warehouse accommodation and general commercial trade is unrivaled for a town of its size. Its university and its other educational institutions are of a high rank. Lord Kelvin, the famous physicist, was professor in the university for some forty years.

Municipal Enterprises

The era of municipal enterprise in Glasgow began with its water scheme in 1860, the first great undertaking of the kind in Britain. Previous to that time the city had been poorly supplied with water by a private company, a number of old wells, and the muddy water of the river Clyde. The municipality boldly launched out on a scheme to bring the water from Loch Katrine, thirty-seven miles away, at an initial cost of $10,000,000. Since then additional culverts have been laid, until the total capital invested in the enterprise amounts to more than $20,000,000. The charge for water is rated as low as fivepence in the pound, as compared with one shilling and twopence (nearly treble the price) charged by the old, private company. Nevertheless, after allowing for all expenditures, including sinking-fund and interest on capital, a clear profit of some $21,000 is carried forward every year. Glasgow was also one of the first cities to municipalize its gas supply (1869) at an initial cost of over $2,500,000, since increased by extensions of the system to $10,500,000. Again, notwithstanding that the rate charged per thousand cubic feet has been reduced from 4*s.* 7*d.* to 2*s.* 1*d.*, and after allowing for all expenditures, including sinking-fund and interest on capital, a net profit of $250,000 is available every year toward paying off the debt. The city also owns its electric supply, from which it derives considerable profit; and it was the first British town to adopt a municipal telephone service in competition with the private National Telephone Company, reducing the charges by one half, and again making a profit. This service was sold at cost price in 1906 to the Government Postal Department, which intends taking over the entire telephone systems of the country.

City Improvement Trust

Another great scheme adopted by Glasgow was that of the City Improvement Trust (1866), which, together with subsequent improvements and housing schemes, has quite remodeled the central part of the city. Slums have been swept away, streets widened, and artizans' dwellings erected; so that the old "salt market," "High Street," and other quarters made famous by Sir Walter Scott's novels have been modernized beyond all recognition. These improvements have not, however, been accomplished without contingent drawbacks. The squalid and criminal classes have been dispersed among the more reputable working class population, where their depraved habits have had a contaminating effect. Thus it is said that drunkenness has been spreading among the working girls and women, and that the children's manners have suffered. "Hooliganism," too, is unfortunately wide-spread, chiefly, it is said, among the Irish laboring class. Perhaps the most doubtful of Glasgow's schemes is that of the Municipal Model Lodging Houses. There are some seven establishments of this kind, accom-

modating altogether (in 1905) 2,166 men and 248 women. Each person has a separate sleeping cubicle for which a charge of three and a half to four and a half pence a night is made; a common dining-room is provided; food is cooked free of further charge; and there are baths and recreation halls attached.

There are many social reformers who incline to the opinion that these Model Lodging Houses tend to lower the standard of living among the laboring class, and to discourage civic responsibility, home life, and regular habits. As a makeshift, however, they are a great improvement upon the dens formerly provided by private lodging-house keepers for that class of people. A notable experiment was made in 1896 by the establishment of a "family home" at a cost of $85,000. Its use is restricted to widowers with families. There are 160 bedrooms, each capable of accommodating one adult and three children, a common dining-room, kitchen with steam cooking boilers, a nursery, recreation hall, and baths. The rent is for a widower and one child $1 a week, and with three children $1.25. Board, consisting of breakfast, dinner, and tea, is at the rate of twenty-four cents per day for adults, forty-four cents a week for one child, and $1 a week for three children. Children of school age are sent to the public schools, and those under school age are nursed and cared for during the day. At present the home just about clears its expenses.

Glasgow is the pioneer of municipal trolleys, and the remarkable success of its system has led other towns in Britain to follow its example.

Street-Cars

Perhaps, too, the fame of its profitable enterprise in this direction has been one of the chief incentives in the great movement in favor of municipal socialism in Britain. It is also worthy of note that the demand for the municipalization of the trolley service in Glasgow was chiefly due to the propaganda of the Socialists in the Trades Council and among the electorate of the city. The cars were taken over from the existing private company in 1892. Since then the municipality has electrified and greatly extended the system. The economic results have been most striking. The wages of the men, which formerly ranged from as low as 16*s*. a week, are now fixt at a minimum of 25*s*., and at the same time the hours of work have been shortened from an average of thirteen or fourteen to ten hours a day. The minimum fare has been lowered from one penny to half a penny, and fares for long distances have been so much reduced that it has been calculated that in fares alone the community now saves over $1,000,000 a year. In addition to this there is a net profit, after paying interest on capital and allowing for a sinking-fund, etc., of about $1,000,000 a year, of which about $850,000 is retained for depreciation and a reserve fund, and about $150,000 is contributed to the rates. The system now extends to neighboring towns seven or eight miles east and west from the center of the city, and the municipality manufactures some of its own cars.

Sewage Disposal

At enormous cost Glasgow has recently been engaged in disposing of its sewage so as to avoid polluting the river. Two great underground conduits have now been made on the north side of the river by which the sewage is collected and treated by chemical precipitation and filtration, the solid matter being afterward pressed into cakes and sold as a manure. Another conduit is being made on the south side, and when this is completed the entire sewage of the city will be disposed of by this method. In 1868 Glasgow decided to establish a Cleansing Department, and now the whole work of scavengering is done by its own staff. The refuse is sifted, a portion being sent to the destructors and a portion being sold to farmers, for which purpose the Cleansing Department owns nearly 1,000 railway wagons. The wharves and docks and the navigation of the river are under the management of a public trust on which the City Council is represented.

The city owns six large public halls in several of which municipal concerts and organ recitals are given every Saturday afternoon during the greater part of the year for a nominal charge. Band performances are also given in the public parks. There are eight splendid municipal bathing establishments, and free libraries are established in every district. The city owns half a dozen great public parks, as well as a fine suburban estate recently gifted to it. A unique possession is a large mountain headland, some ten miles long and one to three miles broad, situated between two beautiful arms of the Firth of Clyde, about thirty miles from the city, which by the terms of the gift must forever be retained as a holiday ground for the people. The city also owns a small island and several farms upon which experiments with the unemployed are being made.

The further municipal undertakings must be briefly summarized. There are public markets, abattoirs, technical colleges, boarding-schools, children's gymnasia, art-galleries, a People's Recreation Palace, bowling-greens, wash-houses, lunatic asylums, hospitals for infectious diseases, fire-brigades, etc. The City Council is also agitating strongly to obtain powers from Parliament to tax land values, and the more advanced section of its members are pressing proposals for municipal fire-insurance, coal-supply, milk-depots, and bakeries.

The Corporation of Glasgow consists of the Lord Provost, bailies, and town councilors, the latter being elected for a term of three years. The councilors in turn elect from among themselves

City Government

the bailies who act as magistrates in the police courts, but, unlike aldermen in England, have no extended term of office. The Lord Provost is chosen annually by the Council. Until the advent of the Labor Party (about 1890) the Council elections were not fought on political or party lines; each candidate stood solely upon his own record or program. There is now, however, a tendency for candidates to come forward as nominees of sections such as the Ratepayers or Anti-Municipalization Party, the Temperance Party, and the Labor Party. The last named numbers about a dozen in a council, which is composed of about eighty representatives, but the majority of the members are usually favorable to progressive enterprises.

Recently an attempt has been made to lessen the drunkenness of the city by the restriction of licenses and the closing of public houses (which open at 8 A.M.) at 10 P.M., an hour earlier than formerly. In Glasgow, as in all Scottish towns, public houses are completely closed on Sundays. It is noticeable that in recent years the strict religious observance of Sunday has disappeared, Sunday concerts and political meetings and all

manner of pleasure-seeking being now quite common in the city.

J. Bruce Glasier.

GLASIER, J. BRUCE: Scotch Socialist and editor; born in Glasgow, 1859. As a boy he herded sheep in the county of Ayr, and later was apprenticed to an architect, and afterwards engaged in designing art metal work. One of the first avowed Socialists in the modern movement in Britain, as far back as 1879 and 1880 he advocated Socialist views in Glasgow. He took an active part in the Henry George, Crofter, and Irish Land League agitations. Together with a few other Socialists he founded the Social Democratic Federation in Scotland, but seceded from that body when the Socialist League was formed in 1884. Glasier was for many years the most active apostle of socialism in Scotland, writing locally but contributing also articles to Morris's *Commonweal*. He joined the Independent Labor Party on its formation in 1893, and in the same year married the young Socialist speaker Katherine St. John Conway; since then both have devoted their lives to the Socialist agitation. Glasier was elected chairman of the Independent Labor Party in succession to Keir Hardie; and at the general election in 1906 he contested the Bordesley division of Birmingham as a Socialist. He is now (1907) editor of the *Labor Leader*, which, under his management, has become the chief organ of the Socialist and the Labor movements in Great Britain. Author of numerous socialist pamphlets and songs. *Address*: Chapel-en-le-Frith, Derbyshire, England.

GLENN, JOHN M.: Secretary of the Sage Endowment (*q. v.*); born Baltimore, 1858; graduated at Washington and Lee University; was admitted to the Maryland bar 1881, and actively practised law ten years. Increasingly interested in practical philanthropies, he has since devoted his time wholly to philanthropic work. He became chairman of the joint executive committee of the Federated Charities of Baltimore, secretary of the State Tuberculosis Commission, lecturer on social work at Johns Hopkins University, president of the National Conferences of Charities and Corrections (1901); since 1904 president of the Supervisors of City Charities. In 1907 he was chosen first director of the Sage Endowment. His wife, Mrs. Mary W. B. Glenn, has been his active associate, as also secretary of the Baltimore Charity Organization Society. *Address*: 30 Broad Street, New York City.

GLOVER, THOMAS: English Labor Member of Parliament; born at Prescot, Lancashire, 1852; worked in the coal mines at the age of nine; and in 1867 was appointed secretary of a local branch of the Miners' Union. In 1880 he was instrumental in founding the St. Helens District Miners' Association; and he also helped to found the Miners' Federation of Great Britain. He has been treasurer of the Lancashire and Cheshire Miners' Federation since 1905, and in 1906 was returned to Parliament from St. Helens. *Address*: 56 Bickerstaffe Street, St. Helens, Lancaster, England.

GOBLET, RENÉ MARIE: French Socialist; born at Aire, Pas-de-Calais, 1828; entered the legal profession, then journalism, and, later, politics. In 1870 he was procureur-général at Amiens; and in 1871 a representative for La Somme, being a Republican of the Left, and tho at first a supporter of the government, he gradually became more and more independent. From January to August, 1882, he held the portfolio of the Interior in the Freycinet Cabinet; and from April, 1885, to December, 1886, that of Public Instruction under Brisson. From 1886–87 he was President of the Council; and from April, 1888, to April, 1889, Minister of Foreign Affairs. He is considered a leading Socialist in French Government circles. In 1891 he was elected a senator for the Department of the Seine, and in 1893 a deputy from the first arrondissement of Paris. Failing of reelection in 1898 he retired to private life. Besides numerous essays, etc., he has published: "La Revision de la Constitution," 1893.

GODIN, JEAN BAPTISTE ANDRÉ: French politician; founder of the *Familistère* at Guise; born at Esquehéries, Aisne, 1817. Early engaging in industry, in 1847 he moved his works to Guise, and became interested in cooperation as a disciple of Fourier. In 1859 he commenced his famous *Familistère*, or communal home, and rapidly developed it. In 1870 he was elected Mayor of Guise, and in 1871 representative for Aisne. In 1871 he published his "Solutions Sociales," an account of his *Familistère*. He fully established profit-sharing in 1876, and in 1886 made the *Familistère de Guise* a cooperative society, associating in his firm thirty-two clerks or workmen. From 1876–88 the average sales were 3,935,600 francs, with a gross profit of 735,000 frs., which were distributed among the workmen, the capital, the common fund, the educational fund, and the sinking-fund. The *Familistère* is organized like a great family. It has its buildings for habitation, baking-house, steward's office, nursery, schools, pension bank, and insurance office. In 1888 the corporation had 13 *associés*, 67 *sociétaires*, and 52 *participants*, out of 1,237 employees. The industry carried on is the making of stoves, ovens, and smaller hardware. There are three big buildings with 1,800 inhabitants, each family having two or three rooms. Each building encloses an interior court, covered with a glass roof and paved with cement. The building is four stories high. The stores of the association on the lowest story of the central portion of the building contain whatever is necessary for ordinary need and comfort, without reference to luxuries. The social palace can accommodate 1,500 persons, who can do their marketing and shopping under covered galleries, without traversing more than 200 yards. Much attention is given to education. Babies can be left by their mothers in a *crèche* from 7 A.M. to 7 P.M. There is considerable social life. Godin died in 1888.

GODWIN, MARY WOLLSTONECRAFT: English educational reformer; born at Hoxton, a district of London, 1759. Forced early to earn her own living, she became governess in the family of Lord Kingsborough, in Ireland. She soon resolved to devote herself altogether to literary work, and began to translate from the French. In 1792 appeared her best known work, "A Vindication of the Rights of Woman." Her book was mainly a plea for equality of education, for State education, and for the joint education of the sexes. It was a strong protest against the assumption that woman was only the plaything of man; and

she asserted that intellectual companionship was the chief and lasting happiness of marriage. She daringly dealt with dangerous questions, incidentally upheld greater freedom of divorce, and denied the eternity of the torments of hell. Having great sympathy with the ideas back of the French Revolution, she went to Paris and remained there during the Reign of Terror. In 1796 she was married to William Godwin, and died in giving birth to a daughter, who became the wife of the poet Shelley.

GODWIN, WILLIAM: English clergyman and writer; born at Wisbeach, Cambridgeshire, 1756; son of a Nonconformist minister. Educated for his father's profession, he was at first more Calvinistic than his teachers, becoming a Sandemanian, of which sect he says that they were the followers of "a celebrated north-country apostle, who, after Calvin had damned ninety-nine in a hundred of mankind, has contrived a scheme for damning ninety-nine in a hundred of the followers of Calvin."

Acquaintance with French revolutionary thought led Godwin to exchange the pulpit for the pen, and he removed to London to engage in literature. His first work, "Historical Sketches," met with no success, and he was reduced to penury and despair; but through his work he became acquainted with Fox, Sheridan, and other Whig leaders, and he turned his attention to politics. The American Revolution, closely followed by that of France, excited the public mind, and in 1793 Godwin wrote his "Inquiry Concerning Political Justice." This was followed by "The Adventures of Caleb Williams," a remarkable novel, intended to illustrate his political views.

In 1796 Godwin married Mary Wollstonecraft. Since both held the same views regarding the slavery of marriage, and since they only married at all for the sake of possible offspring, the marriage was concealed for some time, and the happiness of the avowed married life was very brief. Mrs. Godwin died in giving birth to a daughter, afterward the second wife of Percy Bysshe Shelley. The cares of a family led him to contract a second marriage with Mrs. Clairmont in 1800.

Godwin wrote school-books; an admirable "Life of Chaucer" (1801); "Fleetwood," a novel (3 vols., 1803); "Mandeville" (1817); a "Treatise on Population," a refutation of Malthus (1820); a "History of the Republic of England" (4 vols., 1824–28); "Cloudesley" (1830); "Thoughts on Man" (1833). As he grew old, he modified his opinions on politics and society, and especially on marriage, which he warmly commends in some of his later works. He was appointed to a government position, but continued to write, "Deloraine," a novel, and "Lives of the Necromancers" being among his latest works. Many of his books were translated into foreign languages. He died in London in 1836.

Godwin was an intense individualist, holding that all control of man by man was wrong, and that government must disappear. But all was to be done by discussion, and matured change resulting from discussion. His "Political Justice" almost created the English radicalism of the early part of the century, and led to the milder liberalism of to-day. In it he maintained that natural relationship had no claim on man, nor was gratitude to parents or benefactors any part of justice or virtue. Property was to belong to him who most wants it; accumulated property was a monstrous injustice. Hence marriage, which is law, is the worst of all laws, and property the worst of all properties. His life was published in 1876 in two volumes, under the title "William Godwin, His Friends and Contemporaries."

GOEHRE, PAUL: Socialist writer; born April 18, 1864, at Wurzen, Saxony; studied theology at Leipsic, 1885–88; became assistant pastor at Schönbach and Löbau; was at the same time associate editor of the *Christliche Welt*. Deeply interested in social and industrial conditions, he entered a factory at Chemnitz as a common laborer in the spring of 1890. He later described his experiences in a book, "Drei Monate Fabrickarbeiter und Handwerksbursche" (Three Months in a Factory), 1891; he went then to Berlin to study political economy, and became (1891) general secretary of the Evangelical Social Congress, and while in this office he conducted an inquiry into the condition of agricultural laborers. In 1894 he became pastor of a church in Frankfort-on-the-Oder, where he had mostly working men in his congregation. He resigned in 1897, and was with Naumann (*q. v.*) one of the founders of the National-Sozialen Party (*q. v.*), but disagreed with its tendency, and joined the Social Democrats in 1899. He was elected to the Reichstag in 1903, but resigned owing to attacks made on him by some of the members of the party. Author: "The Evangelical Social Movement: Its History and Aims," 1896; "How a Clergyman Became a Socialist," 1900; "Socialism and Liberalism," 1902; "Recollections of a Workingman," 1903.

GOLD AND SILVER: The color, luster, and power of resisting oxidation possessed by gold have caused it to be considered a precious metal from the earliest times. Allusions to gold are frequent in the Jewish Scriptures and in classical writings. Jewelry and vessels found in Egyptian, Greek, and Trojan tombs show the perfection attained in working gold, while the value attached to it is shown by its being used in religious worship and in its being chosen by the poets to describe the glory of the gods.

I. Supply of Gold

The ancient supply of gold seems to have come from Eastern Africa, and around the sources of the Indus. In the times of the Romans gold does not seem to have been so abundant, tho gold was worked near Apulia and in Spain. After the discovery of America it was brought in large quantities from Mexico, Brazil, and other South American countries. Between 1829 and 1838 it was found in Siberia and largely exported. The great gold-fields of California were discovered in 1848, by accident, by a Mr. Marshall, who found particles of gold-dust in a mill-race on the estate of a Captain Sutter. It led to intense excitement.

In Feb., 1851, the gold-fields of Australia were discovered near Bathurst by a Mr. Hargraves, and this led to a series of discoveries, and a rush to Australia (*q. v.*). Gold was discovered in South Africa in 1867, but the great gold-mines of the Transvaal were not actively worked till the early eighties, since when they have grown into a leading position. The most famous gold-mines of

Europe are those of Hungary and Transylvania. The great Alaskan discoveries and the rush to the Klondike began in 1897.

The greater part of the gold of the world is obtained by washing from detrital deposits along the beds of rivers; a smaller quantity is obtained by crushing and washing quartz.

II. Silver

Silver, like gold, has been known and prized from the earliest ages. Phidon, King of Ægina, is said to have struck coins in silver B.C. 869. Silver currency was adopted by the Romans in 269 B.C. It was largely used by Greek and Roman artists. The silver-mines of Mexico were, however, until quite recently, by far the richest known to exist. Until the remarkable discoveries of silver ore in Nevada and adjoining states in 1859 and 1860, Chile and Peru had long stood next to Mexico in their yield. Bolivia is also rich in silver. Of European countries, Spain is the most productive.

The great silver-mining industry of the U. S. had no existence before 1860. The prospectors and pioneers who traversed Arizona, Idaho, Nevada, Colorado, seeking for gold, in the years between 1850 and 1860, fell upon silver unexpectedly. The greatest silver-mine ever known was discovered in this way in 1858–59, on the eastern foot-hills of the Sierra Nevada. This was the celebrated "Comstock" mine, which was found by James Shinney and Henry Comstock, who parted with their interests for a trifle, not knowing its value. A portion of the mine was worked in 1860–61, and by 1865 it had yielded the value of $30,000,000; and a city of 20,000 inhabitants was planted on its site. Idaho and Montana became silver-bearing territory. Up to 1879 the value of the silver yield of Colorado was about only $16,000,000. Two years later the mines of Leadville, alone, not discovered till 1877, yielded as much.

III. Statistics

All the statistics, except as stated, are from the report of the Director of the U. S. Mint (1906):

In the calendar year 1905 the world produced 18,243,911 fine ounces of gold of the value of $377,135,100, exceeding 1904 by 1,453,560 fine ounces, or $30,047,800, equivalent to 8.6 + per cent.

The greatest increase, 1,326,212 fine ounces, was in Africa, which was followed by the U. S. and Mexico, with 373,262 and 169,400 fine ounces, respectively. The largest decrease was in Russia.

The great producing countries were Africa, 5,482,296 ounces; the U. S., 4,265,742 ounces; Australasia, 4,156,692 ounces; Russia, 1,078,356 ounces; Mexico, 779,181 ounces; Canada, 700,800 ounces; and British India, 563,817 ounces. The British Empire leads with over 11,000,000 ounces, or about 60 per cent of the total. The U. S. produced 23 + per cent.

The world's product of silver in 1905 amounted to 167,727,934 fine ounces, of the commercial value, at 61 cents per ounce—the average price in New York in that year—of $102,314,000, an increase in production of 3,391,526 fine ounces over 1904, and an increase in value, owing to the rise in price of 3 cents per ounce, of $6,998,900.

Mexico held the first place with 65,040,865 fine ounces; the U. S. following with 56,101,600 ounces. The remaining large producers were Australasia, 12,561,600 ounces; Canada, 5,974,875 ounces; Germany, 5,820,947 ounces, and Peru, 5,169,659 ounces.

The commercial value of the world's production of the precious metals in 1905 was $479,449,100, an increase as compared with the value of the yield of 1904 of $34,890,600.

1. Production of Gold and Silver in the U. S., 1905

State or Territory	Gold	Silver	Total value (silver at commercial value)
	Value	Commercial value	
Alabama	$41,500	$183	$41,683
Alaska	14,925,600	103,212	15,028,812
Arizona	2,691,300	1,589,477	4,280,777
California	19,197,100	660,020	19,857,120
Colorado	25,701,100	7,895,108	33,596,208
Georgia	94,800	549	95,349
Idaho	1,075,600	4,956,616	6,032,216
Maryland	16,900	61	16,961
Michigan	.....	154,330	154,330
Missouri	.....	7,869	7,869
Montana	4,889,300	8,207,367	13,096,667
Nevada	5,359,100	3,576,735	8,935,835
New Mexico	265,800	216,489	482,289
North Carolina	123,900	8,052	131,952
Oregon	1,244,900	54,229	1,299,129
South Carolina	95,100	122	95,222
South Dakota	6,913,900	109,190	7,023,090
Tennessee	3,300	58,194	61,494
Texas	1,900	254,492	256,392
Utah	5,140,900	6,295,078	11,435,978
Virginia	5,000	122	5,122
Washington	370,000	72,834	442,834
Wyoming	23,700	1,647	25,347
Total	$88,180,700	$34,221,976	$122,402,676

2. Coinage of the United States since 1873

Fiscal Year	Gold	Silver	
	Value	Dollars coined	Subsidiary coined
1873	$35,249,337.00	$977,150	$1,968,645.50
1874	50,442,690.00	3,588,900	2,394,701.39
1875	33,553,965.00	5,697,500	4,372,868.00
1876	38,178,963.00	6,132,050	12,994,452.50
1877	44,078,199.00	9,162,900	19,387,035.00
1878	52,798,980.00	19,951,510	8,339,311.50
1879	40,986,912.00	27,227,500	382.50
1880	56,157,735.00	27,933,750	8,687.50
1881	78,733,864.00	27,637,955	12,011.75
1882	89,413,447.00	27,772,075	11,313.75
1883	35,936,928.00	28,111,119	724,351.15

Total	$1,933,498,014.50	$607,259,120	$169,029,376.34

3. Production of Gold and Silver in the World

(From 1493 to 1885 is from a table of averages for certain periods, compiled by Dr. Adolph Soetbeer; for the years 1886 to 1905 the production is the annual estimate of the Bureau of the Mint.)

Period	Gold		Silver	
	Annual average for period		Annual average for period	
	Fine ounces	Value	Fine ounces	Coining value
1493–1520	186,470	$3,855,000	1,511,050	$1,954,000
1521–44	230,194	4,759,000	2,899,930	3,740,000
1545–60	273,596	5,656,000	10,017,940	12,952,000
1561–80	219,906	4,546,000	9,628,925	12,450,000
1581–1600	237,267	4,905,000	13,467,635	17,413,000
1601–20	273,918	5,662,000	13,596,235	17,579,000
1621–40	266,845	5,516,000	12,654,240	16,361,000
1641–60	281,955	5,828,000	11,776,545	15,226,000
1661–80	297,709	6,154,000	10,834,550	14,008,000
1681–1700	346,095	7,154,000	10,992,085	14,212,000
1701–20	412,163	8,520,000	11,432,540	14,781,000
1721–40	613,422	12,681,000	13,803,080	17,924,000
1741–60	791,211	16,356,000	17,140,612	22,162,000
1761–80	665,666	13,761,000	20,985,591	27,133,000
1781–1800	571,948	11,823,000	28,261,779	36,540,000
1801–10	571,563	11,815,000	28,746,922	37,168,000
1811–20	367,957	7,606,000	17,385,755	22,479,000
1821–30	457,044	9,448,000	14,807,004	19,144,000
1831–40	652,291	13,484,000	19,175,867	24,793,000
1841–50	1,760,502	36,393,000	25,090,342	32,440,000
1851–55	6,410,324	132,513,000	28,488,597	36,824,000
1856–60	6,486,262	134,083,000	29,095,428	37,618,000
1861–65	5,949,582	122,989,000	35,401,972	45,772,000
1866–70	6,270,086	129,614,000	43,051,583	55,663,000
1871–75	5,591,014	115,577,000	63,317,014	81,864,000
1876–80	5,543,110	114,586,000	78,775,602	101,851,000
1881–85	4,794,755	99,116,000	92,003,944	118,955,000
1886–90	5,461,282	112,895,000	108,911,431	140,815,000
1891–95	7,882,565	162,947,000	157,581,331	203,742,000
1896–1900	12,446,939	257,301,100	165,693,304	214,229,700
1901–5	15,579,746	322,061,900	165,028,092	213,369,700
Total for periods	564,857,380	$11,676,640,100	9,653,671,507	$12,481,514,700

4. Bullion Value of the Silver Dollar [371¼ Grains of Pure Silver] at the Annual Average Price of Silver each Year from 1837

Year	Value	Year	Value
1837	$1.009	1872	$1.022
1838	1.008	1873	1.00368
1839	1.023	1874	.98909
1840	1.023	1875	.96086
1841	1.018	1876	.90039
1842	1.007	1877	.92958
1843	1.003	1878	.89222
1844	1.008	1879	.86928

5. Coinage of Nations of the World

Calendar Year	Gold	Silver
1903	$240,499,547	$211,795,829
1904	455,427,085	176,508,646
1905	245,954,257	103,880,205

IV. Ratio of Gold to Silver

The columns showing the amount of silver produced to one unit of gold in dollars and in ounces were prepared by Mr. George B. Waldron, down to 1894.

For purposes of comparison are added Dr. Soetbeer's estimates of the commercial ratio of gold to silver down to 1832, the estimates of Pixley and Abell from 1833–78, and those of the Director of the Mint from 1879–94. Variations between the highest and lowest ratios of each period are given in the next column from 1687–1894, based on daily London quotations beginning with 1833.

The question of the relative value of gold and silver and the currency problems arising from this have long been among the burning economic questions of modern times. We give here only tabular statements of the facts for all discussion of them, referring the reader to articles: Bimetallism; Currency; Contraction and Expansion of Currency; Money.

The facts seem to be as shown in the following tables.

For the ratio since 1904 see tables 3, 4 and 5.

Calendar Years	Silver produced to one of gold: Ounces	Commercial value of silver to one of gold: Average ratio	Commercial value of silver to one of gold: Variation between highest and lowest ratio	Significant historical events
1493–1520	8.10	11.30	.....	1492. Discovery of America

1893.....	21.27	26.49	6.58	1893. Suspension of silver coinage in India and repeal of purchasing clause of act of 1890 in the U. S.
1894.....	18.89	32.59	5.22	
1493–1600	30.25	11.48	.70	
1601–1700	40.81	13.97	2.20	
1701–1800	30.02	14.97	1.60	
1801–1848	28.98	15.69	1.14	
1849–1873	6.88	15.48	1.26	
1874–1894	17.52	20.22	18.97	
1806–1894	13.94	16.65	19.88	
1493–1894	19.34	13.95	23.72	

The commercial ratio of gold to silver, from the time of Herodotus (born 484 B.C.) down to the year 1717, is shown in the following from the letter of Lord Liverpool to the King of England (see "Coinage Laws of the U. S.," 1894, p. 435):

In Persia, according to Herodotus..... 1 to 11⅓
In Greece at same period..... 1 to 13
In Greece in the time of Plato..... 1 to 12
In Greece it is stated by Xenophon at..... 1 to 10
After the plunder of gold from the Temple of Apollo, according to Menander, it was..... 1 to 10
In the reign of Alexander the Great it was.... 1 to 10
In Rome, according to Pliny the Elder..... 1 to 10⅓
In Rome, after the tribute from the Etolians.. 1 to 10
The plunder of gold from the Gauls by Julius Cæsar reduced the proportions to..... 1 to 7½
In the reign of Claudius, Tacitus states it at... 1 to 12½
Until the reign of Alexander Servius it contained 1 to 12½
In the reign of Constantine the Great..... 1 to 01½
The disorders in the Roman Empire under Arcadus and Honorius raised it to..... 1 to 14⅔
From which it appears that gold, unless when deprest by sudden and unusual occurrences, or enhanced by a dread of public insecurity, may be stated to have been for upward of 900 years in the proportion of..... 1 to 10 or 12
England, under Henry III., 1216 to 1272..... 1 to 9½
England, under Edward III., 1330 to 1377.... 1 to 12½
In England, in the reign of Henry IV., 1400 to 1412..... 1 to 10½
In England, in the reign of Edward IV., 1461 to 1477..... 1 to 11⅓
In England, in the reign of Henry VIII., 1510 to 1547..... 1 to 11.10
In England, in the reign of Queen Elizabeth, 1560..... 1 to 11
In England, in the reign of King James I., 1604..... 1 to 12⅛
In England, in the reign of King James I., 1611..... 1 to 13½
In England, in the reign of Charles II., 1665... 1 to 14½
In England, in the reign of George I., 1717.... 1 to 15½
Relative proportions in China, according to Humboldt..... 1 to 12½
Relative proportions in Japan, according to Humboldt..... 1 to 8½
Relative proportions in Bengal, according to bullion report..... 1 to 14.86
Relative proportions in Madras, according to bullion report..... 1 to 13⅞
Relative proportions in Bombay according to bullion report..... 1 to 15
In the China Diaries it is stated at 16 taels of silver to 1 tael of gold of 100 touch of pure gold. If it is meant to be of pure silver also, the proportion would be 1 to 16; but it is believed to be the average fineness of silver in dollars, which would be..... 1 to 14.296

References: See Currency.

GOLDMAN, EMMA: Communist Anarchist; born 1869, near Kovno, Russia; educated in St. Petersburg and Königsberg (Prussia). She became acquainted with modern revolutionary ideas at an early age, in Russia, and joined the ranks of Communist Anarchists in America. She has been an active anarchist for about twenty years. She served one year in prison at Blackwell's Island, N. Y., for addressing an outdoor meeting of the New York unemployed, in 1893, and was arrested in Chicago, in 1901, together with a number of other anarchists, on the charge of conspiracy with Czolgosz, but discharged in the police court. Delegate from America to the International Anarchist Congress at Paris, 1900, and to the Amsterdam (Holland) Congress, 1907. Publisher of a monthly magazine devoted to social science and literature, *Mother Earth*. *Address*: 210 East Thirteenth Street, New York City.

GOLDSTEIN, MISS VIDA: Australian woman suffragist; born in Portland, Victoria. She is president of the Woman's Political Association of Victoria, secretary of the United Council for Woman's Suffrage, and a member of the executive committees of the National Council of Women of Victoria, of the Criminology Society, and of the Royal Victorian Trained Nurses' Association. She has spoken on woman suffrage before the United States House of Representatives and Senate committees, and was the representative for Australia and New Zealand at the International Woman's Suffrage Conference held in Washington in 1902. Miss Goldstein was the first woman candidate for Parliament in the British Dominions (December, 1903). She is the editor and proprietor of *Woman's Sphere*. *Address*: Oxford Chambers, Bourke Street, Melbourne, Victoria.

GOMPERS, SAMUEL: American labor leader; president of the American Federation of Labor; born in London, England, 1850; apprenticed to a shoemaker at the age of ten; obtained his education after working-hours. He later became a cigarmaker and came to the United States in 1863. Joining the cigarmakers' union he soon became prominent in its councils and served as president of Union 144 for six years, during which time he was repeatedly elected delegate to the conventions of the Cigar Workers' International Union, the constitution and development of which are largely the results of his efforts. He was one of the founders of the AMERICAN FEDERATION OF LABOR, was elected its first president, 1882, and has been reelected every year since except in 1895, when he was defeated because of his opposition to the endeavors of the Socialist Party to capture the federation.

Mr. Gompers has repeatedly declined election or appointment to important and remunerative political and other offices, and has devoted his every energy to upbuilding the trade-union movement. For this he has worked unremittedly, traveling over the whole country. During the first six years of his official duty he received no salary nor any other emolument. In the eight-hour struggle of 1886 he paid his entire expenses and worked night and day for many weeks. He is not opposed to the aims of socialism, tho not committed to its views, and he believes in political action on the part of Labor, but holds that the main hope of Labor is in the trade-union movement and that to commit that movement to any political party or endeavor would be to disrupt it and hurt it irremediably. Mr. Gompers has been editor of the federation's organ for thirteen years, is vice-president of the National Civic Federation, and has written numerous tracts and magazine articles on labor subjects. *Address*: 423 G Street, Washington, D. C.

GOOD GOVERNMENT CLUBS: The establishment of "good government clubs," the object of which is explained by their name, began with the formation of the City Club in New York, April 13, 1892.

The failure of the Municipal League to elect its candidate to the mayoralty in 1891 occasioned profound discouragement among those desirous of obtaining good city government. It seemed to indicate that mere popular indignation or enthusiasm could not be counted upon when pitted against an organized political machine. It became clear, therefore, that if the work of improving city government was to be undertaken at all, it must be undertaken upon a permanent plan—a fact which suggested the organization of a social club which would serve to bring together and to keep together all those interested in good government. The City Club was established, largely owing to the efforts of Mr. Edward Kelly. One of its chief activities was to establish other local clubs, which were called good government clubs, and have been very successful. More recently, however, the name "Good Government Club" has been less used. (See MUNICIPAL REFORM.)

GOOD TEMPLARS, INDEPENDENT ORDER OF: The Independent (International) Order of Good Templars originated in Utica, N. Y., in 1851. Its platform is total abstinence for the individual and prohibition for the State. It was the first secular organization in the world to admit woman upon equal terms with man, and its attitude in this respect has been a very material help to all movements looking to the advancement of woman. For the first seventeen years of its existence the order was confined to the United States and Canada. It spread all over North America, numbering hundreds of thousands of members; and many of the laws dealing with the liquor traffic in the different states and provinces are the result of its work. The order has also been largely instrumental in originating other movements, such as the Woman's Crusade, the Woman's Christian Temperance Union, and the Prohibition Party.

In 1868 Good Templarism was introduced into England and Scotland, and somewhat later into Ireland and Wales. There are very strong bodies in these countries; and in the British Isles, as in North America, the order has had a great influence in shaping legislation. Rather more than a quarter of a century ago the Good Templar Order was carried to Scandinavia, where it immediately took root, and has made the most astonishing progress. The grand lodge of Sweden is now the largest organization in the world, having about 125,000 members. Norway and Denmark have also large grand lodges in proportion to their population. In Iceland about one in seven of the population is a member of the order.

Within about fifteen years after its foundation, the order reached Germany, where it is rapidly becoming a tremendous power, already counting a membership of about 40,000. It publishes several newspapers, and owns a number of halls, hotels, and restaurants. Smaller organizations

exist in Belgium, Holland, and Switzerland; and, quite recently, beginnings have been made in Hungary and Rumania. For many years Good Templar grand lodges have been maintained in all the Australian states and in New Zealand. Four grand lodges, each having several thousand members, are to be found in South Africa. A remarkable work is going on among the natives on the Gold Coast and in other parts of Africa. There are three grand lodges in India, where some of the work is carried on in the vernacular, and there are lodges, some of them using the Spanish language, in different parts of South America and the West Indies.

A feature of the order's work is that carried on among the soldiers and sailors of Great Britain. A large proportion of the British war-ships have lodges on board, holding regular meetings; and a majority of the regiments of the British army have also their Good Templar organizations. Wherever the order has gone it has enrolled children as well as adults, and it now has a juvenile membership of about a quarter of a million. The number of grand lodges in the world is now 70, with a total membership of 407,645. *International Secretary*, Col. B. F. Packer, Milwaukee, Wis.

GORKI, MAXIM (pen-name of **Aleksei Maksimovich Pyeshkov**): Russian social writer and novelist; born 1868 at Nijni-Novgorod. He was successively a shoemaker's apprentice, scullery-boy, baker, ship's cook, porter, gardener, painter of ikons, lawyer's clerk, tramp, and finally writer. As a tramp he journeyed over large portions of the empire, and his idealistic yet realistic novels are largely based on his experiences with the working and vagrant classes, whose thoughts and social conditions he has brilliantly interpreted. His novel "Makar Choudra" (1892) was the first of a large number among which "Foma Gordye'eff" is probably the best known outside of Russia. Other works are "Chelkash"; "Song of the Falcon"; "Song of the Petrel"; "The Orloff Couple and Mava"; "Troye"; "About the Devil"; "More About the Devil"; "The Reader"; "The Outcasts" (1902); "Three Men" (1902). Gorki has visited other countries (the United States in 1906), writing and lecturing, largely on social themes, and voicing the socialistic radicalism of the Russian and other working classes. *Address*: Arsemas, Nijni-Novgorod, Russia.

GOSMAN, ALEXANDER: Australian clergyman; born at Crail, Fife County, Scotland, 1829; educated in public schools and at the University of Glasgow; degree of D.D. conferred upon him by St. Andrew's University in 1904. In 1864 he was appointed professor of theology in the Congregational College of Victoria, and in 1876 became its principal. Since 1879 he has been minister of the Augustine Congregational Church at Hawthorn, near Melbourne, Victoria. Mr. Gosman is chairman of the Victorian Congregational Union, and was a delegate to the first and second International Congregational Councils, London, 1891, and Boston, 1899. He was chairman of the Wages Board and president of the Antisweating League from 1895 to 1902. *Address*: Burwood Road, Hawthorn, Victoria.

GOTHENBURG. See NORWEGIAN COMPANY SYSTEM.

GOUGH, JOHN BARTHOLOMEW: American temperance lecturer; born at Sandgate, Kent, England, 1817; son of a pensioner of the Peninsular War and a village schoolmistress. At the age of twelve he went to America and worked on a farm in Oneida County, N. Y. In 1831 he went to New York City, where he found employment in the binding department of the Methodist book establishment; but habits of dissipation lost him this employment, and reduced him to that of giving recitations and singing comic songs at low grog-shops. He was married in 1839; but his drunken habits reduced him to poverty, and probably caused the death of his wife and child. A benevolent Quaker induced him to take the pledge; and he attended temperance meetings and related his experience with such effect as to influence many others.

Gough later became a prominent advocate of the temperance cause. After ten years of great success as a temperance lecturer he went to England in 1853 and carried on a remarkable work there. He returned to the United States in August, 1860, and soon began to lecture on "Street Life in London." Other subjects were added to his list, and in all he retained his great popularity. In 1873 he announced that he would retire from the lecture field, but he was afterward prevailed upon to appear on special occasions. In 1878 he again visited England. In 1869 he issued his "Autobiography and Personal Recollections," and in 1880 "Sunshine and Shadow," being chiefly passages from his lectures. He died in Philadelphia, Pa., 1886.

GOULD, ELGIN RALSTON LOVELL: American economist and banker; born at Oshawa, Ontario, 1860; educated at home, at Victoria University, Coburg (now at Toronto), and at Johns Hopkins University. From 1884 to 1887 he was instructor in the Department of History and Political Economy in the Washington (D. C.) High School; in 1885 he conducted an official inquiry in Belgium and Germany for the Department of Labor, and in 1887 he became permanently connected with that department as a statistical expert. In 1887–88 he was reader in social statistics at the Johns Hopkins University, and in 1892 became resident lecturer there. He has represented the United States Government at various international congresses, and is a member of economic and statistical societies at home and abroad. In 1894 he became professor of statistics at the University of Chicago. Mr. Gould became president of the City and Suburban Homes Company (New York) in 1896, the purpose of this enterprise being to provide model homes and tenements for wage-earners. He is also president of the Thirty-fourth Street National Bank in New York.

Mr. Gould believes thoroughly in the application of the historical method and of statistics to economics, but does not accept the opportunism of some of the historical school. He believes in the gradual reduction of the tariff and in international bimetallism; he does not believe in the nationalization of natural monopolies, but thinks the municipalization of some of them might be carefully tried. Among his works may be mentioned: "Housing of Working People," "Popular Control of the Liquor Traffic," "The Gothenburg System of Liquor Traffic," and "The Social Condition of Labor." *Address*: 301 West Seventy-seventh Street, New York City.

GOURNAY, JEAN CLAUDE MARIE VINCENT, SEIGNEUR DE: French economist; born at

Saint Malo, 1712. Traveling as a merchant in Spain, Holland, and England, he published in France on his return a report on the economic and financial condition of these countries. Appointed *intendant du commerce* in 1851, his observation convinced him that the lack of development in French manufacturing was due to the various governmental restrictions, and he came thus largely tho not wholly to embrace the views of the PHYSIOCRATS, and became the author of the famous phrase, *Laissez-faire, laissez-passer.* He died in 1759.

GOVERNMENT: This term, which is derived from the Latin *gubernare* (to steer, direct, govern), denotes the power vested in the State by which its affairs are conducted. Government may be of any form—monarchical, despotic, autocratic, aristocratic, plutocratic, democratic; it may be local, municipal, state, or national. (For the principles involved and the various forms of government, see ANARCHISM; DEMOCRATIC PARTY; FEDERATIONS; INDIVIDUALISM; REPUBLICAN PARTY; SOCIALISM; STATE; VOLUNTARYISM, etc.).

Says Hamilton (*Federalist*, No. 15), "Why has government been instituted at all? Because the passions of men will not conform to the dictates of reason and justice without constraint." (For a discussion of this, see ANARCHISM; SOCIALISM; STATE.)

Total Autocratic	15,789,645	625,798,754

Republican government embraces 24.3 per cent of the area of the habitable world, and 11.4 per cent of the world's population. Constitutional government (not republican) embraces 17.2 per cent of the area, and 18.5 per cent of the population. Colonies or dependencies without self-government embrace 27.3 per cent of the area, and 31.4 per cent of the population. Autocracy embraces 31.1 per cent of the area, and 38.8 per cent of the population.

GRANGERS: An association of American agriculturists commonly known by this name, tho formerly called Patrons of Husbandry.

Soon after the close of the Civil War, President Johnson sent O. H. Kelly, an employee of the Department of Agriculture, as an agent into the Southern States to investigate the condition of the farmers in that section of the country and to report the result of his observations. He was so seriously imprest with what he saw that he proposed a national association of farmers, with branches in all sections of the country. On Dec. 4, 1867, the National Grange was organized with Mr. Kelly as secretary.

It was to be divided into national, state, and subordinate assemblies or "granges." Women were to be admitted to membership on equal standing with men. The purposes of the order were two—the industrial benefit and the social improvement of its members. The discussion of any political question was strictly forbidden. This was found difficult, but its leaders have been successful in the main in keeping it out of politics, and it is different in this respect from the other farmers' organizations. (See FARMERS' ALLIANCE.)

Up to the close of 1871 there were but about 200 granges organized, while the national grange contained only its seven original members. From this time forward its progress was rapid. The farming population began to perceive the advantages of the association, and grew as enthusiastic as they had been lethargic. At the close of 1875 there were about 30,000 granges in existence, said to average about forty members each, the order being strongest in the West and Northwest and well represented in the South. By this time, however, its climax of prosperity had been reached. Jealousy arose between the subordinate and the national granges, and parties with no interest in agriculture beyond that of selling goods to the farmers made their way into the order. So far was this carried that one grange was organized on Broadway, New York City, with forty-five members, representing capital of perhaps as many millions, and composed of bank presidents, wholesale dealers, sewing-machine manufacturers, and speculators. The result of all this was a great

depression of the order. Nevertheless, the order endured, and has had no little influence. It is said to have organized 30,000 subordinate groups in forty-four states and territories. It claims to have prevented the renewals of patents on sewing-machines; to have taught transportation companies that the creator is greater than the creature; to have passed and enforced oleomargarine laws, laws restricting alien landlords and corporations, the interstate commerce law, ballot reform laws, the making the Secretary of Agriculture a cabinet officer, establishing agricultural colleges and stations, arbor days, public schools, numerous local institutions.

Cooperation has been much favored by the Grange, and numerous experiments have been tried, but without great success. (See COOPERATION.)

The following legislation, according to the *World Almanac*, 1907, is favored by the National Grange:

1. Free delivery of mails in the rural districts be placed upon the same permanent footing as the delivery of mails in the cities and the appropriations to be commensurate with the demands and the benefits of the service. 2. Postal savings-banks. 3. Election of United States senators by direct vote of the people. 4. An amendment to the Constitution granting the power to Congress to regulate and control all corporations and combinations. 5. Enlargement of the powers and duties of the Interstate Commerce Commission, giving it authority to determine what changes shall be made or what practises are discriminative or unreasonable, and their findings to be immediately operative and so to continue until overruled by the courts. 6. Regulation of the use of shoddy. 7. Pure food laws. 8. Extension of the markets for farm products equally with manufactured articles. 9. An antitrust law, clearly defining what acts on the part of any corporation would be detrimental to public welfare. 10. The speedy construction of a ship canal connecting the Mississippi River with the Great Lakes and the Great Lakes with the Atlantic Ocean. 11. Revision of the fees and salaries of all federal officers, and placing them on a basis of similar service in private business. 12. Parcels post, telephone and telegraph in the mail service. 13. National and state aid to improve the public highways.

Master, N. J. Bachelder, Concord, N. H.; *Secretary*, C. M. Freeman, Tippecanoe City, Ohio.

GRAYSON, VICTOR: Member of Parliament for Colne Valley, division of Yorkshire, July, 1907; the first man in the United Kingdom elected simply as a Socialist; born 1881 at Liverpool; became an engineer's apprentice, and studied life as a stowaway and tramp; he matriculated at the Liverpool and Manchester universities with a view to entering the Unitarian ministry, but abandoned this, went to live in a Manchester slum, and earned his living as a journalist and lecturer. Gaining popularity among the workers in the Colne Valley, he was selected as candidate for Parliament, and adopted by the Independent Labor Party (*q. v.*), but not by the Labor Party (*q. v.*). He defeated Philip Bright (Liberal—son of John Bright) by 153 votes, and a Conservative by 421. The fact that a Socialist could defeat both the old parties without the formal support of the Labor Party, created a great sensation throughout the United Kingdom.

GREAT BRITAIN (see also BRITISH EMPIRE; IRELAND; SCOTLAND): In this article we simply outline British social reform to bring out the continuity, referring for all statistics and details to special articles.

The story of social reform in England begins with Alfred's efforts at establishing justice and promoting learning, if not with Augustine and with Aidan. The early English Church and some of England's kings struggled to put down slavery. Englishmen like Anselm and Theobald withstood Norman oppression. In 1215 the knights at Runnymede, led by Stephen Langton, Archbishop of Canterbury, won from King John the Great Charter, with its fundamental rights, freedom from imprisonment without trial, and from taxation without consent of the council of the nation. In 1265 Earl Simon of Montfort, for Henry III., summoned the burgesses to Parliament, and under Edward I. they came, reasserting the old rights of the Anglo-Saxon Witenagemot.

As early as 1360 did John Ball (*q. v.*), "the mad priest of Kent," preach a medieval Christian socialism, asking in the name of the common folk by what right men called lords were greater folk than they, and declaring that the lords held their estates by the toil of the villeins. The Peasants' Revolt (*q. v.*) resulted and was put down, yet serfdom was conquered and the spirit engendered has never wholly died away. One finds it alike in the rough poetry of Langland's "Piers Plowman" (1377) and in the courtly words of More's "Utopia" (1516). It enters in milder form into Erasmus's "Christian Prince," and again in Harrington's "Oceana" (1656). It is voiced in Beller's proposed "College of Industry" (1695), and in Spence's land nationalization of 1775. (See these names.) England, freed from serfdom, enjoyed what some called the "Golden Age" of Merrie England.

Beginnings

But after the Golden Age came the Iron. In the sixteenth century the nobles, impoverished by the long French wars and the wars of the Roses, drove out many of their humble folk, and turned their fields into sheep walks for the raising of wool for the Flemish market, and at the same time fenced in many of the commons, calling forth continual protest, including Latimer's sermons. This robbery of the land by those who were its rulers but not its owners, together with the confiscation of the monasteries and other causes, produced the landless class (see LAND), and made necessary the poor-laws (*q. v.*). These laws, altho turned by remorseless magistrates into a means of the degradation of England's poor, contained, nevertheless, the socialistic claim of the right of every man to receive opportunity for life and work from the State.

The contest with Charles, the Puritan Commonwealth, the English Revolution, were not movements of the industrial classes, but they laid the foundation of England's political democracy and made possible the England of to-day. (See LEVELERS.)

When, in the eighteenth century, the discovery of steam-power and machine production developed modern industrial England, it caused an economic revolution. Under the *laissez-faire* teachings of Adam Smith, trade threw off restraint; manufacturers robbed cottages of their women and cradles of their children to employ them in factories utterly without sanitation, coining their blood into profits. Employees were worked like slaves and housed more poorly than the beasts, the whispers of Malthusianism quieting any stirrings of the conscience. It was necessary that men be killed, it was said; there was not room for all. It was these conditions that led to modern industrial legislation.

In 1795 Dr. Aikin, a Manchester physician, published a statement concerning the evil condition of the children working in the mills. In 1796 a committee was formed in Manchester to inquire into the health of the poor. In 1802 the elder Peel brought in and passed the

first bill for the preservation of the health and morals of apprentices and of others employed in cotton and other factories. It immediately accomplished nothing, being fatally defective; but it established the principle. Other bills introduced did little more. In 1824 a bill was passed, mainly owing to the efforts of Francis Place, outside of Parliament, and Joseph Hume within, giving trade-unions, which had secretly existed since about 1700, the right to partially organize. In 1830 Richard Oastler, speaking for the antislavery movement, discovered that there was "white slavery" in England, and from that date gave his time and strength in poverty, and even when imprisoned for debt, to exposing the facts of factory evils, and agitating for legislation. He accomplished little, however, till Lord Ashley, afterward the Earl of Shaftesbury, took up his cause. T. Sadler, in 1831, had moved a ten hours' bill, but to no effect. A select committee was appointed in the matter in 1832, but only to gain time and prevent action. Lord Ashley, however, now taking hold, brought in a ten hours' bill for women and children, which was read a second time in 1833. It was violently opposed, especially by individualist Liberals like Cobden and John Bright. Finally, Lord Althorp brought in for the government and carried a compromise bill, which was better than nothing. Oastler, however, continued his agitation. Children's Employment Commissions of 1842 and 1843 published terrible revelations. A factory act was passed in 1844, and finally the Ten Hours' Bill of 1847.

Early Factory Legislation

Meanwhile Robert Owen (*q. v.*), at his mills in New Lanark, had been putting in practise various reforms, and in the year 1817 laid a scheme of a socialistic community before the House of Commons. This act is sometimes considered the beginning of socialism in England; but it was not socialism as we understand the word to-day. Owen's utopianism and evolutionary social democracy in industry have little in common. In 1825 Owen purchased New Harmony in the U. S. and started a short-lived community. In 1835 he founded an association of all classes of all nations; and during the discussions which arose over this, the words "socialism" and "Socialist" seem first to have been used.

The passage of the Reform Bill in 1832 had abolished the "pocket boroughs" and given England a taste of democracy. Slavery (*q. v.*) was abolished in the British colonies in 1834. The poor laws were reformed. The middle classes were now indeed enfranchised, but these reforms did little for the workmen. These Owen reached. The Owenite press, the *Crisis*, the *Pioneer*, the *Herald of the Rights of Industry*, and other papers, created a wide-spread movement. Within a few weeks half a million members are said to have joined Owen's Grand National Consolidated Trade-Union, including tens of thousands of farm laborers and women. The object was to put an end to all competition. The wealthier classes were alarmed. In 1834 six Dorchester laborers were sentenced to seven years' transportation for the mere act of administering an oath. (See Conspiracy Laws.) Monster labor congresses were held; 30,000 persons took part in a procession in London protesting against the judgment; over 250,000 signed a petition. Strikes were numerous. They generally failed, however. A levy of 18*d.* per member hurt the Grand National. It was too hurriedly organized, and did not endure. The trade-unions all suffered. Led by William Cobbett, William Lovett, and others, working men began to turn to political methods.

The Owenite Period

In 1838 a representative meeting of workmen drew up a program of political reforms which they held to be necessary. Speaking to the representatives, the Irish orator O'Connell called it their charter, and in all the subsequent agitation this program was called the "People's Charter," and its supporters "Chartists." (See Chartism.) The charter called for the famous "six points"—manhood suffrage, equal electoral districts, vote by ballot, annual parliaments, abolition of property qualification for members of the House of Commons, and payment of members of Parliament for their services. Enormous meetings were held. Orators, writers, editors, poets were developed—O'Connor, Lovett, Cleave, Hetherington, and O'Brien being among the leaders. Every center had its Chartist journal. But there soon developed a division as to the means to be adopted. Some favored an appeal to force; many—probably most—advocated constitutional methods. In June, 1839, a petition signed by nearly 1,300,000 persons was presented to the House of Commons, "bound in iron hoops, four men bearing it," asking that the charter be considered. By a large majority the House of Commons refused. Relations between the government and the people became strained; public meetings were forbidden; riots were of frequent occurrence. Agitation continued more or less vigorously until 1848, the year of revolutions. A meeting was called on Kennington Common for April 10th, at which it was expected that half a million workers would be present. Great alarm prevailed; the military under the Duke of Wellington was called out; cannon were planted to cover the meeting-place and the exits, and nearly 200,000 civilians were enrolled as special constables. After all these threatenings the gathering on the common was not as large as had been anticipated, a heavy storm interfering. Not 100,000 were present. This was the end of Chartism. The movement collapsed when apparently at its highest. During all the ten years of the agitation it had been largely an economic change that was desired. Political change was only sought in order to secure economic changes. Every constitutional means had been tried and had failed, and now the government had shown that if an appeal were to be made to force, it would use all its strength to crush the appeal, and would yield no quarter. Just while men were pondering the alternatives, a new door of escape was opened—gold was discovered in America, and New Zealand and Australia were calling for colonists.

Chartism

The repeal of the corn laws in 1846, after the long free-trade agitation of Cobden and Bright, and the passage of the Ten Hours' Bill in 1847, also gave hope of relief.

The close of the Chartist agitation witnessed the birth of organized Christian Socialism (*q. v.*). Charles Kingsley and Frederick Denison Maurice, clergymen of the Church of England, with E. Vansittart Neale, Thomas Hughes, J. M. Ludlow (see these names), organized a society under the avowed name of Christian Socialism. They published pamphlets and two

Christian Socialism

papers, and started some cooperative stores. Their papers were soon discontinued; their stores either failed or were swallowed up in the larger Rochdale cooperative movement; but their thought lived. Kingsley's bold denunciation of the soulless Manchester school of political economy and the deeper philosophy of Maurice are potent to-day.

From 1850–80 English trade-unionism was taking form and growing, with many ups and downs. The Rochdale cooperative movement, beginning in 1844, during this period made its phenomenal advance. The writings of Carlyle and of Ruskin struck strong blows against the orthodox political economy. In 1848 Mill published his "Political Economy." Henceforth political economy was no longer a dismal science of theories, but a discussion of how to meet practical industrial problems. Mill himself, in his "Autobiography," came to announce himself a Socialist. There were other radical forces at work. From 1849 to his death in 1883 Marx resided in London. In London, also, was Mazzini. Opposed to socialism, as it was presented to him, he really preached its deepest and most ethical ideas. As early as 1847 Marx and Engels, corresponding with a London society, turned this society into a communist league; and the following year published from Brussels the manifesto of the communist party. In 1862 a party of French working men visited the International Exhibition in London, getting into communication with English trade-unionists; on Sept. 28, 1864, the famous "International" (*q. v.*) was founded at St. Martin's Hall, London. It was not at first a socialistic organization. Its simple aim was to unite the working men of all countries. Naturally it took a different coloring with different nations. In England it meant little more than an attempt at international trade-unionism, and took no deep root.

Socialism

Little as he intended it, the lectures in England of Henry George (*q. v.*), individualist as he proclaimed himself, seem to have been the occasion for the first crystallization in England of modern Socialist thought. According to Sidney Webb ("Socialism in England"), the coercive measures introduced by Mr. Gladstone's ministry against the Irish Land League had alienated many of the earnest Radicals from the Liberal Party. It became evident that Liberalism was not inconsistent with shameless international aggression in the interests of the officers and the bondholders. The neglect of English social questions became more and more pressingly felt. The "Democratic Federation" was founded in 1881, by H. M. Hyndman, Herbert Burrows, Miss Helen Taylor (stepdaughter of John Stuart Mill), and some others. The only distinctively Socialist proposal explicitly set forth in the first program of this organization was "nationalization of the land," placed ninth in the list; but it was from the first essentially a Socialist body, and it changed its name in 1884 to the "Social Democratic Federation" (*q. v.*). Men joined like William Morris, Tom Mann, John Burns, and others.

At the end of 1884, however, William Morris (*q. v.*) withdrew from the Federation, and with others formed the Socialist League. The grounds of secession were mainly personal, but the new society soon developed a policy of its own, standing for a more communistic and less governmental conception of socialism. Publishing the *Commonweal* (1885), to which Mr. Morris gave brilliant contributions, it exerted no small influence. About 1892, however, the organization and the *Commonweal* came under anarchist control; Mr. Morris withdrew, and the league virtually died, the Social Democratic Federation keeping on.

A more potent and unique organization of English Socialists is the Fabian Society (*q. v.*), founded in 1883, and to-day still adding to its strength. Commenced mainly as an educational and propagandist center, it includes members of other societies. In one year its members have given thousands of lectures and distributed still more thousands of Socialist essays and tracts. It has influenced political parties, economic literature, and trade-union thought. It may almost be said to have created the London County Council (*q. v.*), and to have changed the thought of the working men's clubs of London. Leaders in it like Sidney Webb, Bernard Shaw, H. G. Wells, and others have had most respectful hearing, and many of its members have been elected to Parliament. (See FABIAN SOCIETY.)

These various societies, taking advantage of industrial depressions and discontent, have largely captured the English trade-unions for socialism. A "New Trade-Unionism" grew steadily till 1895. The agitation in behalf of the unemployed in 1886, resulting in the prosecution at the Old Bailey of Messrs. Hyndman, Burns, Champion, and Williams, led, altho they were acquitted, to making socialism somewhat popular among the London masses. The great dock strike of 1889 saw a turning of the tide. Ben Tillett, Tom Mann, and John Burns organized the dock laborers and won. It led to the organization of other trades thus far unorganized. These new unions followed the new leaders, and the movement began to grow in the rank and file of even the old unions. By 1890 the new unionism was in the majority in the trade congresses, and in 1894 voted to support only collectivist candidates. The defeat of the Liberal Party in 1894, however, to which many of the old trade-unionists were allied, led to the older trade-unions securing a change in representation, giving the newer trade-unions less power, and thus defeating the new trade-unionism at the Congress of 1895. Some of the new trade-unions, too, did not endure.

New Trade-Unionism

Labor representatives began to be elected to Parliament as Liberals or as miners' members. In 1873–74 no fewer than thirteen "labor candidates" went to the polls; and Alexander Macdonald and Thomas Burt (*q. v.*), two leading officials of the miners' national unions, were elected the first "labor members" of the House.

However, altho largely enfranchised by the Reform Bill of 1867, English workmen in their trades congresses even rejected amendments in favor of manhood suffrage as late as 1882 and 1883. In order to win legal recognition at all for their trade-unions, the leaders had had to plant themselves wholly on the middle-class ground of the individual freedom of each man to sell his labor as he pleased, collectively or not. Even after trade-unions were themselves in 1871 fully legalized, even when "in restraint of trade," their members were still so liable to prosecution under vague combination laws, that the unions were engaged in a battle for mere existence down to 1875. At this date, however, the Liberal Par-

ty having been defeated largely by the division of the labor vote, a Conservative government wiped away the last vestige of the combination laws. But this long struggle for life had so indoctrinated the trade-unions with the individualist economy, that, save for a few leaders like Allan of the Engineers and Applegarth of the Carpenters, the average trade-unionist cared nothing for parliamentary action. Even when free to act, their very successes made the trade-unions conservative. Men, like Mr. Broadhurst, actually opposed eight-hour legislation; a motion in support of it was defeated by a large majority at a trade-union congress as late as 1889.

The collectivist policy, however, became so popular that, weary of the vast promises and slight fulfilment of both the Liberal and Conservative parties, there was organized (Jan., 1893), mainly under the lead of Keir Hardie, elected M. P., an Independent Labor Party, its object being, as stated, "the collective ownership and control of the means of production, distribution, and exchange." Robert Blatchford's "Merrie England," emphasizing the principles of the party, about this time is estimated to have reached 2,000,000 readers.

Municipalism of various kinds was long, however, the main practical form of English socialism. The formation of the county councils, and particularly of the London County Council, to bring together under one control the numberless boards and vestries that had power in various ways in London, was another step toward socialism.

Later, attention was directed to some extent from social problems by the Boer War and discussions arising from it, and under its influence the Conservatives gained a new lapse of life. Gradually, however, the majority of the trade-unions, while not committing themselves to avowed socialism, came to favor political action directly in their own interests, on largely socialistic lines and independent of any political party.

Labor Politics

A Labor Representation Committee was organized composed mainly of representatives of such unions, and of a few other organizations, like the Fabian Society, willing to cooperate on those lines, to manage the campaigns of candidates indorsed by the committee, and create a fund for the payment of the elected members. (See LABOR REPRESENTATION COMMITTEE.) This movement had growing success, till in the general election on Jan., 1906, the Labor forces astonished themselves and all England by electing to Parliament twenty-nine candidates indorsed by the Labor Representation Committee, which with eleven "miners' members" and fourteen Liberals, but also Labor members, made fifty-four Labor members (twenty-nine independent of other parties). The committee therefore adopted, 1906, the name of the Labor Party (*q. v.*), with Keir Hardie as its head. The independent, aggressive, and yet, on the whole, constructive and practical position of the party's representatives in Parliament has been the social reform political interest of the year, while by-elections have added three to their number (including one elected as a Socialist), making some eighty members all largely socialistic in their policies.

Meanwhile other phases of social reform have recently rapidly advanced. Distributive cooperation has grown steadily and productive cooperation has been begun in earnest. (See COOPERATION.) Cooperative housebuilding has begun, but especially have municipal and county councils taken up the housing question, in many cases undertaking large housing schemes. (See HOUSING QUESTION.) A successful Garden City movement has been developed (see GARDEN CITIES), while prominent employers have developed large and beautiful model villages for their employees. (See BOURNEVILLE; PORT SUNLIGHT; MODEL VILLAGES.) The question of employing the unemployed has been largely agitated and successful attempts inaugurated. (See LABOR COLONIES; UNEMPLOYMENT.)

Present Movements

Considerable attention has been called to the woman-suffrage question by women who were willing to storm the House of Parliament in demanding a hearing and allow themselves to be imprisoned for creating disturbance. (See WOMAN'S MOVEMENTS.) Much thought has been attracted to the taxation of land values by the introduction in Parliament of a Scotch bill calling for a distinction in making up rates on values of land and values of improvements. Many members, including the Premier, are said to favor the distinction. (See LAND.) The school question has been a burning theme, tho a compromise bill calling in the main for separation of all public schools from Church control was thrown out of the Lords after it had passed the Lower House. (See SCHOOL QUESTION, articles on both sides.) (For the home rule question, which has so largely affected English politics, see HOME RULE; IRELAND.) Great Britain may be said to-day to be leading the world (outside of New Zealand and Australia) in the actual taking up of detailed social questions and pressing for their solution from an advanced point of view, tho Germany and Switzerland are probably actually doing more on slightly more paternal lines. (See special articles for references and all details.)

GREDESKUL, NICHOLAS ANDREYEVICH: Russian jurist, editor, and politician; born in 1864. He was graduated from the University of Kharkof, and later became a professor there, and dean of the law department. Gredeskul, who was second vice-president of the first Duma, was arrested just before election by order of Minister Durnovo, and was exiled to Archangel; but on being elected he was released. He is a Constitutional Democrat, and edits a newspaper called *Mir*.

GREEK SOCIAL POLITY: This was, in a word, the exaltation of the State, ordinarily a democratic city, based upon slave labor, over all departments of life. (See ATHENS; ARISTOTLE; PLATO.) We give here the synopsis of the Greek economic and social idea, as given in Professor Ingram's "History of Political Economy":

1. The individual is conceived as subordinated to the State, through which alone his nature can be developed and completed, and to the maintenance and service of which all his efforts must be directed. The great aim of all political thought is the formation of good citizens; every social question is studied primarily from the ethical and educational point of view. The citizen is not regarded as a producer, but only as a possessor of material wealth; and this wealth is not esteemed for its own sake or for the enjoyments it procures, but for the higher moral and public aims to which it may be made subservient.

2. The State, therefore, claims and exercises a controlling and regulating authority over every sphere of social life, including the economic, in order to bring individual action into harmony with the good of the whole.

3. With these fundamental notions is combined a tendency

to attribute to institutions and to legislation an unlimited efficacy, as if society had no spontaneous tendencies, but would obey any external impulse, if imprest upon it with sufficient force and continuity.

GREELEY, HORACE: American editor and social reformer; born at Amherst, N. H., 1811. Before he was ten years old his father became bankrupt. The family then moved to Vermont, where they made a scanty living as day laborers. When fourteen years of age Greeley was apprenticed in the office of the *Northern Spectator*, East Poultney, Vt. His wages were but $40 a year; but by living on almost nothing he was able to send money home. He remained here six years, when the paper was suspended. For a time he worked with his father on a rough farm in Pennsylvania, and then began to tramp the country in search of employment. In 1831 he entered New York with $10 in his pocket, and two years later formed a partnership with a fellow workman, Francis V. Story. Combining their capital, which amounted to $150, they commenced by printing the *Morning Post*, which failed in three weeks. But Greeley went on writing as well as printing. He was invited by James Gordon Bennett to go into a partnership with him in the *Herald*, but he declined, and issued instead the *New Yorker*, a literary journal which lived seven years. Later he published the *Log Cabin*, a weekly campaign paper, which was a great success. On April 10, 1841, Greeley commenced the New York *Tribune*, his life-work.

Greeley was then entirely without money. From a personal friend, Mr. James Coggeshall, he borrowed $1,000, on which capital and the editor's reputation the *Tribune* was founded. It began with 600 subscribers. Mr. Greeley opened its columns to well-nigh every reform. He made it the leading abolition newspaper. He advocated in it dress reform, vegetarianism, and FOURIERISM.

From 1850 until the end of the Civil War the *Tribune* did much to create and awaken the anti-slavery sentiment of the North. Greeley urged in his paper the vigorous prosecution of the war, but at its close immediately advocated universal amnesty and suffrage. From 1848 to 1849 he was a Whig representative in Congress.

In 1867 Greeley was appointed delegate to the convention for the revision of the Constitution. He antagonized General Grant's administration, and was one of the chief promoters of the Liberal Republican Party, which held its national convention at Cincinnati in 1872, and nominated him for president. His lifelong opponents, the Democrats, nominated him also at their national convention—a move which greatly lessened his chances of success by repelling many of his Republican supporters. During the canvass feeling ran high, and he took the field in person and made one of the most brilliant, able, and sustained series of campaign speeches on record. In the election he received 2,834,079 votes as against 3,597,070 for Grant. Greeley carried Georgia, Kentucky, Maryland, Missouri, Tennessee, and Texas. He at once resumed the editorship of the *Tribune*, but it was soon evident that he had overtaxed his strength in the campaign. No sooner was it ended than he was called to the bedside of his dying wife, from which he went only to be himself prostrated by a nervous disorder of the brain. His illness was short, and on Nov. 29, 1872, he died. His published volumes are as follows: "Hints Toward Reforms" (1850); "Glances at Europe" (1851); "History of the Struggle for Slavery Extension" (1856); "Overland Journey to San Francisco" (1860); "The American Conflict" (2 vols., 1864–66); "Recollections of a Busy Life" (1868); "Essays Designed to Elucidate the Science of Political Economy" (1870); and "What I Know of Farming" (1871). His life was written by James Parton in 1855, and a new edition appeared in 1868.

GREENBACK PARTY, THE: A party which originated in the United States in 1873–74 as a result of the opposition felt by many to the asserted manipulation of the currency in favor of the banking and bondholding class. (See CURRENCY.) It was claimed that the bankers of the country had conspired (1) to make the issue of the war greenbacks a failure by inducing Congress to prevent their being legal tenders for customs and for payment of the national debt, and so depreciating their value; (2) to buy up these greenbacks at their depreciated value, and with them purchase bonds, paying for the bonds with greenbacks at their face value; (3) to induce Congress to vote that these bonds bought with greenbacks at thirty cents on the dollar should be redeemed by Congress under the pretense of national faith and of "an honest dollar" in gold (interest as well as capital), while the soldiers and sailors of the war who had risked their lives and got no "interest" had been paid in greenbacks. Intense excitement was aroused, which the period of contraction of the currency greatly increased. As early as 1868 the demand called "the Ohio idea" was broached, claiming that all bonds which did not distinctly call for payment in coin should be redeemed in greenbacks. This "idea" seemed to have dominated the Democratic convention of 1868, but was distinctly disavowed by Mr. Tilden and other leading Democrats. Many local and state conventions in the West, however—chiefly Democratic—indorsed the idea. Its advocates still hoped to bring the entire party to their way of thinking.

Demands

Finally the financial crisis of 1873 caused the masses of the people to seek legislative relief for the evils from which they were suffering, and produced a certain disintegration of the established political parties. The pressing questions of the time appeared to require and justify new political organizations. A Greenback convention was held at Indianapolis in 1874, and demanded: (1) The withdrawal of the national bank-note currency; (2) that the only currency should be of paper, and that such currency should be made exchangeable for bonds bearing interest at 3.65 per cent; and (3) that coin might be used for the payment of the interest and principal of such bonds, and such only, as expressly called for coin payments. In 1876 a national Greenback convention was held at Indianapolis, which nominated Peter Cooper, of New York, and Samuel F. Cary, of Ohio, for president and vice-president. In the election which followed they received 81,737 popular votes.

To these attempts to found a new party, based on financial issues, a turn in another direction was given by the labor troubles which had culminated in the great railroad strikes of 1877. In 1878 a "National or Greenback-Labor Convention" was held at Toledo, O., as the result of a coalition between the labor reformers and the advocates of a greenback currency. In the following election

the Greenback-Labor tickets polled over 1,000,000 votes, and fourteen representatives of the party were sent to Congress. But the party was made up of different elements; and altho the distress which gave it strength was real, none of the party leaders seems to have had definite ideas as to what was to effect a cure. In 1880 the Greenback-Labor convention, at Chicago, nominated James B. Weaver, of Iowa, and B. J. Chambers, of Texas. In that year the popular Greenback-Labor vote was 300,867, and eight of their representatives were elected to Congress. The ticket in 1884 was headed by General B. F. Butler, who was also the Anti-Monopoly candidate, and received 175,380 votes. In that year the Greenback ticket in Iowa, Michigan, and Nebraska was fused with that of the Democrats, and in Missouri and West Virginia with the Republican ticket.

The Greenback Party proper always had its strongest support in the Western States. In Maine, New York, Vermont, and Massachusetts the Greenback element was made up of labor reformers, and its tickets were as a rule supported principally by laboring men. But on several occasions the Greenbackers received encouragement and support from either one or the other of the two great parties of the country, who hoped to create a diversion in their own favor by running a third ticket, so made up as to draw votes from the opposing party.

The following is the platform of the Greenback-Labor Party, adopted at the National Convention, held in Chicago, June 9 and 10, 1880:

Platform of 1880

Civil government should guarantee the divine right of every laborer to the results of his toil, thus enabling the producers of wealth to provide themselves with the means for physical comfort and the facilities for mental, social, and moral culture; and we condemn as unworthy of our civilization the barbarism which imposes upon the wealth producers a state of perpetual drudgery as the price of bare animal existence.

Notwithstanding the enormous increase of productive power, the universal introduction of labor-saving machinery, and the discovery of new agents for the increase of wealth, the task of the laborer is scarcely lightened, the hours of toil are but little shortened, and few producers are lifted from poverty into comfort and pecuniary independence.

The associated monopolies, the international syndicates, and other income classes demand dear money and cheap labor, a "strong government," and hence a weak people.

Corporate control of the volume of money has been the means of dividing society into hostile classes; of the unjust distribution of the products of labor, and of building up monopolies of associated capital, endowed with power to confiscate private property. It has kept money scarce, and scarcity of money enforces debt trade, and public and corporate loans—debt engenders usury, and usury ends in the bankruptcy of the borrower.

Other results are deranged markets, uncertainty of manufacturing enterprise and agriculture, precarious and intermittent employment for the laborer, industrial war, increasing pauperism and crime, and the consequent intimidation and disfranchisement of the producer, and a rapid declension into corporate feudalism.

Therefore we declare:

(1) That the right to make and issue money is a sovereign power to be maintained by the people for the common benefit. The delegation of this right to corporations is a surrender of the central attribute of sovereignty, void of constitutional sanction, conferring upon a subordinate irresponsible power, and absolute dominion over industry and commerce. All money, whether metallic or paper, should be issued and its volume controlled by the government, and not by or through banking corporations, and when so issued should be a full legal tender for all debts, public and private.

(2) That the bonds of the United States should not be refunded, but paid as rapidly as it is practicable, according to contract. To enable the government to meet these obligations, legal tender currency should be substituted for the notes of the national banks, the national banking system abolished, and the unlimited coinage of silver, as well as gold, established by law.

(3) That labor should be so protected by national and state authority as to equalize its burdens and insure a just distribution of its results; the eight-hour law of Congress should be enforced; the sanitary condition of industrial establishments placed under rigid control; the competition of contract convict labor abolished; a bureau of labor statistics established; factories, mines, and workshops inspected; the employment of children under fourteen years of age forbidden, and wages paid in cash.

(4) Slavery being simply cheap labor, and cheap labor being simply slavery, the importation and presence of Chinese serfs necessarily tends to brutalize and degrade American labor; therefore immediate steps should be taken to abrogate the Burlingame treaty.

(5) Railroad land grants forfeited by reason of non-fulfilment of contract should be immediately reclaimed by the government; and henceforth the public domain reserved exclusively as homes for actual settlers.

(6) It is the duty of Congress to regulate interstate commerce. All lines of communication and transportation should be brought under such legislative control as shall secure moderate, fair, and uniform rates for passenger and freight traffic.

(7) We denounce, as destructive to prosperity and dangerous to liberty, the action of the old parties in fostering and sustaining gigantic land, railroad, and money corporations and monopolies, invested with and exercising powers belonging to the government, and yet not responsible to it for the manner of their use.

(8) That the Constitution, in giving Congress the power to borrow money, to declare war, to raise and support armies, to provide and maintain a navy, never intended that the men who loaned their money for an interest consideration should be preferred to the soldier and sailor who periled their lives and shed their blood on land and sea in defense of their country, and we condemn the cruel class legislation of the Republican Party, which, while professing great gratitude to the soldier, has most unjustly discriminated against him, and in favor of the bondholder.

(9) All property should bear its just proportion of taxation, and we demand a graduated income tax.

(10) We denounce as most dangerous the efforts everywhere manifest to restrict the right of suffrage.

(11) We are opposed to an increase of the standing army in time of peace, and the insidious scheme to establish an enormous military power under the guise of militia laws.

(12) We demand absolute democratic rules for the government of Congress, placing all representatives of the people upon an equal footing, and taking away from committees a veto power greater than that of the president.

(13) We demand a government of the people, by the people, and for the people, instead of a government of the bondholder, by the bondholder, and for the bondholder; and we denounce every attempt to stir up sectional strife as an effort to conceal monstrous crimes against the people.

(14) In the furtherance of these ends we ask the cooperation of all fair-minded people. We have no quarrel with individuals, we wage no war upon classes, but only against vicious institutions. We are not content to endure further discipline from our present actual rulers, who, having dominion over money, over transportation, over land and labor, over the machinery of government, and largely over the press, wield unwarrantable power over our institutions, and over life and property.

The literature of the movement is large, but much of it was in only transient form. Among the best books is B. S. Heath's "Labor and Finance Revolution." The papers of Henry C. Baird and "The Currency Question," a pamphlet by G. M. Steele, contain more moderate statements of the views of the Greenback Party. (For a discussion of the principles voiced by the Chicago convention of 1880, see CURRENCY; MONEY.)

GREULICH, HERMANN: Swiss statistician; Swiss Workmen's Secretary. The Swiss Confederation has no department of labor, but the *Arbeitersekretariat* was established in 1887. It has a semiofficial standing, the salaries and expenses being paid by the government, while the secretary is chosen by the labor organizations. The office was created in April, 1887, by the election of Mr. Greulich, a statistician of Zurich; 142 labor organizations, representing about 100,000 working men, were interested in the election through a central committee; it was for three years, but has been renewed since. The new secretary placed himself in touch with the cantonal and foreign governments' labor and social departments. In 1888 he published an exhaustive study of wages in Switzerland; 1890 and 1893 statistics on accidents. Author: "In-

stitutions of the Paris Municipal Council for the Protection of the Working Classes" (1889). *Address*: *Arbeitersekretariat*, Bern, Switzerland.

GREY, SIR GEORGE: Third governor of New Zealand; has been called "the greatest figure in the first half-century of New Zealand's colonial history"; born at Lisburn, Ireland, 1812; educated at Sandhurst for the army; entered the service and became captain in 1835. In 1839 he went on an exploring expedition in Australia, and two years later was appointed Governor of South Australia. In 1845 he was transferred to the governorship of New Zealand, and successfully closed the first Maori War. He largely drafted the present constitution of the colony, which had been on the brink of ruin when he became its executive. In 1854 he left the colony on the road to prosperity, and was transferred to the governorship of Cape Colony; but in 1861 he was transferred back to New Zealand to conduct the second Maori War. He retired in 1868, but in 1875 came into public life as a leading Liberal, and was premier from 1877 to 1879. After resigning this office he sat in Parliament almost continuously till he retired in 1894 on account of old age. He gained great support all over Australia for his liberal views, especially for his advocacy of the "one man, one vote" idea, woman's suffrage, and national ownership of the soil. A natural leader with extraordinary abilities, he was at times hated and criticized by some, but honored, loved, and followed by the many. He died in 1898.

GRONLUND, LAWRENCE: American Socialist, lawyer, and writer; born in Denmark, 1848; took part in the Dano-German War of 1864; studied law at the University of Copenhagen; emigrated to the United States in 1867, and for a time taught German in a public school in Milwaukee. In 1869 he was admitted to the bar and began practising law in Chicago. He became interested in socialism by reading Pascal's "Pensées." In 1880 he published a dialogue on "The Coming Revolution," and in 1884 his "Cooperative Commonwealth," the first full statement of modern socialism published in this country, and which had a wide sale and influence. Mr. Gronlund then devoted himself to the propaganda of socialism, and wrote and lectured wherever he could get a hearing—in Chicago, New York, Boston, and on the Pacific coast. He held for a while an office in the U. S. Labor Department. In 1887 he published "Danton," a study of the French Revolution, and in 1890 "Our Destiny," a work religious as well as socialistic, which had a large sale, especially in England, where 1,000 copies were sold in the first month. The *Revue d'Économie Politique* called it "the most elevated and attractive conception of socialism yet published." Mr. Gronlund died in 1899.

GROTIUS, HUGO, or DE GROOT: Dutch jurist and writer; born at Delft, 1583; son of the burgomaster of the town; entered the University of Leyden in 1594, graduating in 1598. Traveling in France, he returned to practise as a lawyer, and in 1607 was fiscal general, and in 1610 council-pensionary at Rotterdam. For supporting the Remonstrants he was condemned, in 1619, to imprisonment for life, but escaped by the aid of his wife, who took his place in the castle, tho for her bravery she was set free. He wandered through the Netherlands and France, and for a while enjoyed a pension at the court of Louis XIII. He was allowed to return to Holland, but was soon again exiled for life. A wanderer again, he entered the service of Sweden, and from 1635 to 1645 was Swedish ambassador at Paris. Returning to Sweden, he passed through Amsterdam, and was honored there as well as in Sweden. He received a pension, but while journeying fell ill and died at Rostock in 1645. He was a profound scholar, an eminent theologian, an erudite historian, a Latin poet, an eminent jurist. His "De Jure Belli et Pacis" (1625) has been translated into all the languages of Europe, and may be called the basis of international law. (See POLITICAL SCIENCE.)

GRÜN, KARL: German Socialist; born at Lüdenscheid, 1813; educated at the gymnasium at Wetzlar; studied theology and philosophy at Bonn and Berlin. From 1839 to 1842 he taught languages in Colmar, whereafter he returned to Germany, founding the *Mannheimer Abendzeitung*. He was, however, expelled from Baden on account of alleged revolutionary tendencies, whereupon he settled in Cologne where he edited a weekly, *Der Sprecher*. He became converted to socialism, and visited Belgium and Paris. In 1845 he published "Die Sociale Bewegung in Frankreich und Belgien, Briefe und Studien." Returning to Germany in 1848, Grün was elected to the second chamber of the Prussian Diet, where he joined the extreme Left. On the dissolution of this Diet he was accused of having taken an "intellectual" part in the "Pfalz Uprising"; but after eight months' incarceration was acquitted. He then spent some years abroad, returning on the death of Frederick William IV., and settling in Frankfort-on-the-Main, where he earned a living as an instructor in a commercial school. In 1870 he settled in Vienna, where he died in 1887.

GUESDE, JULES: French Socialist leader; born in Paris, 1845. Entering political journalism in Paris, Toulouse, and Montpellier, at the latter place he published the *Droits de l'homme*, and was imprisoned six months for a revolutionary article against the empire. At the time of the Commune he attempted to stir up a revolution in Montpellier; was condemned to five years' imprisonment; fled to Geneva and joined the Internationalists. Driven to Italy, he returned to Paris in 1876 and edited the *Citoyen*, the *Cri du Peuple*, and then founded the *Egalité*, the first paper of modern Marxist socialism in France. In 1879, with Marx, Engels, and La Fargue, he drafted the program of the Marxist *Parti ouvrier français*, of which he became the foremost leader. (See FRANCE.) Imprisoned for six months in 1878 and again in 1883 for his Socialist activities, in 1893 he was elected deputy from Roubaix. Since this date to his reelection in 1906, he followed the varying fortunes of the *Parti ouvrier français*, and is now one of the active members of the United French Socialist Party. Among his numerous tho brief writings are: "Collectivisme et Revolution"; "Socialisme et services publices"; "Le Collectivisme au Collége de France."

GUILDS. See GILDS.

GUNTON, GEORGE: American economist and editor; born in Cambridgeshire, England, 1847;

emigrated to the United States in 1874, and for some time worked in factories in Massachusetts. Interested in social studies, and especially in the eight-hour philosophy, he became an editorial writer on economic themes. His "Wealth and Progress," which appeared in 1887, is the fullest statement of the eight-hour philosophy, tho not indorsed by most of the eight-hour trade-unionists on account of its author's opposition to many other progressive views held by trade-unions, and by some of them on account of his advocacy of protection. In 1890 Mr. Gunton became president of the Institute of Social Economics, and editor of the *Social Economist*, the name of which was changed in 1896 to *Gunton's Magazine*. *Address*: Colorado Buildings, Washington, D. C.

GUTHRIE, ROBERT STORRIE: Australian statesman; born in Ayr County, Scotland, 1857; spent ten years at sea; went to Australia in 1878 and engaged in the coasting trade; became secretary of the Federated Seamen's Union of Australia in 1887, and is also secretary of the Federal Council of Australian Labor Unions. He was elected senator for South Australia in the Australian Federal Parliament in 1903. *Address*: Knighton Villa, Peterhead, South Australia.

H

HADLEY, ARTHUR TWINING: President of Yale University: born at New Haven, Conn., 1856. Graduated from Yale, 1876. Studied in Berlin. Tutor and lecturer on railroad transportation at Yale 1879–86. Commissioner of Labor for Connecticut 1885–87. Professor of political science, Yale, 1886–99. Since then president. Author of "Railroad Transportation" (1885); "Labor Reports" (1885–86); "Economics" (1896), a work largely used as a text-book; "The Education of the American Citizen" (1901); "Freedom and Responsibility" (1903); "Baccalaureate Addresses" (1907). *Address*: 93 Whitney Avenue, New Haven, Conn.

HAGGARD, HENRY RIDER: Author; sociologist; born Bradenham, Norfolk, 1856. Educated at Ipswich and privately. Secretary to Governor of Natal and then to a commissioner in Transvaal, 1875–79. Formally hoisted the British flag at Pretoria, 1877. Barrister of Lincoln's Inn, 1884. His first book, "Cetywayo and His White Neighbors," appeared 1882; "Dawn" (1884); "King Solomon's Mines" (1886). These and other novels made him famous, and he wrote prolifically. From 1896–98 he journeyed through England, studying rural conditions, and became deeply interested in social problems with which he deals in "Rural England," his most important work. He was made commissioner to report on the Salvation Army colonies in the United States, and made a report (1905) strongly advocating similar schemes for the colonization of England's unemployed by private associations, but with government control and aid, with a scheme for national land settlement. He is an active magistrate and member of the Royal Commission on Coast Erosion, 1906. *Address*: Ditchingham House, Norfolk, England.

HALE, EDWARD EVERETT: Unitarian clergyman and author; born in Boston, 1822. Graduated at Harvard College in 1839. and licensed to preach in 1842. Pastor in Worcester (1846–1856), then pastor of the South Congregational (Unitarian) Church, in Boston, where he still remains. He is even better known as a leader and often the starter of a marvelous number of philanthropic movements. His *Ten Times One is Ten* led to the establishment of clubs devoted to doing good scattered throughout the world, with a membership of over 50,000. They are called "Lend-a-Hand" clubs and have for their motto, "Look up and not down; look forward and not back; look out and not in: and lend a hand." He has also taken great interest in the Chautauqua and other literary, educational, and reform movements. When the Nationalist and Christian Socialist movements were commenced, Dr. Hale interested himself in them, and has sometimes even declared himself a Socialist. In 1869 he founded, in connection with the American Unitarian Association, the magazine *Old and New*, which in 1875 was merged into *Scribner's Monthly*. In 1886 he started *Lend a Hand*. His short stories are among his best works, notably "My Double and How He Undid Me" (1859), "The Man Without a Country" (1863), "In His Name," and "How They Lived in Hampton"—a socialistic story. *Address*: 39 Highland Street, Roxbury, Mass.

HALL, BOLTON: Lawyer; reformer; born in Ireland, 1859; son of Dr. John Hall. Educated in Dublin till 1867. Graduated at Princeton University, 1875. Has lectured and written many brochures on fundamental reforms, advocating the single tax, and large personal liberty. He has been especially active in promoting the cultivation of vacant lots by the unemployed. (See VACANT LOTS.) Author of "Even as You and I" (1889); "Things as They Are" (1900); "The Game of Life" (1903); "Three Acres and Liberty" (1907). *Address*: 33 East Sixty-first Street, New York.

HALL, FRED: Labor member of Parliament for Nomanton, West Riding, Yorkshire. Born 1855 in Staffordshire. He entered a Rotherham colliery, became secretary of the Yorkshire Miners' Association in 1878, and later treasurer and agent. Has been Grand Master of the British United Order of Odd Fellows. He was returned to Parliament in Nov., 1905, without opposition, chiefly by the miners, assisted by the Liberals. *Address*: Rowmarsh Hill, Parkgate, near Rotherham, Yorkshire, England.

HAMPDEN, JOHN: English statesman and patriot; born London, 1594. Entered Oxford, 1610, and the Inner Temple, London, 1621. In 1621 he first sat in the House of Commons as member of the antiroyalist party. In 1627 he was imprisoned for nearly a year for refusing his proportion of a general loan, which the king concluded to force. He remained in Parliament till the dissolution in 1628, becoming one of its leading members. In 1634 he refused to pay a tax, unjustly levied, and was prosecuted for non-pay-

ment and was condemned. In the Short Parliament of 1640 he took an active part against the crown. In the Long Parliament, 1647, he was one of the first members the king attempted to seize. During the Civil War he was colonel of a regiment he himself raised and was wounded at Chalgrove Field. He died 1643.

HAMILTON, ALEXANDER: American statesman; born on the island of Nevis, West Indies, in 1757, the son of a Scotch merchant. Entering a counting-house at the age of twelve, his abilities induced his friends to secure for him a college education, and he was graduated at Columbia College, New York. At the age of eighteen he wrote a series of papers on the relation of the colonies to England, which were at first taken for the production of the statesman Jay. On the outbreak of the war he became a captain of artillery, but soon gained the confidence of Washington and became his aide-de-camp and confidant in 1777. In 1780 he married a daughter of General Schuyler, and became one of New York's leading lawyers.

He was a member of the Continental Congress from 1782–83, and of the Convention of 1787. His perspicacity and power of thought were remarkable. One of the most abused as well as one of the most lauded of men, he played a leading part in the early history of this country.

In conjunction with Madison, he had the most important share in drafting the Constitution. He was a strong supporter of the federal policy of developing a strong national government, and, along with Jay and Madison, defended the Constitution against all attacks by a series of letters in the *Daily Advertiser* of New York, afterward collected and published under the title of "The Federalist" (*q. v.*). On the establishment of the new government in 1789, with Washington as president, Hamilton was appointed Secretary of the Treasury. The disorder of the public credit and the deficiency of official accounts of the State treasury rendered this office one of peculiar difficulty. In order to reestablish public credit, he carried, in spite of much opposition, a measure for the funding of the domestic debt, founded a national bank, and rearranged the system of duties. In 1795 he resigned his office and resumed the practise of law in New York. When the war with France broke out in 1798, he was, according to the wish of Washington, made Major-General of the United States Army; and, on the death of Washington, he succeeded to the chief command. When peace was restored, he returned to his civil duties, but became involved in a political quarrel with Aaron Burr. This difference unhappily culminated in a duel, in which Hamilton received a wound of which he died the following day (July 12, 1804). (See FEDERAL PARTY; CONSTITUTION.)

HANFORD, BEN: Socialist; born Cleveland, Ohio, 1859; an active member of the International Typographical Union for twenty-eight years. In 1898 the Socialist Labor Party made him their candidate for governor of New York; in 1900 was candidate of Social Democratic Party for the same office; in 1901 candidate of Social Democratic Party for mayor of New York City; in 1902 its candidate for the governorship again. In 1904 Hanford was its candidate for the vice-presidency. He is a political and revolutionary Socialist, and author of numerous political and industrial pamphlets and leaflets, which have had a circulation of many million copies. *Address*: 2335 Bedford Avenue, Brooklyn, New York.

HARDIE, JAMES KEIR: Labor leader; member of Parliament; born 1856, near Holytown, Lanarkshire, Scotland; had no schooling advantages. At eight years of age he was a doorkeeper in a mine, and worked in the mines until twenty-three, when a difficulty between masters and men having arisen he was chosen leader of the miners. Dismissed and blacklisted, he was elected secretary of a miners' union. In 1882 he joined the editorial staff of *The Cumnock News*. In 1888 he stood as a Socialist for Parliament at Mid-Lanark, but was defeated. He was successful, however, in 1892, in South West Ham, gaining a majority of 1,232. Defeated in the same constituency in 1895, in the 1900 election he contested Preston and Merthyr Tydvil, losing the former and winning the latter by 1,700 votes over a Liberal candidate. In 1906 he was elected the second time for Merthyr Tydvil with 3,000 majority. He founded the INDEPENDENT LABOR PARTY, established *The Labor Leader* in 1887, and edited the paper until 1904, when it became the official organ of the party, and was definitely taken over as such. In Parliament he has championed the cause of the unemployed, strenuously opposed the South African War, and is a strong advocate of equal rights being granted to women as to men. He is a member of the Fabian Society. He was in February, 1906, elected parliamentary leader of the Labor Party. He is often spoken of as the "Member for the Unemployed." He has written much on social topics and published pamphlets on almost every subject bearing upon working class reform. *Address*: 14 Nevill's Court, E. C., London, England. *Home Address*: Lochnorris, Old Cumnock, Scotland.

HARMONISTS, THE: The name of a religious celibate German community, established at Economy, Pa. The sect was founded in Würtemberg by George Rapp with his son Frederick about 1787, and its adherents are sometimes called Rappists. They believe that the condition of celibacy is most pleasing to God; that the coming of Christ and the renovation of the world are near at hand; that Christ taught a community of goods; that ultimately all mankind will find salvation; but that only those who are celibates, and otherwise conform to what they believe to be the commandments of Jesus, will be at once received into the company of Christ and His companions. The early members were so harassed by petty persecutions that in 1803 they emigrated to Pennsylvania and Maryland. In 1805 they were prosperously established at Harmony, Butler County, Pa., where they remained ten years, but lack of water communication induced them to migrate to New Harmony, Ind., remaining there until 1824, when they sold their land to Robert Owen, the Socialist, and returned to Pennsylvania, establishing themselves at Economy, near Pittsburg. With their accustomed energy they set to work establishing mills, a tannery, a distillery, and other plants, and adding a large hotel to their various industries. They produced silk, wool, and cotton goods, and made a remarkably good wine. Everything was turned into the productive channel, even the vines over the doors bearing fruit. They also "struck oil" on their property, which added largely to their wealth, and they purchased 2,000 acres more.

All this prosperity, which lasted many years, was due to the administrative genius of Father Rapp, his equally able son, and to Father Henrici, long the head of the community. In numbers, however, they declined, due to their celibacy and to the fact that they sought few accessions. As Economy, too, was so near a large manufacturing center many of the members forsook their earlier ideals and took their place in the competitive strife of the city, and the last years of the society's existence were marked by desertions, deaths, and lawsuits. In April, 1903, all the holdings of the Harmony Society, including the town of Economy, were bought by a Pittsburg syndicate. Their wealth at one time was variously estimated from $5,000,000 to $25,000,000.

HARRINGTON, JAMES: Born at Upton, 1611; educated at Oxford University. In 1646 he was a personal attendant to Charles I. when he was imprisoned, and attended him at his execution. In 1656 he published the work he is best known by, "Oceana"—a political allegory, somewhat in imitation of Plato—in which he depicted an ideal republic named Oceana. He was arrested in 1661 on a charge of treason, but was confined without a trial until he finally became insane, and died in 1677. The probable reason of his imprisonment was his avowed republican opinions.

HARRIS, THOMAS LAKE: Born at Fenny Stratford, England, 1823. In 1827 his father came to America and settled at Utica, N. Y. Soon compelled to earn his own living, at seventeen he began to write for newspapers. In 1844 he became a Universalist preacher at Minden, N. Y., and from 1845–47 in New York City. In 1848, having adopted Swedenborgian views, he organized an Independent Christian Society in New York. He afterward lectured in many parts of the union, endeavoring to turn the public interest in spiritualism to what he considered a higher plane of religious thought and life. In 1855 he established the *Herald of Light* to advance his views, and in 1858 visited England and Scotland, where he gained converts. Returning in 1861, he settled in Amenia, N. Y., where friends gathered around him and formed the "Brotherhood of the New Life." The Brotherhood was afterward removed to Brocton, N. Y., where Lady Oliphant and several Japanese of distinction joined the society, and remained many years. The Brotherhood was a school and the friends came as students desirous of a social life higher and more unselfish than the conventional life of civilization. The property was not held in common, but Mr. Harris seemed to hold all power in his hands, creating great hostility, deserved or undeserved. After 1876, however, it was transferred to Santa Rosa, Cal.; it gradually lost almost all its aspects as a community and became simply a prosperous business corporation, carrying on extensive agricultural undertakings, mainly in California wines. Harris died in 1905.

In reply to an inquirer, Harris made the following statement in brief:

The life, system, and action of the society which I represent are so far removed from the lines of the usual thought, that I fear I shall hardly be able to answer your friendly inquiries with the fulness you desire. Personally I am not a communist. . . . I find myself enzoned by a large circle of men and women who have been driven to me by a potent attraction but without any conscious endeavor of my own. My life is devoted to their service, and they constitute the society known as the "Brotherhood of the New Life."

This family passed, years ago, through the communistic phase, in which, however, I did not take part, tho esteeming it a phase in evolution and serving it financially. Without dissension or disunion, its members then passed into a phase of modified socialism, each series constituting a family partnership; and they found that this mode of combined action developed a large force of individual character, as well as a more strict business habit and aptitude, but the spirit was not fully satisfied.

Views

Meanwhile I organized my own affairs amid my friends, and employed all who did not fit or find place elsewhere, treating them as sons, but insisting on paying weekly wages. After a time they found it incompatible with their forming affections to receive money-pay. I then entertained them as guests, brethren, and children in their father's house; and this satisfied them. There is no espionage; honor rules; love is supreme. Gradually the family partnerships have ceased, without a struggle, and all have entered into this order.

We think that generation must cease till the sons and daughters of God are prepared for the higher generation, by evolution into structural, bisexual completeness, above the plane of sin, of disease, or of natural mortality.

Believers in the Divine Immanence, we hold by the "True Light," that lighteth every man who cometh into the world; but we further conclude that the Creative Logos, "God manifested in the flesh," is not male merely, nor female merely, but the two in one. The doctrine of the Divine-Human Two-in-One, in whose individual and social likeness, in whose spiritual and physical likeness, we seek to be reborn, is the pivot of our faith and the directive force of our life.

His principal works are: "Lyric of the Golden Age" (1855); "Arcana of Christianity" (Genesis), (1858); "The Great Republic" (1867); "Wisdom of the Adepts" (1884); "The New Republic" (1894); "The Marriage of Heaven and Earth" (1903). See also Edwin Markham's "Remarkable Pages from Thomas Lake Harris" (1908).

EDWIN MARKHAM.

HARRISON, FREDERIC: Leading English Positivist; born in London, 1831; educated at King's College, London, and at Oxford. He was admitted to the bar in 1858. Member of the Royal Commission of Trade-Unions, 1867–69, and for Digesting the Laws, 1869–70. In 1877 he was appointed Professor of Jurisprudence and International Law by the Council of Legal Education, and remained till 1889. He was alderman and on the London County Council 1889–92. He has deeply interested himself in the English Labor movement, in 1861 writing important letters to the press defending trade-unionism; later getting trade-unions legalized as friendly societies; writing for the *Beehive* from 1861–77, the principal Labor paper of London, etc. He is the chief exponent of the Positivist school, a critic of authority, and a master of English prose. Among his works are: "The Meaning of History" (1862); "Social Statics" (1875); "Order and Progress" (1875); "Oliver Cromwell" (1888); "American Addresses" (1901); "Memories and Thoughts" (1906). *Address*: Elm Hill, Hawkhurst, Kent.

HARTMANN, KONRAD: German civil engineer; born in Nuremberg, Oct. 8, 1853; studied engineering at the technical high school at Munich, later becoming an instructor at industrial and polytechnic institutions in Nuremberg and elsewhere. In 1891 he was appointed a member of the German Reichs-Versicherungsamt, of which he in 1901 became chairman. He is also professor of accident insurance at the Royal Technical high school in Berlin. His activity is directed toward the promotion of mechanical safety devices; and he is director of the perpetual exposition of such contrivances which has been established by the German government. He has

published numerous booklets and papers on safety devices, accident insurance, factory hygiene, accident statistics, etc., etc. *Address*: Kurfürstendamm 100, Berlin-Halensee, Germany.

HASLAM, JAMES: Labor member of Parliament for Chesterfield, Derbyshire. Born 1842, and educated in the village schools. He was a coal miner for twenty-nine years, and the general secretary of the Derbyshire Miners' Association for twenty-five years. He was a member of the Clay Lane School Board, of the Chesterfield Board of Guardians, and of the Chesterfield Borough Council; of the Parliamentary Committee of the Trade-Union Congress; a justice of the peace at Chesterfield in 1893. Haslam was elected to Parliament in 1906 chiefly by the miners' votes, assisted by the Liberals. *Address*: 47 Clarence Road, Chesterfield, Derbyshire, England.

HAW, GEORGE: Author; born at Darlington, Durham, England, 1871. In 1889 he went to London as a journalist, and for a time was at Toynbee Hall. He helped to found and was the first warden of the Maurice Hostel, of the Christian Social Union. Mr. Haw is on the staff of the London *Daily News*. He is author of: "No Room to Live: the Story of Overcrowded London"; "To-Day's Work: or Municipal Government the Hope of Democracy"; "Britain's Homes: a Review of the Housing Problem in Town and Country." Editor of two popular books defending Christianity against agnostic attacks; "Religious Doubts of the Democracy"; "Christianity and the Working Classes." *Address*: 34 Linzee Road, Hornsey, N. London, England.

HAWAII TERRITORY: A group of eight inhabited and eleven uninhabited islands annexed in 1898 to the United States by vote of the legislatures of the islands and of Congress. In 1900 the islands were organized under a territorial form of government. The Senate has fifteen members, the House thirty. The legislature meets biennially. The executive is a governor with a secretary, appointed by the President for four years. Other officials are appointed by the governor with the approval of the Hawaiian Senate, and must be citizens of Hawaii. Hawaii is represented in Congress by one delegate, elected biennially by the people.

Total area (including water) 6,449 square miles. The island of Hawaii has 4,210 square miles; Maui, 760; Oahu, 600; Kauai, 590. Population (1900), 154,001 (only 47,632 female). This is an increase of 41 per cent since 1896. Oahu has 58,504; Hawaii, 46,847; Honolulu, the capital of Oahu, has 39,305. Of the total number, 29,787 are Hawaiians (in 1896, 31,019); 7,848 are part Hawaiian; 25,767 Chinese, and 61,111 Japanese. The total white population is 28,533. In 1902–3 there were 12,050 Japanese immigrants. Almost all the natives are Christian, about half Protestant and half Roman Catholic. Education is free, but 33.1 per cent of the population over ten is illiterate. In 1903 there were 144 public schools and 13,793 enrolled pupils.

Exports to countries outside the U. S. (1905), $59,541. Imports from the same, $3,014,969. Merchandise to the U. S. (1905), $36,112,055 ($35,112,127 sugar), and from the U. S., $11,753,180. Sugar and rice are the staple products, but coffee, hides, bananas, wool, and whale oil and bone are also exported.

There are 128 miles of railway; nearly every house in Honolulu has its telephone.

Of those engaged in gainful occupations, 62 per cent are in agriculture, 18 per cent in domestic and personal service, 9 per cent in manufacturing, 7 per cent in trade and transportation. Fifty-two per cent are Japanese, 21 per cent Chinese, 12 per cent Caucasian, 11 per cent Hawaiian. In 1902 the wages of mechanics were $3.80 per day; of unskilled males, seventy-one cents; of unskilled females, forty-five cents.

REFERENCE: *Third Report of the Commissioners of Labor on Hawaii*. Bulletin of the (U. S.) Bureau of Labor, No. 66, September, 1906.

HAYES, JOHN W.: the present General Master Workman of the Knights of Labor; born in Philadelphia, 1854. He never attended school. As a boy Hayes worked as brakeman on the Pennsylvania Railroad. In 1878 he lost his right arm, but took to telegraphy, at which he worked until 1883. He entered the Knights of Labor on the General Executive Board 1884–88; was secretary-treasurer 1888–92; since, General Master Workman. *Address*: 43 B Street, N. W., Washington, D. C.

HAYES, MAX S.: American Socialist; born at Havana, O., 1866. Educated in the public schools and became a printer. Aided in establishing *The Cleveland Citizen*, 1890, and its editor since 1897. Populist till 1896, since that time a Socialist. Has been prominent in the Socialist Party and also in trade-unions. *Address*: 193 Champlain Street, Cleveland, O.

HAYWOOD, WILLIAM D.: Secretary of the Western Federation of Miners; tried with Messrs. Moyers and Pettibone in Boisé, Idaho, June–July, 1907, for complicity in the murder of ex-Governor Steunenberg and acquitted. (See WESTERN FEDERATION OF MINERS.)

HEADLAM, STEWART DUCKWORTH: A ritualistic Church of England clergyman and a Fabian Socialist; born at Wavertree, near Liverpool, in 1847, and educated at Eton, and Trinity College, Cambridge. He was curate of St. John's, Drury Lane, from 1870–73; St. Matthew's, Bethnal Green, 1873–78; St. Thomas's, Charterhouse, 1880–81; St. Michael's, Shoreditch, 1881–84. Mr. Headlam early interested himself in social problems as a priest of the Church of England, and his parochial duties bringing him in contact with girls and actors on the stage, he defended them from what he believed unwarranted condemnation, and came to believe in and study stage dancing as an art. A lecture on this subject gave serious offense to the late Bishop of London, and he refused him a license in his diocese, so that Mr. Headlam has worked under great difficulties. He has been the leading spirit and the real founder of the Church and Stage Guild, and also of the Guild of St. Matthew (*q. v.*), the first society still existing in England to declare for socialism. He was, till its suspension in 1895, the editor of *The Church Reformer*, the organ of the gild. Mr. Headlam is the author of several small but remarkable volumes of sermons and lectures: "Priestcraft and Progress" (1882); "Lessons from the Cross" (1887); "The Laws of Eternal Life" (1888); "Salvation through Christ"; "Christian Socialism" (1888). He has also edited part of Carlo Blesis's work on dancing, under

the title "The Theory of Theatrical Dancing." He has written essays on "The Function of the Stage," "The Ballet," etc. He thus unites the most radical views with a high Anglican Catholicism. He is most popular with the London working men, and has been elected on the London School Board for Hackney, and most actively works as a Fabian Socialist. *Address*: Waver-tree, St. Margaret's on Thames.

HEARST, WILLIAM RANDOLPH: American newspaper proprietor and politician; born 1863 in San Francisco; son of a United States Senator; educated in public schools and Harvard University. Editor and proprietor of *Examiner*, San Francisco, since 1886. In 1895 Mr. Hearst came to New York and bought the New York *Journal*, the name of which he changed to the *New York American*, and later founded and acquired the New York *Evening Journal*, and dailies in Boston, Chicago, and Los Angeles; also the *Cosmopolitan Magazine*, *Hearst's Home and American Farm and Motor*. His dailies reach 2,000,000 readers and employ 4,000 persons, besides space writers. They are people's papers, and are often accused of being "yellow journals"—advocating political measures popular with the masses merely to help Mr. Hearst's political ambitions, and to increase the sale of his papers. This motive is strenuously denied by practically all who know Mr. Hearst personally, who urge that his papers take this tone in order to reach the masses, but that Mr. Hearst advocates those measures from a genuine belief in democracy.

Mr. Hearst was elected as a Democrat to the Fifty-eighth and Fifty-ninth Congresses for the Eleventh New York district. In 1905 he was candidate for the mayoralty of New York, and was, in the opinion of almost all, elected, but counted out by 3,000 votes, and unable to secure a recount. In 1906 he was made candidate for the governorship of New York by the Independent League—which he had organized—and was also indorsed by the Democratic Convention, tho many Democrats opposed him. He received 691,105 votes, against 749,002 for Mr. Hughes (Republican).

HEATH, RICHARD: Author; born in Southwark, London, 1831. In 1845 was apprenticed as a wood-engraver. Roused by the French Revolution of 1848 to a serious life, he joined his ancestral church and became interested in the social problem. In 1868 he walked through the country studying the rural situation and gave the result in many articles on rural conditions. In 1884 he published "The English Via Dolorosa; or, History of the Agricultural Laborer," and another book "The English Peasant" in 1893. Mr. Heath would work for a real and complete separation of the Church from the world; for a reorganization of all states on a Social-Democratic basis with ultimate federation; for a Church whose only bond is faith in Christ and in God, and having for its ideal the voluntary communism of the New Testament. He is the author of: "The Early Life and Writings of Edgar Quinet"; "Anabaptism in 1526–1536"; "The Captive City of God," and articles in *Contemporary Review*, etc. *Address*: Trevereux Hill, Limpsfield, Surrey, England.

HEGEL, GEORG WILHELM FRIEDRICH: Philosopher; born at Stuttgart, 1770. He studied at Tübingen with Schelling, and became professor at Jena, Heidelberg, and Berlin, where he died in 1831. His principal works are: "Die Phenomenologie des Geistes" (1807); the "Logik" (1812–1816); an "Encyklopedie der Philosoph. Wissenschaften" (1817); "Philosophie des Rechts" (1821). He early in life turned his attention to social questions, writing (1797) a commentary on Stewart's "Inquiry into the Principles of Political Economy." Later he published various small works on the political constitutions of Württemberg and Germany, criticizing them and admiring Napoleon, "that universal genius." Living in the stirring times of the French Revolution, rejecting the idea of the Absolute, and conceiving of everything, even of God, as an eternal process, he thinks of society as developing through the individual, the family, the town, the State, the world, higher and higher unities, each unity, however, realizing and not destroying the lower unity. It is easy to see how he came to be the intellectual father of Marx and of most early German Socialists.

HELD, ADOLF: Political economist, born in Würzburg in 1844. He studied in Würzburg and Munich. In 1867 he became teacher, and in 1872 Professor of Political Economy at Bonn. In 1880 he was called to the university at Berlin, but was drowned on Aug. 25th of the same year. He was prominent as one of the Socialists of The Chair (*q. v.*). Among his best-known works are: "Die Einkommensteuer" (1872); "Die deutsche Arbeiterpresse der Gegenwart" (1873); "Grundriss für Vorlesungen über Nationalökonomie" (1876); "Sozialismus, Sozialdemokratie und Sozialpolitik" (1878).

HELICON HALL: In response to a call published in *The Independent*, New York, a meeting of about 300 people was held in Berkeley Lyceum, New York City, July 17, 1906. The object of the meeting was the establishment of a cooperative home. The Helicon Home Colony was subsequently organized by the persons interested. In October of the same year this organization secured nine acres and a half of land, with the buildings thereon, known as the Helicon Hall property, at Englewood, N. J.

The title to this property was taken by the Home Colony Company, a separate corporation, formed to raise the necessary capital. The company engaged to put the main building (Helicon Hall) in thorough repair and to equip it for use as a residence, and the colony rented the property from the company upon a three-year lease.

The Helicon Home Colony was a membership corporation governed by a board of directors elected for six months by secret ballot. The only conditions to residence in the colony were "congeniality" and freedom from contagious disease. One might reside in the colony indefinitely without becoming a member, but only members had the right to vote. The conditions of membership were one month's residence, election by a four-fifths vote, and the payment of an initiation fee of $25. The constitution of the colony provided for initiative, referendum, and recall of members of the board of directors.

The colony believed that, by means of cooperation, the introduction of system and labor-saving machinery, household labor could be lifted to the rank of a profession and that people could be found to do such labor and, at the same time, be admitted to the colony as members. The ex-

perience of five months at Helicon Hall justified this belief.

The name "Colony" suggests "Brook Farm," "Ruskin," and similar cooperative experiments, but, as a matter of fact, all these colonies were experiments in cooperative production, while the Helicon Hall Colony was an experiment in cooperative distribution.

Helicon Hall was destroyed by a fire originating before daybreak on March 16, 1907. In this fire one life was lost and several persons were seriously but not fatally injured.

UPTON SINCLAIR.

HENDERSON, ARTHUR: English Labor M. P.; born at Glasgow, 1863; and on moving to Newcastle in 1875, apprenticed as a molder to Robert Stephenson & Co. In 1883 he joined the Friendly Society of Ironfounders, and in a short time was made an official. In 1894 was secretary of the North-Eastern Conciliation Board. His municipal work includes labor on the Newcastle City Council, Durham County Council, and Darlington Borough Council. A member of the Wesleyan Church for twenty-five years, he has filled nearly all the lay offices connected therewith. At a by-election in 1893, he was elected to Parliament the first Labor representative independent of the old parties. In 1903 he was Mayor of Darlington. In 1906 he was elected for Barnard Castle, Durham. Not a party Socialist, he is a strong believer in collectivist principles to be developed through the trade-union movement. *Address*: Teesdale, Atherfold Road, Clapham, S. W.

HENDERSON, CHARLES RICHMOND: Sociologist; born 1848, at Covington, Ind.; educated at public schools, (former) University of Chicago, Baptist Union Theological Seminary, Leipsic University. Pastor of churches at Terre Haute and Detroit until 1892, when he became Professor of Sociology at University of Chicago. President National Conference of Charities and Corrections in 1899; of National Prison Association in 1902; of National Children's Home Society. Associate editor of *American Journal of Sociology*. He believes in sociological science as an instrument of coordination of bodies of knowledge which in isolation would be sterile. He is the author of: "Social Elements"; "Introduction to the Study of the Dependent, Defective, and Delinquent Classes"; "Social Spirit in America"; "Social Settlements"; "Modern Methods of Charity," etc. *Address*: University of Chicago, Chicago, Ill.

HERBERGEN ZUR HEIMATH. See RELIEF STATIONS.

HERBERT, AUBERON EDWARD WILLIAM MOLYNEUX: English reformer; the son of the third earl of Carnarvon, born 1838. He left Oxford for the army, serving eighteen months in India, but returned, and took his degree, and for a year taught at Oxford. He then visited Denmark during the Prussian-Danish War, and the United States during the War of the Rebellion, becoming acquainted in camp with Generals Grant and Meade. His next few years were spent in London aiding working men in clubs. From 1870 to 1874 he was in Parliament for Nottingham. He went to France during the Franco-Prussian War. He left Parliament, coming to believe, with Spencer, that the people needed to reconstruct their own conditions in life and not to depend on politicians. He has thus become an intense individualist, the editor of *Free Life*, the organ of Voluntaryism (*q. v.*), advocating the voluntary state and voluntary taxation. He published "The Right and Wrong of Compulsion by the State" in 1885. *Address*: Old House, Ringwood, Hants.

HEREDITY: The importance of heredity in questions of social reform is large, but cannot be briefly discust, except in the most general terms. Scientific authorities have come as yet to few exact conclusions as to heredity, and even some of its fundamental characteristics are yet in dispute. (For the great Weismann controversy as to whether acquired characteristics can be transmitted to posterity or not, see EVOLUTION.) Of the bearing of this upon social reform, Professor Ely says (*Outlook*, 1893):

> Recent studies of heredity appear also to give less importance to it, on the whole, than earlier ones. It is now frequently asserted by scientists that acquired qualities cannot be transmitted. An English economist says of Weismann, whose essays upon heredity are well known, that he has reopened the case for socialism. What he means is this, socialism lays emphasis almost entirely upon circumstances, and Weismann's investigations have so emphasized the importance of circumstances as opposed to heredity that once more the case for socialism requires discussion before the bar of public opinion.

In a recent letter Mr. C. Loring Brace, secretary of the Children's Aid Society of New York, said:

> So far as we can judge, inheritance does not figure in the problem. . . . This society has placed 84,000 children in homes since it began this work forty years ago, and it is our experience that no matter what the parents may be, if the child is taken away at an age so early that it has not yet understood the wickedness about, if placed in a country home with kind and judicious adopted parents, it is almost certain to do well. . . . But if the child is not transplanted early enough, then there are the bad examples, bad habits, and knowledge of evil ways to contend against.
>
> The last word of the scientists is in accord with the words of these practical scientists. The theory of heredity now held by Wallace, who shares with Darwin the credit of the hypothesis of natural selection, and by Weismann and the most eminent authorities, is that acquired characteristics of the parent do not pass to the child by inheritance.

A large majority of physicians also testify that most babies are born healthy, but early develop disease from improper care.

Dr. H. D. Chapin, in the *Forum* (March, 1894), gives the results of his studies:

> Dr. Chapin is a physician to the New York Post-Graduate Hospital, and has made a record of 600 cases that came under his care. His object was to determine how far the diseases of very little children were occasioned by heredity and how far by the conditions in which they lived. Most of the children were under two years of age, and nearly half under one year. At the time of birth, 508 of them were reported to have been in good condition, and only 20 were reported to have been in bad condition. In 12 cases the report was "only fair," and in the remaining cases there was no report. The children as a whole, therefore, seem to have started life well. What, then, had been their environment? It was found that in 106 cases the mothers were the sole breadearners, and that in 88 cases the fathers were out of work when the children came to the hospital. Besides these there were 176 cases in which the mothers as well as the fathers were obliged to work. The results of this were very striking. "Two hundred and fifty-seven of the cases," says Dr. Chapin, "were deprived of maternal nourishment before the proper time, and 101 of the babies never received it at all. The usual reason was that the mothers were obliged to go out to work and remain away for too long intervals to care properly for their infants. As a direct result, a large number develop rickets, which is usually accompanied by a softening of the bones, together with great irritation of the nervous system. Almost all these diseases could have been prevented by proper diet and care, and yet when brought to the hospital they were frequently so far advanced as to result either in

death or in a more or less permanent crippling of a healthy life."

The result of this view upon social reform is thus summed up by Alex. MacKendrick (*Westminster Review*, 162, Aug., 1904):

The lesson for the social reformer which seems to grow out of these considerations is that we may cease attempting to control the hereditary or transmissible forces at the back of human life, as they lie far more deeply and are far more subtly interfused with the primal law of things than we have imagined. We cannot "deal with existing heredity for the benefit of future heredities," as one writer has hoped. We cannot educate the race by educating its present representatives. We cannot moralize the next and unborn generation by the simple process of moralizing the present one. But what we can do, or could do if we would, is to prepare such an environment for the reception of the next generation as will mold it after a different shape—an environment in which the natural and beneficent force of parental affection will find room to realize itself, and in which the bitterness and despoil engendered by poverty and struggle will be eliminated.

Nevertheless, it must not be forgotten that *unacquired* characteristics are transmitted, and that this heredity plays a very large part in life. W. Duncan McKim says ("Heredity and Human Progress," p. 120, 1900):

Heredity (in the broadest sense including transmitted specific tendency and deficient vitality) is the fundamental cause of human wretchedness. He quotes G. A. Dorsey as saying (*Science*, New Series, vi., 119, 1897): "Every human child at birth is endowed with the heritage transmitted from innumerable ancestors, and is already rich with impersonal experiences from its prenatal life. . . . These combined decide the individual's race and strain, and potentially incline, if they do not absolutely coerce, his tastes and ambitions, his fears and hopes, his failure or success." Prof. Angelo Messo is quoted as saying (Eng. trans. by E. Lough and F. Kieson, 1896): "Destiny loads each of us with a fatal inheritance. . . . We feel the breath, the advice, the experience of all men, from those who lived on acorns and struggled with the wild beasts, dying naked in the forest, down to the virtue and evil of our father, or the fear and love of our mother."

For a classic example of the influence of heredity, see R. L. Dugdale's book, "The Jukes." Similarity of generation after generation in certain families, as of the English aristocracy, is well known. Tho this can be in part accounted for by each generation having much the same environment, instances of similarities between ancestors and descendants are found in every-day life, which environment will hardly account for. Only gradually is science, however, becoming able to accurately measure this influence. Francis Galton first attempted any general law. According to him the two parents contribute in general each one half, the four grandparents in general each one fourth, the eight great-grandparents one eighth, in heredity; in general the influence in heredity of any ancestral generation, he says, is inversely proportioned to the total number of individuals comprized in that generation. Recent investigators and writers, like Pierrson in England, DeVries in Holland, Cowens in Germany, Tschermak in Austria, Spellman in America, have made each some new progress in the investigation, but all witnessing to the fact and potency of heredity. But perhaps more than all has Mendel, working alone in his Augustan monastery at Brunn, Austria, contributed to the knowledge of the subject with his investigation of the transmission of dominant characteristics.

REFERENCE: See the works and authors quoted or named in this article. (See also EVOLUTION.)

HERRON, GEORGE DAVIS: Socialist lecturer; born, 1862, Montezuma, Md.; educated Ripon College, Wisconsin. Entering the Congregational ministry, he held pastorates at Lake City, Minn., and Burlington, Ia. (1891–93). Becoming interested in social questions he wrote (1891), "The Message of Jesus to Men of Wealth," which at once aroused wide-spread interest, and led to his forming a social crusade by lecturing and preaching in the churches through all parts of the country. Passionate utterance and brilliant thought brought large and rapt audiences. In 1893 he was chosen to the Chair of Applied Christianity of Iowa College, Grinnell, endowed by Mrs. Rand. His views at this time were those of a radical and intense Christian Socialism, but as they continually grew more radical and extreme, great opposition was developed in religious circles culminating, in 1901, owing to Dr. Herron's separation from his wife and marriage to Miss Rand. Dr. Herron was deposed from the ministry, he, however, having already resigned his chair (1900) and renounced belief in Christianity as a distinctive religion. Dr. Herron has since worked only with the Socialist Party as lecturer and writer, recently residing for the most part in Italy. His main works are: "The Larger Christ" (1891); "The Call of the Cross" (1892); "The New Redemption" (1893); "The Christian Society" (1894); "The Christian State" (1895); "Between Cæsar and Jesus" (1899).

HERTZEN, ALEXANDER: Born in Moscow, Russia, in 1812. Shortly after completing his education he was imprisoned for his outspoken views and banished to Viatka and Vladimir. On his return he devoted himself to literature, and in 1842 his "Dilettantism *vs.* Naukie" attracted attention. In the same year, for criticizing the police, he was ordered to live in Novgorod. In 1847 he obtained permission to travel, and in 1851 set up in London a *Free Russian Press* to attack the government and issue works forbidden in Russia, notably *Kólokol* (*The Bell*), started in 1857. Thousands of copies were smuggled into Russia and read by all, from the emperor to the peasants. After sympathizing with the Poles in their insurrection of 1863, he transferred the *Kólokol* to Geneva, where it had an obscure existence till about a year before Hertzen's death in Paris in 1870. He was romantic and skeptical, eloquent and satirical. He wrote various books and stories, his complete works being published in Basle in 1875.

HERTZKA, THEODORE: Economist; born in Budapest in 1845, and studied in Vienna. In 1872 he was editor of the *Neue Freie Presse*; in 1880 superintendent of the *Wiener Allgemeine Zeitung*. The same year he brought out his "Die Gesetze der Handelspolitik" ("Laws of Trade"), from the standpoint of the orthodox economy, which, however, he wholly gave up six years later in his "Die Gesetze der Sozialen Entwickelung" ("Laws of Social Evolution"). A still further advance is made in his utopia of "Freiland" (1890), in which he pictures a colony in equatorial Africa on the principles of communism. At the end of this volume he called for the creation of such a colony, and met with a large response. A central committee was organized, and in 1893 a start actually made. At the last, however, the difficulties were too great, and the plan failed.

HERZENSTEIN, MICHAEL YAKOVLEVITCH: Russian Duma leader; 1859–1906. Representative (Constitutional Democrat) from Moscow; of Jewish extraction. Graduate of the law

school of the Novorossiysk University (1881). Educated at the Heidelberg and Berlin Universities; adjunct professor of the Moscow University (1903). Professor of Political Economy of the Moscow Agronomical Institute (1904); chairman of the Moscow Municipal Council and Financial Committee. Member of the Moscow Province Zemstvo Society. Author of a series of works on economics.

HEYDEN, COUNT PETER ALEXANDROVICH: A Russian leader in the Duma; born 1846. Representative (Moderate) of the Pskov Province; leader of the Opochetz nobility. Graduate of the Mikhaeloff Artillery Academy. Ex-chairman of Free Economic Society. Member of the Zemstvo and City Deputation to Nicholas in 1905. An active member and chairman of all the large Zemstvo conferences.

HIGGINS, HON. HENRY BOURNES, K.C.: Member of the Australian Parliament for Northern Melbourne, Victoria; born at Newtownards, Ireland; educated at St. Stephen's Green College, Dublin, University of Melbourne (M.A.) (LL.B.). Scholar in languages and logic, history, political economy. Elected to legislature for Geelong in 1894–1901; 1897, he was member of the convention which framed the Commonwealth Constitution, and was returned to first House of Representatives for Northern Melbourne, 1901. Higgins was attorney-general of the Commonwealth in Watson ministry, 1904, and chairman of the Royal Commission for reform of legal procedure (1897–1899), and member of University Council. He founded a scholarship for poetry at Melbourne University. *Address*: 1 Selborne Chambers, Melbourne.

HIGGINSON, THOMAS WENTWORTH: Born in Cambridge in 1823; graduated from Harvard in 1841. Settled as pastor of the First Church in Newburyport, but, dismissed in 1847 because of his antislavery preaching, he organized the Free Church in Worcester, where he remained nearly six years, an enthusiastic worker against slavery and the intimate friend of Garrison and Phillips. He enlisted in the war in 1862, and served till seriously wounded in 1864. He was appointed colonel of the first regiment of colored troops enlisted in South Carolina. His great work, however, has been as essayist, author, poet, lecturer, and novelist. Some of his best writings have been his short essays contributed to *Harper's Bazar*. His lecture, "The Aristocracy of the Dollar," gave him a national reputation. His devotion to the cause of humanity led him to especially espouse the cause of the slave, and since then of woman emancipation from intellectual and political subjection. He was one of the first interested in Nationalism, and has even been called a Socialist, tho not committed to all its views. Living in Cambridge, Mass., he is prominent in public affairs and reform movements. *Address*: 29 Buckingham Street, Cambridge, Mass.

HIGH LICENSE: May be regarded as a license to sell liquors at what is regarded high rates, and intended thereby to reduce the number and improve the character of the places licensed.

In the early days of the temperance movement action was limited to "total abstinence for the individual and prohibition for the State."

The large city is the crux of the liquor problem, not only because of its size, but also because of the heterogeneous character of its population, the crowded condition of its tenements, and the lack of space which in so many cases prevents the observance of the ordinary decencies of life.

In 1883 I made the following statement from official sources:

City of New York

Liquor sellers	10,075
Food sellers	7,197
Excess of former over latter	2,878
Arrests for crime during the year	67,135
Arrests for intoxication and disorderly conduct	42,612

or 63.5 per cent of the whole.

Prohibition and restriction were the two possible remedial measures by law. In a city with so vast and heterogeneous a population the first remedy was promptly recognized as the dream of an enthusiast; the latter meant high license.

The High License Law of Nebraska was passed in 1881, and fixt the annual fees at $500 for saloons in towns of less than 10,000 population, and $1,000 for those containing more than 10,000 inhabitants.

In 1883 the Harper Law of Illinois fixt the minimum rate for the sale of malt liquors only at $150 and $500 for all kinds of liquors.

In the same year the Downing Law of Missouri fixt a minimum rate of $550, and a maximum of $1,000.

In Massachusetts the minimum license rate for the ordinary saloon selling all kinds of liquors on and off the premises is $1,300.

In Minnesota $500 for towns and $1,000 for cities.

In Greater New York, under the old law, 1896, the number of liquor licenses granted were 15,357; under the new High License Law of 1903, the number was reduced to 12,827.

There is now an effective Excise Department for the State of New York located at Albany, and of which the Hon. Maynard N. Clement is the chief officer.

From the report of 1904 we quote the following points:

"When the liquor tax law (high license) took effect, March 23, 1896, there were 33,437 licenses granted in the state. On Jan. 10, 1902, the number of liquor-tax certificates in force in the state was 26,436, a reduction of over 7,000, or more than 20 per cent, in the number of places authorized to sell liquor.

"According to the reports of the State Commission of Prisons, the number of commitments for drunkenness has fallen from 53,200 in 1897, to 33,203 in 1901, a reduction of nearly 40 per cent.

"From the same authoritative source it appears that the number of criminals confined in the state prisons in 1890 was 3,508, increasing until 1895, when it reached 3,721, but diminishing through the years since the passage of the Liquor Tax Law to 3,375 in 1900.

"The total population of the state jails, penitentiaries, reformatories, and state prisons in 1896 numbered 12,661, but in 1900 it had fallen to 10,761.

"During the period from 1890 to 1900 the population of the state has increased from 5,997,853 to 7,268,012, being 1,270,159 persons, or 21.2 per cent.

"Reasoning from analogy, it was to be expected

that the criminal statistics would steadily increase during the whole decade, in line with the increase of population, even as they did during the first five years, but some great restraining and corrective force has made itself felt during the last half of the period, producing the surprisingly improved results. That restraining and corrective force has been high license."

ROBERT GRAHAM.

HILDEBRAND, BRUNO: Economist; born at Naumburg, Prussia, in 1812. Studying philosophy, he was implicated in the affair of the *Burschenschaften* (corporations of students suspected of liberalism); he succeeded, however, in being appointed Professor Extraordinary in the University of Breslau, then at Marburg (1841), where he published some years later (1848) the first volume of "Die Nationalökonomie der Gegenwart und Zukunft." He was the same year chosen deputy from Marburg to the National Assembly at Frankfort, and his attitude was so hostile to the government that he was exiled to Switzerland. At Zurich he was appointed Professor of Political Economy. He had already created at Marburg a bank for widows (*Wittwen casse*); and he founded at Berne the savings and loan bank. After he left Zurich (1861) he occupied the chair at Jena (1862), and in 1862 founded the "Jahrbücher für National Œconomie und Statistik." After 1873 he edited this journal in connection with Conrad, his son-in-law. He died at Jena, Jan. 29, 1878, a leader in the historical school (*q. v.*).

HILL, OCTAVIA (MISS): Philanthropist; born in England; educated at home. Early became interested in social and charitable work in London; in 1864 she first took charge of the management of homes for the people. She collects rent for the owners of houses and tenements all over the city, and uses her work as an opportunity for aiding those from whom the rent is collected in cleansing and bettering their tenements and in improving the whole environment of their lives. Begun as an experiment, the scheme has grown until now Miss Hill and her assistants have the care of between five and six thousand dwellings. Miss Hill has been connected with many of the societies which are working for a greater and a better London almost from their commencement. Among them, the Charity Organization Society, The Commons Preservation Society, Kyrle Society, Women's University Settlement, and the National Trust for Places of Historic Interest and Natural Beauty. She is the author of "Homes of the London Poor," "Our Common Land," and various articles published in magazines. *Address*: 190 Marylebone Road, N. W., London.

HILL, SIR ROWLAND: Father of cheap postage; born Kidderminster, 1795. After his own education taught in his father's school till 1833, then joined the association for establishing the colony of South Australia on Mr. Wakefield's scheme of colonization (see AUSTRALIA), and became secretary to the Royal Commission on the colony. In 1837 he published his famous pamphlet advocating cheap and uniform postage. In 1840 a uniform rate of 4d. per letter was adopted, soon after reduced to 1d. Mr. Hill was placed in the treasury to work out his plan, but was soon dismissed by a Tory government which came into power. In 1846, however, the Whigs returned to power, and Mr. Hill was made secretary to the postmaster, and in 1854 secretary to the post-office, an appointment he held till failing health compelled him to resign in 1864. He died in 1879.

HIRSCH, JENNY: German author and reformer; advocate of woman's advancement; born at Zerbst, 1829. She wrote in Berlin (1860-64) under the name of J. N. Heynrichs. In 1865 she was a member of the Woman's Congress at Leipzig, and since then has written, besides many tales, numerous works on woman's advance. She died in 1902.

HIRSCH, MAURICE, BARON DE: Austrian Jewish financier and philanthropist; born at Munich, 1831. He inherited his father's fortune (1869) and became associated with the banking firm of Bischoffsheim & Goldsmid, Brussels. Making large profits by building railways in Rumania and Turkey, his fortune was estimated at $200,000,000. He gave about $100,000,000 during his life mainly to Jewish charities, and the Baroness $15,000,000 more at her death (1899). He gave not less than $50,000,000 to establish Jewish colonies in Argentina and $2,500,000, increased by his wife to $3,700,000, to educate and Americanize Russian and Rumanian Jews. He died April 21, 1896.

HIRSCH, MAX: German economist and reformer; born 1832, at Halberstadt, in Prussian Saxony. Studied political economy and jurisprudence at Tübingen, Heidelberg, and Berlin, and traveled extensively in France, England, and North Africa. He has since devoted himself to organizing trade-unions in Germany and in societies in the interests of the working classes. He was elected several times to the Reichstag.

HISTORICAL SCHOOL: A school of political economists which arose in Germany, in reaction from the theorizing of the English school of *laissez-faire* as developed in Ricardo and his followers. Most economists rightly object to being classed in this or any other "school," preferring to be catholic in their views and unfettered by designation of belonging to any school. Yet this school has many sympathizers. The school is in the main inductive, where the Ricardian economy is deductive. It owes its rise very largely to the influence of Comte and the Positivists.

Roscher, Bruno, Hildebrand, and Karl Knies may be said to be its four German founders. (See their names.) The school has always had a marked leaning toward State socialism in reaction from individualism. Says Professor Ingram ("History of Political Economy," p. 207):

> The historical method has exhibited its essential features more fully in the hands of the younger generation of scientific economists in Germany, among whom may be reckoned Lujo Brentano, Adolf Held, Erwin Nasse, Gustav Schmoller, H. Rösler, Albert Schäffle, Hans von Scheel, Gustav Schönberg, and Adolf Wagner. Besides the general principle of an historical treatment of the science, the leading ideas which have been most strongly insisted on by this school are the following: I. The necessity of accentuating the moral element in economic study. This consideration has been urged with special emphasis by Schmoller in his "Grundfragen" (1875) and by Schäffle in his "Das gesellschaftliche System der menschlichen Wirthschaft" (3d ed., 1873).
>
> The two other ideas which Professor Ingram considers prominent in the historical school are a close relation between economics and jurisprudence, and the conception of the State as the organ of the nation for any end that may seem desirable, a view lending itself very easily to State socialism.

HOBBES, THOMAS: Born at Malmesbury, 1588, the son of a clergyman, he went to Oxford at the age of fifteen. He became tutor in the family of the Earl of Devonshire, and acquainted with Bacon, Raleigh, Ben Jonson, and other distinguished men. It was not till he had reached the age of forty that he published, in 1628, his first work, a translation of "Thucydides."

His first original work was "Elementa Philosophica de Cive" (1642). In 1651 he published the "Leviathan," the fullest and perhaps the best-known exposition of his views on mind, politics, morals, and religion.

A friend to royalty, his views were condemned by Parliament in 1666, and he was in danger of still severer measures. His last works were a translation of Homer and a history of the civil wars. He died Dec. 4, 1679.

HOBSON, JOHN ATKINSON: Economist; University extension lecturer; born 1858, at Derby, England; educated at Lincoln College, Oxford. From 1880 to 1887 he was classical master at Faversham and Exeter, and from 1887 to 1897 Lecturer on English Literature and Economics for the London Society for the Extension of University Teaching, and the Oxford University Delegacy. Hobson is a Fabian Socialist. One of the founders and editors of *The Progressive Review*; a frequent contributor to *The Contemporary* and *Westminster* and other reviews. He has written: "Problems of Poverty"; "The Evolution of Modern Capitalism"; "The Problem of the Unemployed"; "John Ruskin, Social Reformer"; "The Economics of Distribution"; "International Trade"; "The Social Problem," etc. He is coauthor with A. F. Mummery of "The Physiology of Industry." *Address*: Elmstead, Limpsfield, Surrey, England.

HODGE, JOHN: English Labor member of Parliament; born 1855, Muirkirk, Ayrshire, Scotland; educated at the Hutchesontown Grammar School, Glasgow. He took an early interest in labor matters, and in 1886 became secretary of the Steel Smelters' Association. To his efforts are due the success and progress of the Association. In 1892 he was president of the Glasgow Trades Council, also president of the Trades Union Congress. In 1898 he was elected to Manchester City Council. He has written many pamphlets and articles. He was elected to Parliament as member for Gorton (Lancashire) in 1906. *Address*: Ormond Mansions, Great Ormond Street, London, W. C.

HOLLAND. See NETHERLANDS.

HOLLAND, CANON HENRY SCOTT: Canon of St. Paul's, London, and chairman of the London Christian Social Union; born in Ledbury, Herefordshire, England, in 1847, and educated at Eton and at Balliol College, Oxford. After some years of residence at Oxford as student of Christ Church, he became canon of Truro (1882), and of St. Paul's, London (1884). He is one of the leaders in the Anglican Church. Besides his notable share in "Lux Mundi," he has written many books, such as "In Behalf of Belief" and "The City of God." He was principal founder of the Christian Social Union (*q. v.*) in 1889, and is chairman of the energetic London branch of the union, and editor. He is in politics and reform an outspoken leader in Anglican Christian Socialism.

HOLLANDER, JACOB H.: Economist; born Baltimore, 1871; graduate of Johns Hopkins University, 1891. He was appointed associate professor of finance and held the position till 1900, when he became associate professor in political economy, 1901–4, and professor in 1904. He is head of the political economy department of the university. In 1897 Hollander was secretary of the Bimetallic Conference abroad. Appointed by President McKinley treasurer of Porto Rico 1900–1901, he organized the revenue system ("Hollander Law"). He investigated the finances of San Domingo for President Roosevelt, 1905, and was special agent of the State Department 1906–7. Author of various economic studies on finance and taxation. *Address*: 335 Dolphin Street, Baltimore.

HOLST, HENRIETTE ROLAND: Author; Socialist; born, 1869, at Noordwyk, Holland; first work published in 1895; joined Social Democratic Labor Party in 1897, and has worked devotedly in the propagation of the principles and ideals of Socialism. Mrs. Holst stands for "orthodox, uncompromising Marxism, understood not only as a political opinion, but a general philosophy." She is the author of "Capital and Labor in Holland," "The General Strike and Social Democracy," "Sonnets," "Poems," etc. *Address*: Laren, Holland.

HOLYOAKE, GEORGE JACOB: Historian of cooperation; born in Birmingham, England, in 1817. The son of an iron-worker, he was educated in the Mechanics' Institute and taught mathematics. In 1837 he heard Robert Owen, and became one of his "social missionaries" stationed at Sheffield. In 1841, in lecturing at Cheltenham, he gave a novel turn to a Bible passage, and was imprisoned six months for blasphemy. He was sometimes called the father of secularism, being neither theistic nor atheistic. For several years he edited *The New Moral World*, and then for fifteen years *The Reasoner*. To abolish "the taxes on knowledge" he printed an unstamped newspaper till his fines amounted to £600,000. Becoming interested in cooperation, he identified himself with the cause, and published "The History of Cooperation in Rochdale," which is said to have led to the formation of 250 cooperative societies. His "History of Cooperation in England" (2 vols.) appeared in 1875–1878; "The Rochdale Pioneer" in 1882. Besides these he has written numerous tracts and papers and innumerable newspaper articles on cooperation and on secularism. His life is told in "Sixty Years of an Agitator's Life" (1892). Died 1906.

HOME COLONY: Home, Wash., "the only anarchist colony." In 1896 three families moved from a disrupted Socialist colony at Glannis, Wash., and without any plan of organization bought adjacent land and commenced a more or less communal life. Other families came and, in 1898, a landholding association was formed. It had as its only rules that no more than two acres per individual should be allowed any person or family, that the title should be held by the association simply to prevent the land being sold in larger quantities, but that the association should

sell, without any other restriction, the use and occupation of the land (including the right of resale), and should sell this for just what the land cost. Beyond this the association does nothing and there is no community, government, authority, or law, except that the association pays the taxes and distributes them according to the landholding and conducts a school under the state law. All improvements are made by the voluntary contribution of those who desire them. A store is also conducted by voluntary cooperation. People are free to marry or to practise "free love," and the views of the community are said to be about equally divided on this subject. There is no law as to saloons or crime, tho there is no saloon and little drinking or evil of any kind. The community has steadily grown and (1907) numbers about 150 persons. At first much criticized, their quiet life has made almost all in the neighborhood friendly to them. Agriculture is the main occupation, though there is carpentry, blacksmithing, and logging. Dissensions arise, but each family is so independent that these differences do not seem to last and the community seems after ten years to be growing in stability. Voluntary cooperation is encouraged. Meetings are held Sundays for ethical, economic, or other addresses and discussions. A little paper is published, *The Demonstrator*. *Address*: Home, Lakebay P. O., Washington.

HOME RULE. See Irish Home Rule.

HOMES, OWNERSHIP OF (for other countries, see Land): In the United States only are there official statistics available on a large scale as to the ownership of homes. (See also Housing Question; Overcrowding; Tenements.)

Ownership of Homes in the U. S., 1890 and 1900

(All these statistics are from the census, 1900)

Kind of Family	Number of families	Per Cent of Families Having Homes—		
		Owned		Hired
		Free	Mortgaged	
1900				
All families	16,187,715	31.8	14.7	53.5
Farm families	5,698,901	44.4	20.0	35.6
Other families	10,488,814	23.4	12.9	63.7
1890				
All families	12,690,152	34.4	13.4	52.2
Farm families	4,767,179	47.3	18.6	34.1
Other families	7,922,973	26.7	10.2	63.1

A "family," according to the census, is any "group of individuals who occupy jointly a dwelling-place or part of a dwelling-place or for any individual living alone in any place of abode." A "family" may include all the occupants and employees of a hotel, cabin, tent, factory, or stable, if they habitually sleep there.

The totals for the 160 cities of continental U. S. having at least 25,000 inhabitants are as follows: Families having home, owned, total, 1,027,256; free, 561,664; mortgaged, 435,233; unknown, 30,359. Families having home, hired, 2,970,107; tenure unknown, 139,916. Per cent of families having home, owned, total, 25.7; free, 14.5; mortgaged, 11.2. Per cent of families having home, hired, 74.3.

Ownership of Homes in Representative Cities, 1900

Washington, D. C.	24.2	16.1	8.1	75.8
Worcester, Mass.	24.9	8.7	16.2	75.1

In 1900 only 46.5 per cent of the families, or less than one half of the families of our country, owned their own homes; only 32 per cent, less than one third, owned unmortgaged homes. From 1890 to 1900, the number of families owning their own homes, free or mortgaged, fell from 47.8 to 46.5 per cent. Of farm families, in 1900, 64.4 per cent owned a home and only 44.4 per cent an unmortgaged home. The number of families owning farms free or mortgaged fell from 65.9 in 1890 to 64.4 in 1900, and those owing unmortgaged farms fell from 47.3 in 1890 to 31.8 in 1900. Other homes free or mortgaged fell from 36.9 in 1890 to 36.3 in 1900; unmortgaged homes other than farms, fell from 26.7 to 23.4 per cent. From 1890 to 1900 farm tenants increased from 34.1 to 35.6. Other tenants increased from 63.1 to 63.7.

These statistics, however, must not be pressed. A mortgage on a home often means a family of immigrants who buy a home but put a temporary mortgage on it till they can pay it off. Or it may mean a newly married couple; or in a hundred ways may mean the gaining and not the losing of a home.
